G20 Leaders' Communiqué

Antalya Summit, 15-16 November 2015

Introduction

1. We, the Leaders of the G20, met in Antalya on 15-16 November 2015 to determine further collective actions towards achieving strong, sustainable and balanced growth to raise the prosperity of our people. We are firm in our resolve to ensure growth is robust and inclusive, and delivers more and better quality jobs. We recognize that advancing inclusive growth and entrenching confidence require the use of all policy tools and strong engagement with all stakeholders.

2. In pursuing our objectives, we have adopted a comprehensive agenda this year around the three pillars of decisive *implementation* of our past commitments to deliver on our promises, boosting *investments* as a powerful driver of growth and promoting *inclusiveness* in our actions so that the benefits of growth are shared by all. We have also enhanced our dialogue with low income developing countries as part of our implementation of this agenda.

Strengthening the Recovery and Lifting the Potential

3. Global economic growth is uneven and continues to fall short of our expectations, despite the positive outlook in some major economies. Risks and uncertainties in financial markets remain, and geopolitical challenges are increasingly becoming a global concern. In addition, a shortfall in global demand and structural problems continue to weigh on actual and potential growth.

4. We will continue to implement sound macroeconomic policies in a cooperative manner to achieve strong, sustainable and balanced growth. Our monetary authorities will continue to ensure price stability and support economic activity, consistent with their mandates. We reiterate our commitment to implement fiscal policies flexibly to take into account near-term economic conditions, so as to support growth and job creation, while putting debt as a share of GDP on a sustainable path. We will also consider the composition of our budget expenditures and revenues to support productivity, inclusiveness and growth. We remain committed to promote global rebalancing. We will carefully calibrate and clearly communicate our actions, especially against the backdrop of major monetary and other policy decisions, to mitigate uncertainty, minimize negative spillovers and promote transparency. Against the background of risks arising from large and volatile capital flows, we will promote financial stability through appropriate frameworks, including by ensuring an adequate global financial safety net, while reaping the benefits of financial globalization. We reaffirm our previous exchange rate commitments and will resist all forms of protectionism.

5. We remain committed to achieving our ambition to lift collective G20 GDP by an additional 2 percent by 2018 as announced in Brisbane last year. Our top priority is timely and effective implementation of our growth strategies that include measures to support demand and structural reforms to lift actual and potential growth, create jobs, promote inclusiveness and reduce inequalities. We have made significant progress towards fulfilling our commitments since last year, implementing half of our multi-year commitments. Analysis by the IMF, OECD and World Bank Group indicates that our implementation so far represents more than one third of our collective growth ambition. Yet we also acknowledge that more needs to be done. We will strive more and take prompt action to expedite implementation of our remaining commitments. Going forward, we will continue to closely monitor the implementation of our commitments through the robust framework we developed this year. We will also continue reviewing and adjusting our growth strategies to ensure that they remain relevant to evolving economic conditions, policy priorities and structural challenges, in particular slow productivity growth, and that they remain consistent with our collective growth ambition. The Antalya Action Plan, comprising our adjusted growth strategies and implementation schedules for key commitments, reflects our determination to overcome global economic challenges.

6. We are committed to ensure that growth is inclusive, job-rich and benefits all segments of our societies. Rising inequalities in many countries may pose risks to social cohesion and the well-

being of our citizens and can also have negative economic impact and hinder our objective to lift growth. A comprehensive and balanced set of economic, financial, labour, education and social policies will contribute to reducing inequalities. We endorse the Declaration of our Labour and Employment Ministers and commit to implementing its priorities to make labour markets more inclusive as outlined by the G20 Policy Priorities on Labour Income Share and Inequalities. We ask our Finance, and Labour and Employment Ministers to review our growth strategies and employment plans to strengthen our action against inequality and in support of inclusive growth. Recognizing that social dialogue is essential to advance our goals, we welcome the B20 and L20 joint statement on jobs, growth and decent work.

7. Unemployment, underemployment and informal jobs are significant sources of inequality in many countries and can undermine the future growth prospects of our economies. We are focused on promoting more and better quality jobs in line with our G20 Framework on Promoting Quality Jobs and on improving and investing in skills through our G20 Skills Strategy. We are determined to support the better integration of our young people into the labour market including through the promotion of entrepreneurship. Building on our previous commitments and taking into account our national circumstances, we agree to the G20 goal of reducing the share of young people who are most at risk of being permanently left behind in the labour market by 15% by 2025 in G20 countries. We ask the OECD and the ILO to assist us in monitoring progress in achieving this goal. We will continue monitoring the implementation of our Employment Plans as well as our goals to reduce gender participation gap and to foster safer and healthier workplaces also within sustainable global supply chains.

8. We will address current opportunities and challenges brought into the labour markets through such issues as international labour mobility and the ageing of populations. Domestic labour mobility is an important labour market issue in some G20 countries. We recognize and will further explore the potential of a flourishing silver economy. We further ask our Labour and Employment Ministers to report to us on progress made in 2016.

9. To provide a strong impetus to boost investment, particularly through private sector participation, we have developed ambitious country-specific investment strategies, which bring together concrete policies and actions to improve the investment ecosystem, foster efficient and quality infrastructure, including by the public sector, support small and medium sized enterprises (SMEs), and enhance knowledge sharing. Analysis by the OECD indicates that these strategies would contribute to lifting the aggregate G20 investment to GDP ratio, by an estimated 1 percentage point by 2018.

10. To improve our investment preparation, prioritization and execution processes, we have developed guidelines and best practices for public-private-partnership (PPP) models. We also considered alternative financing structures, including asset-based financing, and simple and transparent securitization to facilitate better intermediation for SMEs and infrastructure investment. Going forward, we call on our Ministers to continue their work to improve the investment ecosystem, promote long-term financing, foster institutional investors' involvement, support the development of alternative capital market instruments and asset-based financing models, and encourage Multilateral Development Banks (MDBs) to mobilize their resources, optimize their balance sheets, and catalyze private sector funding. We are advancing efforts and developing toolkits to unlock the ways and means for countries to better prepare, prioritize and finance infrastructure projects. We expect the Global Infrastructure Hub to make a significant contribution towards these endeavors. To help ensure a strong corporate governance framework that will support private investment, we endorse the G20/OECD Principles of Corporate Governance. We have placed a special focus on promoting long-term financing for SMEs, and we welcome the Joint Action Plan on SME Financing, the G20/OECD High-Level Principles on SME Financing as guidance, and the establishment of the private sector-led World SME Forum, a new initiative that will serve as a global body to facilitate the contributions of SMEs to growth and employment.

11. Global trade and investment continue to be important engines of economic growth and development, generating employment and contributing to welfare and inclusive growth. We note

that global trade growth remains below pre-crisis levels. This is a result of both cyclical and structural factors. We therefore reaffirm our strong commitment to better coordinate our efforts to reinforce trade and investment, including through our Adjusted Growth Strategies. Inclusive Global Value Chains (GVCs) are important drivers of world trade. We support policies that allow firms of all sizes, particularly SMEs, in countries at all levels of economic development to participate in and take full advantage of GVCs and encourage greater participation and value addition by developing countries. We further reaffirm our longstanding commitment to standstill and rollback on protectionist measures and will remain vigilant by monitoring our progress. For this, we ask the WTO, OECD and UNCTAD to continue their reporting on trade and investment restrictive measures. We ask our Trade Ministers to meet on a regular basis and we agree on a supporting working group.

12.The WTO is the backbone of the multilateral trading system and should continue to play a central role in promoting economic growth and development. We remain committed to a strong and efficient multilateral trading system and we reiterate our determination to work together to improve its functioning. We are committed to working together for a successful Nairobi Ministerial Meeting that has a balanced set of outcomes, including on the Doha Development Agenda, and provides clear guidance to post-Nairobi work. We will also need to increase our efforts to implement all the elements of the Bali Package, including those on agriculture, development, public stock holding as well as the prompt ratification and implementation of the Trade Facilitation Agreement. We will continue our efforts to ensure that our bilateral, regional and plurilateral trade agreements complement one another, are transparent and inclusive, are consistent with and contribute to a stronger multilateral trade system under WTO rules. We emphasize the important role of trade in global development efforts and will continue to support mechanisms such as aid for trade in developing countries in need of capacity building assistance.

Enhancing resilience

13. Strengthening the resilience of financial institutions and enhancing stability of the financial system are crucial to sustaining growth and development. To enhance the resilience of the global financial system, we have completed further core elements of the financial reform agenda. In particular, as a key step towards ending too-big-to-fail, we have finalized the common international standard on total-loss-absorbing-capacity (TLAC) for global systemically important banks. We also agreed to the first version of higher loss absorbency requirements for global systemically important insurers.

14. Critical work remains to build a stronger and more resilient financial system. In particular, we look forward to further work on central counterparty resilience, recovery planning and resolvability and ask the FSB to report back to us by our next meeting. We will continue to monitor and, if necessary, address emerging risks and vulnerabilities in the financial system, many of which may arise outside the banking sector. In this regard, we will further strengthen oversight and regulation of shadow banking to ensure resilience of market-based finance, in a manner appropriate to the systemic risks posed. We look forward to further progress in assessing and addressing, as appropriate, the decline in correspondent banking services. We will expedite our efforts to make further progress in implementing the over-the-counter (OTC) derivatives' reforms, including by encouraging jurisdictions to defer to each other, when it is justified in line with the St. Petersburg Declaration. Going forward, we are committed to full and consistent implementation of the global financial regulatory framework in line with the agreed timelines, and will continue to monitor and address uneven implementation across jurisdictions. We welcome the FSB's first annual report on the implementation of reforms and their effects. We will continue to review the robustness of the global regulatory framework and to monitor and assess the implementation and effects of reforms and their continued consistency with our overall objectives, including by addressing any material unintended consequences, particularly for emerging markets and developing economies (EMDEs).

15. To reach a globally fair and modern international tax system, we endorse the package of measures developed under the ambitious G20/OECD Base Erosion and Profit Shifting (BEPS) project. Widespread and consistent implementation will be critical in the effectiveness of the project, in particular as regards the exchange of information on cross-border tax rulings. We,

therefore, strongly urge the timely implementation of the project and encourage all countries and jurisdictions, including developing ones, to participate. To monitor the implementation of the BEPS project globally, we call on the OECD to develop an inclusive framework by early 2016 with the involvement of interested non-G20 countries and jurisdictions which commit to implement the BEPS project, including developing economies, on an equal footing. We welcome the efforts by the IMF, OECD, UN and WBG to provide appropriate technical assistance to interested developing economies in tackling the domestic resource mobilization challenges they face, including from BEPS. We acknowledge that interested non-G20 developing countries' timing of implementation may differ from other countries and expect the OECD and other international organizations to ensure that their circumstances are appropriately addressed in the framework. We are progressing towards enhancing the transparency of our tax systems and we reaffirm our previous commitments to information exchange on-request as well as to automatic exchange of information by 2017 or end-2018. We invite other jurisdictions to join us. We support the efforts for strengthening developing economies' engagement in the international tax agenda.

16. In support of our growth and resilience agenda, we remain committed to building a global culture of intolerance towards corruption through effectively implementing the 2015-2016 G20 Anti-Corruption Action Plan. We endorse the G20 High-Level Principles on Integrity and Transparency in the Private Sector which will help our companies comply with global standards on ethics and anti-corruption. Ensuring the integrity and transparency of our public sectors is essential. In this regard, we endorse the G20 Anti-Corruption Open Data Principles and the G20 Principles for Promoting Integrity in Public Procurement, and we welcome the ongoing work on asset disclosure frameworks. We will further work to strengthen international cooperation, including where appropriate and consistent with domestic legal systems, on civil and administrative procedures, as an important tool to effectively combat bribery and to support asset recovery and the denial of safe haven to corrupt officials and those who corrupt them. We welcome the publication of our Implementation Plans on beneficial ownership transparency and will continue our efforts in this regard.

17. We remain deeply disappointed with the continued delay in implementing the IMF quota and governance reforms agreed in 2010. The 2010 reforms remain our highest priority for the IMF and we urge the United States to ratify these reforms as soon as possible. Mindful of the aims of the 2010 reforms, we ask the IMF to complete its work on an interim solution that will meaningfully converge quota shares as soon as and to the extent possible to the levels agreed under the 14th General Review of Quotas. The 14th Review should be used as a basis for work on the 15th Review, including a new quota formula. We reaffirm our commitment to maintaining a strong, quota-based and adequately resourced IMF. We reaffirm our agreement that the heads and senior leadership of all international financial institutions should be appointed through an open, transparent and merit-based process and we reiterate the importance of enhancing staff diversity in these organizations. We reaffirm that the Special Drawing Rights (SDR) basket composition should continue to reflect the role of currencies in the global trading and financial system and look forward to the completion of the review of the method of valuation of the SDR.

18. We welcome the progress achieved on the implementation of strengthened collective action and *pari passu* clauses in international sovereign bond contracts, which will contribute to the orderliness and predictability of sovereign debt restructuring processes. We ask the IMF, in consultation with other parties, to continue promoting the use of such clauses and to further explore market-based ways to speed up their incorporation in the outstanding stock of international sovereign debt. We look forward to the upcoming review of the IMF-WB Debt Sustainability Framework for Low-Income Countries. We acknowledge the existing initiatives aimed at improving sustainable financing practices, as stressed in the Addis Ababa Action Agenda. We also take note of the Paris Forum initiative, which contributes to further the inclusiveness by fostering dialogue between sovereign debtors and creditors.

<u>Buttressing Sustainability</u>

19. 2015 is a crucial year for sustainable development and we remain committed to ensuring our actions contribute to inclusive and sustainable growth, including in low income developing

countries. The 2030 Agenda, including the Sustainable Development Goals (SDGs) and the Addis Ababa Action Agenda, sets a transformative, universal and ambitious framework for global development efforts. We are strongly committed to implementing its outcomes to ensure that no-one is left behind in our efforts to eradicate poverty and build an inclusive and sustainable future for all. We adopt the G20 and Low Income Developing Countries Framework to strengthen our dialogue and engagement on development. We will develop an action plan in 2016 to further align our work with the 2030 Agenda.

20. Our work this year supports key areas for sustainable development such as energy access, food security and nutrition, human resource development, quality infrastructure, financial inclusion and domestic resource mobilization. We endorse the G20 Action Plan on Food Security and Sustainable Food Systems, which underlines our commitment to improve global food security and nutrition and ensure the way we produce, consume and sell food is economically, socially and environmentally sustainable. We remain focused on promoting responsible investment in agriculture and food systems, improving market transparency, increasing incomes and quality jobs, and fostering sustainable productivity growth. We will pay particular attention to the needs of smallholder and family farmers, rural women and youth. We also commit to reducing food loss and waste globally. We welcome Expo Milano with the theme “Feeding the Planet – Energy for Life”. We also welcome our Agriculture Ministers´ decision to establish a new platform to improve the way we and other countries can measure and reduce food loss and waste.

21. The private sector has a strong role to play in development and poverty eradication. Through our G20 Call on Inclusive Business we stress the need of all stakeholders to work together in order to promote opportunities for low income people and communities to participate in markets as buyers, suppliers and consumers. Our G20 National Remittance Plans developed this year include concrete actions towards our commitment to reduce the global average cost of transferring remittances to five percent with a view to align with the SDGs and Addis Ababa Action Agenda. We are promoting financial inclusion by helping to open up access to payments, savings, credit and other services. We welcome the continued work on financial inclusion within the Global Partnership for Financial Inclusion (GPFI).

22. We remain focused on the G20 Principles on Energy Collaboration and welcome our Energy Ministers´ first meeting ever. Recognizing that globally over 1.1 billion people lack access to electricity and 2.9 billion rely on the traditional use of biomass for cooking, we endorse the G20 Energy Access Action Plan: Voluntary Collaboration on Energy Access, the first phase of which focuses on enhancing electricity access in Sub-Saharan Africa where the problem is most acute. The Plan aims to strengthen G20 coordination and establishes a long-term voluntary cooperation framework that can be applied to other regions over time, recognising that energy access is a critical factor to foster development. In this first phase, we will cooperate and collaborate with African countries and relevant regional and international organizations on policy and regulatory environments, technology development and deployment, investment and finance, capacity building, regional integration and cooperation, taking into consideration national needs and contexts.

23. We recognize that actions on energy, including improving energy efficiency, increasing investments in clean energy technologies and supporting related research and development activities will be important in tackling climate change and its effects. We endorse the G20 Toolkit of Voluntary Options for Renewable Energy Deployment. We also highlight the progress made this year by participating countries in taking forward our collaboration on energy efficiency and agree to further support on a voluntary basis the 2015 outcomes of existing work streams on efficiency and emissions performance of vehicles, particularly heavy duty vehicles, networked devices, buildings, industrial processes and electricity generation, as well as financing for energy efficiency. We will continue to promote transparent, competitive and well-functioning energy markets, including gas markets. We stress the importance of diversification of energy sources and continued investments for increased energy security. We reaffirm our commitment to rationalise and phase-out inefficient fossil fuel subsidies that encourage wasteful consumption, over the medium term, recognising the need to support the poor. We will endeavour to make enhanced progress in moving

forward this commitment. We ask our Energy Ministers to report back on energy collaboration again in 2016 on the continued implementation of the G20 Principles on Energy Collaboration.

24. Climate change is one of the greatest challenges of our time. We recognize that 2015 is a critical year that requires effective, strong and collective action on climate change and its effects. We reaffirm the below 2°C goal as stated in the Lima Call for Action. We affirm our determination to adopt a protocol, another legal instrument or an agreed outcome with legal force under the UNFCCC that is applicable to all Parties. Our actions will support growth and sustainable development. We affirm that the Paris agreement should be fair, balanced, ambitious, durable and dynamic. We underscore our commitment to reaching an ambitious agreement in Paris that reflects the principle of common but differentiated responsibilities and respective capabilities, in light of different national circumstances. We reaffirm that UNFCCC is the primary international intergovernmental body for negotiating climate change. We welcome that over 160 Parties including all G20 countries have submitted their Intended Nationally Determined Contributions (INDCs) to the UNFCCC, and encourage others to do so in advance of the Paris Conference. We are prepared to implement our INDCs. We will instruct our negotiators to engage constructively and flexibly in the coming days to discuss key issues, among other things, mitigation, adaptation, finance, technology development and transfer and transparency in order to arrive at Paris with a way forward. We commit to work together for a successful outcome of the COP21.

25. The scale of the ongoing refugee crisis is a global concern with major humanitarian, political, social and economic consequences. There is a need for a coordinated and comprehensive response to tackle this crisis, as well as its long term consequences. We commit to continue further strengthening our support for all efforts to provide protection and assistance and to find durable solutions for the unprecedented numbers of refugees and internally displaced persons in various parts of the world. We call upon all states to contribute to responding to this crisis, and share in the burdens associated with it, including through refugee resettlement, other forms of humanitarian admission, humanitarian aid and efforts to ensure that refugees can access services, education and livelihood opportunities. We underline the need to address the root causes of displacement. We highlight, in this regard, the importance of political solutions to conflicts and increased cooperation for development. We also recognize the importance of creating conditions to enable refugees and internally displaced persons to safely and voluntarily return to their homes. We will work with other states to strengthen our long term preparedness and capacity to manage migration and refugee flows. We invite all states according to their individual capacities to scale up their assistance to relevant international organizations in order to enhance their capabilities to assist affected countries in dealing with this crisis. We encourage the private sector and individuals to also join in the international efforts to respond to the refugee crisis.

26. We are living in an age of Internet economy that brings both opportunities and challenges to global growth. We acknowledge that threats to the security of and in the use of ICTs, risk undermining our collective ability to use the Internet to bolster economic growth and development around the world. We commit ourselves to bridge the digital divide. In the ICT environment, just as elsewhere, states have a special responsibility to promote security, stability, and economic ties with other nations. In support of that objective, we affirm that no country should conduct or support ICT-enabled theft of intellectual property, including trade secrets or other confidential business information, with the intent of providing competitive advantages to companies or commercial sectors. All states in ensuring the secure use of ICTs, should respect and protect the principles of freedom from unlawful and arbitrary interference of privacy, including in the context of digital communications. We also note the key role played by the United Nations in developing norms and in this context we welcome the 2015 report of the UN Group of Governmental Experts in the Field of Information and Telecommunications in the Context of International Security, affirm that international law, and in particular the UN Charter, is applicable to state conduct in the use of ICTs and commit ourselves to the view that all states should abide by norms of responsible state behaviour in the use of ICTs in accordance with UN resolution A/C.1/70/L.45. We are committed to help ensure an environment in which all actors are able to enjoy the benefits of secure use of ICTs.

Conclusion

27. We remain resolute to continue our collective action to lift actual and potential growth of our economies, support job creation, strengthen resilience, promote development and enhance inclusiveness of our policies. We thank Turkey for its G20 Presidency and hosting a successful Antalya Summit this year. We look forward to our next meeting in Hangzhou in September 2016 under the Chinese Presidency. We also look forward to meeting in Germany in 2017.

Issues for Further Action

We look forward to further work on investment, including with a follow-up by the OECD and other relevant international organizations on our investment strategies under our broad framework.

We expect the Global Infrastructure Hub to present its report on knowledge sharing to G20 Finance Ministers and Central Bank Governors by April 2016.

We look forward to further work on issues concerning optimization of the balance sheets of MDBs.

Recognizing the potential role of corporates' liability structure in financial stability, we call on the FSB to continue to explore any systemic risks and consider policy options in this regard.

We ask the FSB to continue to engage with public- and private- sector participants on how the financial sector can take account of climate change risks.

Building on its findings presented in its last report to the G20, we call on the Financial Action Task Force (FATF) to report back to our Finance Ministers and Central Bank Governors by their first meeting in 2016 on the steps countries are taking to address the weaknesses identified to cut off terrorism-related financial flows.

A stable and resilient international financial architecture is a key element to foster strong, sustainable and balanced growth as well as financial stability. We ask our Finance Ministers and Central Bank Governors to work and report back to us by our next meeting on this issue.

We agree that attention should be given to global health risks, such as antimicrobial resistance, infectious disease threats and weak health systems. These can significantly impact growth and stability. Building on the Brisbane Statement, we underscore the importance of a coordinated international response and reiterate our resolve to tackle these issues to fight the adverse impacts on the global economy and will discuss the terms of reference to deal with this issue in the G20 next year.

Acknowledgements

We thank international organisations, including the UN, IMF, World Bank Group, OECD, WTO, ILO, FSB, FATF and BIS, for their valuable inputs to the G20 process. We also thank the G20 engagement groups, namely Business 20, Civil Society 20, Labour 20, Think 20 and Youth 20 for their important contributions this year. We welcome the establishment of the Women20 and look forward to its active contributions going forward.

Final

G20 Leaders' Communique

Hangzhou Summit

4-5 September 2016

1. We, the Leaders of the G20, met in Hangzhou, China on 4-5 September 2016.

2. We met at a time when the global economic recovery is progressing, resilience is improved in some economies and new sources for growth are emerging. But growth is still weaker than desirable. Downside risks remain due to potential volatility in the financial markets, fluctuations of commodity prices, sluggish trade and investment, and slow productivity and employment growth in some countries. Challenges originating from geopolitical developments, increased refugee flows as well as terrorism and conflicts also complicate the global economic outlook.

3. We also met at a time of continued shifts and profound transformations in the configuration of the global economic landscape and dynamics for growth. With these transformations come challenges and uncertainties as well as opportunities. The choices we make together will determine the effectiveness of our response to the challenges of today and help to shape the world economy of the future.

4. We believe that closer partnership and joint action by G20 members will boost confidence in, foster driving forces for and intensify cooperation on global economic growth, contributing to shared prosperity and better well-being of the world.

5. We are determined to foster an innovative, invigorated, interconnected and inclusive world economy to usher in a new era of global growth and sustainable development, taking into account the 2030 Agenda for Sustainable Development, the Addis Ababa Action Agenda and the Paris Agreement.

6. In this context, we, the G20, as the premier forum for international economic cooperation, forge a comprehensive and integrated narrative for strong, sustainable, balanced and inclusive growth, and thereby adopt the attached package of policies and actions - the Hangzhou Consensus - based on the following:

----Vision. We will strengthen the G20 growth agenda to catalyze new drivers of growth, open up new horizons for development, lead the way in transforming our economies in a more innovative and sustainable manner and better reflect shared interests of both present and coming generations.

----Integration. We will pursue innovative growth concepts and policies by forging synergy among fiscal, monetary and structural policies, enhancing coherence between economic, labor, employment and social policies as well as combining demand management with supply side reforms, short-term with mid- to long-term policies, economic growth with social development and environmental protection.

----Openness. We will work harder to build an open world economy, reject protectionism, promote global trade and investment, including through further strengthening the multilateral trading system, and ensure broad-based opportunities through and public support for expanded growth in a globalized economy.

----Inclusiveness. We will work to ensure that our economic growth serves the needs of everyone and benefits all countries and all people including in particular women, youth and disadvantaged groups, generating more quality jobs, addressing inequalities and eradicating poverty so that no one is left behind.

Strengthening Policy Coordination

7. Our growth must be shored up by well-designed and coordinated policies. We are determined to use all policy tools - monetary, fiscal and structural - individually and collectively to achieve our goal of strong, sustainable, balanced and inclusive growth. Monetary policy will continue to support economic activity and ensure price stability, consistent with central banks' mandates, but monetary policy alone cannot lead to balanced growth. Underscoring the essential role of structural reforms, we emphasize that our fiscal strategies are equally important to supporting our common growth objectives. We are using fiscal policy flexibly and making tax policy and public expenditure more growth-friendly,

including by prioritizing high-quality investment, while enhancing resilience and ensuring debt as a share of GDP is on a sustainable path. Furthermore, we will continue to explore policy options, tailored to country circumstances, that the G20 countries may undertake as necessary to support growth and respond to potential risks including balance sheet vulnerability. We reiterate that excess volatility and disorderly movements in exchange rates can have adverse implications for economic and financial stability. Our relevant authorities will consult closely on exchange markets. We reaffirm our previous exchange rate commitments, including that we will refrain from competitive devaluations and we will not target our exchange rates for competitive purposes. We will carefully calibrate and clearly communicate our macroeconomic and structural policy actions to reduce policy uncertainty, minimize negative spillovers and promote transparency.

8. We are making further progress towards the implementation of our growth strategies, but much more needs to be done. Swift and full implementation of the growth strategies remains key to supporting economic growth and the collective growth ambition set by the Brisbane Summit, and we are prioritizing our implementation efforts. In the light of this, we launch the Hangzhou Action Plan and have updated our growth strategies, including new and adjusted macroeconomic and structural policy measures that can provide mutually-supportive benefits to growth. We will also strive to reduce excessive imbalances, promote greater inclusiveness and reduce inequality in our pursuit of economic growth.

Breaking a New Path for Growth

9. Our growth, to be dynamic and create more jobs, must be powered by new driving forces. While reaffirming the importance of addressing shortfalls in global demand to support short-term growth, we believe it is also imperative to address supply side constraints so as to raise productivity sustainably, expand the frontier of production and unleash mid- to long-term growth potential.

10. We recognize that in the long run, innovation is a key driver of growth for both individual countries and the global economy as a whole. We are committed to tackling one of the root causes of weak growth by taking innovation as a key element of our effort to identify new growth engines for individual countries and the world economy, which will also contribute to creating new and better jobs, building a cleaner environment, increasing productivity, addressing global challenges, improving people’s lives and building dynamic, cooperative and inclusive innovation ecosystems. We thus endorse the G20 Blueprint on Innovative Growth as a new agenda encompassing policies and measures in and across the areas of innovation, the new industrial revolution and the digital economy. In this context, we recognize the importance of structural reforms. We will act on the recommendations of the Blueprint in accordance with our national circumstances and in line with our vision for leadership, partnership, openness, inclusiveness, creativity, synergy and flexibility.

11. We commit to important cross-cutting actions related to multi-dimensional partnerships, supporting developing countries and improving skills and human capital. We will set up a G20 Task Force supported by the OECD and other relevant international organizations to take forward the G20 agenda on innovation, new industrial revolution and digital economy, subject to the priorities of the respective future G20 presidencies, ensuring continuity and consistency with the results so far, and promoting synergies with other G20 workstreams.

12. To achieve innovation-driven growth and the creation of innovative ecosystems, we support dialogue and cooperation on innovation, which covers a wide range of domains with science and technology innovation at its core. We deliver the G20 2016 Innovation Action Plan. We commit to pursue pro-innovation strategies and policies, support investment in science, technology and innovation (STI), and support skills training for STI - including support for the entry of more women into these fields - and mobility of STI human resources. We support effort to promote voluntary knowledge diffusion and technology transfer on mutually agreed terms and conditions. Consistent with this approach, we support appropriate efforts to promote open science and facilitate appropriate access to publicly funded research results on findable, accessible, interoperable and reusable (FAIR) principles. In furtherance of the above, we emphasize the importance of open trade and investment regimes to facilitate innovation through intellectual property rights (IPR) protection, and improving public communication in science and technology. We are committed to foster exchange of knowledge and experience by supporting an online G20 Community of Practice within the existing Innovation Policy Platform and the release of the 2016 G20 Innovation Report.

13. To seize the opportunity that the new industrial revolution (NIR) presents for industry, particularly manufacturing and related services, we deliver the G20 New Industrial Revolution Action Plan. We commit to strengthen communication, cooperation and relevant research on the NIR, facilitate small and medium-sized enterprises (SMEs) to

leverage benefits from the NIR, address employment and workforce skill challenges, encourage more cooperation on standards, adequate and effective IPR protection in line with existing multilateral treaties to which they are parties, new industrial infrastructure, and support industrialization, as committed in the action plan. We also support industrialization in developing countries, especially those in Africa and Least Developed Countries (LDCs). We are committed to supporting our workforces throughout this transition and to ensuring that the benefits of the NIR extend to all, including women, youth and disadvantaged groups. We call for cooperation to maximize the benefits and mitigate the negative impact of the expected technological and industrial changes. In all these initiatives, the G20 will take into consideration the different opportunities and challenges for developing and developed countries.

14. To unleash the potential of digital economy, we deliver the G20 Digital Economy Development and Cooperation Initiative, which builds on our work begun in Antalya. We aim to foster favorable conditions for its development and to address digital divide, including through expanded and better and affordable broadband access, flow of information for economic growth, trust and security, while ensuring respect for privacy and personal data protection, investment in the ICT sector, entrepreneurship, digital transformation, e-commerce cooperation, enhanced digital inclusion and development of micro, small and medium-sized enterprises (MSMEs). We reaffirm paragraph 26 in the Antalya Communique, commit to offer policy support for an open and secure environment and recognize the key role of adequate and effective IPR protection and enforcement to the development of the digital economy. We welcome the efforts made by the OECD, IMF, national and other international organizations on the measurement of the digital economy, and recognize that further relevant research and exchange are needed.

15. We reiterate the essential role of structural reforms in boosting productivity and potential output, as well as promoting innovative growth in G20 countries. We deliver the Enhanced Structural Reform Agenda, noting that the choice and design of structural reforms are consistent with countries' specific economic conditions. We endorse the nine priority areas of structural reforms and a set of guiding principles identified in the Agenda to provide high-level and useful guidance to members, while allowing them to account for their specific national circumstances. We also support the quantitative framework consisting of a set of indicators, which will be improved over time, to help monitor and assess our efforts and progress with structural reforms and challenges. We are putting in place an integrated strategy for growth with short, medium and long-term measures. We will ensure that the Enhanced Structural Reform Agenda and the relevant elements of the Blueprint on Innovative Growth are well articulated.

More Effective and Efficient Global Economic and Financial Governance

16. Our growth, to be resilient, must be underpinned by effective and efficient global economic and financial architecture. We will continue our work in this regard.

17. We endorse the G20 Agenda Towards A More Stable and Resilient International Financial Architecture. We will continue to improve the analysis and monitoring of capital flows and management of risks stemming from excessive capital flow volatility. We look forward to the IMF's review of country experiences and emerging issues in handling capital flows by year-end. We note the ongoing work on the review of the OECD Code of Liberalization of Capital Movements. We support work to further strengthen the Global Financial Safety Net (GFSN), with a strong, quota-based and adequately resourced IMF at its center, equipped with a more effective toolkit, and with more effective cooperation between the IMF and regional financing arrangements (RFAs), respecting their mandates. In this respect, we welcome the upcoming CMIM-IMF joint test run. We support maintaining access to bilateral and multilateral borrowing agreements between members and the IMF, in line with the objective of preserving the IMF's current lending capacity, and call for broad participation of the IMF membership, including through new agreements. We welcome the entry into effect of the 2010 IMF quota and governance reform and are working towards the completion of the 15th General Review of Quotas, including a new quota formula, by the 2017 Annual Meetings. We reaffirm that any realignment under the 15th review in quota shares is expected to result in increased shares for dynamic economies in line with their relative positions in the world economy, and hence likely in the share of emerging market and developing countries as a whole. We are committed to protecting the voice and representation of the poorest members. We support the World Bank Group to implement its shareholding review according to the agreed roadmap, timeframe and principles, with the objective of achieving equitable voting power over time. We underline the importance of promoting sound and sustainable financing practices and will continue to improve debt restructuring processes. We support the continued effort to incorporate the enhanced contractual clauses into sovereign bonds. We support the Paris Club's discussion of a range of sovereign debt issues, and the ongoing work of the Paris Club, as the principal international forum for restructuring official bilateral debt, towards the broader inclusion of emerging creditors. We welcome the admission of the Republic of Korea and the decision of Brazil to join the Paris Club. We welcome China's continued regular participation in Paris Club meetings and intention to play a more constructive role, including further discussions on

potential membership. Following the IMF's decision, we welcome the inclusion of the RMB into the Special Drawing Right (SDR) currency basket on October 1st. We support the ongoing examination of the broader use of the SDR, such as broader reporting in the SDR and the issuance of SDR-denominated bonds, as a way to enhance resilience. In this context, we take note of the recent issuance of SDR bonds by the World Bank in China's interbank market. We welcome further work by the international organizations to support the development of local currency bond markets, including intensifying efforts to support low-income countries.

18. Building an open and resilient financial system is crucial to supporting sustainable growth and development. To this end, we remain committed to finalizing remaining critical elements of the regulatory framework and to the timely, full and consistent implementation of the agreed financial sector reform agenda, including Basel III and the total-loss-absorbing-capacity (TLAC) standard as well as effective cross-border resolution regimes. We reiterate our support for the work by the Basel Committee on Banking Supervision (BCBS) to finalize the Basel III framework by the end of 2016, without further significantly increasing overall capital requirements across the banking sector, while promoting a level playing field. We welcome the second annual report of the Financial Stability Board (FSB) on implementation and effects of reforms, and will continue to enhance the monitoring of implementation and effects of reforms to ensure their consistency with our overall objectives, including by addressing any material unintended consequences. We will continue to address the issue of systemic risk within the insurance sector. We welcome the work towards the development of an Insurance Capital Standard (ICS) for internationally active insurers. We are committed to full and timely implementation of the agreed over-the-counter (OTC) derivatives reform agenda, and we will remove legal and regulatory barriers to the reporting of OTC derivatives to trade repositories and to authorities' appropriate access to data. We encourage members to close the gap in the implementation of the Principles for Financial Market Infrastructures and welcome the reports by the Committee on Payments and Market Infrastructures, International Organization of Securities Commissions and FSB on enhancing central counterparty resilience, recovery planning and resolvability. Recognizing the importance of effective macroprudential policies in limiting systemic risks, we welcome the joint work by the IMF, FSB and Bank for International Settlements (BIS) to take stock of international experiences with macroprudential frameworks and tools and to help promote effective macroprudential policies. We welcome the FSB consultation on proposed policy recommendations to address structural vulnerabilities from asset management activities. We will continue to closely monitor, and if necessary, address emerging risks and vulnerabilities in the financial system, including those associated with shadow banking, asset management and other market-based finance. We will continue to address, through the FSB-coordinated action plan, the decline in correspondent banking services so as to support remittances, financial inclusion, trade and openness. We look forward to further efforts to clarify regulatory expectations, as appropriate, including through the review in October by the Financial Action Task Force (FATF) of the guidance on correspondent banking. We call on G20 members, the IMF and WBG to intensify their support for domestic capacity building to help countries improve their compliance with global anti-money laundering and countering the financing of terrorism (AML/CFT) and prudential standards. We endorse the G20 High-level Principles for Digital Financial Inclusion, the updated version of the G20 Financial Inclusion Indicators and the Implementation Framework of the G20 Action Plan on SME Financing. We encourage countries to consider these principles in devising their broader financial inclusion plans, particularly in the area of digital financial inclusion, and to take concrete actions to accelerate progress on all people's access to finance.

19. We will continue our support for international tax cooperation to achieve a globally fair and modern international tax system and to foster growth, including advancing on-going cooperation on base erosion and profits shifting (BEPS), exchange of tax information, tax capacity-building of developing countries and tax policies to promote growth and tax certainty. We welcome the establishment of the G20/OECD Inclusive Framework on BEPS, and its first meeting in Kyoto. We support a timely, consistent and widespread implementation of the BEPS package and call upon all relevant and interested countries and jurisdictions that have not yet committed to the BEPS package to do so and join the framework on an equal footing. We also welcome the progress made on effective and widespread implementation of the internationally agreed standards on tax transparency and reiterate our call on all relevant countries including all financial centers and jurisdictions, which have not yet done so to commit without delay to implementing the standard of automatic exchange of information by 2018 at the latest and to sign and ratify the Multilateral Convention on Mutual Administrative Assistance in Tax Matters. We endorse the proposals made by the OECD working with G20 members on the objective criteria to identify non-cooperative jurisdictions with respect to tax transparency. We ask the OECD to report back to the finance ministers and central bank governors by June 2017 on the progress made by jurisdictions on tax transparency, and on how the Global Forum will manage the country review process in response to supplementary review requests of countries, with a view for the OECD to prepare a list by the July 2017 G20 Leaders' Summit of those jurisdictions that have not yet sufficiently progressed toward a satisfactory level of implementation of the agreed international standards on tax transparency. Defensive measures will be considered against listed jurisdictions. We encourage countries and international organizations to assist developing economies in building their tax capacity and

acknowledge the establishment of the new Platform for Collaboration on Taxation by the IMF, OECD, UN and WBG. We support the principles of the Addis Tax Initiative. We recognize the significant negative impact of illicit financial flows on our economies and we will advance the work of the G20 on this theme. We emphasize the effectiveness of tax policy tools in supply-side structural reform for promoting innovation-driven, inclusive growth, as well as the benefits of tax certainty to promote investment and trade and ask the OECD and IMF to continue working on the issues of pro-growth tax policies and tax certainty. In this connection, China would make its own contribution by establishing an international tax policy research center for international tax policy design and research.

20. Financial transparency and effective implementation of the standards on transparency by all, in particular with regard to the beneficial ownership of legal persons and legal arrangements, is vital to protecting the integrity of the international financial system, and to preventing misuse of these entities and arrangements for corruption, tax evasion, terrorist financing and money laundering. We call on the FATF and the Global Forum to make initial proposals by the Finance Ministers and Central Bank Governors Meeting in October on ways to improve the implementation of the international standards on transparency, including on the availability of beneficial ownership information of legal persons and legal arrangements, and its international exchange.

21. We recognize that, in order to support environmentally sustainable growth globally, it is necessary to scale up green financing. The development of green finance faces a number of challenges, including, among others, difficulties in internalizing environmental externalities, maturity mismatch, lack of clarity in green definitions, information asymmetry and inadequate analytical capacity, but many of these challenges can be addressed by options developed in collaboration with the private sector. We welcome the G20 Green Finance Synthesis Report submitted by the Green Finance Study Group (GFSG) and the voluntary options developed by the GFSG to enhance the ability of the financial system to mobilize private capital for green investment. We believe efforts could be made to provide clear strategic policy signals and frameworks, promote voluntary principles for green finance, expand learning networks for capacity building, support the development of local green bond markets, promote international collaboration to facilitate cross-border investment in green bonds, encourage and facilitate knowledge sharing on environmental and financial risks, and improve the measurement of green finance activities and their impacts.

22. Recognizing the detrimental effects of corruption and illicit finance flows on equitable allocation of public resources, sustainable economic growth, the integrity of the global financial system and the rule of law, we will reinforce the G20's efforts to enhance international cooperation against corruption, while fully respecting international law, human rights and the rule of law as well as the sovereignty of each country. We endorse the G20 High Level Principles on Cooperation on Persons Sought for Corruption and Asset Recovery and welcome Chinese initiative to establish in China a Research Center on International Cooperation Regarding Persons Sought for Corruption and Asset Recovery in G20 Member States, which will be operated in line with international norms. We commit to continue the G20 Denial of Entry Experts Network. Consistent with our national legal systems, we will work on cross-border cooperation and information sharing between law enforcement and anti-corruption agencies and judicial authorities. We call for ratification by all the G20 members of the United Nations Convention Against Corruption and welcome the launch of the second cycle of its review mechanism. We will endeavor to apply effectively the extradition, mutual legal assistance and asset recovery provisions of the above Convention and other applicable international conventions. We endorse the 2017-2018 G20 Anti-Corruption Action Plan to improve public and private sector transparency and integrity, implementing our stance of zero tolerance against corruption, zero loopholes in our institutions and zero barriers in our actions. We ask the Anti-Corruption Working Group to develop an implementation plan before the end of 2016 as a flexible framework to carry this work forward with renewed high-level attention and urgency. We also welcome outcomes of the London Anti-Corruption Summit in May 2016 and the OECD Ministerial Meeting in March 2016.

23. In line with the G20 Principles on Energy Collaboration, we reaffirm our commitment to building well-functioning, open, competitive, efficient, stable and transparent energy markets, fostering more effective and inclusive global energy architecture to better reflect the changing realities of the world's energy landscape, and shaping an affordable, reliable, sustainable and low greenhouse gas (GHG) emissions energy future while utilizing energy sources and technologies. We stress that continued investment in energy projects and better regional interconnection, particularly in sustainable energy projects, remains critically important to ensuring future energy security and preventing economically destabilizing price spikes. We endeavor to work with Sub-Saharan and Asia-Pacific countries to improve universal access to affordable, reliable, clean, sustainable and modern energy services, particularly by addressing barriers to electricity access. We encourage members to significantly improve energy efficiency based on the specific needs and national circumstances of each member and promote energy conservation through appropriate lifestyle changes. We will explore innovative collaborative arrangements for international cooperation on energy efficiency. We endorse the

G20 Voluntary Collaboration Action Plan on Energy Access, the G20 Voluntary Action Plan on Renewable Energy and the G20 Energy Efficiency Leading Programme issued by the G20 energy ministers and ask them to meet regularly to follow up on the implementation of these plans.

24. We reaffirm the importance of energy collaboration towards a cleaner energy future and sustainable energy security with a view to fostering economic growth. We welcome the progress on the voluntary international collaboration on energy efficiency in six key areas, taking into consideration the policies outlined in the Energy Efficiency Leading Programme and in line with national circumstances, including in heavy duty vehicles, and improving the efficiency of these vehicles. We also reaffirm our commitment to rationalize and phase-out inefficient fossil fuel subsidies that encourage wasteful consumption over the medium term, recognizing the need to support the poor. We welcome G20 countries' progress on their commitments and look forward to further progress in the future. Further, we encourage G20 countries to consider participating in the voluntary peer review process. Given that natural gas is a less emission-intensive fossil fuel, we will enhance collaboration on solutions that promote natural gas extraction, transportation, and processing in a manner that minimizes environmental impacts. We stress the importance of diversification of energy sources and routes.

Robust International Trade and Investment

25. Our growth, to be strong, must be reinforced by inclusive, robust and sustainable trade and investment growth. We note with concern the slow growth in trade and investment globally and commit to enhance an open world economy by working towards trade and investment facilitation and liberalization. We recognize the importance of economic diversification and industrial upgrading in developing countries to benefit from more open global markets. We endorse the outcome of the G20 Trade Ministers Meeting held in Shanghai on 9-10 July, and welcome the establishment of the G20 Trade and Investment Working Group (TIWG). We commit to further strengthen G20 trade and investment cooperation.

26. We reaffirm our determination to ensure a rules-based, transparent, non-discriminatory, open and inclusive multilateral trading system with the World Trade Organization playing the central role in today's global trade. We reiterate our commitment to shape the post-Nairobi work with development at its center and commit to advancing negotiations on the remaining DDA issues as a matter of priority, including all three pillars of agriculture (i.e. market access, domestic support and export competition), non-agricultural market access, services, development, Agreement on Trade-Related Aspects of Intellectual Property Rights (TRIPs) and rules. We also note that a range of issues may be of common interest and importance to today's economy, and thus may be legitimate issues for discussions in the WTO, including those addressed in regional trade arrangements (RTAs) and by the B20. We will work together with all WTO members with a sense of urgency and solidarity and with a view to achieving positive outcomes of the MC11 and beyond and we will work together to further strengthen the WTO.

27. We commit to ratify the Trade Facilitation Agreement by the end of 2016 and call on other WTO members to do the same. We note the important role that bilateral and regional trade agreements can play in liberalizing trade and in the development of trade rules, while recognizing the need to ensure they are consistent with WTO rules. We commit to working to ensure our bilateral and regional trade agreements complement the multilateral trading system, and are open, transparent, inclusive and WTO-consistent. WTO-consistent plurilateral trade agreements with broad participation can play an important role in complementing global liberalization initiatives. G20 Environmental Goods Agreement (EGA) participants welcome the landing zone achieved in the WTO EGA negotiations, and reaffirm their aim to redouble efforts to bridge remaining gaps and conclude an ambitious, future-oriented EGA that seeks to eliminate tariffs on a broad range of environmental goods by the end of 2016, after finding effective ways to address the core concerns of participants.

28. We reiterate our opposition to protectionism on trade and investment in all its forms. We extend our commitments to standstill and rollback of protectionist measures till the end of 2018, reaffirm our determination to deliver on them and support the work of the WTO, UNCTAD and OECD in monitoring protectionism. We emphasize that the benefits of trade and open markets must be communicated to the wider public more effectively and accompanied by appropriate domestic policies to ensure that benefits are widely distributed.

29.We endorse the G20 Strategy for Global Trade Growth, under which the G20 will lead by example to lower trade costs, harness trade and investment policy coherence, boost trade in services, enhance trade finance, promote e-commerce development, and address trade and development. We welcome the World Trade Outlook Indicator released by the WTO as an important leading indicator of global trade. We endorse the G20 Guiding Principles for

Global Investment Policymaking, which will help foster an open, transparent and conductive global policy environment for investment.

30. We also support policies that encourage firms of all sizes, in particular women and youth entrepreneurs, women-led firms and SMEs, to take full advantage of global value chains (GVCs), and that encourage greater participation, value addition and upward mobility in GVCs by developing countries, particularly low-income countries (LICs).We welcome the B20's interest to strengthen digital trade and other work and take note of it's initiative on an Electronic World Trade Platform (eWTP).

31. We recognize that the structural problems, including excess capacity in some industries, exacerbated by a weak global economic recovery and depressed market demand, have caused a negative impact on trade and workers. We recognize that excess capacity in steel and other industries is a global issue which requires collective responses. We also recognize that subsidies and other types of support from government or government-sponsored institutions can cause market distortions and contribute to global excess capacity and therefore require attention. We commit to enhance communication and cooperation, and take effective steps to address the challenges so as to enhance market function and encourage adjustment. To this end, we call for increased information sharing and cooperation through the formation of a Global Forum on steel excess capacity, to be facilitated by the OECD with the active participation of G20 members and interested OECD members. We look forward to a progress report on the efforts of the Global Forum to the relevant G20 ministers in 2017.

Inclusive and Interconnected Development

32. Our growth, to be strong, sustainable and balanced, must also be inclusive. We are committed to ensuring the benefits of our growth reach all people and maximize the growth potential of developing and low-income countries. In this context, we place sustainable development high on the G20 agenda.

33. We pledge to enhance policy coherence on sustainable development and reaffirm our commitment to further align our work with the universal implementation of the 2030 Agenda for Sustainable Development and the Addis Ababa Action Agenda on financing for development, based on the comparative advantage and the added value of the G20 and in accordance with our national circumstances, while acknowledging that the global follow-up and review of the 2030 Agenda is a UN-led process. We commit to contributing to the implementation of the 2030 Agenda by setting an example through bold, transformative collective and intended national actions in a wide range of areas. By endorsing the G20 Action Plan on the 2030 Agenda for Sustainable Development which also includes high-level principles, we reaffirm our commitment to achieve the ambition of the 2030 Agenda. We note the Addis Tax Initiative, welcome the establishment of the Technology Facilitation Mechanism and stress the importance of enhanced cooperation on technologies to achieving sustainable development.

34. We welcome the Hangzhou Comprehensive Accountability Report on G20 Development Commitments, which reflects our progress already made over the period of 2014-2016.

35. We launch the G20 Initiative on Supporting Industrialization in Africa and LDCs to strengthen their inclusive growth and development potential through voluntary policy options including: promoting inclusive and sustainable structural transformation; supporting sustainable agriculture, agri-business and agro-industry development; deepening, broadening and updating the local knowledge and production base; promoting investment in sustainable and secure energy, including renewables and energy efficiency; exploring ways to develop cooperation on industrial production and vocational training and sustainable and resilient infrastructure and industries; supporting industrialization through trade in accordance with WTO rules; and leveraging domestic and external finance and supporting equitable access to finance - with a focus on women and youth; and promoting science, technology and innovation as critical means for industrialization.

36. We will continue our work on addressing cross-border financial flows derived from illicit activities, including deliberate trade misinvoicing, which hampers the mobilization of domestic resources for development, and welcome the communication and coordination with the World Customs Organization for a study report in this regard following the Hangzhou Summit.

37. We acknowledge the important role of inclusive business in development, and welcome the establishment of the G20 Global Platform on Inclusive Business and its future actions. We welcome the G20 Inclusive Business Report for the 2016 Summit.

38. We will fulfill our collective commitment to achieve a successful 18th replenishment of the International Development Association, as well as 14th replenishment of the African Development Fund.

39. We reaffirm our commitment to promote investment with focus on infrastructure in terms of both quantity and quality. We welcome the Joint Declaration of Aspirations on Actions to Support Infrastructure Investment by 11 multilateral development banks (MDBs), including their announcements of quantitative ambitions for high-quality infrastructure projects within their respective institutional mandates as well as their efforts to maximize the quality of infrastructure projects, strengthen project pipelines, collaborate further among existing and new MDBs, strengthen the enabling environment for infrastructure investment in developing countries, as well as catalyze private resources. We stress the importance of quality infrastructure investment, which aims to ensure economic efficiency in view of life-cycle cost, safety, resilience against natural disaster, job creation, capacity building, and transfer of expertise and know-how on mutually agreed terms and conditions, while addressing social and environmental impacts and aligning with economic and development strategies. We welcome the MDB Response to the G20 MDB Balance Sheet Optimization Action Plan and call for further implementation of the Action Plan. We note that infrastructure connectivity is key to achieving sustainable development and shared prosperity. We endorse the Global Infrastructure Connectivity Alliance launched this year to enhance the synergy and cooperation among various infrastructure connectivity programs in a holistic way. We ask the WBG to serve as the Secretariat of the Alliance, working closely with the Global Infrastructure Hub (GIH), OECD, other MDBs, and interested G20 members to support its activities. We endorse the G20/OECD Guidance Note on Diversification of Financial Instruments for Infrastructure and SMEs and we welcome the Annotated Public-Private Partnership (PPP) Risk Allocation Matrices completed by the GIH to help developing countries better assess infrastructure risks. We support the effective implementation of the G20/OECD Principles of Corporate Governance and G20/OECD High-level Principles on SME Financing and look forward to the revision of the assessment methodology of the G20/OECD Principles of the Corporate Governance, which will be informed by an FSB peer review on corporate governance.

40. Generating quality employment is indispensable for sustainable development and is at the center of the G20's domestic and global agenda. We will work to ensure the benefits from economic growth, globalization and technological innovation are widely shared, creating more and better jobs, reducing inequalities and promoting inclusive labor force participation. We endorse the strategies, action plans and initiatives developed by G20 labor and employment ministers to enhance the growth and development agenda by taking effective actions to address changes in skill needs, support entrepreneurship and employability, foster decent work, ensure safer workplaces including within global supply chains and strengthen social protection systems. We endorse Sustainable Wage Policy Principles. We recognize entrepreneurship is an important driver for job creation and economic growth, reinforce our commitments in the G20 Entrepreneurship Action Plan, and welcome China's contribution in the establishment of an Entrepreneurship Research Center on G20 Economies. We also endorse the G20 Initiative to Promote Quality Apprenticeship with policy priorities of increasing the quantity, quality and diversity of apprenticeships. We will further develop the G20 employment plans in 2017 to address these commitments and monitor progress in a systemic and transparent manner in achieving the G20 goals especially on youth employment and female labor participation. We recognize strengthened labor market institutions and policies can support productivity and promote decent work, and therefore higher, sustainable wage growth, in particular for the low-income workers. We recognize the importance of addressing opportunities and challenges brought into the labor market through labor migration as well-managed migration can bring potential benefits to economies and societies.

41. The G20 will continue to prioritize its work on food security, nutrition, sustainable agricultural growth and rural development as a significant contribution to implementing the 2030 Agenda for Sustainable Development. We endorse the outcome of the G20 Agriculture Ministers Meeting and encourage our agriculture ministers to meet regularly to jointly facilitate sustainable agricultural development and food value chains, including through technological, institutional and social innovation, trade and responsible investment, as a means of food security, rural development and poverty alleviation. We support increasing efforts in this regard by the agricultural scientific and private sectors and welcome the opening of the First G20 Agricultural Entrepreneurs Forum. We recognize the role of family farmers and smallholder agriculture in development, and welcome the Good Practices on Family Farming and Smallholder Agriculture that identifies a set of policies, programs and tools that can prove useful to G20 members and beyond. We welcome the contribution by programs and initiatives that promote sustainable agricultural development, including the Global Agriculture and Food Security Program.

Further Significant Global Challenges Affecting the World Economy

42. The outcome of the referendum on the UK's membership of the EU adds to the uncertainty in the global economy.

Members of the G20 are well positioned to proactively address the potential economic and financial consequences stemming from the referendum. In the future, we hope to see the UK as a close partner of the EU.

43. We reiterate our commitment to sustainable development and strong and effective support and actions to address climate change. We commit to complete our respective domestic procedures in order to join the Paris Agreement as soon as our national procedures allow. We welcome those G20 members who joined the Agreement and efforts to enable the Paris Agreement to enter into force by the end of 2016 and look forward to its timely implementation with all its aspects. We affirm the importance of fulfilling the UNFCCC commitment by developed countries in providing means of implementation including financial resources to assist developing countries with respect to both mitigation and adaptation actions in line with Paris outcomes. We reaffirm the importance of the support provided by the Green Climate Fund. We welcome the G20 Climate Finance Study Group report on "Promoting Efficient and Transparent Provision and Mobilization of Climate Finance to Enhance Ambition of Mitigation and Adaptation Actions". We look forward to successful outcomes in related multilateral fora, including the Montreal Protocol and the International Civil Aviation Organization.

44. Worldwide massive forced displacement of people, unprecedented since the Second World War, especially those generated from violent conflicts, is a global concern. We reiterate our call in Antalya for global concerted efforts in addressing the effects, protection need and root causes of refugee crisis to share in the burden associated with it. We call for strengthening humanitarian assistance for refugees and refugee resettlement, and we invite all states, according to their individual capacity, to scale up assistance to relevant international organizations in order to enhance their capabilities to assist affected countries, intensifying efforts to find durable solutions, in particular for protracted refugee situations, and in this regard, strengthening the contribution of development assistance to host communities. We support the international efforts to respond to the ongoing crisis and note the upcoming high-level meetings which will take place during the UN General Assembly. We note the World Bank's effort to work with other international organizations and its shareholders to develop a global crisis response platform to provide support to refugees and host communities in both low and middle income countries. The G20 will continue to address forced displacement in 2017 with a view to developing concrete actions. The G20 will also examine migration issues in 2017.

45. We strongly condemn terrorism in all forms and manifestations, which poses serious challenges to international peace and security and endangers our ongoing efforts to strengthen the global economy and ensure sustainable growth and development. We reaffirm our solidarity and resolve in the fight against terrorism in all its forms and wherever it occurs. We will tackle all sources, techniques and channels of terrorist financing, including extortion, taxation, smuggling of natural resources, bank looting, looting of cultural property, external donation, and kidnapping for ransom. In confronting terrorism, we remain committed to effectively exchanging information, freezing terrorist assets, and criminalizing terrorist financing. We call for the swift, effective and universal implementation of the FATF standards and of the provisions of the UN Security Council resolution 2253 worldwide. We welcome the progress achieved by the FATF in the implementation of its new Consolidated Strategy on Combating Terrorist Financing and call for effective implementation of its operational plan. We call on the FATF to reflect by March 2017 on ways to progress in strengthening its traction capacity and enhanced effectiveness of the network of FATF and FATF-style regional bodies.

46. Antimicrobial resistance (AMR) poses a serious threat to public health, growth and global economic stability. We affirm the need to explore in an inclusive manner to fight antimicrobial resistance by developing evidence-based ways to prevent and mitigate resistance, and unlock research and development into new and existing antimicrobials from a G20 value-added perspective, and call on the WHO, FAO, OIE and OECD to collectively report back in 2017 on options to address this including the economic aspects. In this context, we will promote prudent use of antibiotics and take into consideration huge challenges of affordability and access of antimicrobials and their impact on public health. We strongly support the work of the WHO, FAO and the OIE and look forward to a successful high-level meeting on AMR during the UN General Assembly. We look forward to the discussion under the upcoming presidency for dealing with these issues.

47. We reaffirm that the G20's founding spirit is to bring together the major economies on an equal footing to catalyze action. Once we agree, we will deliver.

48. We thank China for hosting a successful Hangzhou Summit and its contribution to the G20 process, and look forward to meeting again in Germany in 2017 and in Argentina in 2018.

Alexander Stevenson

Articles of Agreement

INTERNATIONAL MONETARY FUND

AND

INTERNATIONAL BANK FOR RECONSTRUCTION AND DEVELOPMENT

United Nations Monetary and Financial Conference

Bretton Woods, N. H. • July 1 to 22, 1944

U. S. TREASURY WASHINGTON, D. C.

ARTICLES OF AGREEMENT

INTERNATIONAL BANK
FOR
RECONSTRUCTION AND DEVELOPMENT

The Governments on whose behalf the present Agreement is signed agree as follows:

Introductory Article

The International Bank for Reconstruction and Development is established and shall operate in accordance with the following provisions:

Article I. Purposes

The purposes of the Bank are:

(i) To assist in the reconstruction and development of territories of members by facilitating the investment of capital for productive purposes, including the restoration of economies destroyed or disrupted by war, the reconversion of productive facilities to peacetime needs and the encouragement of the development of productive facilities and resources in less developed countries.

(ii) To promote private foreign investment by means of guarantees or participations in loans and other investments made by private investors; and when private capital is not available on reasonable terms, to supplement private investment by providing, on suitable conditions, finance for productive purposes out of its own capital, funds raised by it and its other resources.

(iii) To promote the long-range balanced growth of international trade and the maintenance of equilibrium in balances of payments by encouraging international investment for the development of the productive resources of members, thereby assisting in raising productivity, the standard of living and conditions of labor in their territories.

(iv) To arrange the loans made or guaranteed by it in relation to international loans through other channels so that the more useful and urgent projects, large and small alike, will be dealt with first.

(v) To conduct its operations with due regard to the effect of international investment on business conditions in the territories of members and, in the immediate post-war years, to assist in bringing about a smooth transition from a wartime to a peacetime economy.

The Bank shall be guided in all its decisions by the purposes set forth above.

Article II. Membership in and Capital of the Bank

SECTION 1. *Membership.*—(*a*) The original members of the Bank shall be those members of the International Monetary Fund which accept membership in the Bank before the date specified in Article XI, Section 2 (*e*).

(*b*) Membership shall be open to other members of the Fund, at such times and in accordance with such terms as may be prescribed by the Bank.

SEC. 2. *Authorized capital.*—(*a*) The authorized capital stock of the Bank shall be $10,000,000,000, in terms of United States dollars of the weight and fineness in effect on July 1, 1944. The capital stock shall be divided into 100,000 shares having a par value of $100,000 each, which shall be available for subscription only by members.

(*b*) The capital stock may be increased when the Bank deems it advisible by a three-fourths majority of the total voting power.

SEC. 3. *Subscription of shares.*—(*a*) Each member shall subscribe shares of the capital stock of the Bank. The minimum number of shares to be subscribed by the original members shall be those set forth in Schedule A. The minimum number of shares to be subscribed by other members shall be determined by the Bank, which shall reserve a sufficient portion of its capital stock for subscription by such members.

(*b*) The Bank shall prescribe rules laying down the conditions under which members may subscribe shares of the authorized capital stock of the Bank in addition to their minimum subscriptions.

(*c*) If the authorized capital stock of the Bank is increased, each member shall have a reasonable opportunity to subscribe, under such conditions as the Bank shall decide, a proportion of the increase of stock equivalent to the proportion which its stock theretofore subscribed bears to the total capital stock of the Bank, but no member shall be obligated to subscribe any part of the increased capital.

SEC. 4. *Issue price of shares.*—Shares included in the minimum subscriptions of original members shall be issued at par. Other shares shall be issued at par unless the Bank by a majority of the total voting power decides in special circumstances to issue them on other terms.

SEC. 5. *Division and calls of subscribed capital.*—The subscription of each member shall be divided into two parts as follows:

(i) twenty percent shall be paid or subject to call under Section 7 (i) of this Article as needed by the Bank for its operations;

(ii) the remaining eighty percent shall be subject to call by the Bank only when required to meet obligations of the Bank created under Article IV, Sections 1 (*a*) (ii) and (iii).

Calls on unpaid subscriptions shall be uniform on all shares.

SEC. 6. *Limitation on liability.*—Liability on shares shall be limited to the unpaid portion of the issue price of the shares.

SEC. 7. *Method of payment of subscriptions for shares.*—Payment of subscriptions for shares shall be made in gold or United States dollars and in the currencies of the members as follows:

(i) under Section 5 (i) of this Article, two percent of the price of each share shall be payable in gold or United States dollars, and, when calls are made, the remaining eighteen percent shall be paid in the currency of the member;

(ii) when a call is made under Section 5 (ii) of this Article, payment may be made at the option of the member either in gold, in United States dollars or in the currency required to discharge the obligations of the Bank for the purpose for which the call is made;

(iii) when a member makes payments in any currency under (i) and (ii) above, such payments shall be made in amounts equal in value to the member's liability under the call. This liability shall be a proportionate part of the subscribed capital stock of the Bank as authorized and defined in Section 2 of this Article.

SEC. 8. *Time of payment of subscriptions.*—(*a*) The two percent payable on each share in gold or United States dollars under Section 7 (i) of this Article, shall be paid within sixty days of the date on which the Bank begins operations, provided that

(i) any original member of the Bank whose metropolitan territory has suffered from enemy occupation or hostilities during the present war shall be granted the right to postpone payment of one-half percent until five years after that date;

(ii) an original member who cannot make such a payment because it has not recovered possession of its gold reserves which are still seized or immobilized as a result of the war may postpone all payment until such date as the Bank shall decide.

(*b*) The remainder of the price of each share payable under Section 7 (i) of this Article shall be paid as and when called by the Bank, provided that

(i) the Bank shall, within one year of its beginning operations, call not less than eight percent of the price of the share in addition to the payment of two percent referred to in (*a*) above;

(ii) not more than five percent of the price of the share shall be called in any period of three months.

SEC. 9. *Maintenance of value of certain currency holdings of the Bank.*—(*a*) Whenever (i) the par value of a member's currency is reduced, or (ii) the foreign exchange value of a member's currency has, in the opinion of the Bank, depreciated to a significant extent within that member's territories, the member shall pay to the Bank within a reasonable time an additional amount of its own currency sufficient to maintain the value, as of the time of initial subscription, of the amount of the currency of such member, which is held by the Bank and derived from currency originally paid in to the Bank by the member under Article II, Section 7 (i), from currency referred to in Article IV, Section 2 (*b*), or from any additional currency furnished under the provisions of the present paragraph, and which has not been repurchased by the member for gold or for the currency of any member which is acceptable to the Bank.

(*b*) Whenever the par value of a member's currency is increased, the Bank shall return to such member within a reasonable time an amount of that member's currency equal to the increase in the value of the amount of such currency described in (*a*) above.

(*c*) The provisions of the preceding paragraphs may be waived by the Bank when a uniform proportionate change in the par values of the currencies of all its members is made by the International Monetary Fund.

SEC. 10. *Restriction on disposal of shares.*—Shares shall not be pledged or encumbered in any manner whatever and they shall be transferable only to the Bank.

Article III. General Provisions Relating to Loans and Guarantees

SECTION 1. *Use of resources.*—(*a*) The resources and the facilities of the Bank shall be used exclusively for the benefit of members with equitable consideration to projects for development and projects for reconstruction alike.

(*b*) For the purpose of facilitating the restoration and reconstruction of the economy of members whose metropolitan territories have suffered great devastation from enemy occupation or hostilities, the Bank, in determining the conditions and terms of loans made to such members, shall pay special regard to lightening the financial burden and expediting the completion of such restoration and reconstruction.

SEC. 2. *Dealings between members and the Bank.*—Each member shall deal with the Bank only through its Treasury, central bank, stabilization fund or other similar fiscal agency, and the Bank shall deal with members only by or through the same agencies.

SEC. 3. *Limitations on guarantees and borrowings of the Bank.*—The total amount outstanding of guarantees, participations in loans and direct loans made by the Bank shall not be increased at any time, if by such increase the total would exceed one hundred percent of the unimpaired subscribed capital, reserves and surplus of the Bank.

SEC. 4. *Conditions on which the Bank may guarantee or make loans.*—The Bank may guarantee, participate in, or make loans to any member or any political subdivision thereof and any business, industrial, and agricultural enterprise in the territories of a member, subject to the following conditions:

(i) When the member in whose territories the project is located is not itself the borrower, the member or the central bank or some comparable agency of the member which is acceptable to the Bank, fully guarantees the repayment of the principal and the payment of interest and other charges on the loan.

(ii) The Bank is satisfied that in the prevailing market conditions the borrower would be unable otherwise to obtain the loan under conditions which in the opinion of the Bank are reasonable for the borrower.

(iii) A competent committee, as provided for in Article V, Section 7, has submitted a written report recommending the project after a careful study of the merits of the proposal.

(iv) In the opinion of the Bank the rate of interest and other charges are reasonable and such rate, charges and the schedule for repayment of principal are appropriate to the project.

(v) In making or guaranteeing a loan, the Bank shall pay due regard to the prospects that the borrower, and, if the borrower is not a member, that the guarantor, will be in position to meet its obligations under the loan; and the Bank shall act prudently in the interests both of the particular member in whose territories the project is located and of the members as a whole.

(vi) In guaranteeing a loan made by other investors, the Bank receives suitable compensation for its risk.

(vii) Loans made or guaranteed by the Bank shall, except in special circumstances, be for the purpose of specific projects of reconstruction or development.

SEC. 5. *Use of loans guaranteed, participated in or made by the Bank.*—(*a*) The Bank shall impose no conditions that the proceeds of a loan shall be spent in the territories of any particular member or members.

(*b*) The Bank shall make arrangements to ensure that the proceeds of any loan are used only for the purposes for which the loan was granted, with due attention to considerations of economy and efficiency and without regard to political or other non-economic influences or considerations.

(*c*) In the case of loans made by the Bank, it shall open an account in the name of the borrower and the amount of the loan shall be credited to this account in the currency or currencies in which the loan is made. The borrower shall be permitted by the Bank to draw on this account only to meet expenses in connection with the project as they are actually incurred.

Article IV. Operations

SECTION 1. *Methods of making or facilitating loans.*—(*a*) The Bank may make or facilitate loans which satisfy the general conditions of Article III in any of the following ways:

(i) By making or participating in direct loans out of its own funds corresponding to its unimpaired paid-up capital and surplus and, subject to Section 6 of this Article, to its reserves.

(ii) By making or participating in direct loans out of funds raised in the market of a member, or otherwise borrowed by the Bank.

(iii) By guaranteeing in whole or in part loans made by private investors through the usual investment channels.

(*b*) The Bank may borrow funds under (*a*) (ii) above or guarantee loans under (*a*) (iii) above only with the approval of the member in whose markets the funds are raised and the member in whose currency the loan is denominated, and only if those members agree that the proceeds may be exchanged for the currency of any other member without restriction.

SEC. 2. *Availability and transferability of currencies.*—(*a*) Currencies paid into the Bank under Article II, Section 7 (i), shall be loaned only with the approval in each case of the member whose currency is involved; provided, however, that if necessary, after the Bank's subscribed capital has been entirely called, such currencies shall, without restriction by the members whose currencies are offered, be used or exchanged for the currencies required to meet contractual payments of interest, other charges or amortization on the Bank's own borrowings, or to meet the Bank's liabilities with respect to such contractual payments on loans guaranteed by the Bank.

(*b*) Currencies received by the Bank from borrowers or guarantors in payment on account of principal of direct loans made with currencies referred to in (*a*) above shall be exchanged for the currencies of other members or reloaned only with the approval in each case of the members whose currencies are involved; provided, however, that if necessary, after the Bank's subscribed capital has been entirely called, such currencies shall, without restriction by the members whose currencies are offered, be used or exchanged for the currencies required to meet contractual payments of interest, other charges or amortization on the Bank's own borrowings, or to meet the Bank's liabilities with respect to such contractual payments on loans guaranteed by the Bank.

(*c*) Currencies received by the Bank from borrowers or guarantors in payment on account of principal of direct loans made by the Bank under Section 1 (*a*) (ii) of this Article, shall be held and used, without restriction by the members, to make amortization payments, or to anticipate payment of or repurchase part or all of the Bank's own obligations.

(*d*) All other currencies available to the Bank, including those raised in the market or otherwise borrowed under Section 1 (*a*) (ii) of this Article, those obtained by the sale of gold, those received as payments of interest and other charges for direct loans made under Sections 1 (*a*) (i) and (ii), and those received as payments of commissions and other charges under Section 1 (*a*) (iii), shall be used or exchanged for other currencies or gold required in the operations of the Bank without restriction by the members whose currencies are offered.

(*e*) Currencies raised in the markets of members by borrowers on loans guaranteed by the Bank under Section 1 (*a*) (iii) of this Article, shall also be used or exchanged for other currencies without restriction by such members.

SEC. 3. *Provision of currencies for direct loans.*—The following provisions shall apply to direct loans under Sections 1 (*a*) (i) and (ii) of this Article.

(*a*) The Bank shall furnish the borrower with such currencies of members, other than the member in whose territories the project is located, as are needed by the borrower for expenditures to be made in the territories of such other members to carry out the purposes of the loan.

(*b*) The Bank may, in exceptional circumstances when local currency required for the purposes of the loan cannot be raised by the borrower on reasonable terms, provide the borrower as part of the loan with an appropriate amount of that currency.

(*c*) The Bank, if the project gives rise indirectly to an increased need for foreign exchange by the member in whose territories the project is located, may in exceptional circumstances provide the borrower as part of the loan with an appropriate amount of gold or foreign exchange not in excess of the borrower's local expenditure in connection with the purposes of the loan.

(*d*) The Bank may, in exceptional circumstances, at the request of a member in whose territories a portion of the loan is spent, repurchase with gold or foreign exchange a part of that member's currency thus spent but in no case shall the part so repurchased exceed the amount by which the expenditure of the loan in those territories gives rise to the increased need for foreign exchange.

SEC. 4. *Payment provisions for direct loans.*—Loan contracts under Section 1 (*a*) (i) or (ii) of this Article shall be made in accordance with the following payment provisions:

(*a*) The terms and conditions of interest and amortization payments, maturity and dates of payment of each loan shall be determined by the Bank. The Bank shall also determine the rate and any other terms and conditions of commission to be charged in connection with such loan.

In the case of loans made under Section 1 (*a*) (ii) of this Article during the first ten years of the Bank's operations, this rate of commission shall be not less than one percent per annum and not greater than one and one-half percent per annum, and shall be charged on the outstanding portion of any such loan. At the end of this period of ten years, the rate of commission may be reduced by the Bank with respect both to the outstanding portions of loans already made and to future loans, if the reserve accumulated by the Bank under Section 6 of this Article and out of other earnings are considered by it sufficient to justify a reduction. In the case of future loans the Bank shall also have discretion to increase the rate of commission beyond the above limit, if experience indicates that an increase is advisable.

(*b*) All loan contracts shall stipulate the currency or currencies in which payments under the contract shall be made to the Bank. At the option of the borrower, however, such payments may be made in gold, or subject to the agreement of the Bank, in the currency of a member other than that prescribed in the contract.

(i) In the case of loans made under Section 1 (*a*) (i) of this Article, the loan contracts shall provide that payments to the Bank of interest, other charges and amortization shall be made in the currency loaned, unless the member whose currency is loaned agrees that such payments shall be made in some other specified currency or currencies. These payments, subject to the provisions of Article II, Section 9 (*c*), shall be equivalent to the value of such contractural payments at the time the loans were made, in terms of a currency specified for the purpose by the Bank by a three-fourths majority of the total voting power.

(ii) In the case of loans made under Section 1 (*a*) (ii) of this Article, the total amount outstanding and payable to the Bank in any one currency shall at no time exceed the total amount of the outstanding borrowings made by the Bank under Section 1 (*a*) (ii) and payable in the same currency.

(*c*) If a member suffers from an acute exchange stringency, so that the service of any loan contracted by that member or guaranteed by it or by one of its agencies cannot be provided in the stipulated manner, the member concerned may apply to the Bank for a relaxation of the conditions of payments. If the Bank is satisfied that some relaxation is in the interests of the particular member and of the operations of the Bank and of its members as a whole, it may take action under either, or both, of the following paragraphs with respect to the whole, or part, of the annual service:

(i) The Bank may, in its discretion, make arrangements with the member concerned to accept service payments on the loan in the member's currency for periods not to exceed three years upon appropriate terms regarding the use of such currency and the maintenance of its foreign exchange value; and for the repurchase of such currency on appropriate terms.

(ii) The Bank may modify the terms of amortization or extend the life of the loan, or both.

SEC. 5. *Guarantees.*—(a) In guaranteeing a loan placed through the usual investment channels, the Bank shall charge a guarantee commission payable periodically on the amount of the loan outstanding at a rate determined by the Bank. During the first ten years of the Bank's operations, this rate shall be not less than one percent per annum and not greater than one and one-half percent per annum. At the end of this period of ten years, the rate of commission may be reduced by the Bank with respect both to the outstanding portions of loans already guaranteed and to future loans if the reserves accumulated by the Bank under Section 6 of this Article and out of other earnings are considered by it sufficient to justify a reduction. In the case of future loans the Bank shall also have discretion to increase the rate of commission beyond the above limit, if experience indicates that an increase is advisable.

(*b*) Guarantee commissions shall be paid directly to the Bank by the borrower.

(*c*) Guarantees by the Bank shall provide that the Bank may terminate its liability with respect to interest if, upon default by the borrower and by the guarantor, if any, the Bank offers to purchase, at par and interest accrued to a date designated in the offer, the bonds or other obligations guaranteed.

(*d*) The Bank shall have power to determine any other terms and conditions of the guarantee.

SEC. 6. *Special reserve.*—The amount of commissions received by the Bank under Sections 4 and 5 of this Article shall be set aside as a special reserve, which shall be kept available for meeting liabilities of the Bank in accordance with Section 7 of this Article. The special reserve shall be held in such liquid form, permitted under this Agreement, as the Executive Directors may decide.

SEC. 7. *Methods of meeting liabilities of the Bank in case of defaults.*—In cases of default on loans made, participated in, or guaranteed by the Bank:

(*a*) The Bank shall make such arrangements as may be feasible to adjust the obligations under the loans, including arrangements under or analogous to those provided in Section 4 (c) of this Article.

(*b*) The payments in discharge of the Bank's liabilities on borowings or guarantees under Section 1 (a) (ii) and (iii) of this Article shall be charged:

(i) first, against the special reserve provided in Section 6 of this Article;

(ii) then, to the extent necessary and at the discretion of the Bank, against the other reserves, surplus and capital available to the Bank.

(*c*) Whenever necessary to meet contractual payments of interest, other charges or amortization on the Bank's own borrowings, or to meet the Bank's liabilities with respect to similar payments on loans guaranteed by it, the Bank may call an appropriate amount of the unpaid subscriptions of members in accordance with Article II, Sections 5 and 7. Moreover, if it believes that a default may be of long duration, the Bank may call an additional amount of such unpaid subscriptions not to exceed in any one year one percent of the total subscriptions of the members for the following purposes:

(i) To redeem prior to maturity, or otherwise discharge its liability on, all or part of the outstanding principal of any loan guaranteed by it in respect of which the debtor is in default.

(ii) To repurchase, or otherwise discharge its liability on, all or part of its own outstanding borrowings.

SEC. 8. *Miscellaneous operations.*—In addition to the operations specified elsewhere in this Agreement, the Bank shall have the power:

(i) To buy and sell securities it has issued and to buy and sell securities which it has guaranteed or in which it has invested, provided that the Bank shall obtain the approval of the member in whose territories the securities are to be bought or sold.

(ii) To guarantee securities in which it has invested for the purpose of facilitating their sale.

(iii) To borrow the currency of any member with the approval of that member.

(iv) To buy and sell such other securities as the Directors by a three-fourths majority of the total voting power may deem proper for the investment of all or part of the special reserve under Section 6 of this Article.

In exercising the powers conferred by this Section, the Bank may deal with any person, partnership, association, corporation or other legal entity in the territories of any member.

SEC. 9. *Warning to be placed on securities.*—Every security guaranteed or issued by the Bank shall bear on its face a conspicuous statement to the effect that it is not an obligation of any government unless expressly stated on the security.

SEC. 10. *Political activity prohibited.*—The Bank and its officers shall not interfere in the political affairs of any member; nor shall they be influenced in their decisions by the political character of the member or members concerned. Only economic considerations shall be relevant to their decisions, and these considerations shall be weighed impartially in order to achieve the purposes stated in Article I.

Article V. Organization and Management

SECTION 1. *Structure of the Bank.*—The Bank shall have a Board of Governors, Executive Directors, a President and such other officers and staff to perform such duties as the Bank may determine.

SEC. 2. *Board of Governors.*—(*a*) All the powers of the Bank shall be vested in the Board of Governors consisting of one governor and one alternate appointed by each member in such manner as it may determine. Each governor and each alternate shall serve for five years, subject to the pleasure of the member appointing him, and may be reappointed. No alternate may vote except in the absence of his principal. The Board shall select one of the governors as Chairman.

(*b*) The Board of Governors may delegate to the Executive Directors authority to exercise any powers of the Board, except the power to:

(i) Admit new members and determine the conditions of their admission;

(ii) Increase or decrease the capital stock;

(iii) Suspend a member;

(iv) Decide appeals from interpretations of this Agreement given by the Executive Directors;

(v) Make arrangements to cooperate with other international organizations (other than informal arrangements of a temporary and administrative character);

(vi) Decide to suspend permanently the operations of the Bank and to distribute its assets;

(vii) Determine the distribution of the net income of the Bank.

(*c*) The Board of Governors shall hold an annual meeting and such other meetings as may be provided for by the Board or called by the Executive Directors. Meetings of the Board shall be called by the Directors whenever requested by five members or by members having one-quarter of the total voting power.

(*d*) A quorum for any meeting of the Board of Governors shall be a majority of the Governors, exercising not less than two-thirds of the total voting power.

(*e*) The Board of Governors may by regulation establish a procedure whereby the Executive Directors, when they deem such action to be in the best interests of the Bank, may obtain a vote of the Governors on a specific question without calling a meeting of the Board.

(*f*) The Board of Governors, and the Executive Directors to the extent authorized, may adopt such rules and regulations as may be necessary or appropriate to conduct the business of the Bank.

(*g*) Governors and alternates shall serve as such without compensation from the Bank, but the Bank shall pay them reasonable expenses incurred in attending meetings.

(*h*) The Board of Governors shall determine the remuneration to be paid to the Executive Directors and the salary and terms of the contract of service of the President.

SEC. 3. *Voting.*—(*a*) Each member shall have two hundred fifty votes plus one additional vote for each share of stock held.

(*b*) Except as otherwise specifically provided, all matters before the Bank shall be decided by a majority of the votes cast.

SEC. 4. *Executive Directors.*—(*a*) The Executive Directors shall be responsible for the conduct of the general operations of the Bank, and for this purpose, shall exercise all the powers delegated to them by the Board of Governors.

(*b*) There shall be twelve Executive Directors, who need not be governors, and of whom:

(i) five shall be appointed, one by each of the five members having the largest number of shares;

(ii) seven shall be elected according to Schedule B by all the Governors other than those appointed by the five members referred to in (i) above.

For the purpose of this paragraph, "members" means governments of countries whose names are set forth in Schedule A, whether they are original members or become members in accordance with Article II, Section 1 (*b*). When governments of other countries become members, the Board of Governors may, by a four-fifths majority of the total voting power, increase the total number of directors by increasing the number of directors to be elected.

Executive directors shall be appointed or elected every two years.

(*c*) Each executive director shall appoint an alternate with full power to act for him when he is not present. When the executive directors appointing them are present, alternates may participate in meetings but shall not vote.

(*d*) Directors shall continue in office until their successors are appointed or elected. If the office of an elected director becomes vacant more than ninety days before the end of his term, another director shall be elected for the remainder of the term by the governors who elected the former director. A majority of the votes cast shall be required for election. While the office remains vacant, the alternate of the former director shall exercise his powers, except that of appointing an alternate.

(*e*) The Executive Directors shall function in continuous session at the principal office of the Bank and shall meet as often as the business of the Bank may require.

(*f*) A quorum for any meeting of the Executive Directors shall be a majority of the Directors, exercising not less than one-half of the total voting power.

(*g*) Each appointed director shall be entitled to cast the number of votes allotted under Section 3 of this Article to the member appointing him. Each elected director shall be entitled to cast the number of votes which counted toward his election. All the votes which a director is entitled to cast shall be cast as a unit.

(*h*) The Board of Governors shall adopt regulations under which a member not entitled to appoint a director under (*b*) above may send a representative to attend any meeting of the Executive Directors when a request made by, or a matter particularly affecting, that member is under consideration.

(*i*) The Executive Directors may appoint such committees as they deem advisable. Membership of such committees need not be limited to governors or directors or their alternates.

SEC. 5. *President and staff.*—(*a*) The Executive Directors shall select a President who shall not be a governor or an executive director or an alternate for either. The President shall be Chairman of the Executive Directors, but shall have no vote except a deciding vote in case of an equal division. He may participate in meetings of the Board of Governors, but shall not vote at such meetings. The President shall cease to hold office when the Executive Directors so decide.

(*b*) The President shall be chief of the operating staff of the Bank and shall conduct, under the direction of the Executive Directors, the ordinary business of the Bank. Subject to the general control of the Executive Directors, he shall be responsible for the organization, appointment and dismissal of the officers and staff.

(*c*) The President, officers and staff of the Bank, in the discharge of their offices, owe their duty entirely to the Bank and to no other authority. Each member of the Bank shall respect the international character of this duty and shall refrain from all attempts to influence any of them in the discharge of their duties.

(*d*) In appointing the officers and staff the President shall, subject to the paramount importance of securing the highest standards of efficiency and of technical competence, pay due regard to the importance of recruiting personnel on as wide a geographical basis as possible.

SEC. 6. *Advisory Council.*—(*a*) There shall be an Advisory Council of not less than seven persons selected by the Board of Governors including representatives of banking, commercial, industrial, labor, and agricultural interests, and with as wide a national representation as possible. In those fields where specialized international organizations exist, the members of the Council representative of those fields shall be selected in agreement with such organizations. The Council shall advise the Bank on matters of general policy. The Council shall meet annually and on such other occasions as the Bank may request.

(*b*) Councillors shall serve for two years and may be reappointed. They shall be paid their reasonable expenses incurred on behalf of the Bank.

SEC. 7. *Loan committees.*—The committees required to report on loans under Article III, Section 4, shall be appointed by the Bank. Each such committee shall include an expert selected by the governor representing the member in whose territories the project is located and one or more members of the technical staff of the Bank.

SEC. 8. *Relationship to other international organizations.*—(*a*) The Bank, within the terms of this Agreement, shall cooperate with any general international organization and with public international organizations having specialized responsibilities in related fields. Any arrangements for such cooperation which would involve a modification of any provision of this Agreement may be effected only after amendment to this Agreement under Article VIII.

(*b*) In making decisions on applications for loans or guarantees relating to matters directly within the competence of any international organization of the types specified in the preceding paragraph and participated in primarily by members of the Bank, the Bank shall give consideration to the views and recommendations of such organization.

SEC. 9. *Location of offices.*—(*a*) The principal office of the Bank shall be located in the territory of the member holding the greatest number of shares.

(*b*) The Bank may establish agencies or branch offices in the territories of any member of the Bank.

SEC. 10. *Regional offices and councils.*—(*a*) The Bank may establish regional offices and determine the location of, and the areas to be covered by, each regional office.

(*b*) Each regional office shall be advised by a regional council representative of the entire area and selected in such manner as the Bank may decide.

SEC. 11. *Depositories.*—(*a*) Each member shall designate its central bank as a depository for all the Bank's holdings of its currency or, if it has no central bank, it shall designate such other institution as may be acceptable to the Bank.

(*b*) The Bank may hold other assets, including gold, in depositories designated by the five members having the largest number of shares and in such other designated depositories as the Bank may select. Initially, at least one-half of the gold holdings of the Bank shall be held in the depository designated by the member in whose territory the Bank has its principal office, and at least forty percent shall be held in the depositories designated by the remaining four members referred to above, each of such depositories to hold, initially, not less than the amount of gold paid on the shares of the member designating it. However, all transfers of gold by the Bank shall be made with due regard to the costs of transport and anticipated requirements of the Bank. In an emergency the Executive Directors may transfer all or any part of the Bank's gold holdings to any place where they can be adequately protected.

SEC. 12. *Form of holding of currency.*—The Bank shall accept from any member, in place of any part of the member's currency, paid in to the Bank under Article II, Section 7 (i), or to meet amortization payments on loans made with such currency, and not needed by the Bank in its operations, notes or similar obligations issued by the Government of the member or the depository designated by such member, which shall be non-negotiable, non-interest-bearing and payable at their par value on demand by credit to the account of the Bank in the designated depository.

SEC. 13. *Publication of reports and provision of information.*—(*a*) The Bank shall publish an annual report containing an audited statement of its accounts and shall circulate to members at intervals of three months or less a summary statement of its financial position and a profit and loss statement showing the results of its operations.

(*b*) The Bank may publish such other reports as it deems desirable to carry out its purposes.

(*c*) Copies of all reports, statements and publications made under this section shall be distributed to members.

SEC. 14. *Allocation of net income.*—(*a*) The Board of Governors shall determine annually what part of the Bank's net income, after making provision for reserves, shall be allocated to surplus and what part, if any, shall be distributed.

(*b*) If any part is distributed, up to two percent non-cumulative shall be paid, as a first charge against the distribution for any year, to each member on the basis of the average amount of the loans outstanding during the year made under Article IV, Section 1 (*a*) (i), out of currency corresponding to its subscription. If two percent is paid as a first charge, any balance remaining to be distributed shall be paid to all members in proportion to their shares. Payments to each member shall be made in its own currency, or if that currency is not available in other currency acceptable to the member. If such payments are made in currencies other than the member's own currency, the transfer of the currency and its use by the receiving member after payment shall be without restriction by the members.

Article VI. Withdrawal and Suspension of Membership: Suspension of Operations

SECTION 1. *Right of members to withdraw.*—Any member may withdraw from the Bank at any time by transmitting a notice in writing to the Bank at its principal office. Withdrawal shall become effective on the date such notice is received.

SEC. 2. *Suspension of membership.*—If a member fails to fulfill any of its obligations to the Bank, the Bank may suspend its membership by decision of a majority of the

Governors, exercising a majority of the total voting power. The member so suspended shall automatically cease to be a member one year from the date of its suspension unless a decision is taken by the same majority to restore the member to good standing.

While under suspension, a member shall not be entitled to exercise any rights under this Agreement, except the right of withdrawal, but shall remain subject to all obligations.

SEC. 3. *Cessation of membership in International Monetary Fund.*—Any member which ceases to be a member of the International Monetary Fund shall automatically cease after three months to be a member of the Bank unless the Bank by three-fourths of the total voting power has agreed to allow it to remain a member.

SEC. 4. *Settlement of accounts with governments ceasing to be members.*—(*a*) When a government ceases to be a member, it shall remain liable for its direct obligations to the Bank and for its contingent liabilities to the Bank so long as any part of the loans or guarantees contracted before it ceased to be a member are outstanding; but it shall cease to incur liabilities with respect to loans and guarantees entered into thereafter by the Bank and to share either in the income or the expenses of the Bank.

(*b*) At the time a government ceases to be a member, the Bank shall arrange for the repurchase of its shares as a part of the settlement of accounts with such government in accordance with the provisions of (*c*) and (*d*) below. For this purpose the repurchase price of the shares shall be the value shown by the books of the Bank on the day the government ceases to be a member.

(*c*) The payment for shares repurchased by the Bank under this section shall be governed by the following conditions:

(i) Any amount due to the government for its shares shall be withheld so long as the government, its central bank or any of its agencies remains liable, as borrower or guarantor, to the Bank and such amount may, at the option of the Bank, be applied on any such liability as it matures. No amount shall be withheld on account of the liability of the government resulting from its subscription for shares under Article II, Section 5 (ii). In any event, no amount due to a member for its shares shall be paid until six months after the date upon which the government ceases to be a member.

(ii) Payments for shares may be made from time to time, upon their surrender by the government, to the extent by which the amount due as the repurchase price in (*b*) above exceeds the aggregate of liabilities on loans and guarantees in (*c*) (i) above until the former member has received the full repurchase price.

(iii) Payments shall be made in the currency of the country receiving payment or at the option of the Bank in gold.

(iv) If losses are sustained by the Bank on any guarantees, participations in loans, or loans which were outstanding on the date when the government ceased to be a member, and the amount of such losses exceeds the amount of the reserve provided against losses on the date when the government ceased to be a member, such government shall be obligated to repay upon demand the amount by which the repurchase price of its shares would have been reduced, if the losses had been taken into account when the repurchase price was determined. In addition, the former member government shall remain liable on any call for unpaid subscriptions under Article II, Section 5 (ii), to the extent that it would have been required to respond if the impairment of capital had occurred and the call had been made at the time the repurchase price of its shares was determined.

(*d*) If the Bank suspends permanently its operations under Section 5 (*b*) of this Article, within six months of the date upon which any government ceases to be a member, all rights of such government shall be determined by the provisions of Section 5 of the Article.

SEC. 5. *Suspension of operations and settlement of obligations.*—(*a*) In an emergency the Executive Directors may suspend temporarily operations in respect of new loans and guarantees pending an opportunity for further consideration and action by the Board of Governors.

(*b*) The Bank may suspend permanently its operations in respect of new loans and guarantees by vote of a majority of the Governors, exercising a majority of the total voting power. After such suspension of operations the Bank shall forthwith cease all activities, except those incident to the orderly realization, conservation, and preservation of its assets and settlement of its obligations.

(*c*) The liability of all members for uncalled subscriptions to the capital stock of the Bank and in respect of the depreciation of their own currencies shall continue until all claims of creditors, including all contingent claims, shall have been discharged.

(*d*) All creditors holding direct claims shall be paid out of the assets of the Bank, and then out of payments to the Bank on calls on unpaid subscriptions. Before making any payments to creditors holding direct claims, the Executive Directors shall make such arrangements as are necessary, in their judgment, to insure a distribution to holders of contingent claims ratably with creditors holding direct claims.

(*e*) No distribution shall be made to members on account of their subscriptions to the capital stock of the Bank until

(i) all liabilities to creditors have been discharged or provided for, and

(ii) a majority of the Governors, exercising a majority of the total voting power, have decided to make a distribution.

(*f*) After a decision to make a distribution has been taken under (*e*) above, the Executive Directors may by a two-thirds majority vote make successive distributions of the assets of the Bank to members until all of the assets have been distributed. This distribution shall be subject to the prior settlement of all outstanding claims of the Bank against each member.

(*g*) Before any distribution of assets is made, the Executive Directors shall fix the proportionate share of each member according to the ratio of its shareholding to the total autstanding shares of the Bank.

(*h*) The Executive Directors shall value the assets to be distributed as at the date of distribution and then proceed to distribute in the following manner:

(i) There shall be paid to each member in its own obligations or those of its official agencies or legal entities within its territories, insofar as they are available for distribution, an amount equivalent in value to its proportionate share of the total amount to be distributed.

(ii) Any balance due to a member after payment has been made under (i) above shall be paid, in its own currency, insofar as it is held by the Bank, up to an amount equivalent in value to such balance.

(iii) Any balance due to a member after payment has been made under (i) and (ii) above shall be paid in gold or currency acceptable to the member, insofar as they are held by the Bank, up to an amount equivalent in value to such balance.

(iv) Any remaining assets held by the Bank after payments have been made to members under (i), (ii), and (iii) above shall be distributed *pro rata* among the members.

(*i*) Any member receiving assets distributed by the Bank in accordance with (*h*) above, shall enjoy the same rights with respect to such assets as the Bank enjoyed prior to their distribution.

Article VII. Status, Immunities, and Privileges

SECTION 1. *Purpose of Article.*—To enable the Bank to fulfill the functions with which it is entrusted, the status, immunities and privileges set forth in this Article shall be accorded to the Bank in the territories of each member.

SEC. 2. *Status of the Bank.*—The Bank shall possess full juridical personality, and, in particular, the capacity:

(i) to contract;

(ii) to acquire and dispose of immovable and movable property;

(iii) to institute legal proceedings.

SEC. 3. *Position of the Bank with regard to judicial process.*—Actions may be brought against the Bank only in a court of competent jurisdiction in the territories of a member in which the Bank has an office, has appointed an agent for the purpose of accepting service or notice of process, or has issued or guaranteed securities. No actions shall, however, be brought by members or persons acting for or deriving claims from members. The property and assets of the Bank shall, wheresoever located and by whomsoever held, be immune from all forms of seizure, attachment or execution before the delivery of final judgment against the Bank.

SEC. 4. *Immunity of assets from seizure.*—Property and assets of the Bank, wherever located and by whomsoever held, shall be immune from search, requisition, confiscation, expropriation or any other form of seizure by executive or legislative action.

SEC. 5. *Immunity of archives.*—The archives of the Bank shall be inviolable.

SEC. 6. *Freedom of assets from restrictions.*—To the extent necessary to carry out the operations provided for in this Agreement and subject to the provisions of this Agreement, all property and assets of the Bank shall be free from any restrictions, regulations, controls and moratoria of any nature.

SEC. 7. *Privilege for communications.*—The official communications of the Bank shall be accorded by each member the same treatment that it accords to the official communications of other members.

SEC. 8. *Immunities and privileges of officers and employees.*—All governors, executive directors, alternates, officers and employees of the Bank

(i) shall be immune from legal process with respect to acts performed by them in their official capacity except when the Bank waives this immunity;

(ii) not being local nationals, shall be accorded the same immunities from immigration restrictions, alien registration requirements and national service obligations and the same facilities as regards exchange restrictions as are accorded by members to the representatives, officials, and employees of comparable rank of other members;

(iii) shall be granted the same treatment in respect of travelling facilities as is accorded by members to representatives, officials and employees of comparable rank of other members.

SEC. 9. *Immunities from taxation.*—(*a*) The Bank, its assets, property, income and its operations and transactions authorized by this Agreement, shall be immune from all taxation and from all customs duties. The Bank shall also be immune from liability for the collection or payment of any tax or duty.

(*b*) No tax shall be levied on or in respect of salaries and emoluments paid by the Bank to executive directors, alternates, officials or employees of the Bank who are not local citizens, local subjects, or other local nationals.

(*c*) No taxation of any kind shall be levied on any obligation or security issued by the Bank (including any dividend or interest thereon) by whomsoever held

(i) which discriminates against such obligation or security solely because it is issued by the Bank; or

(ii) if the sole jurisdictional basis for such taxation is the place of currency in which it is issued, made payable or paid, or the location of any office or place of business maintained by the Bank.

(*d*) No taxation of any kind shall be levied on any obligation or security guaranteed by the Bank (including any dividend or interest thereon) by whomsoever held

(i) which discriminates against such obligation or security solely because it is guaranteed by the Bank; or

(ii) if the sole jurisdictional basis for such taxation is the location of any office or place of business maintained by the Bank.

SEC. 10. *Application of Article.*—Each member shall take such action as is necessary in its own territories for the purpose of making effective in terms of its own law the principles set forth in this Article and shall inform the Bank of the detailed action which it has taken.

Article VIII. Amendments

(*a*) Any proposal to introduce modifications in this Agreement, whether emanating from a member, a governor or the Executive Directors, shall be communicated to the Chairman of the Board of Governors who shall bring the proposal before the Board. If the proposed amendment is approved by the Board the Bank shall, by circular letter or telegram, ask all members whether they accept the proposed amendment. When three-fifths of the members, having four-fifths of the total voting power, have accepted the proposed amendment, the Bank shall certify the fact by a formal communication addressed to all members.

(*b*) Nothwithstanding (*a*) above, acceptance by all members is required in the case of any amendment modifying

(i) the right to withdraw from the Bank provided in Article VI, Section 1;

(ii) the right secured by Article II, Section 3 (*c*);

(iii) the limitation on liability provided in Article II, Section 6.

(*c*) Amendments shall enter into force for all members three months after the date of the formal communication unless a shorter period is specified in the circular letter or telegram.

Article IX. Interpretation

(*a*) Any question of interpretation of the provisions of this Agreement arising between any member and the Bank or between any members of the Bank shall be submitted to the Executive Directors for their decision. If the question particularly affects any member not entitled to appoint an executive director, it shall be entitled to representation in accordance with Article V, Section 4 (*h*).

(*b*) In any case where the Executive Directors have given a decision under (*a*) above, any member may require that the question be referred to the Board of Governors, whose decision shall be final. Pending the result of the reference to the Board, the Bank may, so far as it deems necessary, act on the basis of the decision of the Executive Directors.

(*c*) Whenever a disagreement arises between the Bank and a country which has ceased to be a member, or between the Bank and any member during the permanent suspension of the Bank, such disagreement shall be submitted to arbitration by a tribunal of three arbitrators, one appointed by the Bank, another by the country involved and an umpire who, unless the parties otherwise agree, shall be appointed by the President of the Permanent Court of International Justice or such other authority as may have been prescribed by regulation adopted by the Bank. The umpire shall have full power to settle all questions of procedure in any case where the parties are in disagreement with respect thereto.

Article X. Approval Deemed Given

Whenever the approval of any member is required before any act may be done by the Bank, except in Article VIII, approval shall be deemed to have been given unless the member presents an objection within such reasonable period as the Bank may fix in notifying the member of the proposed act.

Article XI. Final Provisions

SECTION 1. *Entry into force.*—This Agreement shall enter into force when it has been signed on behalf of governments whose minimum subscriptions comprise not less than sixty-five percent of the total subscriptions set forth in Schedule A and when the instruments referred to in Section 2 (*a*) of this Article have been deposited on their behalf, but in no event shall this Agreement enter into force before May 1, 1945.

SEC. 2. *Signature.*—(*a*) Each government on whose behalf this Agreement is signed shall deposit with the Government of the United States of America an instrument setting forth that it has accepted this Agreement in accordance with its law and has taken all steps necessary to enable it to carry out all of its obligations under this Agreement.

(*b*) Each government shall become a member of the Bank as from the date of the deposit on its behalf of the instrument referred to in (*a*) above, except that no government shall become a member before this Agreement enters into force under Section 1 of this Article.

(*c*) The Government of the United States of America shall inform the governments of all countries whose names are set forth in Schedule A, and all governments whose membership is approved in accordance with Article II, Section 1 (*b*), of all signatures of this Agreement and of the deposit of all instruments referred to in (*a*) above.

(*d*) At the time this Agreement is signed on its behalf, each government shall transmit to the Government of the United States of America one one-hundredth of one percent of the price of each share in gold or United States dollars for the purpose of meeting administrative expenses of the Bank. This payment shall be credited on account of the payment to be made in accordance with Article II, Section 8 (*a*). The Government of the United States of America shall hold such funds in a special deposit account and shall transmit them to the Board of Governors of the Bank when the initial meeting has been called under Section 3 of this Article. If this Agreement has not come into force by December 31, 1945, the Government of the United States of America shall return such funds to the governments that transmitted them.

(*e*) This Agreement shall remain open for signature at Washington on behalf of the governments of the countries whose names are set forth in Schedule A until December 31, 1945.

(*f*) After December 31, 1945, this Agreement shall be open for signature on behalf of the government of any country whose membership has been approved in accordance with Article II, Section 1 (*b*).

(*g*) By their signature of this Agreement, all governments accept it both on their own behalf and in respect of all their colonies, overseas territories, all territories under their protection, suzerainty, or authority and all territories in respect of which they exercise a mandate.

(*h*) In the case of governments whose metropolitan territories have been under enemy occupation, the deposit of the instrument referred to in (*a*) above may be delayed until one hundred and eighty days after the date on which these territories have been liberated. If, however, it is not deposited by any such government before the expiration of this period, the signature affixed on behalf of that government shall become void and the portion of its subscription paid under (*d*) above shall be returned to it.

(*i*) Paragraphs (*d*) and (*h*) shall come into force with regard to each signatory government as from the date of its signature.

SEC. 3. *Inauguration of the Bank.*—(*a*) As soon as this Agreement enters into force under Section 1 of this Article, each member shall appoint a governor and the member to whom the largest number of shares is allocated in Schedule A shall call the first meeting of the Board of Governors.

(*b*) At the first meeting of the Board of Governors, arrangements shall be made for the selection of provisional executive directors. The governments of the five countries, to which the largest number of shares are allocated in Schedule A, shall appoint provisional executive directors. If one or more of such governments have not become members, the executive directorships which they would be entitled to fill shall remain vacant until they become members, or until January 1, 1946, whichever is the earlier. Seven provisional executive directors shall be elected in accordance with the provisions of Schedule B and shall remain in office until the date of the first regular election of executive directors which shall be held as soon as practicable after January 1, 1946.

(*c*) The Board of Governors may delegate to the provisional executive directors any powers except those which may not be delegated to the Executive Directors.

(*d*) The Bank shall notify members when it is ready to commence operations.

Done at Washington, in a single copy which shall remain deposited in the archives of the Government of the United States of America, which shall transmit certified copies to all governments whose names are set forth in Schedule A and to all governments whose membership is approved in accordance with Article II, Section 1 (*b*).

Schedule A. Subscriptions

[Millions of dollars]

Australia	200	Iran	24
Belgium	225	Iraq	6
Bolivia	7	Liberia	.5
Brazil	105	Luxembourg	10

[1] The subscription of Denmark shall be determined by the Bank after Denmark accepts membership in accordance with these Articles of Agreement.

Schedule B. Election of Executive Directors

1. The election of the elective executive directors shall be by ballot of the Governors eligible to vote under Article V, Section 4 (*b*).

2. In balloting for the elective executive directors, each governor eligible to vote shall cast for one person all of the votes to which the member appointing him is entitled under Section 3 of Article V. The seven persons receiving the greatest number of votes shall be executive directors, except that no person who receives less than four-

teen percent of the total of the votes which can be cast (eligible votes) shall be considered elected.

3. When seven persons are not elected on the first ballot, a second ballot shall be held in which the person who received the lowest number of votes shall be ineligible for election and in which there shall vote only (*a*) those governors who voted in the first ballot for a person not elected and (*b*) those governors whose votes for a person elected are deemed under 4 below to have raised the votes cast for that person above fifteen percent of the eligible votes.

4. In determining whether the votes cast by a governor are to be deemed to have raised the total of any person above fifteen percent of the eligible votes, the fifteen percent shall be deemed to include first, the votes of the governor casting the largest number of votes for such person, then the votes of the governor casting the next largest number, and so on until fifteen percent is reached.

5. Any governor, part of whose votes must be counted in order to raise the total of any person above fourteen percent, shall be considered as casting all of his votes for such person even if the total votes for such person thereby exceed fifteen percent.

6. If, after the second ballot, seven persons have not been elected, further ballots shall be held on the same principles until seven persons have been elected, provided that after six persons are elected, the seventh may be elected by a simple majority of the remaining votes and shall be deemed to have been elected by all such votes.

COUNTRIES REPRESENTED AND CHAIRMEN OF DELEGATIONS

AUSTRALIA.—Leslie G. Melville, *Economic Adviser to the Commonwealth Bank of Australia.*

BELGIUM.—Camille Gutt, *Minister of Finance and Economic Affairs.*

BOLIVIA.—Rene Ballivian, *Financial Counselor, Bolivian Embassy, Washington.*

**SYNTHESIS PAPER:
NEW WORLD, NEW WORLD BANK GROUP**

Attached for the April 25, 2010, Development Committee Meeting is a background document entitled "Synthesis Paper: New World, New World Bank," prepared by the staff of the World Bank.

* * *

SYNTHESIS PAPER:

NEW WORLD, NEW WORLD BANK GROUP

April 2010

New World, New World Bank Group

After the worst crisis in decades, the world economy faces an uncertain and uneven recovery with new risks to jobs and growth. The crisis response has shown why international cooperation -- and effective multilateral institutions -- matter. Called on to play a historically large role to protect the poor and lay the foundations of recovery, the World Bank Group has risen to the challenge: we have committed over $100 billion since the force of the crisis began.

We also got money where it was needed fast. Even though the World Bank Group has traditionally financed longer-term projects, our actual disbursements have exceeded the IMF's.

Past crises taught us to target this support where it would be most effective: to social safety nets for the most vulnerable; to productive investments in agriculture, infrastructure, and innovation as seeds of future opportunity; and to the private sector as an engine of growth. We launched creative ways to help our clients -- from the food crisis response to the IDA Crisis Response Facility and IFC's special vehicles for trade finance, microfinance, bank capitalization, infrastructure and distressed debt. This support benefited all: the recovery is demonstrating the key role of developing countries in generating new sources of demand. Over time, more and more developing countries can become new poles of growth for the global economy.

At the same time, we have not been diverted from laying the groundwork for new challenges such as combining development and climate change policies, and integrating governance, security, and development to help weak states coming out of conflict.

The crisis shows the possibilities of international cooperation, but it also underscores the need to modernize multilateralism -- and multilateral institutions -- to reflect a changing world. Addressing development challenges now requires institutions that are not only close to people in developing countries, but able to mobilize all key actors -- whether governments, the private sector, or civil society -- to address global threats together and support regional integration within a global system. It requires institutions that are innovative, adaptable, and able to seize new opportunities.

Building on our crisis response, we are putting before you a package of actions and reforms to modernize the World Bank Group. This aims to create a new Bank Group that:

- **Is strategically focused where we can add most value --** With our global reach, we can make a unique contribution to overcoming poverty through advancing inclusive and sustainable globalization, enhancing growth with care for the environment, and creating individual opportunity and hope. We can encourage the benefits of regional integration while avoiding the dangers of regional blocs by connecting regional interests to global goods. Looking ahead, we will focus on five priorities: targeting the poor and vulnerable, especially in Sub-Saharan Africa; creating opportunities for growth; promoting global collective action; strengthening governance; and preparing for crises.

- **Has 21st Century governance --** Voting power for developing and transition countries will increase to about 47.19% in IBRD, 39.48% in IFC, and about 46% in IDA. In the future, IBRD's shareholdings will reflect economic weights, contributions to IDA, and development contributions from the Bank Group's clients moving toward equitable voting power, with a review every five years. We are protecting the voting power of the smallest poor members. And we have created a third Board chair for Sub-Saharan Africa.

  Voice and balance will also be reflected through staffing, senior appointments, a focus on problem solving for clients, country ownership and a wider network of South-South (and South-North) experience, research and practice.

- **Remains financially strong --** We have developed a package that emphasizes mutual responsibility and sharing of interests. For IBRD, developing countries are enabling us to access their paid-in capital and are paying higher prices for loans while reform of loan maturity terms will be discussed in June. Developing and developed countries contribute to a selective capital increase of $27.8 billion of which $1.6 billion would be paid in and a general capital increase of $58.4 billion, of which 6%, or $3.5 billion, would be paid in and fully usable, with the remainder callable.

  We are also seeking to enhance IFC's financial capacity, through a combination of a voice reform connected to a selective capital increase of $200 million; consideration of a long-term hybrid instrument to shareholders (subject to realization of other capital options and Board review of terms and conditions and permitting significant capital treatment); and earnings retention.

  The World Bank Group responded vigorously to the crisis, but this has left us with little capacity to play a supportive role should recovery falter. We must remain capable of addressing new vulnerabilities as they arise. The Bank Group should also play a key role in supporting a sound, broad-based recovery that fosters multilateral cooperation and balanced growth. We are only seeking resources sufficient to allow a return to previous lending levels. We will also persist in exercising budget discipline.

- **Is more responsive, innovative, flexible, and accountable --** We are presenting a package of reforms that, taken together, represent the most ambitious reform agenda undertaken by the Bank Group: modernizing our products and services, fostering opportunities for innovation, and creating a new decentralization model that will enable us to apply cutting-edge skills closer to clients while gathering, customizing and spreading knowledge and experience more effectively. And we are sharpening our focus on results, opening access to our information and processes, and strengthening our governance and anti-corruption efforts.

Each part of the package is significant, and together they represent a dynamic transformation of the Bank Group. The package also has a shared balance. At a time when multilateral cooperation – from trade to climate change is struggling, the Bank Group is working as a cooperative of all its members. Each shareholder gains and all contribute.

Against this background, we ask that you:

- Support our post-crisis direction and reform agenda.
- Endorse the package of agreed reforms to voice and participation as outlined below, including a selective capital increase of $27.8 billion of which $1.6 billion would be paid in.
- Endorse the package for enhancing IBRD's financial capacity as outlined below, including a general capital increase for IBRD of $58.4 billion, of which 6%, or $3.5 billion, would be paid-in and fully usable, with the remainder callable.
- Endorse a package to enhance IFC's voice reform and financial capacity, consisting of an increase in basic votes and a selective capital increase of $200 million to boost developing and transition country ownership; consideration of a long-term hybrid instrument to shareholders (subject to realization of other capital options and Board review of terms and conditions and permitting significant capital treatment); and earnings retention.

Strategically focused where we can add most value

The Bank Group is setting clear priorities, sharpening our comparative advantages, and extending our complementarities with other institutions. As a global institution, we are uniquely positioned to reach across countries and regions to connect with other global actors and help tackle global issues. We bring worldwide catalytic and convening power to global and country problem-solving, along with global best practice services and standards. With world-class risk management and banking services, we can significantly leverage our resources and serve as an incubator for innovations in development financing, such as the Malawi weather derivative or the Caribbean Catastrophic Risk Insurance Facility. We offer a wide range of products and services, with knowledge and expertise gained globally but customized locally.

The core work of the World Bank Group is overcoming poverty and boosting growth; the question is how we can best carry out that mission in a changing world. We have identified five strategic priorities. We will tailor implementation to needs of key client groups: low-income and least developed countries, fragile and conflict-affected states, middle-income countries, and the Arab World—and will factor in gender and good governance as key cross-cutting issues.

- ***Targeting the poor and vulnerable, especially in Sub-Saharan Africa.*** Only five years remain to reach the Millennium Development Goals (MDGs), so we must intensify efforts to reach the poor wherever they are—in middle income countries, low income countries, and especially in Sub-Saharan Africa. We need innovative and targeted approaches to get the most "bang for the buck" from available resources. We need approaches that contribute to several goals at once and tap the innovation and capability of the private sector. And we must address the particular vulnerabilities of women and children and the special challenges facing the "bottom billion" living in fragile and conflict-affected states.

- ***Creating opportunities for growth.*** Sustained growth is the most robust and durable path out of poverty. Across our public and private sector arms, we will support developing countries with investments in agriculture, infrastructure, innovation and human capital. We will work to improve business environments and public spending, to build markets and invest in firms, and to foster growth that creates jobs and opportunities for all.

- ***Promoting global collective action.*** We will bring global connectivity, financial leverage and innovation, and world-class analysis and advocacy to global issues from climate change and trade, to agriculture and food security, energy, water, and health.

- ***Strengthening governance.*** We will help countries to place good governance at the heart of development programs and projects. Successful development requires local ownership, which depends in turn on governance and capacity. Corruption is a criminal waste of resources, and has a corrosive effect on public trust in government and institutions. We will assist countries to prevent and fight corruption, and will hold ourselves to the highest standards. We will help countries build open institutions for sound management of public resources, and service delivery. We will be an agent of change on governance: recovering stolen assets (StAR), preventing illegal tax havens, and managing revenues of extractive industries (EITI++).

- ***Preparing for crises.*** Countries need to lay the groundwork for crisis response before it is needed. We are developing new assessment, risk-sharing, financial, and policy tools to help countries better manage crises**.**

Within these five priorities, we will continually assess where we can have the most impact. For example, as other players have become more active in financing for priority diseases, the Bank Group is increasingly focusing on strengthening health systems. We will be selective, but our diverse client base and the interconnections of development challenges require a range of capabilities and actions. Past examples where the Bank has withdrawn – infrastructure, agriculture, or the financial sector – are now recognized as costly mistakes.

We are also ramping up our cooperation with other international organizations, stepping back where others have clear comparative advantage, leading where we are well placed to do so, and working together to solve problems. And we are using our expertise and balance sheet to partner with others to implement innovative solutions to development problems — such as creating market incentives to develop medical treatments (Advance Market Commitment for pneumococcal diseases) or new ways to finance vaccination (the International Finance Facility for Immunization).

We are bringing this same spirit of innovation and partnership to the replenishment of IDA16, set for later this year. This will be the last full replenishment before the 2015 MDG deadline. IDA resources remain essential to combating poverty in the poorest countries. We will be seeking the cooperation of all donors in this effort. We are also considering how to strengthen IDA's finances and long-term sustainability. We look forward to discussing these issues with you in the coming months.

21st Century governance

Voice and participation

A modernized WBG must represent the international economic realities of the early 21st Century. The first phase of voice reforms, completed a year ago, increased the voting power of developing and transition countries in IBRD to 44.06% and created a third chair on the Board for Sub-Saharan Africa. Part II country voting power was also increased in IDA, as countries took up allocated but unsubscribed shares. A donor trust fund assisted some IDA countries to take up their remaining shares. Shareholders also committed themselves to an ambitious second phase of reform by spring 2010.

In this second phase, we are significantly increasing developing and transition country voice across the Group, with the share in IBRD increasing to 47.19%. This realignment strengthens our ability to continue to support the smallest poor members, and demonstrates that a greater say for emerging and developing countries brings with it greater responsibility for the financial soundness of the Bank Group. It represents a balance of interests across shareholders with the aim of moving to equitable voting power in the World Bank over time.

For the 2010 IBRD selective capital increase only, realignment would be based on: economic weight calculated on the basis of a GDP blend; contributions to IDA, and development contributions from the Bank Group's clients, with measures to protect the voting power of the smallest poor members.

- ***Increasing developing and transition country voting power in 2010 to enhance legitimacy and effectiveness:***

    a. IBRD: an increase in voting power of 3.13%, bringing developing and transition country voting power to 47.19% — together the 2008 and 2010 reforms will increase it by 4.59%.

    b. IFC: an increase in developing and transition country voting power from the current 33.4% to 39.48%, through an increase in basic votes (to 5.55% from the current 250 per shareholder) and a selective capital increase.

    c. IDA: bringing the voting share of Part II countries to about 46%,

    d. MIGA: maintaining parity between developed and developing members.

- ***Dynamism:*** IBRD shareholding would be reviewed every five years to allow for changes based on the continuing economic growth and evolution of our members as well as contributions to IDA. IFC would similarly review shareholding every five years.

- ***Future IBRD Shareholding Formula:*** For the next shareholding review in 2015, shareholders will establish a work program and a roadmap to arrive at a benchmark for a dynamic formula, reflecting the principles agreed at the October 2009 Development Committee meeting in Istanbul, moving over time towards equitable voting power and protecting the voting power of the smallest poor countries.

Internal governance reform

Led by the Board, we are also working to enhance transparency and accountability of World Bank Group governance to support our overall program of reform and renewal. We are working closely with the Board on an agenda of issues for shareholder decision. These include freeing time for more strategic board discussions through conditional project approvals, clarifying the relationship between the board and management through a review of policy waivers and delegation of authority, and sharpening board oversight through a review of oversight units and enhanced performance reporting. The Board's work will further clarify the relationships among shareholders, the Board, and management to enhance stewardship of the institution and strengthen overall Bank Group corporate governance. Shareholders have reiterated the importance of an open, merit-based and transparent process for the selection of the World Bank President. The Board will put forward proposals for strengthening corporate governance and accountability for the WBG at the 2010 Annual Meetings.

Remaining financially strong

The Bank Group has provided over $100 billion in support since July 2008. Going into the crisis, we were well-capitalized, thanks to prudent policies and financial management, and could respond effectively to clients' needs. But the recovery remains fragile and uneven across regions. Should it falter in 2010 or 2011, we will not have the capacity to respond as we did in the past. We also need to be in a position to contribute to opportunities to boost global growth. To meet these needs, we have developed a package that emphasizes mutual responsibility and sharing of interests.

For the IBRD, we are seeking resources that are sufficient to return to our lending levels before the crisis. The package includes contributions from developing and developed countries through a general price increase last summer; reform of loan maturity terms to be discussed in June; releases of national currency paid-in capital; a selective capital increase from the voice reforms of $27.8 billion of which $1.6 billion would be paid in; and our first general capital increase for 20 years. We are proposing a general capital increase of $58.4 billion, of which 6%, or $3.5 billion, would be paid in and fully usable, with the remainder callable. The general capital increase would be agreed with the clear understanding that if it is no longer needed to back lending in the future, it will be redirected to other purposes as decided by shareholders, with strong consideration given to IDA transfers to support the poorest countries.

Budget discipline is also a key element of the package. Among the major international financial institutions, we have one of the slowest growing budgets, effectively flat in real terms since 1999, even while lending at record levels in fiscal 2009. The IMF budget, for example, has grown at twice the rate of the Bank's over the last decade. Going forward, we are determined to build on past efforts and to continue to maintain tight budget discipline.

We have also boosted our financial capacity by getting the most from our capital base. This includes an almost five-to-one leveraging of our capital which is considerably higher than the regional development banks; allowing reasonable flexibility in our equity-loan ratio relative to the strategic capital adequacy range; introducing a new exposure management framework to make the most efficient use of existing capital; and actively working with shareholders to release their national currency paid-in capital. The almost five-to-one leveraging of our balance sheet and the participation of other shareholders significantly multiplies any shareholder's investment: the investment of a country with a 5% share is multiplied one-hundred fold in its impact for development.

These actions allow us to make optimal use of our balance sheet to respond to the crisis, while remaining consistent with prudent financial management -- a key factor in our AAA rating. And in line with this prudent approach, we are further strengthening our financial model by synchronizing the annual deliberations on budget, pricing, and income allocations to ensure the financial sustainability of income transfers and formulating principles to link loan pricing to cost coverage.

We are also proposing to increase IFC's capital to allow us to increase financing for the private sector in the IDA countries, especially poor and risky markets; to restore financial flexibility; and to enable future growth and further mobilization of outside investors. We are proposing a package of options including a voice reform to boost developing and transition country ownership through an increase in basic votes and a selective capital increase of $200 million; consideration of a long-term hybrid instrument to shareholders (subject to realization of other capital options and Board review of terms and conditions and permitting significant capital treatment); and earnings retention.

A selective capital increase, achieved in the context of the Voice discussions, would generate usable resources. The hybrid instrument issuance would both raise capital and provide an innovative financing source for IFC, multiplying flexibility and capital-raising alternatives. This experience might be useful to other IFIs. IFC also has earnings that can build capital over time. Some shareholders have suggested that, especially given the volatility of IFC's private sector and equity earnings, IFC's policies on retained earnings should offer it flexibility to build capital internally.

Despite the constraints on IFC's capital, we have delivered more by increasing efficiency and effectiveness, keeping expenses below budget, focusing on development impact, and leading in results measurement. To enhance IFC's capital position, we have also divested mature equity investments and realized capital gains as development objectives were reached and market opportunities permitted. IFC will continue to focus on its equity strategy to further strengthen capital regeneration while optimizing capital use.

Becoming more responsive, innovative, flexible, and accountable

Our series of reforms, taken together, represents the most comprehensive reform agenda undertaken by the Bank Group. Our goal is to deliver a customized package of top quality global knowledge and financial services in real time to a growing range of clients—poor countries, fragile and small states, middle-income countries, and the private sector. Reforms encompass IBRD/IDA, the IFC, and MIGA, and while the specifics differ among the three institutions, the drivers of reform -- the need to get closer to the client, to enhance our financial services, and to better gather and disseminate knowledge and expertise -- are the same. Our four mutually reinforcing initiatives will modernize our services; enhance service delivery; speed-up processes, track results; and sustain our high fiduciary standards.

Modernizing services

Earlier reforms across the Bank Group enabled us to provide timely and record assistance to our clients. We are now overhauling Bank investment lending to focus on results, increase our speed and delivery, improve risk management, and better align our services with government priorities and partners in the field. We are also reviewing our instruments for clients, including consolidating our expanding trust fund portfolio. IFC is improving its business processes, while MIGA is modernizing its Convention.

We are also enhancing our knowledge services. This is critical for development as experiences in one country -- such as conditional cash transfers in Mexico -- can be shared with and tailored for others. The World Bank has been relatively good at sharing knowledge within regions. It must do a better job at this globally. We must ensure that we create incentives for capturing, sharing, and disseminating knowledge quickly to our staff and clients. To achieve this, a World

Bank Knowledge Strategy is revitalizing our knowledge products, strengthening our technical teams, and adding outside expertise.

The IFC has created practice groups across industry, regional, and service departments, using knowledge-sharing tools and social media to foster virtual teams. MIGA is working with the Berne Union of public political risk insurers on state of the art industry research.

Enhancing service delivery

We need to promote greater connectivity, more staff mobility, clearer accountabilities, and seamless knowledge flows. To do this, at both the Bank and IFC we are refreshing our matrix structure, clarifying roles, accountabilities, and reporting lines. We also need to reengineer our decentralization model. More than 5,000 Bank Group staff are already in the field. In the short term, we will strengthen our field presence in low-income and fragile states by moving more task management to country offices and adding country directors. But the current model of decentralization appears to have run its course. We need to combine close-to-the-client service, the ability for the client to tap top-flight global expertise quickly and easily, and strong central capabilities to guide a unified effort. In the medium to long term, therefore, we are considering an adjusted decentralized structure, perhaps through a combination of hubs, of varying size and capabilities, to complement country offices and with global-quality services.

Supporting reform

Human resource, information technology, and budget processes and policies need to keep up.

- ***Human resource*** reforms seek to recruit and retain the right diverse talent, foster career development, and enable greater flexibility and mobility, moving over time to a new global human resource framework. Promoting staff diversity will reflect better the global nature of the WBG.

- ***Information management and technology:*** a new three-year strategy supports our reform initiatives. It includes new platforms to support cooperation and knowledge, new systems for document search and retrieval, and improved connectivity for country offices and staff.

- ***Budget processes*** are being reformed to (i) strengthen the links among our priorities, results and budget allocations, (ii) expand planning and budget discussions to trust funds and other revenues (iii) and streamline and simplify budgeting, planning and performance systems, while continuing to focus on cost efficiency.

Getting results and maintaining standards

Demonstrating results is central to our credibility. To measure and track development effectiveness, we are:

- Strengthening results frameworks for all strategies and operations;

- Expanding core indicators to measure our outputs; and

- Building a results framework for tracking progress on reforms and transforming it into a corporate scorecard. The IFC already has the Development Outcomes Tracking System, considered best practice among multilateral development banks.

As we reform, we must also maintain our high fiduciary and other standards.

- In addition to beefing up IDA controls, the Board is working with us on an independent review of **oversight units** to strengthen them and remove redundancies.

- We are moving forward on **Governance and Anti-Corruption**, fully implementing the Volcker Panel recommendations and putting in place strengthened sanctions, including cross-debarment with other multilateral development banks. We are incorporating "lessons learned" into prevention planning and exploring new ways to promote accountability by corporations with which we work.

- We are developing an **integrated risk management** framework, to be reported on annually and overseen by a Chief Risk Officer.

- Finally, our new **Access to Information** policy, effective on July 1, 2010, puts us in the forefront of all U.N. and multilateral institutions by granting access to all information in the Bank's possession, other than narrowly defined exceptions.

To make sure we are achieving our vision, we will establish a Secretariat in the Bank headed by a Director to monitor, advise and report on internal reforms (timing of reforms is at Annex 1) reporting to Senior Management. An IFC Director of Change Management will oversee implementation of the IFC 2013 strategy.

Conclusion

Individually, these are transformational changes. In combination, they will modernize multilateralism in the World Bank Group. Together, they balance cooperation, dynamism and effectiveness – so that all shareholders can both benefit from and contribute to this vital multilateral institution and its mission.

Given the pace and scope of change globally, regionally, and within countries, the reforms and resources of this modernized World Bank Group cannot be static. We must continue to anticipate, reach out, listen to feedback loops, and determine how to adjust. Reforms are a process, not a conclusion.

Nevertheless, the changes underway position the World Bank Group very well to assist developing countries – and the world economy – as we move out of this crisis towards a new possibility of multiple poles of growth and opportunity. Now we need shareholder support and action.

Annex 1: Timeline for Deliverables

Reform	End Fiscal Year 2010	End Calendar Year 2010	End Fiscal Year 2011
Reforming loan maturity terms	• Bring proposal for restoration of loan maturity limits to the level before 2008 while offering borrowers the option to extend the maturity with a premium to provide augmentation of $1.2 billion of capital by FY19.		
Releasing existing NCPIC	• Work intensively with shareholders holding unreleased NCPIC to release as much as possible as soon as possible.		
Synchronizing year-end financial discussions	• Synchronize year-end discussions on budget, pricing and net income. • Discuss a sustainable financial model that unifies budget, pricing and net income decisions. • Develop pricing principles that link loan pricing to lending-related cost coverage, and consider expected losses. • Develop proposal for net income allocation principles that, subject to Board decision, place a priority on IDA transfers – after ensuring		

	adequate transfers to reserves – that would: • Support IDA transfers at a flat real level until the IBRD returns to the lower end of the capital adequacy range, currently 23%. • Allow for modest growth in IDA transfers when the E/L is within the capital adequacy range, currently between 23-27%. • Link the income allocation principles to the contingent-out mechanism where, subject to future Board decision, redirection of the GCI resources, with strong consideration to IDA transfers, would start after IBRD's E/L ratio has reached the upper bound of its capital adequacy range, currently 27%, and with a review to determine timing of the redirection taking place once IBRD reaches the middle of its capital adequacy range, currently 25%.		
Modernizing services	• Fully roll out operational risk assessment framework, new model of implementation support, and remodeled reporting framework • Establish Knowledge Council • Update Trust Fund Management Framework	• Revise and consolidate policies and procedures for investment lending • Expand to 12 the number of specified teams of global experts on high priority topics	• Agree on new results-based investment lending option • Finalize reform proposals for analytical and advisory activities

Enhancing service delivery	• Strengthen field presence in low-income and fragile-states, especially Africa, by moving more task management to the field • Increase number of country directors in Africa • Establish accountability framework for Bank operations • Establish matrix leadership team	• Identify "early movers" to gain implementation experience for new decentralization model on a small scale, including establishment of at least one subregional hub in Africa to serve fragile states • Increase cross support by high-end staff and monitor implementation • Launch IFC (i) new industry groups and (ii) Istanbul operating center	• Approve new decentralization approach, including a phased and costed transition and implementation plan to commence in FY12 • Implement organizational plan to rationalize sector managers' span of control • Establish framework for network accountability including for knowledge
Enabling systems	• Consolidate discussion of net income allocations, pricing, and budget • Institute annual corporate review of managerial bench strength • Launch Information Management Technology strategy for integration and standardization • Implement WBG Dashboard for decision support • IFC roadmap for IFC 2013 recommendations and budget proposals, including cost implications of IFC 2013	• Operationalize Corporate Scorecard • Implement new recruitment process aimed at reducing cycle time • Expand use of clustered recruitment • Enhance control and knowledge transfer through implementation of new document retrieval and search system • Launch new IFC performance management cycle	• Finalize new compensation and benefits framework for approval

Transparency, accountability, and results	• Implement Access to Information policy • Establish external appeals committee for access to information policy • Establish secretariat to monitor, advise and report on internal reforms • Put in place sanctions reform, including cross-debarment • Develop and report on core indicators in four sectors for IDA	•Complete IDA controls effort • Conduct an independent review of oversight units agreed with the Board • Appoint a World Bank Group Chief Risk Officer, who will annually publish an integrated Risk Monitoring Report • Complete first Annual Results Report • Proposals for strengthening corporate governance and accountability (2010 Annual Meetings).	• Implement fully the Results Agenda by establishing corporate-level reporting framework and issuing annual results reports. Expand number of sectors with core indicators to seven

THE WORLD BANK
IBRD • IDA

SECTION I – PURPOSE AND APPLICATION

1. This Policy governs the public accessibility of information in the Bank's possession. This document reflects revisions approved by the Board on April 3, 2013, and June 30, 2015, and supersedes the *World Bank Policy on Access to Information, July 1, 2013.*

2. This Policy applies to the Bank.

SECTION II – DEFINITIONS

As used in this Policy, the following terms have the meanings set forth below:

1. ***AI***: access to information.

2. ***AI Committee***: Access to Information Committee established by the Policy.

3. ***AMS***: Administrative Manual Statement of the World Bank Group.

4. ***Appeals Board***: Appeals Board established by the Policy.

5. ***Archives Unit***: the archives unit of the World Bank Group.

6. ***Articles of Agreement of IBRD***: the charter that governs IBRD.

7. ***Articles of Agreement of IDA***: the charter that governs IDA.

8. ***Attorney-Client Privilege***: the exception set forth in section III.B.2(d) of this Policy.

9. ***Bank***: see definition for World Bank.

10. ***Board***: the board of Executive Directors of IBRD and IDA.

11. ***Board Committee***: a committee of the Board.

12. ***Board of Governors***: the body with which all powers of the Bank are vested, pursuant to the respective Articles of Agreement of IBRD and of IDA.

13. ***Board of Governors Documents***: documents that are specifically prepared by staff for (a) discussion or consideration (decision) by the Board of Governors, (b) discussion by the Board of Governors committees, task forces, working groups and other bodies created under the auspices of the committee or of the Board of Governors, or (c) information for the Board of Governors or the Board of Governors committees, task forces, working groups and other bodies created under their auspices.

14. ***Board of Governors Documents and Records***: collectively, the Board of Governors Documents and the Board of Governors Records.

15. ***Board of Governors Records***: records of the discussions of the Board of Governors or of the Board of Governors committees, task forces, working groups and other bodies created under the auspices of the committee or of the Board of Governors, such as summary proceedings, statements and speeches of Governors and World Bank management, verbatim transcripts and minutes.

16. ***Board Papers***: documents that are specifically prepared by staff for (a) discussion or consideration (decision) by the Board, (b) discussion by a Board Committee, or (c) information to the Board or a Board Committee.

17. ***Board Records***: records of Board or Board Committee discussions such as verbatim transcripts, minutes, statements of Executive Directors, Chairman's Summings-up, Summaries of Discussions and Chair Summaries.

18. ***Borrowers***: borrowers of Bank financing and, for the purpose of this Policy, the term includes credit and grant recipients and guarantors of such Bank financing.

19. ***CAS***: see definition for Country Assistance Strategy.

20. ***CAS Completion Report***: completion report prepared near the end of a CAS cycle.

21. ***CAS Progress Report***: progress report of a CAS.

22. ***Chair Summaries***: single category of Board Records that replace Chairman's Summings-up and Summaries of Discussions beginning July 1, 2013.

23. ***Chairman's Concluding Remarks***: written statements, prepared until June 30, 2010, that reflected discussions by the Board on major issues concerning matters such as country assistance strategies, transitional support strategies, and interim strategy notes.

24. ***Chairman's Summings-up*** or ***Summings-up***: brief statement that summarizes the conclusions of the chair of the Board, or of the Committee of the Whole, concerning policy, strategy and other important topical issues discussed by the Board or the Committee of the Whole.

25. ***Code of Conduct for Board Officials***: the code of conduct adopted by the Board for IBRD, IFC, IDA and MIGA for Board Officials (as the term is defined in the document) to set forth principles and ethical standards for Board officials in connection with, or having bearing on, their status and responsibilities to these organizations.

26. ***Committee of the Whole***: a Board committee made up of all Executive Directors, and whose role is to make recommendations or exchange views on matters of interest to the Board.

27. ***Communications of Governors and/or Executive Directors' Offices***: the exception set forth in section III.B.2(b) of this Policy.

28. ***Confidential***: the definition for this term as set forth in AMS 6.21A, *Information Classification and Control Policy*.

29. ***Corporate Administrative Matters***: the exception set forth in section III.B.2(h) of this Policy.

30. ***Country Assistance Strategy***: country assistance strategy that provides the framework for Bank assistance to a given country over a period of time.

31. ***Country Portfolio Performance Review*** or ***CPPR***: reviews prepared pursuant to OP/BP 13.16, *Country Portfolio Performance Reviews.*

32. ***CPIA***: Country Policy and Institutional Assessment.

33. ***CPPR***: See definition for Country Portfolio Performance Review.

34. ***Deliberative Information***: the exception set forth in section III.B.2(i) of this Policy.

35. ***Development Policy Financing*** or ***DPF***: development policy financing (formerly referred to as "Development Policy Operations" or "DPO") as the term is defined in OP 8.60, *Development Policy Financing*.

36. ***Development Policy Operations*** or ***DPO***: see definition for Development Policy Financing.

37. ***Directive/Procedure***: *Bank Directive/Procedure: Access to Information*, July 1, 2015, Catalogue No. ECR4.01-DIR.01.

38. ***DPF***: see definition for Development Policy Financing.

39. ***DPO***: see definition for Development Policy Operations.

40. ***Economic and Sector Work***: work that provides the basis for the Bank's diagnosis of a given country's development prospects.

41. ***Ethics Committee***: the committee, established pursuant the Code of Conduct for Board Officials, that considers matters relating to the interpretation or application of that document; and for the purposes of this Policy, the term also means the exception set forth in section III.B.2(c) of this Policy.

42. ***Executive Directors***: persons elected or appointed as executive directors of the World Bank to be responsible for the conduct of the general operations of the Bank and exercise all the powers delegated to them by the Board of Governors pursuant to the respective Articles of Agreement of IBRD and of IDA.

43. ***Factual Technical Documents***: documents that underpin project preparation.

44. ***Financial Information***: the exception set forth in section III.B.2(j) of this Policy.

45. ***Financial Sector Assessment Program*** or ***FSAP***: a joint program of the Fund and World Bank that provides a comprehensive framework through which assessors and authorities in participating countries can identify financial system vulnerabilities and develop appropriate policy responses.

46. ***FSAP***: see definition for Financial Sector Assessment Program.

47. ***Fund***: International Monetary Fund.

48. ***General Counsel***: World Bank Group General Counsel.

49. ***Green Sheets***: reports to the Board from Board Committees.

50. ***Governors***: the governors of the Board of Governors.

51. ***Heavily Indebted Poor Country (HIPC) Initiative***: initiative aimed at reducing the external debt stock of heavily indebted poor countries to sustainable levels.

52. ***HIPC***: see definition for Heavily Indebted Poor Country.

53. ***IAD***: Internal Audit vice presidency of the World Bank Group.

54. ***ICSID***: International Centre for Settlement of Investment Disputes.

55. ***IBRD***: International Bank for Reconstruction and Development.

56. ***ICR***: see definition for Implementation Completion and Results Report.

57. ***IDA***: International Development Association.

58. ***IEG***: Independent Evaluation Group.

59. ***IFC***: International Finance Corporation.

60. ***IMF***: International Monetary Fund.

61. ***Implementation Completion and Results Report*** or ***ICR***: report that assesses an operation upon completion.

62. ***Information***: documents of any type (e.g., paper, electronic, photograph, film, sound recordings, videotapes) prepared or received by the Bank in the course of its official business.

63. ***Information Provided by Member Countries or Third Parties in Confidence***: the exception set forth in section III.B.2(g) of this Policy.

64. ***Information Restricted Under Separate Disclosure Regimes and Other Investigative Information***: the exception set forth in section III.B.2(f) of this Policy.

65. ***Inspection Panel***: the panel established pursuant to Resolution IBRD 93–10 and Resolution IDA 93–6, dated September 22, 1993.

66. ***INT***: Integrity vice presidency of the World Bank.

67. ***Integrated Safeguards Data Sheet***: document setting forth a project's basic information, and identifies key issues under the Bank's safeguards policies, including environmental and social issues, and provides relevant information concerning their management in the proposed operation.

68. ***Interim Strategy Note***: document prepared for countries that are in transition from conflict or political crisis, countries going through an unusually uncertain period, and countries where the Bank is reengaging after a prolonged hiatus.

69. ***IP***: Inspection Panel.

70. ***Joint Staff Advisory Notes on PSRP***: document prepared by IDA and Fund staff as feedback to the country and to the Boards of the World Bank and the Fund on priority areas for strengthening the poverty reduction strategy and its implementation.

71. ***Letter of Development Policy***: a borrower's document setting forth the program of actions, objectives and policies to be supported by a DPF.

72. ***Loans***: World Bank loans, which for the purpose of this Policy may include IDA credits and grants, grants made out of the Bank's net income and administrative budget, and trust fund grants.

73. ***Loan Agreement***: an agreement between the Bank and a borrower providing for a Loan.

74. ***Managing Director***: a managing director of the World Bank

75. ***Memoranda of the President or MOP***: the President's memoranda to the Board.

76. ***MIGA***: Multilateral Investment Guarantee Agency.

77. ***Monthly Loan and Credit Statement***: monthly statements of all Bank loans and credits.

78. ***Monthly Operational Summary*** or ***MOS***: monthly report on the status of each lending operation under preparation for Bank financing.

79. ***MOP***: see definition for Memoranda of the President.

80. ***MOS***: see definition for Monthly Operational Summary.

81. ***Note on Cancelled Operations***: a note prepared for an operation that fails to become effective or is cancelled before significant implementation is initiated.

82. ***Official Use Only***: the definition set forth in AMS 6.21A, *Information Classification and Control Policy*, for this term.

83. ***OP/BP***: Operational policy and Bank procedure for Bank operations.

84. ***Personal Information***: the exception set forth in section III.B.2(a) of this Policy.

85. ***Policy***: *Bank Policy: Access to Information*, July 1, 2015, Catalogue No. EXC4.01-POL.01.

86. ***PowerPoint***: a Microsoft slide-based presentation program.

87. ***Poverty Reduction Strategy Paper*** or ***PRSP***: paper setting forth the framework for poverty reduction in a country.

88. ***President***: President of the World Bank Group.

89. ***Principles of Staff Employment***: the general conditions and terms of employment set out in the Staff Manual.

90. ***Procurement Plan***: borrower's procurement plan prepared in accordance with the *Guidelines: Procurement of Goods, Works, and Non-Consulting Services under IBRD Loans and IDA Credits & Grants by World Bank Borrowers.*

91. ***Program Document***: document that describes a DPF and sets forth the Bank's appraisal and assessment of the feasibility of, and justification for, the program to be supported by the Bank.

92. ***Project***: the project described in a Loan Agreement, for which the Loan is extended.

93. ***Project Appraisal Document***: document that describes a project and sets forth the Bank's appraisal and assessment of the feasibility of, and justification for, the project.

94. ***PRSP***: see definition for Poverty Reduction Strategy Paper.

95. ***QAG***: Quality Assurance Group.

96. ***Resolution***: resolution of the Board.

97. ***Restricted information***: information that falls under one or more of the exceptions set forth in this Policy and information to which the World Bank's prerogative to restrict has been applied.

98. ***Sanctions Board***: the World Bank Group Sanctions Board.

99. ***Sanctions Board Statute***: the statute governing the Sanctions Board.

100. ***Sanctions Board Procedures***: the World Bank procedures to be followed in cases involving sanctionable practices as defined in the procedures.

101. ***Security and Safety***: the exception set forth in section III.B.2(e) of this Policy.

102. ***Sector Strategy Paper*** or ***SSP***: paper which reviews the Bank's experience in a given sector and sets forth the Bank's strategy for future work in the sector.

103. ***SOPE***: see definition for Status of Projects in Execution.

104. ***SSP***: see definition for Sector Strategy Paper.

105. ***Staff Appraisal Report***: document that preceded the Project Appraisal Document.

106. ***Staff Manual***: the manual that sets forth the Principles of Staff Employment and Staff Rules for World Bank staff.

107. ***Staff Rules***: the rules set forth in the Staff Manual.

108. ***Status of Projects in Execution*** or ***SOPE***: annual report to the Board on the implementation status of projects in execution.

109. ***Strictly Confidential***: the definition for this term as set forth in AMS 6.21A, *Information Classification and Control Policy*.

110. ***Summary of Discussion***: a summary of discussion concerning certain items discussed at a meeting of the Board that does not attribute the views of individual Executive Directors.

111. ***Third party***: any individual, group of individuals, organization, or other entity that provides information to the Bank.

112. ***Tranche Release Document***: document prepared for each tranche of a multi-tranche DPF that reports on the status of the program being supported under the DPF.

113. ***Treasury***: the Treasury vice presidency of the World Bank.

114. ***UCS***: use of country systems.

115. ***WBG***: see definition for World Bank Group.

116. ***World Bank*** or ***Bank***: collectively IBRD and IDA.

117. ***World Bank Group*** or ***WBG***: collectively IBRD, IDA, IFC, ICSID and MIGA.

Section III – Scope

A. GUIDING PRINCIPLES

1. This Policy is based on five principles:

- Maximizing access to information;
- Setting out a clear list of exceptions;
- Safeguarding the deliberative process;
- Providing clear procedures for making information available; and
- Recognizing requesters' right to an appeals process.

B. THE POLICY

1. The Bank allows access to any information in its possession that is not on a list of exceptions (set forth in section III.B.2 of this Policy). In addition, over time the Bank declassifies and makes publicly available certain information that falls under the exceptions (as explained in section III.B.6 of this Policy).[1] Notwithstanding the broad intent of this Policy, the Bank reserves the right, under exceptional circumstances, to disclose certain information covered by the list of exceptions, or to restrict access to information that it normally discloses (as explained in section IV of this Policy).

2. **The Exceptions.** The Bank does not provide access to information whose disclosure could cause harm to specific parties or interests. Accordingly, the Bank does not provide access to documents that contain or refer to the information listed in subparagraphs (a) through (j) below.

(a) ***Personal Information***. The Bank's Principles of Staff Employment require the Bank to establish and maintain appropriate safeguards to respect the personal privacy of staff members and protect the confidentiality of personal information about them. Accordingly, the Bank does not provide access to the following information, except to the extent expressly permitted by the Staff Rules:

i. Personal information, including personal staff records, medical information, and personal communications (including e-mail)[2] of the following individuals and their families: Executive Directors, their alternates, and their senior advisers; the President of the Bank; other Bank officials; and Bank staff.

---

[1] For the purpose of this Policy, the terms "disclose," "provide access," and "make publicly available" (and their variants) are used interchangeably.

[2] *See* Policy at section III.B.5(c).

ii. Information relating to staff appointment and selection processes.

iii. Information relating to proceedings of the Bank's internal conflict resolution mechanisms.

iv. Information relating to investigations of allegations of staff misconduct and personal conflicts of interest.

(b) ***Communications of Governors and/or Executive Directors' Offices.*** The Bank does not provide access to:

i. Communications within and between individual Governors and/or Executive Directors' offices.

ii. Communications between individual Governors and/or Executive Directors' offices and the member country or countries they represent.

iii. Communications between individual Governors and/or Executive Directors' offices and third parties.

(c) ***Ethics Committee.*** The Bank does not provide access to proceedings of the Ethics Committee for Board officials (unless the Executive Directors initiate a decision to disclose such information).

(d) ***Attorney-Client Privilege.*** The Bank does not provide access to information subject to attorney-client privilege, including, among other things, communications provided and/or received by the General Counsel, in-house Bank counsel, and other legal advisors.

(e) ***Security and Safety.*** The Bank does not provide access to:

i. Information whose disclosure would compromise the security of Bank staff and their families, contractors, other individuals, and Bank assets.

ii. Information about logistical and transport arrangements related to the Bank's shipments of its assets and documents and the shipment of staff's personal effects.

iii. Information whose disclosure is likely to endanger the life, health, or safety of any individual, or the environment.

(f) ***Information Restricted Under Separate Disclosure Regimes and Other Investigative Information.*** The Bank does not provide access to information whose disclosure is restricted under the separate disclosure regimes of IEG,[3]

[3] *See* Access to Information Policy for the Independent Evaluation Group.

IP,[4] INT,[5] and the Bank's sanctions process.[6] The Bank also does not provide access to any other information that would prejudice an investigation that is not addressed under such separate disclosure regimes.

(g) ***Information Provided by Member Countries or Third Parties in Confidence.*** The Bank has an obligation to protect information that it receives in confidence. Thus, the Bank does not provide access to information provided to it by a member country or a third party on the understanding of confidentiality, without the express permission of that member country or third party.[7]

(h) ***Corporate Administrative Matters.*** The Bank does not provide access to information relating to the Bank's corporate administrative matters, including, but not limited to, corporate expenses, procurement, real estate, and other activities.

(i) ***Deliberative Information.*** The Bank, like any institution or group, needs space to consider and debate, away from public scrutiny. It generally operates by consensus, and it needs room to develop that consensus. During the process it seeks, and takes into account, the input of many stakeholders; but it must preserve the integrity of its deliberative processes by facilitating and safeguarding the free and candid exchange of ideas. Therefore, while the Bank makes publicly available the decisions, results, and agreements that result from its deliberative processes, it does not provide access to the following information:[8]

i. Information (including e-mail, notes, letters, memoranda, draft reports, or other documents) prepared for, or exchanged during the course of,

---

[4] *See* Resolution No. IBRD 93-10, No. IDA 93-6, September 1993 (Resolution) establishing the Inspection Panel, and subsequent clarifications to the Resolution (i.e., *Review of the Resolution Establishing the Inspection Panel: 1996 Clarification of Certain Aspects of the Inspection Panel;* and *1999 Clarification of the Board's Second Review of the Inspection Panel)*, all available on the Inspection Panel website.

[5] This includes information gathered, received, or generated by INT in connection with or related to inquiries, investigations, audits, or any other types of INT reviews, programs, products, or outputs, as well as any other information gathered, received, or generated by INT on a confidential basis.

[6] This includes information whose disclosure is restricted under the *Sanctions Board Statute* and the *Sanctions Procedures*.

[7] When a member country or a third party provides financial, business, proprietary, or other non-public information to the Bank with the understanding that it will not be disclosed, the Bank treats the information accordingly. Material held by the Bank in which other parties hold the copyright may be made available for review, but copying or distributing such material is limited to respect the rights of the copyright holder. See also relevant discussion in section III.B.3 of the Directive/Procedure.

[8] Certain deliberative information is eligible for declassification and disclosure over time, as indicated in section III.B.6 of this Policy.

its deliberations with member countries or other entities with which the Bank cooperates.[9]

ii. Information (including e-mail, notes, letters, memoranda, draft reports or other documents) prepared for, or exchanged during the course of, its own internal deliberations, including the following documents pertaining to Board of Governors and Board deliberations:

(A) Verbatim transcripts of meetings of the Boards of Governors and their committees, task forces, working groups and other bodies created under their auspices.

(B) Verbatim transcripts of Board meetings and Board Committee meetings, and the Memoranda of the President that accompany Board Papers.

(C) Statements of Executive Directors and staff in the context of Board meetings or Board Committee meetings.

(D) Reports to the Board from its Committees (Green Sheets) if subsequent Board discussion is expected.[10]

(E) Communications and memoranda originating in Executive Directors' offices relating to Board or Board Committee proceedings.

(F) Miscellaneous memoranda or informal notes distributed to the full Board or to a Board Committee.[11]

iii. Statistics prepared, or analyses carried out, solely to inform the Bank's internal decision-making processes (such as analyses of country creditworthiness, credit ratings, and risk, the write-ups underpinning the Country Policy and Institutional Assessment (CPIA) for IBRD and IDA borrowers, and the CPIA ratings for IBRD borrowers).

[9] This includes financial sector stress tests, the aide-mémoire following Bank-Fund financial sector assessments under the Financial Sector Assessment Program (FSAP), the report following the Bank's assessment of government debt management capacity, other technical advisory reports requested by member countries from Treasury, deliberations relating to IDA replenishments, IDA country allocations, and deliberations with donors relating to trust funds.

[10] However, if no subsequent Board meeting is expected, the Bank makes publicly available reports to the Board from its Committees, with deliberative information removed (summary portion of the Green Sheet).

[11] This is a heterogeneous group of documents that includes information notes, technical briefing papers, PowerPoint presentations that supplement Board Papers, presentations to Board Committees, and administrative papers (such as meeting notices) that are not used as a basis for consultation or decision but are used solely for information or administrative purposes.

iv. Audit reports prepared by IAD, except its finalized annual and quarterly activity reports.

(j) ***Financial Information.*** The Bank does not provide access to the following financial information:[12]

i. Estimates of future borrowings by IBRD, contributions by individual donors to IDA, financial forecasts and credit assessments, and data on investment, hedging, borrowing, and cash management transactions[13] generated by or for the Bank's treasury operations for the World Bank Group entities and other parties.

ii. Documents, analysis, correspondence, or other information used or produced to execute financial and budgetary transactions, or to support the preparation of internal and external financial reports.

iii. Details of individual transactions under loans and trust funds, information regarding amounts overdue from borrowers, or actions taken before any loans are placed in nonaccrual status.

iv. Banking or billing information of World Bank Group entities, member countries, clients, donors, recipients, or vendors, including consultants.

3. **Board of Governors Proceedings.** Board of Governors Documents and Records relating to or arising from meetings held jointly with the IMF may be made publicly available if and when the IMF provides its written approval to disclose. The following Board of Governors Documents and Records that are routinely available from the Bank are posted on the Bank's external website:[14]

(a) Reports of the Executive Directors recommending decisions to the Boards of Governors on such matters as capital increases and replenishments are posted on the Bank's external website at the end of the Boards of Governors' deliberative process.

(b) Resolutions adopted by the Boards of Governors at the Annual Meetings or through a vote by mail.

(c) Statements of the Governors and of the President during the Annual Meetings.

---

[12] Certain financial information is eligible for declassification and disclosure over time, as indicated in section III.B.6 this Policy.

[13] This includes holdings, positions, and performance information for World Bank Group entities and other parties.

[14] Board of Governors Documents and Records, as defined in section II of this Policy, are not all prepared following every Board of Governors meeting.

(d) Summary Proceedings of the Annual Meetings of the Boards of Governors.

(e) Agendas of the meetings of the Joint Ministerial Committee of the Boards of Governors of the Bank and the IMF on the Transfer of Real Resources to Developing Countries (known as the Development Committee); communiques and announcements issued by the Development Committee; statements and declarations submitted by Development Committee members during the meetings of the Development Committee; and reports, papers, notes and other documents prepared by Bank staff for the meetings of the Development Committee.

(f) Statements Submitted to the Meeting of the Development Committee.

4. **Board Proceedings.** Board Papers and Board Records that are routinely available from the Bank are posted on the Bank's external website at specific Board milestones.[15] Some Board discussions may deal with issues that fall under the exceptions of the policy. In such cases, the related Board Records are classified as *Confidential* and *Strictly Confidential* and are not disclosed unless they become eligible for declassification under the declassification schedule provided under section III.B.5 of this Policy. Board Records of a Board meeting or Board Committee meeting initially held as a regular session but subsequently converted into an executive session or a restricted executive session are considered (as applicable) to be Board Records of a meeting of an executive session or a restricted executive session, as converted, in their entirety.

(a) The following Board Records *prepared on or after July 1, 2010*, are posted at the end of the Board's deliberative process:

i. Minutes of Board meetings.[16]
ii. Minutes of Board Committee meetings.
iii. Summings-up of Board meetings and Committee of the Whole meetings.[17]
iv. Summaries of Discussion (related to Board meetings).
v. Reports to the Board from its Committees (Green Sheets) with deliberative information removed (summary portion of the Green Sheets), if a subsequent Board discussion is not expected.
vi. Annual reports of Board Committees.

(b) Board Papers distributed for discussion or consideration (decision) by the Board are posted at the end of the Board's deliberative process, once they are finalized. However, the following Board Papers whose preparation may

---

[15] Board Records, as defined in section II of this Policy, are not all prepared following every Board meeting.

[16] Board minutes created after April 1, 2005, are already publicly available. For Board minutes created before April 1, 2005, see section III.B.6(b) of this Policy.

[17] Beginning July 1, 2013, Chairman's Summings-up and Summaries of Discussions are replaced by a single category of Board Records called Chair Summaries.

have involved consultations with affected parties, civil society groups, and other stakeholders are posted before the Board discussion:

i. Operational policy papers and sector strategy papers that are prepared following a public consultation process, if the Executive Directors have already reviewed a draft version of the paper.[18]

ii. Country assistance strategy papers, project appraisal documents, and program documents, if the member country consents to such early disclosure.

(c) Board Papers distributed for discussion by a Board committee are posted at the end of the committee's deliberation if a subsequent Board discussion is not anticipated.

(d) Board Papers distributed to the Executive Directors for information are posted upon distribution.

5. **Electronic Mail.** E-mail, which has become the Bank's predominant medium of communication, is treated as follows:

(a) E-mails that contain or convey decisions or outcomes and that are filed in the Bank's records management system and classified as *Public* are publicly available.

(b) E-mails that are filed in the Bank's records management system but classified as *Official Use Only*, *Confidential*, or *Strictly Confidential* are not publicly available unless the information content of the e-mail becomes eligible for declassification and disclosure over time.

(c) The Bank does not provide access to e-mail that resides outside its records management system (including e-mail that does not pertain to official matters and e-mail containing personal information or communications of Bank staff and other officials; see also sections III.B.2(a)i, and III.B.2(i)i and ii of this Policy).

6. **Declassification.** The Bank declassifies and discloses – routinely on the Bank's external website, and in response to requests – certain types of restricted information (including information prepared under earlier disclosure policies of the Bank) as their sensitivity diminishes over time. Some restricted information is not eligible for declassification.

---

[18] If a draft version has not been previously reviewed by the Executive Directors, the paper is still made available to the public at least two weeks before the Board discussion if the Board approves such early disclosure.

(a) ***Information Not Eligible for Declassification.*** The information that is restricted from disclosure under the exceptions of *Personal Information, Communications of Governors and/or Executive Directors' Offices*, *Ethics Committee*, *Attorney-Client Privilege*, *Security and Safety*, *Information Restricted Under Separate Disclosure Regimes and Other Investigative Information*, *Information Provided by Member Countries or Third Parties in Confidence, Corporate Administrative Matters*, and *Financial Information* (as it relates to banking or billing information of World Bank Group entities, member countries, clients, donors, recipients, or vendors, including consultants), and the financial and deliberative information that contains or relates to such information, and/or information for which the IMF has not provided its written approval to disclose pursuant to section III.B.3 of this Policy, is not declassified or made publicly available.[19]

(b) ***Information Eligible for Declassification.*** The following documents are declassified and made publicly available 5, 10, or 20 years after the date on the document,[20] *provided that they do not contain or refer to information that is not eligible for declassification as set out in paragraph 6(a) of this section*[21].

i. ***After 5 years***

- Board minutes prepared before April 1, 2005, other than those of executive sessions and restricted executive sessions.
- Minutes of Board Committee meetings prepared before July 1, 2010, other than those of executive sessions and restricted executive sessions.
- Chairman's Concluding Remarks and Summings-up of Board meetings prepared before January 1, 2002.
- Summings-up of Committee of the Whole Meetings prepared before July 1, 2010.
- Summaries of Discussion (relating to Board meetings) prepared before July 1, 2010.
- Annual reports of Board Committees prepared before July 1, 2010.
- Board Papers that were prepared before July 1, 2010, and are classified *Official Use Only*.
- Final documents listed in the annex of this Policy that were prepared before July 1, 2010, and classified as *Official Use Only*. (Draft

---

19 *See* Policy at sections III.B.2(a) through (h), and (j) iv.

20 In applying these declassification schedules, the relevant date for unpublished documents is the date when the document was created; the relevant date for published documents is the date of publication.

21 With respect to the Board Records of a Board meeting or a Board Committee meeting that are listed in this section, as indicated in section III.B.4 of this Policy, if the meeting was initially held as a regular session but subsequently converted into an executive session or a restricted executive session, the related Board Records are considered (as applicable) to be Board Records of a meeting of an executive session or a restricted executive session, as converted, in their entirety.

documents and other deliberative documents, although classified as *Official Use Only*, are considered to be deliberative information and are declassified only after 20 years.)

ii. ***After 10 years***

- Verbatim transcripts of regular sessions of Board meetings and Board Committee meetings.
- Verbatim transcripts of meetings held as regular sessions of the Boards of Governors and of the Board of Governors Committees, task forces, working groups and other bodies created under their auspices.
- Statements of individual Executive Directors and staff in the context of regular sessions of Board meetings or Board Committee meetings.
- Reports to the Board from its Committees (Green Sheets).
- Miscellaneous memoranda or informal notes distributed to the full Board or to a Board Committee.

iii. ***After 20 years***

- Verbatim transcripts of executive sessions and restricted executive sessions of Board meetings and Board Committee meetings.
- Verbatim transcripts of meetings held as executive sessions or restricted executive sessions of the Boards of Governors and of the Board of Governors Committees, task forces, working groups and other bodies created under their auspices.
- Verbatim transcripts of meetings of the Development Committee.
- Statements of individual Executive Directors and staff in the context of executive sessions and restricted executive sessions of Board meetings and Board Committee meetings.
- Minutes of executive sessions and restricted executive sessions of the Board and its Committees.
- Communications and memoranda originating in Executive Directors' offices relating to Board or Board Committee proceedings.
- Board Papers that are classified as *Confidential* or *Strictly Confidential*.
- Memoranda of the President that accompany Board Papers.
- Final documents listed in the annex of this Policy that were prepared before July 1, 2010, and classified as *Confidential* or *Strictly Confidential*.
- Financial information restricted under section III.B.2(j) i, ii, and iii of this Policy, unless the information pertains to the exceptions set forth in sections III.B.2(a) through (h) or III.B.2(j) iv of this Policy.
- Other documents in the possession of the Bank's Archives Unit, unless the documents pertain to the exceptions set forth in sections

III.B.2(a) through (h) or III.B.2(j) iv of this Policy, including any deliberative or financial information containing or referring to those exceptions.

7. **Access to Information Committee.** To facilitate the AI Policy's implementation, the AI Committee is an administrative body that reports to Bank management and advises management on the application of this Policy to complex issues, reviews proposals to disclose information that is on the list of exceptions,[22] receives and rules on appeals under this Policy,[23] establishes service fees and service standards, and issues guidelines to staff on policy implementation. The AI Committee has the authority to interpret this Policy in line with the Policy's guiding principles, and to uphold or reverse prior decisions to deny access, with the exception of decisions made by the Bank's Board.

8. **Appeals*.***

(a) A requester who is denied access to information by the Bank may file an appeal if:

i. the requester is able to establish a *prima facie* case that the Bank has violated this Policy by improperly or unreasonably restricting access to information that it would normally disclose under the Policy; *or*

ii. the requester is able to make a public interest case to override the Policy exceptions that restrict the information requested (limited to those exceptions set out in sections III.B.2(h) (*Corporate Administrative Matters*), III.B.2(i) (*Deliberative Information*), and III.B.2(j) i, ii and iii (relating to certain *Financial Information*) of this Policy).

(b) The two stage appeals mechanism consists of the following:

i. ***Appealing the Initial Denial—Access to Information Committee.*** Appeals of a Bank decision to deny access are first considered by the Bank's AI Committee.[24] For appeals that assert a public interest case to override a Policy exception,[25] the decision of the AI Committee is final. The AI Committee may decide to refer a particular issue to the relevant Managing Director for his/her recommendation, which the AI Committee takes into account in its decision.[26] Appeals to the AI Committee must be filed, in writing, within 60 calendar days of the Bank's initial decision

---

22 *See* section IV.1 of this Policy for details on the Bank's prerogative to disclose restricted information under exceptional circumstances.

23 *See* section III.B.8 of this Policy on the provisions relating to appeals.

24 Because the AI Committee has no authority over decisions by the Board, appeals of Board decisions are automatically dismissed.

25 *See* section III.B.8(a) ii of this Policy.

26 This may include instances when the AI Committee has provided direct input in the initial decision to deny access.

to deny access to the requested information. The AI Committee makes its best efforts to reach a decision on appeals within 45 working days of receiving an appeal (delays are communicated in writing to the requester).

ii. ***Appealing the AI Committee's Denial—Appeals Board.*** The Bank has established an independent Appeals Board[27] to consider appeals alleging that the Bank violated this Policy by restricting access to information that it would normally disclose under the Policy,[28] if the AI Committee upholds the initial decision to deny access; the Appeals Board does not consider appeals concerning requests to override the Policy's exceptions.[29] The Appeals Board has the authority to uphold or reverse the relevant decisions of the AI Committee, and the Appeals Board's decisions in such instances are final. Appeals to the Appeals Board must be filed, in writing, within 60 calendar days after the AI Committee's decision to uphold the Bank's initial decision to deny access. The Appeals Board makes its best efforts to consider all appeals that are received within a reasonable time period before the next scheduled Appeals Board session.

(c) The remedy available to a requester who prevails on appeal is limited to receiving the information requested.

SECTION IV – EXCEPTIONS

1. **Bank's Prerogative to Disclose Restricted Information.** The Bank reserves the right to disclose, under exceptional circumstances, certain corporate administrative information,[30] deliberative information,[31] and financial information[32] that is restricted under the exceptions, if the Bank determines that the overall benefits of such disclosure outweigh the potential harm to the interest(s) protected by the exception(s). In exercising this prerogative:

(a) The disclosure of Board of Governors Documents and Records and of Board Papers or Board Records classified as *Confidential* or *Strictly Confidential*, requires Board approval.

---

[27] The Appeals Board established under this Policy comprises three outside experts on access to information matters. Panel members are nominated by the President of the World Bank and endorsed by the Bank's Board of Executive Directors.

[28] *See* section III.B.8(a) i of this Policy.

[29] *See* section III.B.8(a) ii of this Policy.

[30] *See* section III.B.2(h) of this Policy.

[31] *See* section III.B.2(i) of this Policy.

[32] *See* section III.B.2(j) i, ii and iii of this Policy.

(b) The disclosure of information provided to the Bank by a member country or a third party in confidence requires the written consent of the member country or the third party concerned.

(c) The disclosure of other restricted information requires the approval of the Bank's AI Committee.

2. **Bank's Prerogative to Restrict Access.** Except for verbatim transcripts of meetings (a) of the Boards of Governors, (b) of the Board of Governors Committees, task forces, working groups and other bodies created under their auspices, and (c) of the Development Committee, the Bank also reserves the right not to disclose, under exceptional circumstances, information that it would normally disclose if it determines that such disclosure is likely to cause harm that outweighs the benefits of disclosure. This prerogative may be exercised only by:

(a) The Board, with respect to Board Records. In the case of verbatim transcripts and statements of individual Executive Directors and staff, prepared on or after July 1, 2013, the Bank's prerogative to restrict access to such Board Records will only be effective up to a maximum of 20 years after the date of the document;

(b) The vice president concerned, with respect to Board Papers; and

(c) The director concerned, with respect to other information.

SECTION V – WAIVER

1. Provisions of this Policy may be waived by the Board.

SECTION VI – EFFECTIVE DATE

1. This Policy is effective as of July 1, 2015.

SECTION VII – ISSUER

1. This Policy is issued by the President.

SECTION VIII – SPONSOR

1. The Sponsor of this Policy is the Vice President, External and Corporate Relations.

SECTION IX – RELATED DOCUMENTS

ANNEX

Declassification Schedule for Certain Historical Documents prepared before July 1, 2010. Pursuant to section III.B.6(b) of this Policy, the final documents listed in this Annex—if they were created before July 1, 2010, and were not already made public pursuant to earlier disclosure policies of the World Bank—are eligible for declassification according to the following schedule:

- 5 years after the date of a document classified as *Official Use Only*, and
- 20 years after the date of a document classified as *Confidential*, or *Strictly Confidential*.

The documents are eligible for declassification if they do not contain or refer to information that fall under an exception that is not eligible for declassification (see section III.B.6(a) of the Policy).

(a) **Operational documents prepared by the Bank**

- Country Assistance Strategies (CASs)
- CAS Progress Reports
- Interim Strategy Notes
- CAS Completion Reports (included as an annex to the follow-on CAS)
- Public information notice for a CAS
- Joint Staff Advisory Notes on PRSPs
- Country financing parameters (including the analyses that underpin their preparation)
- Economic and Sector Work and non-lending technical assistance reports
- Factual Technical Documents that underpin project preparation
- Project Appraisal Documents (previously Staff Appraisal Reports)
- Project papers
- Program Documents for Development Policy Operations (DPOs)
- Supplemental financing documents (DPOs)
- Tranche Release Documents (DPOs)
- Integrated Safeguards Data Sheets
- Country assessment reports on the Use of Country Systems (UCS)
- Project assessments for UCS pilot countries
- Implementation Completion and Results Reports (ICR)
- Note on Cancelled Operations (NCO) (previously Project Completion Note)

- Monthly Loan and Credit Statements
- Monthly Operational Summary of the lending pipeline (MOS)
- Status of Projects in Execution (SOPE)
- Country Portfolio Performance Reviews (CPPRs)
- Sector Strategy Papers (SSPs), draft SSPs, draft concept notes and consultation plan for an SSP
- All other operational policy and strategy papers
- Numerical CPIA ratings for countries eligible for IDA financing
- Numerical IDA country performance ratings (derived from CPIA ratings)
- Funding proposals for activities financed through Bank-administered trust funds
- Preliminary, decision-point, and completion-point documents prepared under the Heavily Indebted Poor Country (HIPC) Initiative
- QAG synthesis

BASLE COMMITTEE
ON
BANKING SUPERVISION

INTERNATIONAL CONVERGENCE OF CAPITAL MEASUREMENT AND CAPITAL STANDARDS

Basle
July 1988

Table of Contents

International Convergence of Capital Measurement and Capital Standards

Introduction

1. This report presents the outcome of the Committee's[1] work over several years to secure international convergence of supervisory regulations governing the capital adequacy of international banks. Following the publication of the Committee's proposals in December 1987, a consultative process was set in train in all G-10 countries and the proposals were also circulated to supervisory authorities worldwide. As a result of those consultations some changes were made to the original proposals. The present paper is now a statement of the Committee agreed by all its members. It sets out the details of the agreed framework for measuring capital adequacy and the minimum standard to be achieved which the national supervisory authorities represented on the Committee intend to implement in their respective countries. The framework and this standard have been endorsed by the Group of Ten central-bank Governors.

2. With a view to implementation as soon as possible, it is intended that national authorities should now prepare papers setting out their views on the timetable and the manner in which this accord will be implemented in their respective countries. This document is being circulated to supervisory authorities worldwide with a view to encouraging the adoption of this framework in countries outside the G-10 in respect of banks conducting significant international business.

3. Two fundamental objectives lie at the heart of the Committee's work on regulatory convergence. These are, firstly, that the new framework should serve to strengthen the soundness and stability of the international banking system; and secondly that the framework should be in fair and have a high degree of consistency in its application to banks in different countries with a view to diminishing an existing source of competitive inequality among international banks. The Committee notes that, in responding to the invitation to comment on its original proposals, banks have welcomed the general shape and rationale of the framework and have expressed support for the view that it should be applied as uniformly as possible at the national level.

---

1 The Basle Committee on Banking Supervision comprises representatives of the central banks and supervisory authorities of the Group of Ten countries (Belgium, Canada, France, Germany, Italy, Japan, Netherlands, Sweden, Switzerland, United Kingdom, United States) and Luxembourg. The Committee meets at the Bank for International Settlements, Basle, Switzerland.

4. Throughout the recent consultations, close contact has been maintained between the Committee in Basle and the authorities of the European Community in Brussels who are pursuing a parallel initiative to develop a common solvency ratio to be applied to credit institutions in the Community. The aim has been to ensure the maximum degree of consistency between the framework agreed in Basle and the framework to be applied in the Community. It is the Committee's hope and expectation that this consistency can be achieved, although it should be noted that regulations in the European Community are designed to apply to credit institutions generally, whereas the Committee's framework is directed more specifically with banks undertaking international business in mind.

5. In developing the framework described in this document the Committee has sought to arrive at a set of principles which are conceptually sound and at the same time pay due regard to particular features of the present supervisory and accounting systems in individual member countries. It believes that this objective has been achieved. The framework provides for a transitional period so that the existing circumstances in different countries can be reflected in flexible arrangements that allow time for adjustment.

6. In certain very limited respects (notably as regards some of the risk weightings) the framework allows for a degree of national discretion in the way in which it is applied. The impact of such discrepancies on the overall ratios is likely to be negligible and it is not considered that they will compromise the basic objectives. Nevertheless, the Committee intends to monitor and review the application of the framework in the period ahead with a view to achieving even greater consistency.

7. It should be stressed that the agreed framework is designed to establish *minimum* levels of capital for internationally active banks. National authorities will be free to adopt arrangements that set higher levels.

8. It should also be emphasised that capital adequacy as measured by the present framework, though important, is one of a number of factors to be taken into account when assessing the strength of banks. The framework in this document is mainly directed towards assessing capital in relation to credit risk (the risk of counterparty failure) but other risks, notably interest rate risk and the investment risk on securities, need to be taken into account by supervisors in assessing overall capital adequacy. The Committee is examining possible approaches in relation to these risks. Furthermore, and more generally, capital ratios, judged in isolation, may provide a misleading guide to relative strength. Much also depends on the quality of a bank's assets and, importantly, the level of provisions a bank may be holding outside its capital against assets of doubtful value. Recognising the close relationship between capital and provisions, the Committee will continue to monitor provisioning policies by banks in member countries and will seek to promote convergence of policies in this field as in other regulatory matters. In assessing progress by banks in member countries towards meeting the

agreed capital standards, the Committee will therefore take careful account of any differences in existing policies and procedures for setting the level of provisions among countries' banks and in the form in which such provisions are constituted.

9. The Committee is aware that differences between countries in the fiscal treatment and accounting presentation for tax purposes of certain classes of provisions for losses and of capital reserves derived from retained earnings may to some extent distort the comparability of the real or apparent capital positions of international banks. Convergence in tax regimes, though desirable, lies outside the competence of the Committee and tax considerations are not addressed in this paper. However, the Committee wishes to keep these tax and accounting matters under review to the extent that they affect the comparability of the capital adequacy of different countries' banking systems.

10. This agreement is intended to be applied to banks on a consolidated basis, including subsidiaries undertaking banking and financial business. At the same time, the Committee recognises that ownership structures and the position of banks within financial conglomerate groups are undergoing significant changes. The Committee will be concerned to ensure that ownership structures should not be such as to weaken the capital position of the bank or expose it to risks stemming from other parts of the group. The Committee will continue to keep these developments under review in the light of the particular regulations in member countries, in order to ensure that the integrity of the capital of banks is maintained. In the case of several of the subjects for further work mentioned above, notably investment risk and the consolidated supervision of financial groups, the European Community has undertaken or is undertaking work with similar objectives and close liaison will be maintained.

11. This document is divided into four sections. The first two describe the framework: Section I the constituents of capital and Section II the risk weighting system. Section III deals with the target standard ratio; and Section IV with transitional and implementing arrangements.

I. The constituents of capital

(a) Core capital (basic equity)

12. The Committee considers that the key element of capital on which the main emphasis should be placed is equity capital[2] and disclosed reserves. This key element of capital is the only element common to all countries' banking systems; it is wholly visible in

---

2 Issued and fully paid ordinary shares/common stock and non-cumulative perpetual preferred stock (but excluding cumulative preferred stock).

the published accounts and is the basis on which most market judgements of capital adequacy are made; and it has a crucial bearing on profit margins and a bank's ability to compete. This emphasis on equity capital and disclosed reserves reflects the importance the Committee attaches to securing a progressive enhancement in the quality, as well as the level, of the total capital resources maintained by major banks.

13. Notwithstanding this emphasis, the member countries of the Committee also consider that there are a number of other important and legitimate constituents of a bank's capital base which may be included within the system of measurement (subject to certain conditions set out in sub-section (b) below).

14. The Committee has therefore concluded that capital, for supervisory purposes, should be defined in two tiers in a way which will have the effect of requiring at least 50% of a bank's capital base to consist of a core element comprised of equity capital and published reserves from post-tax retained earnings (tier 1). The other elements of capital (supplementary capital) will be admitted into tier 2 up to an amount equal to that of the core capital. These supplementary capital elements and the particular conditions attaching to their inclusion in the capital base are set out below and in more detail in Annex 1. Each of these elements may be included or not included by national authorities at their discretion in the light of their national accounting and supervisory regulations.[3]

(b) Supplementary capital

(i) Undisclosed reserves

15. Unpublished or hidden reserves may be constituted in various ways according to differing legal and accounting regimes in member countries. Under this heading are included only reserves which, though unpublished, have been passed through the profit and loss account and which are accepted by the bank's supervisory authorities. They may be inherently of the same intrinsic quality as published retained earnings, but, in the context of an internationally agreed minimum standard, their lack of transparency, together with the fact that many countries do not recognise undisclosed reserves, either as an accepted accounting concept or as a legitimate element of capital, argue for excluding them from the core equity capital element.

(ii) Revaluation reserves

16. Some countries, under their national regulatory or accounting arrangements, allow certain assets to be revalued to reflect their current value, or something closer to their current

---

3 One member country, however, maintains the view that an international definition of capital should be confined to core capital elements and indicated that it would continue to press for the definition to be reconsidered by the Committee in the years ahead.

value than historic cost, and the resultant revaluation reserves to be included in the capital base. Such revaluations can arise in two ways:

(a) from a formal revaluation, carried through to the balance sheets of banks' own premises; or

(b) from a notional addition to capital of hidden values which arise from the practice of holding securities in the balance sheet valued at historic costs.

Such reserves may be included within supplementary capital provided that the assets are considered by the supervisory authority to be prudently valued, fully reflecting the possibility of price fluctuations and forced sale.

17. Alternative (b) is relevant to those banks whose balance sheets traditionally include very substantial amounts of equities held in their portfolio at historic cost but which can be, and on occasions are, realised at current prices and used to offset losses. The Committee considers these "latent" revaluation reserves can be included among supplementary elements of capital since they can be used to absorb losses on a going-concern basis, provided they are subject to a substantial discount in order to reflect concerns both about market volatility and about the tax charge which would arise were such cases to be realised. A discount of 55% on the difference between the historic cost book value and market value is agreed to be appropriate in the light of these considerations. The Committee considered, but rejected, the proposition that latent reserves arising in respect of the undervaluation of banks' premises should also be included within the definition of supplementary capital.

(iii) General provisions/general loan-loss reserves

18. General provisions or general loan-loss reserves are created against the possibility of future losses. Where they are not ascribed to particular assets and do not reflect a reduction in the valuation of particular assets, these reserves qualify for inclusion in capital and it has been agreed that they should be counted within tier 2. Where, however, provisions have been created against identified losses or in respect of a demonstrable deterioration in the value of particular assets, they are not freely available to meet unidentified losses which may subsequently arise elsewhere in the portfolio and do not possess an essential characteristic of capital. Such specific or earmarked provisions should therefore not be included in the capital base.

19. The Committee accepts, however, that, in practice, it is not always possible to distinguish clearly between general provisions (or general loan-loss reserves) which are genuinely freely available and those provisions which in reality are earmarked against assets already identified as impaired. This partly reflects the present diversity of accounting, supervisory, and, importantly, fiscal policies in respect of provisioning and in respect of national definitions of capital. This means, inevitably, that initially there will be a degree of

inconsistency in the characteristics of general provisions or general loan-loss reserves included by different member countries within the framework.

20. In the light of these uncertainties, the Committee intends during the transitional period (see paragraphs 45 to 50 below) to clarify the distinction made in member countries between those elements which should conceptually be regarded as part of capital and those which should not qualify. The Committee will aim to develop before the end of 1990 firm proposals applicable to all member countries, so as to ensure consistency in the definition of general provisions and general loan-loss reserves eligible for inclusion in the capital base by the time the interim and final minimum target standards fall to be observed.

21. As a further safeguard, in the event that agreement is not reached on the refined definition of unencumbered resources eligible for inclusion in supplementary capital, where general provisions and general loan-loss reserves may include amounts reflecting lower valuations for assets or latent but unidentified losses present in the balance sheet, the amount of such reserves or provisions that qualify as capital would be phased down so that, at the end of the transitional period, such items would constitute no more than 1.25 percentage points, or exceptionally and temporarily up to 2.0 percentage points, of risk assets within the secondary elements.

(iv) Hybrid debt capital instruments

22. In this category fall a number of capital instruments which combine certain characteristics of equity and certain characteristics of debt. Each of these has particular features which can be considered to affect its quality as capital. It has been agreed that, where these instruments have close similarities to equity, in particular when they are able to support losses on an on-going basis without triggering liquidation, they may be included in supplementary capital. In addition to perpetual preference shares carrying a cumulative fixed charge, the following instruments, for example, may qualify for inclusion: long-term preferred shares in Canada, titres participatifs and titres subordonnés à durée indéterminée in France, Genussscheine in Germany, perpetual debt instruments in the United Kingdom and mandatory convertible debt instruments in the United States. The qualifying criteria for such instruments are set out in Annex 1.

(v) Subordinated term debt

23. The Committee is agreed that subordinated term debt instruments have significant deficiencies as constituents of capital in view of their fixed maturity and inability to absorb losses except in a liquidation. These deficiencies justify an additional restriction on the amount of such debt capital which is eligible for inclusion within the capital base. Consequently, it has been concluded that subordinated term debt instruments with a minimum original term to maturity of over five years may be included within the supplementary

elements of capital, but only to a maximum of 50% of the core capital element and subject to adequate amortisation arrangements.

(c) Deductions from capital

24. It has been concluded that the following deductions should be made from the capital base for the purpose of calculating the risk-weighted capital ratio. The deductions will consist of:

(i) goodwill, as a deduction from tier 1 capital elements;

(ii) investments in subsidiaries engaged in banking and financial activities which are not consolidated in national systems. The normal practice will be to consolidate subsidiaries for the purpose of assessing the capital adequacy of banking groups. Where this is not done, deduction is essential to prevent the multiple use of the same capital resources in different parts of the group. The deduction for such investments will be made against the total capital base. The assets representing the investments in subsidiary companies whose capital had been deducted from that of the parent would not be included in total assets for the purposes of computing the ratio.

25. The Committee carefully considered the possibility of requiring deduction of banks' holdings of capital issued by other banks or deposit-taking institutions, whether in the form of equity or of other capital instruments. Several G-10 supervisory authorities currently require such a deduction to be made in order to discourage the banking system as a whole from creating cross-holdings of capital, rather than drawing capital from outside investors. The Committee is very conscious that such double-gearing (or "double-leveraging") can have systemic dangers for the banking system by making it more vulnerable to the rapid transmission of problems from one institution to another and some members consider these dangers justify a policy of full deduction of such holdings.

26. Despite these concerns, however, the Committee as a whole is not presently in favour of a general policy of deducting all holdings of other banks' capital, on the grounds that to do so could impede certain significant and desirable changes taking place in the structure of domestic banking systems.

27. The Committee has nonetheless agreed that:

(a) individual supervisory authorities should be free at their discretion to apply a policy of deduction, either for all holdings of other banks' capital, or for holdings which exceed material limits in relation to the holding bank's capital or the issuing bank's capital, or on a case-by-case basis;

(b) where no deduction is applied, banks' holdings of other banks' capital instruments will bear a weight of 100%;

(c) in applying these policies, member countries consider that reciprocal cross-holdings of bank capital designed artificially to inflate the capital position of the banks concerned should not be permitted;

(d) the Committee will closely monitor the degree of double-gearing in the international banking system and does not preclude the possibility of introducing constraints at a later date. For this purpose, supervisory authorities intend to ensure that adequate statistics are made available to enable them and the Committee to monitor the development of banks' holdings of other banks' equity and debt instruments which rank as capital under the present agreement.

II. The risk weights

28. The Committee considers that a weighted risk ratio in which capital is related to different categories of asset or off-balance-sheet exposure, weighted according to broad categories of relative riskiness, is the preferred method for assessing the capital adequacy of banks. This is not to say that other methods of capital measurement are not also useful, but they are considered by the Committee to be supplementary to the risk-weight approach. The Committee believes that a risk ratio has the following advantages over the simpler gearing ratio approach:

(i) it provides a fairer basis for making international comparisons between banking systems whose structures may differ;

(ii) it allows off-balance-sheet exposures to be incorporated more easily into the measure;

(iii) it does not deter banks from holding liquid or other assets which carry low risk.

29. The framework of weights has been kept as simple as possible and only five weights are used - 0, 10, 20, 50 and 100%. There are inevitably some broad-brush judgements in deciding which weight should apply to different types of asset and the weightings should not be regarded as a substitute for commercial judgement for purposes of market pricing of the different instruments.

30. The weighting structure is set out in detail in Annexes 2 and 3. There are six aspects of the structure to which attention is particularly drawn.

(i) Categories of risk captured in the framework

31. There are many different kinds of risks against which banks' managements need to guard. For most banks the major risk is *credit risk*, that is to say the risk of counterparty

failure, but there are many other kinds of risk - for example, investment risk, interest rate risk, exchange rate risk, concentration risk. The central focus of this framework is credit risk and, as a further aspect of credit risk, country transfer risk. In addition, individual supervisory authorities have discretion to build in certain other types of risk. Some countries, for example, will wish to retain a weighting for open foreign exchange positions or for some aspects of investment risk. No standardisation has been attempted in the treatment of these other kinds of risk in the framework at the present stage.

32. The Committee considered the desirability of seeking to incorporate additional weightings to reflect the investment risk in holdings of fixed rate government securities - one manifestation of interest rate risk which is of course present across the whole range of a bank's activities, on and off the balance sheet. For the present, it was concluded that individual supervisory authorities should be free to apply either a zero *or* a low weight to claims on governments (e.g. 10% for all securities or 10% for those maturing in under one year and 20% for one year and over). All members agreed, however, that interest rate risk generally required further study and that if, in due course, further work made it possible to develop a satisfactory method of measurement for this aspect of risk for the business as a whole, consideration should be given to applying some appropriate control alongside this credit risk framework. Work is already under way to explore the possibilities in this regard.

(ii) Country transfer risk

33. In addressing country transfer risk, the Committee has been very conscious of the difficulty of devising a satisfactory method for incorporating country transfer risk into the framework of measurement. In its earlier, consultative, paper two alternative approaches were put forward for consideration and comment. These were, firstly, a simple differentiation between claims on domestic institutions (central government, official sector and banks) and claims on all foreign countries; and secondly, differentiation on the basis of an approach involving the selection of a defined grouping of countries considered to be of high credit standing.

34. The comments submitted to the Committee by banks and banking associations in G-10 countries during the consultative period were overwhelmingly in favour of the second alternative. In support of this view, three particular arguments were strongly represented to the Committee. Firstly, it was stressed that a simple domestic/foreign split effectively ignores the reality that transfer risk varies greatly between different countries and that this risk is of sufficient significance to make it necessary to ensure that broad distinctions in the credit standing of industrialised and non-industrialised countries should be made and captured in the system of measurement, particularly one designed for international banks. Secondly, it was argued that the domestic/foreign split does not reflect the global integration of financial markets and the absence of some further refinement would discourage international banks

from holding securities issued by central governments of major foreign countries as liquid cover against their Euro-currency liabilities. To that extent a domestic/foreign approach would run counter to an important objective of the risk weighting framework, namely that it should encourage prudent liquidity management. Thirdly, and most importantly, the member states of the European Community are firmly committed to the principle that all claims on banks, central governments and the official sector within European Community countries should be treated in the same way. This means that, where such a principle is put into effect, there would be an undesirable asymmetry in the manner in which a domestic/foreign split was applied by the seven G-10 countries which are members of the Community compared with the manner in which it was applied by the non-Community countries.

35. In the light of these arguments, the Committee has concluded that a defined group of countries should be adopted as the basis for applying differential weighting coefficients, and that this group should be full members of the OECD or countries which have concluded special lending arrangements with the IMF associated with the Fund's General Arrangements to Borrow. This group of countries is referred to as the OECD in the rest of the report.

36. This decision has the following consequences for the weighting structure. Claims on central governments within the OECD will attract a zero weight (or a low weight if the national supervisory authority elects to incorporate interest rate risk); and claims on OECD non-central government public-sector entities will attract a low weight (see (iii) below). Claims on central governments and central banks outside the OECD will also attract a zero weight (or a low weight if the national supervisory authority elects to incorporate interest rate risk), provided such claims are denominated in the national currency and funded by liabilities in the same currency. This reflects the absence of risks relating to the availability and transfer of foreign exchange on such claims.

37. As regards the treatment of interbank claims, in order to preserve the efficiency and liquidity of the international interbank market there will be no differentiation between short-term claims on banks incorporated within or outside the OECD. However, the Committee draws a distinction between, on the one hand, short-term placements with other banks which is an accepted method of managing liquidity in the interbank market and carries a perception of low risk and, on the other, longer-term cross-border loans to banks which are often associated with particular transactions and carry greater transfer and/or credit risks. A 20% weight will therefore be applied to claims on all banks, wherever incorporated, with a residual maturity of up to and including one year; longer-term claims on OECD incorporated banks will be weighted at 20%; and longer-term claims on banks incorporated outside the OECD will be weighted at 100%.

(iii) Claims on non-central-government, public-sector entities (PSEs)

38. The Committee concluded that it was not possible to settle on a single common weight that can be applied to all claims on domestic public-sector entities below the level of central government (e.g. states. local authorities, etc.) in view of the special character and varying creditworthiness of these entities in different member countries. The Committee therefore opted to allow discretion to each national supervisory authority to determine the appropriate weighting factors for the PSEs within that country. In order to preserve a degree of convergence in the application of such discretion, the Committee agreed that the weights ascribed in this way should be 0, 10, 20 or 50% for domestic PSEs, but that PSEs in foreign countries within the OECD should attract a standard 20% weight. These arrangements will be subject to review by the Committee in pursuit of further convergence towards common weights and consistent definitions in member countries and in the light of decisions to be taken within the European Community on the specification of a common solvency ratio for credit institutions.

Commercial companies owned by the public sector will attract a uniform weight of 100% inter alia in order to avoid competitive inequality vis-à-vis similar private-sector commercial enterprises.

(iv) Collateral and guarantees

39. The framework recognises the importance of collateral in reducing credit risk, but only to a limited extent. In view of the varying practices among banks in different countries for taking collateral and different experiences of the stability of physical or financial collateral values, it has not been found possible to develop a basis for recognising collateral generally in the weighting system. The more limited recognition of collateral will apply only to loans secured against cash or against securities issued by OECD central governments and specified multilateral development banks. These will attract the weight given to the collateral (i.e. a zero or low weight). Loans partially collateralised by these assets will also attract the equivalent low weights on that part of the loan which is fully collateralised.

40. As regards loans or other exposures guaranteed by third parties, the Committee has agreed that loans guaranteed by OECD central governments, OECD public-sector entities, or OECD incorporated banks will attract the weight allocated to a direct claim on the guarantor (e.g. 20% in the case of banks). Loans guaranteed by non-OECD incorporated banks will also be recognised by the application of a 20% weight, but only where the underlying transaction has a residual maturity not exceeding one year. The Committee intends to monitor the application of this latter arrangement to ensure that it does not give rise to inappropriate weighting of commercial loans. In the case of loans covered by partial guarantees, only that part of the loan which is covered by the guarantee will attract the

reduced weight. The contingent liability assumed by banks in respect of guarantees will attract a credit conversion factor of 100% (see sub-section (vi) below).

(v) Loans secured on residential property

41. Loans fully secured by mortgage on occupied residential property have a very low record of loss in most countries. The framework will recognise this by assigning a 50% weight to loans fully secured by mortgage on residential property which is rented or is (or is intended to be) occupied by the borrower. In applying the 50% weight, the supervisory authorities will satisfy themselves, according to their national arrangements for the provision of housing finance, that this concessionary weight is applied restrictively for residential purposes and in accordance with strict prudential criteria. This may mean, for example, that in some member countries the 50% weight will only apply to first mortgages, creating a first charge on the property; and that in other member countries it will only be applied where strict, legally-based, valuation rules ensure a substantial margin of additional security over the amount of the loan. The 50% weight will specifically not be applied to loans to companies engaged in speculative residential building or property development. Other collateral will not be regarded as justifying the reduction of the weightings that would otherwise apply.[4]

(vi) Off-balance-sheet engagements

42. The Committee believes that it is of great importance that all off-balance-sheet activity should be caught within the capital adequacy framework. At the same time, it is recognised that there is only limited experience in assessing the risks in some of the activities; also that for some countries, a complex analytical approach and detailed and frequent reporting systems cannot easily be justified when the amounts of such business, particularly in the newer, more innovative instruments, are only small. The approach that has been agreed, which is on the same lines as that described in the Committee's report on the supervisory treatment of off-balance-sheet exposures issued to banks in March 1986, is comprehensive in that all categories of off-balance-sheet engagements, including recent innovations, will be converted to credit risk equivalents by multiplying the nominal principal amounts by a credit conversion factor, the resulting amounts then being weighted according to the nature of the counterparty. The different instruments and techniques are divided into five broad categories (within which member countries will have some limited discretion to allocate particular instruments according to their individual characteristics in national markets):

---

4 One member country feels strongly that the lower weight should also apply to other loans secured by mortgages on domestic property, provided that the amount of the loan does not exceed 60% of the value of the property as calculated according to strict legal valuation criteria.

(a) those which substitute for loans (e.g. general guarantees of indebtedness, bank acceptance guarantees and standby letters of credit serving as financial guarantees for loans and securities) - these will carry a 100% credit risk conversion factor;

(b) certain transaction-related contingencies (e.g. performance bonds, bid bonds, warranties and standby letters of credit related to particular transactions) - a 50% credit risk conversion factor;

(c) short-term, self-liquidating trade-related contingent liabilities arising from the movement of goods (e.g. documentary credits collateralised by the underlying shipments) - a 20% credit risk conversion factor;

(d) commitments with an original maturity[5] exceeding one year (the longer maturity serving broadly as a proxy for higher risk facilities) and all NIFs and RUFs - a 50% credit risk conversion factor. Shorter-term commitments or commitments which can be unconditionally cancelled at any time, it is agreed, generally carry only low risk and a nil weight for these is considered to be justified on de minimis grounds;

(e) interest and exchange rate related items (e.g. swaps, options, futures) - the credit risk equivalent amount for these contracts will be calculated in one of two ways (see below and Annex 3).

43. Special treatment is needed for the items in (e) above because banks are not exposed to credit risk for the full face value of their contracts, but only to the cost of replacing the cash flow if a counterparty defaults. Most members of the Committee accept that the correct method of assessing the credit risk on these items is to calculate the current replacement cost by marking to market and to add a factor to represent potential exposure during the remaining life of the contract. Some member countries, however, are concerned about the consistency of this method in relation to the rest of the system which only makes broad distinctions between relative risks for on-balance-sheet items, particularly for banks where these off-balance-sheet items currently constitute only a very small part of the total risks. They would prefer to apply an alternative approach consisting of conversion factors based on the nominal principal sum underlying each contract according to its type and maturity. The Committee has concluded that members will be allowed to choose either of the two methods. The details of the two alternative methods are set out in Annex 3.

---

5 In order to facilitate date collection, during the transitional period up to end-1992, but not beyond, national supervisory authorities will have discretion to apply residual maturity as a basis for measuring commitments.

III. A target standard ratio

44. In the light of consultations and preliminary testing of the framework, the Committee is agreed that a minimum standard should be set now which international banks generally will be expected to achieve by the end of the transitional period. It is also agreed that this standard should be set at a level that is consistent with the objective of securing over time soundly-based and consistent capital ratios for all international banks. Accordingly, the Committee confirms that the target standard ratio of capital to weighted risk assets should be set at 8% (of which the core capital element will be at least 4%). This is expressed as a common minimum standard which international banks in member countries will be expected to observe by the end of 1992, thus allowing a transitional period of some four-and-a-half years for any necessary adjustment by banks who need time to build up to those levels. The Committee fully recognises that the transition from existing, sometimes long-established, definitions of capital and methods of measurement towards a new internationally agreed standard will not necessarily be achieved easily or quickly. The full period to end-1992 is available to ensure progressive steps towards adjustment and banks whose ratios are presently below the 8% standard will not be required to take immediate or precipitate action.

IV. Transitional and implementing arrangements

(i) Transition

45. Certain transitional arrangements have been agreed upon to ensure that there are sustained efforts during the transitional period to build up individual banks' ratios towards the ultimate target standard; and to facilitate smooth adjustment and phasing in of the new arrangements within a wide variety of existing supervisory systems.

46. The transitional period will be from the date of this paper to the end of 1992, by which latter date all banks undertaking significant cross-border business will be expected to meet the standard in full (see paragraph 50 below). In addition, there will be an interim standard to be met by the end of 1990 (see paragraph 49 below).

47. Initially no formal standard or minimum level will be set. It is the general view of the Committee, however, that every encouragement should be given to those banks whose capital levels are at the low end of the range to build up their capital as quickly as possible and the Committee expects there to be no erosion of existing capital standards in individual member countries' banks. Thus, during the transitional period, all banks which need to improve capital levels up to the interim and final standards should not diminish even temporarily their current capital levels (subject to the fluctuations which can occur around the time new capital is raised). A level of 5% attained by application of the framework and transitional arrangements is considered by some countries to be a reasonable yardstick for the lower capitalised banks to seek to attain in the short term. Individual member countries will,

of course, be free to set, and announce, at the outset of the transitional period the level from which they would expect all their banks to move towards the interim and final target standard. In order to assess and compare progress during the initial period of adjustment to end-1990 in a manner which takes account both of existing supervisory systems and the new arrangements, the Committee and individual supervisory authorities will initially apply the basis of measurement set out in paragraph 48 below.

48. In measuring the capital position of banks at the start of the transitional period, a proportion of the core capital may be made up of supplementary elements up to a maximum of 25% of core capital elements, reducing to 10% by end-1990. In addition, throughout the transitional period up to end-1992, subject to more restrictive policies which individual authorities may wish to apply, term subordinated debt may be included without limit as a constituent of supplementary elements and the deduction from tier 1 capital elements in respect of goodwill may be waived.

49. At end-1990 there will be an interim minimum standard of 7.25% of which at least half should be core capital. However, between end-1990 and end-1992 up to 10% of the required core elements may be made up of supplementary elements. This means, in round figures, a minimum core capital element of 3.6%, of which tier 1 elements should total at least 3.25%, is to be achieved by the end of 1990. In addition, from end-1990, general loan-loss reserves or general provisions which include amounts reflecting lower valuations of assets or latent but unidentified losses present in the balance sheet will be limited to 1.5 percentage points, or exceptionally up to 2.0[6] percentage points, of risk assets within supplementary elements.

50. At end-1992 the transitional period ends. The minimum standard will then be 8%, of which core capital (tier 1, equity and reserves) will be at least 4%, supplementary elements no more than core capital and term subordinated debt within supplementary elements no more than 50% of tier 1. In addition, general loan-loss reserves or general provisions (having the characteristics described in paragraph 49) will be limited at end-1992 to 1.25 percentage points, or exceptionally and temporarily up to 2.0[6] percentage points, within supplementary elements.

For ease of reference, the arrangements described in paragraphs 45 to 50 are summarised in a table at Annex 4.

---

6 These limits would only apply in the event that no agreement is reached on a consistent basis for including unencumbered provisions or reserves in capital (see paragraphs 20 and 21).

(ii) Implementation

51. The arrangements described in this document will be implemented at national level at the earliest possible opportunity. Each country will decide the way in which the supervisory authorities will introduce and apply these recommendations in the light of their different legal structures and existing supervisory arrangements. In some countries, changes in the capital regime may be introduced, after consultation, relatively speedily without the need for legislation. Other countries may employ more lengthy procedures, and in some cases these may require legislation. In due course the member states of the European Community will also need to ensure that their own domestic regulations are compatible with the Community's own legislative proposals in this field. None of these factors needs result in any inconsistency in the timing of implementation among member countries. For example, some countries may apply the framework in this report, formally or informally, in parallel with their existing system, certainly during the initial period of transition. In this way banks can be assisted to start the necessary process of adjustment in good time before substantive changes in national systems are formally introduced.

July 1988

Annex 1

Definition of capital included in the capital base (To apply at end-1992 - see Annex 4 for transitional arrangements)

A. Capital elements

Tier 1 (a) Paid-up share capital/common stock
(b) Disclosed reserves

Tier 2 (a) Undisclosed reserves
(b) Asset revaluation reserves
(c) General provisions/general loan-loss reserves
(d) Hybrid (debt/equity) capital instruments
(e) Subordinated debt

The sum of tier 1 and tier 2 elements will be eligible for inclusion in the capital base, subject to the following limits.

B. Limits and restrictions

(i) The total of tier 2 (supplementary) elements will be limited to a maximum of 100% of the total of tier 1 elements;

(ii) subordinated term debt will be limited to a maximum of 50% of tier 1 elements;

(iii) where general provisions/general loan-loss reserves include amounts reflecting lower valuations of asset or latent but unidentified losses present in the balance sheet, the amount of such provisions or reserves will be limited to a maximum of 1.25 percentage points, or exceptionally and temporarily up to 2.0 percentage points, of risk assets;[1]

(iv) asset revaluation reserves which take the form of latent gains on unrealised securities (see below) will be subject to a discount of 55%.

---

1 This limit would only apply in the event that no agreement is reached on a consistent basis for including unencumbered provisions or reserves in capital (see paragraphs 20 and 21).

C. Deductions from the capital base

From tier 1: Goodwill

From total capital: (i) Investments in unconsolidated banking and financial subsidiary companies.

N.B. The presumption is that the framework would be applied on a consolidated basis to banking groups.

(ii) Investments in the capital of other banks and financial institutions (at the discretion of national authorities).

D. Definition of capital elements

(i) **Tier 1**: includes only *permanent shareholders' equity* (issued and fully paid ordinary shares/common stock and perpetual non-cumulative preference shares) and *disclosed reserves* (created or increased by appropriations of retained earnings or other surplus, e.g. share premiums, retained profit,[2] general reserves and legal reserves). In the case of consolidated accounts, this also includes minority interests in the equity of subsidiaries which are less than wholly owned. This basic definition of capital excludes revaluation reserves and cumulative preference shares.

(ii) **Tier 2: (a) undisclosed reserves** are eligible for inclusion within supplementary elements provided these reserves are accepted by the supervisor. Such reserves consist of that part of the accumulated after-tax surplus of retained profits which banks in some countries may be permitted to maintain as an undisclosed reserve. Apart from the fact that the reserve is not identified in the published balance sheet, it should have the same high quality and character as a disclosed capital reserve; as such, it should not be encumbered by any provision or other known liability but should be freely and immediately available to meet unforeseen future losses. This definition of undisclosed reserves excludes hidden values arising from holdings of securities in the balance sheet at below current market prices (see below).

(b) Revaluation reserves arise in two ways. Firstly, in some countries, banks (and other commercial companies) are permitted to revalue fixed assets, normally their own premises, from time to time in line with the change in market values. In some of these countries the amount of such revaluations is determined by law. Revaluations of this kind are reflected on the face of the balance sheet as a revaluation reserve.

---

2 Including, at national discretion, allocations to or from reserve during the course of the year from current year's retained profit.

Secondly, hidden values of "latent" revaluation reserves may be present as a result of long-term holdings of equity securities valued in the balance sheet at the historic cost of acquisition.

Both types of revaluation reserve may be included in tier 2 provided that the assets are prudently valued, fully reflecting the possibility of price fluctuation and forced sale. In the case of "latent" revaluation reserves a discount of 55% will be applied to the difference between historic cost book value and market value to reflect the potential volatility of this form of unrealised capital and the notional tax charge on it.

(c) General provisions/general loan-loss reserves: provisions or loan-loss reserves held against future, presently unidentified losses are freely available to meet losses which subsequently materialise and therefore qualify for inclusion within supplementary elements. Provisions ascribed to impairment of particular assets or known liabilities should be excluded. Furthermore, where general provisions/general loan-loss reserves include amounts reflecting lower valuations of assets or latent but unidentified losses already present in the balance sheet, the amount of such provisions or reserves eligible for inclusion will be limited to a maximum of 1.25 percentage points, or exceptionally and temporarily up to 2.0 percentage points.[3]

(d) Hybrid (debt/equity) capital instruments. This heading includes a range of instruments which combine characteristics of equity capital and of debt. Their precise specifications differ from country to country, but they should meet the following requirements:

- they are *unsecured, subordinated* and *fully paid-up*;
- they are *not redeemable* at the initiative of the holder or without the prior consent of the supervisory authority;
- they are *available to participate in losses* without the bank being obliged to cease trading (unlike conventional subordinated debt);
- although the capital instrument may carry an obligation to pay interest that cannot permanently be reduced or waived (unlike dividends on ordinary shareholders' equity), *it should allow service obligations to be deferred* (as with cumulative preference shares) where the profitability of the bank would not support payment.

---

3 This limit would apply in the event that no agreement is reached on a consistent basis for including unencumbered provisions or reserves in capital (see paragraphs 20 and 21).

Cumulative preference shares, having these characteristics, would be eligible for inclusion in this category. In addition, the following are examples of instruments that may be eligible for inclusion: long-term preferred shares in Canada, titres participatifs and titres subordonnés à durée indéterminée in France, Genusscheine in Germany, perpetual subordinated debt and preference shares in the United Kingdom and mandatory convertible debt instruments in the United States. Debt capital instruments which do not meet these criteria may be eligible for inclusion in item (e).

(e) Subordinated term debt: includes conventional unsecured subordinated debt capital instruments with a minimum original fixed term to maturity of over five years and limited life redeemable preference shares. During the last five years to maturity, a cumulative discount (or amortisation) factor of 20% per year will be applied to reflect the diminishing value of these instruments as a continuing source of strength. Unlike instruments included in item (d), these instruments are not normally available to participate in the losses of a bank which continues trading. For this reason these instruments will be limited to a maximum of 50% of tier 1.

Annex 2

Risk weights by category of on-balance-sheet asset

0%	(a)	Cash[1]
	(b)	Claims on central governments and central banks denominated in national currency and funded in that currency
	(c)	Other claims on OECD[2] central governments[3] and central banks
	(d)	Claims collateralised by cash of OECD central-government securities[3] or guaranteed by OECD central governments[4]
0, 10, 20 or 50% (at national discretion)	(a)	Claims on domestic public-sector entities, excluding central government, and loans guaranteed[4] by such entities
20%	(a)	Claims on multilateral development banks (IBRD, IADB, AsDB, AfDB, EIB)[5] and claims guaranteed by, or collateralised by securities issued by such banks[4]
	(b)	Claims on banks incorporated in the OECD and loans guaranteed[4] by OECD incorporated banks

---

1 Includes (at national discretion) gold bullion held in own vaults or on an allocated basis to the extent backed by bullion liabilities.

2 For the purpose of this exercise, the OECD group comprises countries which are full members of the OECD or which have concluded special lending arrangements with the IMF associated with the Fund's General Arrangements to Borrow.

3 Some member countries intend to apply weights to securities issued by OECD central governments to take account of investment risk. These weights would, for example, be 10% for all securities or 10% for those maturing in up to one year and 20% for those maturing in over one year.

4 Commercial loans partially guaranteed by these bodies will attract equivalent low weights on that part of the loan which is fully covered. Similarly, loans partially collateralised by cash or securities issued by OECD central governments and multilateral development banks will attract low weights on that part of the loan which is fully covered.

5 Claims on other multilateral development banks in which G-10 countries are shareholding members may, at national discretion, also attract a 20% weight.

(c) Claims on banks incorporated in countries outside the OECD with a residual maturity of up to one year and loans with a residual maturity of up to one year guaranteed by banks incorporated in countries outside the OECD

(d) Claims on non-domestic OECD public-sector entities, excluding central government, and loans guaranteed[4] by such entities

(e) Cash items in process of collection

50% (a) Loans fully secured by mortgage on residential property that is or will be occupied by the borrower or that is rented

100% (a) Claims on the private sector

(b) Claims on banks incorporated outside the OECD with a residual maturity of over one year

(c) Claims on central governments outside the OECD (unless denominated in national currency - and funded in that currency - see above)

(d) Claims on commercial companies owned by the public sector

(e) Premises, plant and equipment and other fixed assets

(f) Real estate and other investments (including non-consolidated investment participations in other companies)

(g) Capital instruments issued by other banks (unless deducted from capital)

(h) all other assets

Annex 3

Credit conversion factors for off-balance-sheet items

The framework takes account of the credit risk on off-balance-sheet exposures by applying credit conversion factors to the different types of off-balance-sheet instrument or transaction. With the exception of foreign exchange and interest rate related contingencies, the credit conversion factors are set out in the table below. They are derived from the estimated size and likely occurrence of the credit exposure, as well as the relative degree of credit risk as identified in the Committee's paper "*The management of banks' off-balance-sheet exposures: a supervisory perspective*" issued in March 1986. The credit conversion factors would be multiplied by the weights applicable to the category of the counterparty for an on-balance-sheet transaction (see Annex 2).

Instruments

	Instruments	Credit conversion factors
1.	Direct credit substitutes, e.g. general guarantees of indebtedness (including standby letters of credit serving as financial guarantees for loans and securities) and acceptances (including endorsements with the character of acceptances)	100%
2.	Certain transaction-related contingent items (e.g. performance bonds, bid bonds, warranties and standby letters of credit related to particular transactions)	50%
3.	Short-term self-liquidating trade-related contingencies (such as documentary credits collateralised by the underlying shipments)	20%

4.	Sale and repurchase agreements and asset sales with recourse,[1] where the credit risk remains with the bank	100%
5.	Forward asset purchases, forward forward deposits and partly-paid shares and securities,[1] which represent commitments with certain drawdown	100%
6.	Note issuance facilities and revolving underwriting facilities	50%
7.	Other commitments (e.g. formal standby facilities and credit lines) with an original[2] maturity of over one year	50%
8.	Similar commitments with an original[2] maturity of up to one year, or which can be unconditionally cancelled at any time	0%

(N.B. Member countries will have some limited discretion to allocate particular instruments into items 1 to 8 above according to the characteristics of the instrument in the national market.)

Foreign exchange and interest rate related contingencies

The treatment of foreign exchange and interest rate related items needs special attention because banks are not exposed to credit risk for the full face value of their contracts, but only to the potential cost of replacing the cash flow (on contracts showing positive value) if the counterparty defaults. The credit equivalent amounts will depend inter alia on the maturity of the contract and on the volatility of the rates underlying that type of instrument.

Despite the wide range of different instruments in the market, the theoretical basis for assessing the credit risk on all of them has been the same. It has consisted of an analysis of the behaviour of matched pairs of swaps under different volatility assumptions. Since exchange rate contracts involve an exchange of principal on maturity, as well as being generally more volatile, higher conversion factors are proposed for those instruments which

---

1 These items are to be weighted according to the type of asset and not according to the type of counterparty with whom the transaction has been entered into. Reverse repos (i.e. purchase and resale agreement - where the bank is the receiver of the asset) are to be treated as collateralised loans, reflecting the economic reality of the transaction. The risk is therefore to be measured as an exposure on the counterparty. Where the asset temporarily acquired is a security which attracts a preferential risk weighting, this would be recognised as collateral and the risk weighting would be reduced accordingly.

2 But see footnote 5 in the main text.

feature exchange rate risk. Interest rate contracts[3] are defined to include single-currency interest rate swaps, basis swaps, forward rate agreements, interest rate futures, interest rate options purchased and similar instruments. Exchange rate contracts[3] include cross-currency interest rate swaps, forward foreign exchange contracts, currency futures, currency options purchased and similar instruments. Exchange rate contracts with an original maturity of fourteen calendar days or less are excluded.

A majority of G-10 supervisory authorities are of the view that the best way to assess the credit risk on these items is to ask banks to calculate the current replacement cost by marketing contracts to market, thus capturing the current exposure without any need for estimation, and then adding a factor (the "add-on") to reflect the potential future exposure over the remaining life of the contract. It has been agreed that, in order to calculate the credit equivalent amount of its off-balance-sheet interest rate and foreign exchange rate instruments under this **current exposure method**, a bank would sum:

- the total replacement cost (obtained by "marking to market") of all its contracts with positive value, and
- an amount for potential future credit exposure calculated on the basis of the total notional principal amount of its book, split by residual maturity as follows:

Residual maturity	Interest rate contracts	Exchange rate contracts
Less than one year	nil	1.0%
One year and over	0.5%	5.0%

No potential credit exposure would be calculated for single currency floating/floating interest rate swaps; the credit exposure on these contracts would be evaluated solely on the basis of their mark-to-market value.

A few G-10 supervisors believe that this two-step approach, incorporating a "mark-to-market" element, is not consistent with the remainder of the capital framework. They favour a simpler method whereby the potential credit exposure is estimated against each type of contract and a notional capital weight allotted, no matter what the market value of the contract might be at a particular reporting date. It has therefore been agreed supervisory

---

3 Instruments traded on exchanges may be excluded where they are subject to daily margining requirements. Options purchased over the counter are included with the same conversion factors as other instruments, but this decision might be reviewed in the light of future experience.

authorities should have discretion[4] to apply the alternative method of calculation described below, in which credit conversion factors are derived without reference to the current market price of the instruments. In deciding on what those notional credit conversion factors should be, it has been agreed that a slightly more cautious bias is justified since the current exposure is not being calculated on a regular basis.

In order to arrive at the credit equivalent amount using this **original exposure method**, a bank would simply apply one of the following two sets of conversion factors to the notional principal amounts of each instrument according to the nature of the instrument and its maturity:

Maturity[5]	**Interest rate contracts**	**Exchange rate contracts**
Less than one year	0.5%	2.0%
One year and less than two years	1.0%	5.0% (i.e. 2% + 3%)
For each additional year	1.0%	3.0%

It is emphasised that the above conversion factors, as well as the "add-ons" for the current exposure method, should be regarded as provisional and may be subject to amendment as a result of changes in the volatility of exchange rates and interest rates.

Careful consideration has been given to the arguments put forward for recognising **netting**, i.e. for weighting the net rather than the gross claims arising out of swaps and similar contracts with the same counterparties. The criterion on which a decision has been based is the status of a netting contract under national bankruptcy regulations. If a liquidator of a failed counterparty has (or may have) the right to unbundle the netting contracts, demanding performance on those contracts favourable to his client and defaulting on unfavourable contracts, there is no reduction in counterparty risk. Accordingly, it has been agreed that:

- banks may net contracts subject to novation,[6] since it appears that counterparty risk is genuinely reduced by the substitution of a novated contract which legally

---

4 Some national authorities may permit individual banks to choose which method to adopt, it being understood that once a bank had chosen to apply the current exposure method, it would not be allowed to switch back to the original exposure method.

5 For interest rate contracts, there is national discretion as to whether the conversion factors are to be based on original or residual maturity. For exchange rate contracts, the conversion factors are to be calculated according to the original maturity of the instrument.

6 Netting by novation as defined in this context is a bilateral contract between two counterparties under which any obligation to each other to deliver a given currency on a given date is automatically

extinguishes the previous obligation. However, since under some national bankruptcy laws liquidators may have the right to unbundle transactions undertaken within a given period under a charge of fraudulent preference, supervisory authorities will have national discretion to require a phase-in period before a novation agreement can be recognised in the weighting framework;

- banks may not for the time being net contracts subject to close-out clauses.[7] The effectiveness of such agreements in an insolvency has not yet been tested in the courts, nor has it been possible to obtain satisfactory legal opinion that liquidators would not be able to overturn them. However, the Committee does not wish to discourage market participants from employing clauses which might well afford protection in certain circumstances in some national jurisdictions and would be prepared to reverse its conclusion if subsequent decisions in the courts support the integrity of close-out netting agreements.[8] In any event, the Committee will continue its work to assess the acceptability of various forms of netting.

Once the bank has calculated the credit equivalent amounts, whether according to the current or the original exposure method, they are to be **weighted** according to the category of counterparty in the same way as in the main framework, including concessionary weighting in respect of exposures backed by eligible guarantees and collateral. In addition, since most counterparties in these markets, particularly for long-term contracts, tend to be first-class names, it has been agreed that a 50% weight will be applied in respect of counterparties which would otherwise attract a 100% weight.[9] However, the Committee will keep a close eye on the credit quality of participants in these markets and reserves the right to raise the weights if average credit quality deteriorates or if loss experience increases.

---

amalgamated with all other obligations for the same currency and value date, legally substituting one single net amount for the previous gross obligations.

7 Close-out as defined in this context refers to a bilateral contract which provides that, if one of the counterparties is wound up, the outstanding obligations between the two are accelerated and netted to determine the counterparty's net exposure.

8 The other principal form of netting, payments netting, which is designed to reduce the counterparty risk arising out of daily settlements, will not be recognised in the capital framework since the counterparty's gross obligations are not in any way affected.

9 Some member countries reserve the right to apply the full 100% weight.

Annex 4

Transitional arrangements

	Initial	**End-1990**	**End-1992**
1. Minimum standard	The level prevailing at end-1987	7.25%	8.0%
2. Measurement formula	Core elements plus 100%	Core elements plus 100% (3.625% plus 3.625%)	Core elements plus 100% (4% plus 4%)
3. Supplementary elements included in core	Maximum of 25% of total core	Maximum 10% of total core (i.e. 0.36%)	None
4. Limit on general loan-loss reserves in supplementary elements*	No limit	1.5 percentage points or, exceptionally up to 2.0 percentage points	1.25 percentage points or, exceptionally and temporarily up to 2.0 percentage points
5. Limit on term subordinated debt in supplementary elements	No limit (at discretion)	No limit (at discretion)	Maximum of 50% of tier 1
6. Deduction for goodwill	Deducted from tier 1 (at discretion)	Deducted from tier 1 (at discretion)	Deducted from tier 1

* This limit would only apply in the event that no agreement is reached on a consistent basis for including unencumbered provisions or reserves in capital (see paragraphs 20 and 21).

International Convergence of Capital Measurement and Capital Standards: A Revised Framework

(Comprehensive Version: June 2006)

Introduction

1. This report presents the outcome of the Basel Committee on Banking Supervision's ("the Committee")[1] work over recent years to secure international convergence on revisions to supervisory regulations governing the capital adequacy of internationally active banks. Following the publication of the Committee's first round of proposals for revising the capital adequacy framework in June 1999, an extensive consultative process was set in train in all member countries and the proposals were also circulated to supervisory authorities worldwide. The Committee subsequently released additional proposals for consultation in January 2001 and April 2003 and furthermore conducted three quantitative impact studies related to its proposals. As a result of these efforts, many valuable improvements have been made to the original proposals. The present paper is now a statement of the Committee agreed by all its members. It sets out the details of the agreed Framework for measuring capital adequacy and the minimum standard to be achieved which the national supervisory authorities represented on the Committee will propose for adoption in their respective countries. This Framework and the standard it contains have been endorsed by the Central Bank Governors and Heads of Banking Supervision of the Group of Ten countries.

2. The Committee expects its members to move forward with the appropriate adoption procedures in their respective countries. In a number of instances, these procedures will include additional impact assessments of the Committee's Framework as well as further opportunities for comments by interested parties to be provided to national authorities. The Committee intends the Framework set out here to be available for implementation as of year-end 2006. However, the Committee feels that one further year of impact studies or parallel calculations will be needed for the most advanced approaches, and these therefore will be available for implementation as of year-end 2007. More details on the transition to the revised Framework and its relevance to particular approaches are set out in paragraphs 45 to 49.

3. This document is being circulated to supervisory authorities worldwide with a view to encouraging them to consider adopting this revised Framework at such time as they believe is consistent with their broader supervisory priorities. While the revised Framework has been designed to provide options for banks and banking systems worldwide, the Committee acknowledges that moving toward its adoption in the near future may not be a first priority for all non-G10 supervisory authorities in terms of what is needed to strengthen their supervision. Where this is the case, each national supervisor should consider carefully the benefits of the revised Framework in the context of its domestic banking system when developing a timetable and approach to implementation.

---

1 The Basel Committee on Banking Supervision is a committee of banking supervisory authorities that was established by the central bank governors of the Group of Ten countries in 1975. It consists of senior representatives of bank supervisory authorities and central banks from Belgium, Canada, France, Germany, Italy, Japan, Luxembourg, the Netherlands, Spain, Sweden, Switzerland, the United Kingdom, and the United States. It usually meets at the Bank for International Settlements in Basel, where its permanent Secretariat is located.

4. The fundamental objective of the Committee's work to revise the 1988 Accord[2] has been to develop a framework that would further strengthen the soundness and stability of the international banking system while maintaining sufficient consistency that capital adequacy regulation will not be a significant source of competitive inequality among internationally active banks. The Committee believes that the revised Framework will promote the adoption of stronger risk management practices by the banking industry, and views this as one of its major benefits. The Committee notes that, in their comments on the proposals, banks and other interested parties have welcomed the concept and rationale of the three pillars (minimum capital requirements, supervisory review, and market discipline) approach on which the revised Framework is based. More generally, they have expressed support for improving capital regulation to take into account changes in banking and risk management practices while at the same time preserving the benefits of a framework that can be applied as uniformly as possible at the national level.

5. In developing the revised Framework, the Committee has sought to arrive at significantly more risk-sensitive capital requirements that are conceptually sound and at the same time pay due regard to particular features of the present supervisory and accounting systems in individual member countries. It believes that this objective has been achieved. The Committee is also retaining key elements of the 1988 capital adequacy framework, including the general requirement for banks to hold total capital equivalent to at least 8% of their risk-weighted assets; the basic structure of the 1996 Market Risk Amendment regarding the treatment of market risk; and the definition of eligible capital.

6. A significant innovation of the revised Framework is the greater use of assessments of risk provided by banks' internal systems as inputs to capital calculations. In taking this step, the Committee is also putting forward a detailed set of minimum requirements designed to ensure the integrity of these internal risk assessments. It is not the Committee's intention to dictate the form or operational detail of banks' risk management policies and practices. Each supervisor will develop a set of review procedures for ensuring that banks' systems and controls are adequate to serve as the basis for the capital calculations. Supervisors will need to exercise sound judgements when determining a bank's state of readiness, particularly during the implementation process. The Committee expects national supervisors will focus on compliance with the minimum requirements as a means of ensuring the overall integrity of a bank's ability to provide prudential inputs to the capital calculations and not as an end in itself.

7. The revised Framework provides a range of options for determining the capital requirements for credit risk and operational risk to allow banks and supervisors to select approaches that are most appropriate for their operations and their financial market infrastructure. In addition, the Framework also allows for a limited degree of national discretion in the way in which each of these options may be applied, to adapt the standards to different conditions of national markets. These features, however, will necessitate substantial efforts by national authorities to ensure sufficient consistency in application. The Committee intends to monitor and review the application of the Framework in the period ahead with a view to achieving even greater consistency. In particular, its Accord Implementation Group (AIG) was established to promote consistency in the Framework's application by encouraging supervisors to exchange information on implementation approaches.

[2] *International Convergence of Capital Measurement and Capital Standards*, Basel Committee on Banking Supervision (July 1988), as amended.

8. The Committee has also recognised that home country supervisors have an important role in leading the enhanced cooperation between home and host country supervisors that will be required for effective implementation. The AIG is developing practical arrangements for cooperation and coordination that reduce implementation burden on banks and conserve supervisory resources. Based on the work of the AIG, and based on its interactions with supervisors and the industry, the Committee has issued general principles for the cross-border implementation of the revised Framework and more focused principles for the recognition of operational risk capital charges under advanced measurement approaches for home and host supervisors.

9. It should be stressed that the revised Framework is designed to establish *minimum* levels of capital for internationally active banks. As under the 1988 Accord, national authorities will be free to adopt arrangements that set higher levels of minimum capital. Moreover, they are free to put in place supplementary measures of capital adequacy for the banking organisations they charter. National authorities may use a supplementary capital measure as a way to address, for example, the potential uncertainties in the accuracy of the measure of risk exposures inherent in any capital rule or to constrain the extent to which an organisation may fund itself with debt. Where a jurisdiction employs a supplementary capital measure (such as a leverage ratio or a large exposure limit) in conjunction with the measure set forth in this Framework, in some instances the capital required under the supplementary measure may be more binding. More generally, under the second pillar, supervisors should expect banks to operate above minimum regulatory capital levels.

10. The revised Framework is more risk sensitive than the 1988 Accord, but countries where risks in the local banking market are relatively high nonetheless need to consider if banks should be required to hold additional capital over and above the Basel minimum. This is particularly the case with the more broad brush standardised approach, but, even in the case of the internal ratings-based (IRB) approach, the risk of major loss events may be higher than allowed for in this Framework.

11. The Committee also wishes to highlight the need for banks and supervisors to give appropriate attention to the second (supervisory review) and third (market discipline) pillars of the revised Framework. It is critical that the minimum capital requirements of the first pillar be accompanied by a robust implementation of the second, including efforts by banks to assess their capital adequacy and by supervisors to review such assessments. In addition, the disclosures provided under the third pillar of this Framework will be essential in ensuring that market discipline is an effective complement to the other two pillars.

12. The Committee is aware that interactions between regulatory and accounting approaches at both the national and international level can have significant consequences for the comparability of the resulting measures of capital adequacy and for the costs associated with the implementation of these approaches. The Committee believes that its decisions with respect to unexpected and expected losses represent a major step forward in this regard. The Committee and its members intend to continue playing a pro-active role in the dialogue with accounting authorities in an effort to reduce, wherever possible, inappropriate disparities between regulatory and accounting standards.

13. The revised Framework presented here reflects several significant changes relative to the Committee's most recent consultative proposal in April 2003. A number of these changes have already been described in the Committee's press statements of October 2003, January 2004 and May 2004. These include the changes in the approach to the treatment of expected losses (EL) and unexpected losses (UL) and to the treatment of securitisation exposures. In addition to these, changes in the treatments of credit risk mitigation and qualifying revolving retail exposures, among others, are also being incorporated. The Committee also has sought to clarify its expectations regarding the need for banks using the

advanced IRB approach to incorporate the effects arising from economic downturns into their loss-given-default (LGD) parameters.

14. The Committee believes it is important to reiterate its objectives regarding the overall level of minimum capital requirements. These are to broadly maintain the aggregate level of such requirements, while also providing incentives to adopt the more advanced risk-sensitive approaches of the revised Framework. To attain the objective, the Committee applies a scaling factor to the risk-weighted asset amounts for credit risk under the IRB approach. The current best estimate of the scaling factor using quantitative impact study data is 1.06. National authorities will continue to monitor capital requirements during the implementation period of the revised Framework. Moreover, the Committee will monitor national experiences with the revised Framework.

15. The Committee has designed the revised Framework to be a more forward-looking approach to capital adequacy supervision, one that has the capacity to evolve with time. This evolution is necessary to ensure that the Framework keeps pace with market developments and advances in risk management practices, and the Committee intends to monitor these developments and to make revisions when necessary. In this regard, the Committee has benefited greatly from its frequent interactions with industry participants and looks forward to enhanced opportunities for dialogue. The Committee also intends to keep the industry apprised of its future work agenda.

16. In July 2005, the Committee published additional guidance in the document *The Application of Basel II to Trading Activities and the Treatment of Double Default Effects*. That guidance was developed jointly with the International Organization of Securities Commissions (IOSCO) and demonstrates the capacity of the revised Framework to evolve with time. It refined the treatments of counterparty credit risk, double default effects, short-term maturity adjustment and failed transactions, and improved the trading book regime.[3]

17. One area where the Committee intends to undertake additional work of a longer-term nature is in relation to the definition of eligible capital. One motivation for this is the fact that the changes in the treatment of expected and unexpected losses and related changes in the treatment of provisions in the Framework set out here generally tend to reduce Tier 1 capital requirements relative to total capital requirements. Moreover, converging on a uniform international capital standard under this Framework will ultimately require the identification of an agreed set of capital instruments that are available to absorb unanticipated losses on a going-concern basis. The Committee announced its intention to review the definition of capital as a follow-up to the revised approach to Tier 1 eligibility as announced in its October 1998 press release, "Instruments eligible for inclusion in Tier 1 capital". It will explore further issues surrounding the definition of regulatory capital, but does not intend to propose changes as a result of this longer-term review prior to the implementation of the revised Framework set out in this document. In the meantime, the Committee will continue its efforts to ensure the consistent application of its 1998 decisions regarding the composition of regulatory capital across jurisdictions.

18. The Committee also seeks to continue to engage the banking industry in a discussion of prevailing risk management practices, including those practices aiming to

---

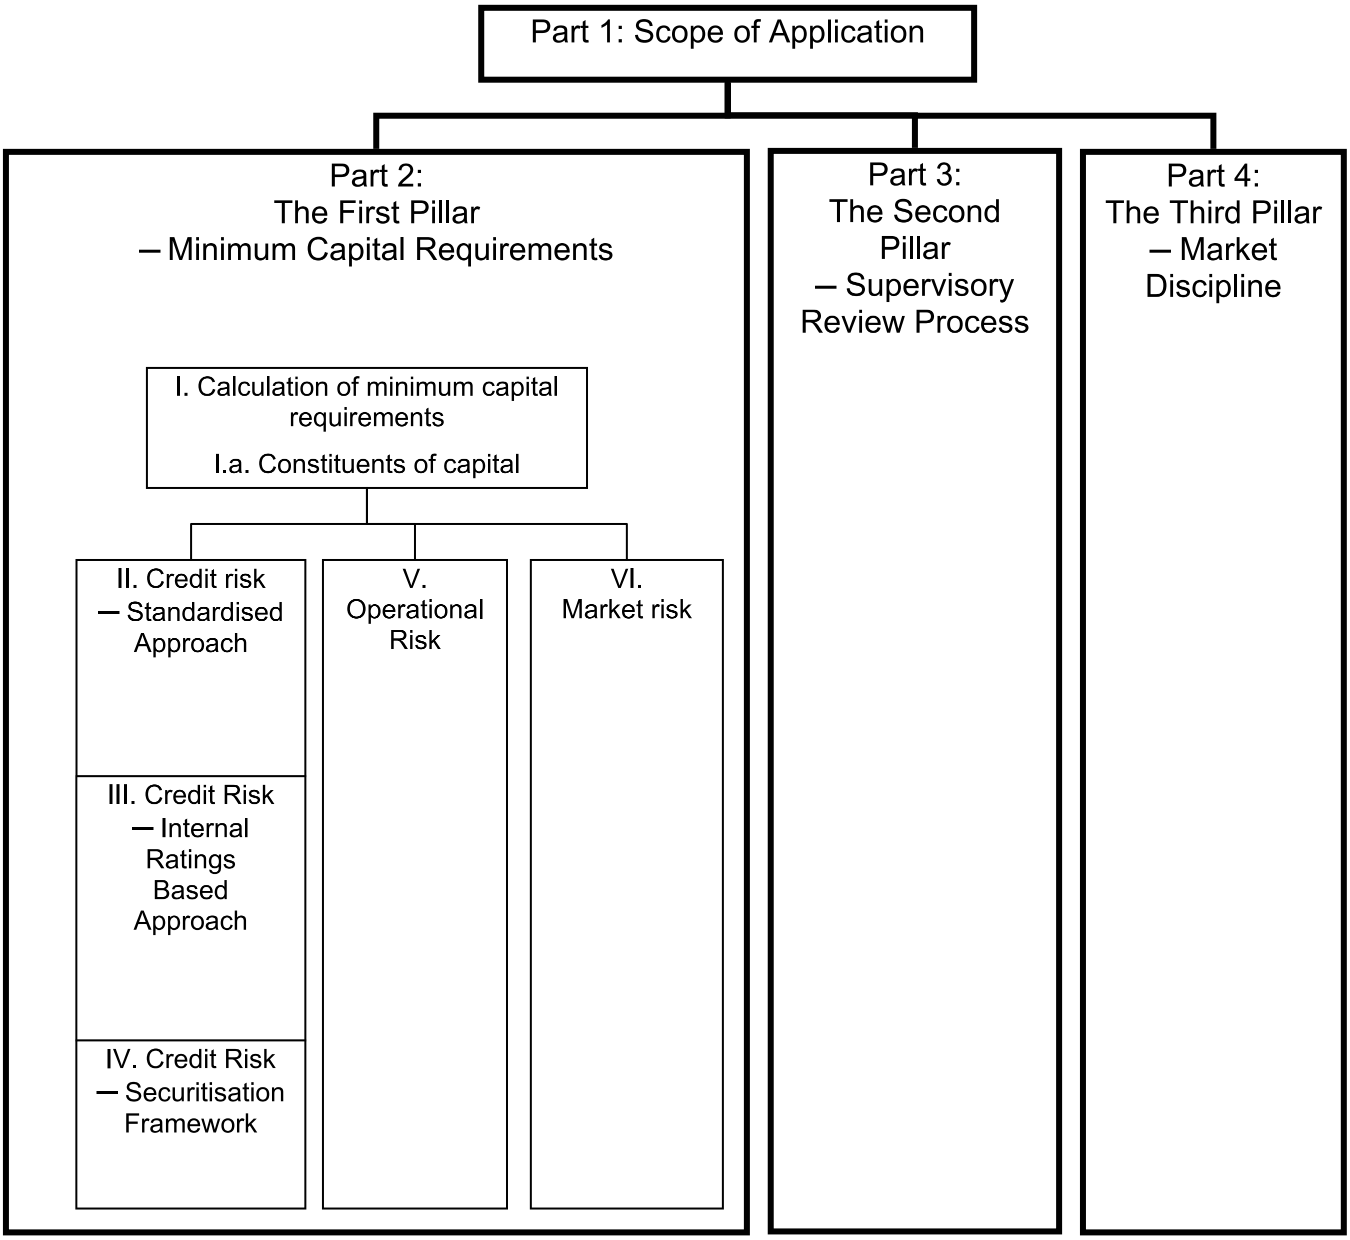
[3] The additional guidance does not modify the definition of trading book set forth in the revised Framework. Rather, it focuses on policies and procedures that banks must have in place to book exposures in their trading book. However, it is the Committee's view that, at the present time, open equity stakes in hedge funds, private equity investments and real estate holdings do not meet the definition of trading book, owing to significant constraints on the ability of banks to liquidate these positions and value them reliably on a daily basis.

produce quantified measures of risk and economic capital. Over the last decade, a number of banking organisations have invested resources in modelling the credit risk arising from their significant business operations. Such models are intended to assist banks in quantifying, aggregating and managing credit risk across geographic and product lines. While the Framework presented in this document stops short of allowing the results of such credit risk models to be used for regulatory capital purposes, the Committee recognises the importance of continued active dialogue regarding both the performance of such models and their comparability across banks. Moreover, the Committee believes that a successful implementation of the revised Framework will provide banks and supervisors with critical experience necessary to address such challenges. The Committee understands that the IRB approach represents a point on the continuum between purely regulatory measures of credit risk and an approach that builds more fully on internal credit risk models. In principle, further movements along that continuum are foreseeable, subject to an ability to address adequately concerns about reliability, comparability, validation, and competitive equity. In the meantime, the Committee believes that additional attention to the results of internal credit risk models in the supervisory review process and in banks' disclosures will be highly beneficial for the accumulation of information on the relevant issues.

19. This document is divided into four parts as illustrated in the following chart. The first part, scope of application, details how the capital requirements are to be applied within a banking group. Calculation of the minimum capital requirements for credit risk, operational risk, and market risk are provided in part two. The third and fourth parts outline expectations concerning supervisory review and market discipline, respectively.

19(i). This comprehensive version of the revised Framework incorporates the additional guidance set forth in the Committee's paper *The Application of Basel II to Trading Activities and the Treatment of Double Default Effects* (July 2005), the *Amendment to the Capital Accord to Incorporate Market Risks* (January 1996) as well as elements of the 1988 Accord that remain in effect. This version is primarily aimed at providing banks with a comprehensive view of international solvency standards. It does not contain any new elements. Each of the individual documents incorporated into this text (i.e. the 1988 Accord, the Amendment to the Capital Accord to Incorporate Market Risks, and *The Application of Basel II to Trading Activities and the Treatment of Double Default Effects)* will remain available on a stand-alone basis.

Structure of this document



Part 1: Scope of Application

I. Introduction

20. This Framework will be applied on a consolidated basis to internationally active banks. This is the best means to preserve the integrity of capital in banks with subsidiaries by eliminating double gearing.

21. The scope of application of the Framework will include, on a fully consolidated basis, any holding company that is the parent entity within a banking group to ensure that it captures the risk of the whole banking group.[4] Banking groups are groups that engage predominantly in banking activities and, in some countries, a banking group may be registered as a bank.

22. The Framework will also apply to all internationally active banks at every tier within a banking group, also on a fully consolidated basis (see illustrative chart at the end of this section).[5] A three-year transitional period for applying full sub-consolidation will be provided for those countries where this is not currently a requirement.

23. Further, as one of the principal objectives of supervision is the protection of depositors, it is essential to ensure that capital recognised in capital adequacy measures is readily available for those depositors. Accordingly, supervisors should test that individual banks are adequately capitalised on a stand-alone basis.

II. Banking, securities and other financial subsidiaries

24. To the greatest extent possible, all banking and other relevant financial activities[6] (both regulated and unregulated) conducted within a group containing an internationally active bank will be captured through consolidation. Thus, majority-owned or -controlled banking entities, securities entities (where subject to broadly similar regulation or where securities activities are deemed banking activities) and other financial entities[7] should generally be fully consolidated.

25. Supervisors will assess the appropriateness of recognising in consolidated capital the minority interests that arise from the consolidation of less than wholly owned banking,

---

4 A holding company that is a parent of a banking group may itself have a parent holding company. In some structures, this parent holding company may not be subject to this Framework because it is not considered a parent of a banking group.

5 As an alternative to full sub-consolidation, the application of this Framework to the stand-alone bank (i.e. on a basis that does not consolidate assets and liabilities of subsidiaries) would achieve the same objective, providing the full book value of any investments in subsidiaries and significant minority-owned stakes is deducted from the bank's capital.

6 "Financial activities" do not include insurance activities and "financial entities" do not include insurance entities.

7 Examples of the types of activities that financial entities might be involved in include financial leasing, issuing credit cards, portfolio management, investment advisory, custodial and safekeeping services and other similar activities that are ancillary to the business of banking.

securities or other financial entities. Supervisors will adjust the amount of such minority interests that may be included in capital in the event the capital from such minority interests is not readily available to other group entities.

26. There may be instances where it is not feasible or desirable to consolidate certain securities or other regulated financial entities. This would be only in cases where such holdings are acquired through debt previously contracted and held on a temporary basis, are subject to different regulation, or where non-consolidation for regulatory capital purposes is otherwise required by law. In such cases, it is imperative for the bank supervisor to obtain sufficient information from supervisors responsible for such entities.

27. If any majority-owned securities and other financial subsidiaries are not consolidated for capital purposes, all equity and other regulatory capital investments in those entities attributable to the group will be deducted, and the assets and liabilities, as well as third-party capital investments in the subsidiary will be removed from the bank's balance sheet. Supervisors will ensure that the entity that is not consolidated and for which the capital investment is deducted meets regulatory capital requirements. Supervisors will monitor actions taken by the subsidiary to correct any capital shortfall and, if it is not corrected in a timely manner, the shortfall will also be deducted from the parent bank's capital.

III. Significant minority investments in banking, securities and other financial entities

28. Significant minority investments in banking, securities and other financial entities, where control does not exist, will be excluded from the banking group's capital by deduction of the equity and other regulatory investments. Alternatively, such investments might be, under certain conditions, consolidated on a pro rata basis. For example, pro rata consolidation may be appropriate for joint ventures or where the supervisor is satisfied that the parent is legally or de facto expected to support the entity on a proportionate basis only and the other significant shareholders have the means and the willingness to proportionately support it. The threshold above which minority investments will be deemed significant and be thus either deducted or consolidated on a pro-rata basis is to be determined by national accounting and/or regulatory practices. As an example, the threshold for pro-rata inclusion in the European Union is defined as equity interests of between 20% and 50%.

29. The Committee reaffirms the view set out in the 1988 Accord that reciprocal cross-holdings of bank capital artificially designed to inflate the capital position of banks will be deducted for capital adequacy purposes.

IV. Insurance entities

30. A bank that owns an insurance subsidiary bears the full entrepreneurial risks of the subsidiary and should recognise on a group-wide basis the risks included in the whole group. When measuring regulatory capital for banks, the Committee believes that at this stage it is, in principle, appropriate to deduct banks' equity and other regulatory capital investments in insurance subsidiaries and also significant minority investments in insurance entities. Under this approach the bank would remove from its balance sheet assets and liabilities, as well as third party capital investments in an insurance subsidiary. Alternative approaches that can be

applied should, in any case, include a group-wide perspective for determining capital adequacy and avoid double counting of capital.

31. Due to issues of competitive equality, some G10 countries will retain their existing risk weighting treatment[8] as an exception to the approaches described above and introduce risk aggregation only on a consistent basis to that applied domestically by insurance supervisors for insurance firms with banking subsidiaries.[9] The Committee invites insurance supervisors to develop further and adopt approaches that comply with the above standards.

32. Banks should disclose the national regulatory approach used with respect to insurance entities in determining their reported capital positions.

33. The capital invested in a majority-owned or controlled insurance entity may exceed the amount of regulatory capital required for such an entity (surplus capital). Supervisors may permit the recognition of such surplus capital in calculating a bank's capital adequacy, under limited circumstances.[10] National regulatory practices will determine the parameters and criteria, such as legal transferability, for assessing the amount and availability of surplus capital that could be recognised in bank capital. Other examples of availability criteria include: restrictions on transferability due to regulatory constraints, to tax implications and to adverse impacts on external credit assessment institutions' ratings. Banks recognising surplus capital in insurance subsidiaries will publicly disclose the amount of such surplus capital recognised in their capital. Where a bank does not have a full ownership interest in an insurance entity (e.g. 50% or more but less than 100% interest), surplus capital recognised should be proportionate to the percentage interest held. Surplus capital in significant minority-owned insurance entities will not be recognised, as the bank would not be in a position to direct the transfer of the capital in an entity which it does not control.

34. Supervisors will ensure that majority-owned or controlled insurance subsidiaries, which are not consolidated and for which capital investments are deducted or subject to an alternative group-wide approach, are themselves adequately capitalised to reduce the possibility of future potential losses to the bank. Supervisors will monitor actions taken by the subsidiary to correct any capital shortfall and, if it is not corrected in a timely manner, the shortfall will also be deducted from the parent bank's capital.

V. Significant investments in commercial entities

35. Significant minority and majority investments in commercial entities which exceed certain materiality levels will be deducted from banks' capital. Materiality levels will be

---

8 For banks using the standardised approach this would mean applying no less than a 100% risk weight, while for banks on the IRB approach, the appropriate risk weight based on the IRB rules shall apply to such investments.

9 Where the existing treatment is retained, third party capital invested in the insurance subsidiary (i.e. minority interests) cannot be included in the bank's capital adequacy measurement.

10 In a deduction approach, the amount deducted for all equity and other regulatory capital investments will be adjusted to reflect the amount of capital in those entities that is in surplus to regulatory requirements, i.e. the amount deducted would be the lesser of the investment or the regulatory capital requirement. The amount representing the surplus capital, i.e. the difference between the amount of the investment in those entities and their regulatory capital requirement, would be risk-weighted as an equity investment. If using an alternative group-wide approach, an equivalent treatment of surplus capital will be made.

determined by national accounting and/or regulatory practices. Materiality levels of 15% of the bank's capital for individual significant investments in commercial entities and 60% of the bank's capital for the aggregate of such investments, or stricter levels, will be applied. The amount to be deducted will be that portion of the investment that exceeds the materiality level.

36. Investments in significant minority- and majority-owned and -controlled commercial entities below the materiality levels noted above will be risk-weighted at no lower than 100% for banks using the standardised approach. For banks using the IRB approach, the investment would be risk weighted in accordance with the methodology the Committee is developing for equities and would not be less than 100%.

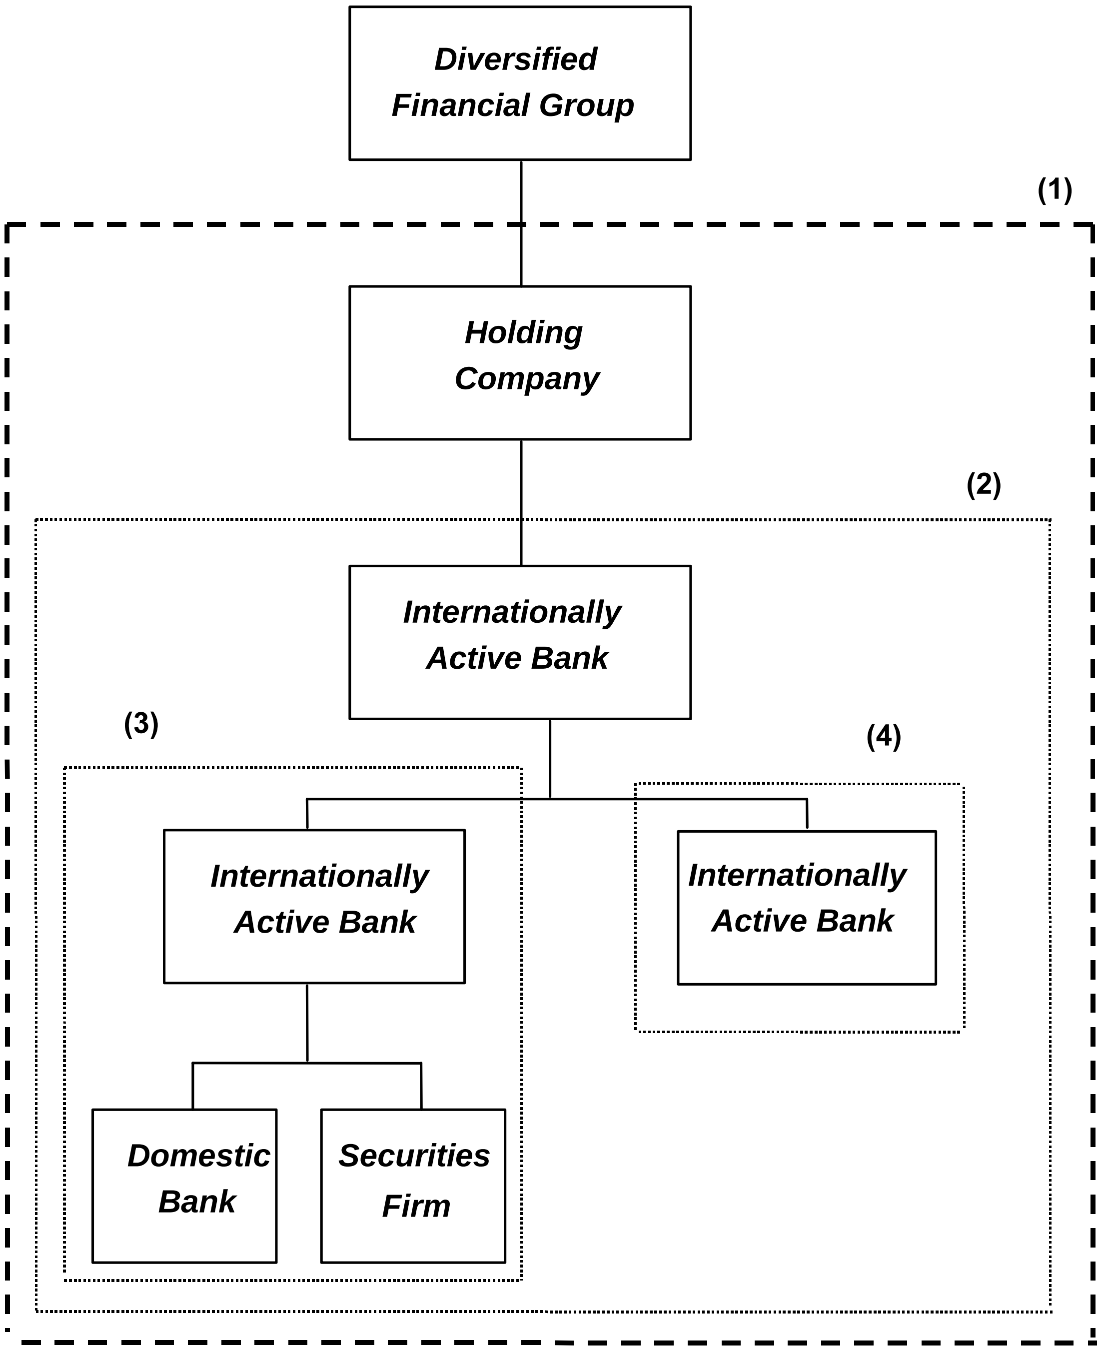
VI. Deduction of investments pursuant to this part

37. Where deductions of investments are made pursuant to this part on scope of application, the deductions will be 50% from Tier 1 and 50% from Tier 2 capital.

38. Goodwill relating to entities subject to a deduction approach pursuant to this part should be deducted from Tier 1 in the same manner as goodwill relating to consolidated subsidiaries, and the remainder of the investments should be deducted as provided for in this part. A similar treatment of goodwill should be applied, if using an alternative group-wide approach pursuant to paragraph 30.

39. The limits on Tier 2 and Tier 3 capital and on innovative Tier 1 instruments will be based on the amount of Tier 1 capital after deduction of goodwill but before the deductions of investments pursuant to this part on scope of application (see Annex 1 for an example how to calculate the 15% limit for innovative Tier 1 instruments).

ILLUSTRATION OF NEW SCOPE OF APPLICATION OF THIS FRAMEWORK



(1) Boundary of predominant banking group. The Framework is to be applied at this level on a consolidated basis, i.e. up to holding company level (paragraph 21).

(2), (3) and **(4)**: the Framework is also to be applied at lower levels to all internationally active banks on a consolidated basis.

Part 2: The First Pillar – Minimum Capital Requirements

I. Calculation of minimum capital requirements

40. Part 2 presents the calculation of the total minimum capital requirements for credit, market and operational risk. The capital ratio is calculated using the definition of regulatory capital and risk-weighted assets. The total capital ratio must be no lower than 8%. Tier 2 capital is limited to 100% of Tier 1 capital.

A. Regulatory capital

41. The definition of eligible regulatory capital, as outlined in the 1988 Accord and clarified in the 27 October 1998 press release on "Instruments eligible for inclusion in Tier 1 capital", remains in place except for the modifications in paragraphs 37 to 39 and 43. The definition is outlined in paragraphs 49 (i) to 49 (xviii) and in Annex Ia.

42. Under the standardised approach to credit risk, general provisions, as explained in paragraphs 381 to 383, can be included in Tier 2 capital subject to the limit of 1.25% of risk-weighted assets.

43. Under the internal ratings-based (IRB) approach, the treatment of the 1988 Accord to include general provisions (or general loan-loss reserves) in Tier 2 capital is withdrawn. Banks using the IRB approach for securitisation exposures or the PD/LGD approach for equity exposures must first deduct the EL amounts subject to the corresponding conditions in paragraphs 563 and 386, respectively. Banks using the IRB approach for other asset classes must compare (i) the amount of total eligible provisions, as defined in paragraph 380, with (ii) the total expected losses amount as calculated within the IRB approach and defined in paragraph 375. Where the total expected loss amount exceeds total eligible provisions, banks must deduct the difference. Deduction must be on the basis of 50% from Tier 1 and 50% from Tier 2. Where the total expected loss amount is less than total eligible provisions, as explained in paragraphs 380 to 383, banks may recognise the difference in Tier 2 capital up to a maximum of 0.6% of credit risk-weighted assets. At national discretion, a limit lower than 0.6% may be applied.

B. Risk-weighted assets

44. Total risk-weighted assets are determined by multiplying the capital requirements for market risk and operational risk by 12.5 (i.e. the reciprocal of the minimum capital ratio of 8%) and adding the resulting figures to the sum of risk-weighted assets for credit risk. The Committee applies a scaling factor in order to broadly maintain the aggregate level of minimum capital requirements, while also providing incentives to adopt the more advanced risk-sensitive approaches of the Framework.[11] The scaling factor is applied to the risk-weighted asset amounts for credit risk assessed under the IRB approach.

---

[11] The current best estimate of the scaling factor is 1.06. National authorities will continue to monitor capital requirements during the implementation period of this Framework. Moreover, the Committee will monitor national experiences with this Framework.

C. Transitional arrangements

45. For banks using the IRB approach for credit risk or the Advanced Measurement Approaches (AMA) for operational risk, there will be a capital floor following implementation of this Framework. Banks must calculate the difference between (i) the floor as defined in paragraph 46 and (ii) the amount as calculated according to paragraph 47. If the floor amount is larger, banks are required to add 12.5 times the difference to risk-weighted assets.

46. The capital floor is based on application of the 1988 Accord. It is derived by applying an adjustment factor to the following amount: (i) 8% of the risk-weighted assets, (ii) plus Tier 1 and Tier 2 deductions, and (iii) less the amount of general provisions that may be recognised in Tier 2. The adjustment factor for banks using the foundation IRB approach for the year beginning year-end 2006 is 95%. The adjustment factor for banks using (i) either the foundation and/or advanced IRB approaches, and/or (ii) the AMA for the year beginning year-end 2007 is 90%, and for the year beginning year-end 2008 is 80%. The following table illustrates the application of the adjustment factors. Additional transitional arrangements including parallel calculation are set out in paragraphs 263 to 269.

	From year-end 2005	**From year-end 2006**	**From year-end 2007**	**From year-end 2008**
Foundation IRB approach[12]	Parallel calculation	95%	90%	80%
Advanced approaches for credit and/or operational risk	Parallel calculation or impact studies	Parallel calculation	90%	80%

47. In the years in which the floor applies, banks must also calculate (i) 8% of total risk-weighted assets as calculated under this Framework, (ii) less the difference between total provisions and expected loss amount as described in Section III.G (see paragraphs 374 to 386), and (iii) plus other Tier 1 and Tier 2 deductions. Where a bank uses the standardised approach to credit risk for any portion of its exposures, it also needs to exclude general provisions that may be recognised in Tier 2 for that portion from the amount calculated according to the first sentence of this paragraph.

48. Should problems emerge during this period, the Committee will seek to take appropriate measures to address them, and, in particular, will be prepared to keep the floors in place beyond 2009 if necessary.

49. The Committee believes it is appropriate for supervisors to apply prudential floors to banks that adopt the IRB approach for credit risk and/or the AMA for operational risk following year-end 2008. For banks that do not complete the transition to these approaches in the years specified in paragraph 46, the Committee believes it is appropriate for supervisors to continue to apply prudential floors — similar to those of paragraph 46 — to provide time to ensure that individual bank implementations of the advanced approaches are sound. However, the Committee recognises that floors based on the 1988 Accord will become increasingly impractical to implement over time and therefore believes that supervisors should have the flexibility to develop appropriate bank-by-bank floors that are

[12] The foundation IRB approach includes the IRB approach to retail.

consistent with the principles outlined in this paragraph, subject to full disclosure of the nature of the floors adopted. Such floors may be based on the approach the bank was using before adoption of the IRB approach and/or AMA.

Ia. The constituents of capital

A. Core capital (basic equity or Tier 1)

49(i). The Committee considers that the key element of capital on which the main emphasis should be placed is equity capital[13] and disclosed reserves. This key element of capital is the only element common to all countries' banking systems; it is wholly visible in the published accounts and is the basis on which most market judgements of capital adequacy are made; and it has a crucial bearing on profit margins and a bank's ability to compete. This emphasis on equity capital and disclosed reserves reflects the importance the Committee attaches to securing an appropriate quality, and the level, of the total capital resources maintained by major banks.

49(ii). Notwithstanding this emphasis, the member countries of the Committee also consider that there are a number of other important and legitimate constituents of a bank's capital base which may be included within the system of measurement (subject to certain conditions set out in paragraphs 49(iv) to 49(xii) below).

49(iii). The Committee has therefore concluded that capital, for supervisory purposes, should be defined in two tiers in a way which will have the effect of requiring at least 50% of a bank's capital base to consist of a core element comprised of equity capital and published reserves from post-tax retained earnings (Tier 1). The other elements of capital (supplementary capital) will be admitted into Tier 2 limited to 100% of Tier 1. These supplementary capital elements and the particular conditions attaching to their inclusion in the capital base are set out in paragraphs 49(iv) to 49(xii) below and in more detail in Annex 1a. Each of these elements may be included or not included by national authorities at their discretion in the light of their national accounting and supervisory regulations.

B. Supplementary capital (Tier 2)

1. Undisclosed reserves

49(iv). Unpublished or hidden reserves may be constituted in various ways according to differing legal and accounting regimes in member countries. Under this heading are included only reserves which, though unpublished, have been passed through the profit and loss account and which are accepted by the bank's supervisory authorities. They may be inherently of the same intrinsic quality as published retained earnings, but, in the context of an internationally agreed minimum standard, their lack of transparency, together with the fact that many countries do not recognise undisclosed reserves, either as an accepted accounting concept or as a legitimate element of capital, argue for excluding them from the core equity capital element.

---

[13] Issued and fully paid ordinary shares/common stock and non-cumulative perpetual preferred stock (but excluding cumulative preferred stock).

2. Revaluation reserves

49(v). Some countries, under their national regulatory or accounting arrangements, allow certain assets to be revalued to reflect their current value, or something closer to their current value than historic cost, and the resultant revaluation reserves to be included in the capital base. Such revaluations can arise in two ways:

(a) from a formal revaluation, carried through to the balance sheets of banks' own premises; or

(b) from a notional addition to capital of hidden values which arise from the practice of holding securities in the balance sheet valued at historic costs.

Such reserves may be included within supplementary capital provided that the assets are considered by the supervisory authority to be prudently valued, fully reflecting the possibility of price fluctuations and forced sale.

49(vi). Alternative (b) in paragraph 49(v) above is relevant to those banks whose balance sheets traditionally include very substantial amounts of equities held in their portfolio at historic cost but which can be, and on occasions are, realised at current prices and used to offset losses. The Committee considers these "latent" revaluation reserves can be included among supplementary elements of capital since they can be used to absorb losses on a going-concern basis, provided they are subject to a substantial discount in order to reflect concerns both about market volatility and about the tax charge which would arise were such cases to be realised. A discount of 55% on the difference between the historic cost book value and market value is agreed to be appropriate in the light of these considerations. The Committee considered, but rejected, the proposition that latent reserves arising in respect of the undervaluation of banks' premises should also be included within the definition of supplementary capital.

3. General provisions/general loan-loss reserves

49(vii). General provisions or general loan-loss reserves are created against the possibility of losses not yet identified. Where they do not reflect a known deterioration in the valuation of particular assets, these reserves qualify for inclusion in Tier 2 capital. Where, however, provisions or reserves have been created against identified losses or in respect of an identified deterioration in the value of any asset or group of subsets of assets, they are not freely available to meet unidentified losses which may subsequently arise elsewhere in the portfolio and do not possess an essential characteristic of capital. Such provisions or reserves should therefore not be included in the capital base.

49(viii). The supervisory authorities represented on the Committee undertake to ensure that the supervisory process takes due account of any identified deterioration in value. They will also ensure that general provisions or general loan-loss reserves will only be included in capital if they are not intended to deal with the deterioration of particular assets, whether individual or grouped.

49(ix). This would mean that all elements in general provisions or general loan-loss reserves designed to protect a bank from identified deterioration in the quality of specific assets (whether foreign or domestic) should be ineligible for inclusion in capital. In particular, elements that reflect identified deterioration in assets subject to country risk, in real estate lending and in other problem sectors would be excluded from capital.

49(x). General provisions/general loan-loss reserves that qualify for inclusion in Tier 2 under the terms described above do so subject to a limit of

(a) 1.25 percentage points of weighted risk assets to the extent a bank uses the Standardised Approach for credit risk; and

(b) 0.6 percentage points of credit risk-weighted assets in accordance with paragraph 43 to the extent a bank uses the IRB Approach for credit risk.

4. Hybrid debt capital instruments

49(xi). In this category fall a number of capital instruments which combine certain characteristics of equity and certain characteristics of debt. Each of these has particular features which can be considered to affect its quality as capital. It has been agreed that, where these instruments have close similarities to equity, in particular when they are able to support losses on an on-going basis without triggering liquidation, they may be included in supplementary capital. In addition to perpetual preference shares carrying a cumulative fixed charge, the following instruments, for example, may qualify for inclusion: long-term preferred shares in Canada, titres participatifs and titres subordonnés à durée indéterminée in France, Genussscheine in Germany, perpetual debt instruments in the United Kingdom and mandatory convertible debt instruments in the United States. The qualifying criteria for such instruments are set out in Annex 1a.

5. Subordinated term debt

49(xii). The Committee is agreed that subordinated term debt instruments have significant deficiencies as constituents of capital in view of their fixed maturity and inability to absorb losses except in a liquidation. These deficiencies justify an additional restriction on the amount of such debt capital which is eligible for inclusion within the capital base. Consequently, it has been concluded that subordinated term debt instruments with a minimum original term to maturity of over five years may be included within the supplementary elements of capital, but only to a maximum of 50% of the core capital element and subject to adequate amortisation arrangements.

C. Short-term subordinated debt covering market risk (Tier 3)

49(xiii). The principal form of eligible capital to cover market risks consists of shareholders' equity and retained earnings (Tier 1 capital) and supplementary capital (Tier 2 capital) as defined in paragraphs 49(i) to 49(xii). But banks may also, at the discretion of their national authority, employ a third tier of capital ("Tier 3"), consisting of short-term subordinated debt as defined in paragraph 49(xiv) below for the *sole* purpose of meeting a proportion of the capital requirements for market risks, subject to the following conditions:

- Banks will be entitled to use Tier 3 capital solely to support market risks as defined in paragraphs 709 to 718(Lxix). This means that any capital requirement arising in respect of credit and counterparty risk in the terms of this Framework, including the credit counterparty risk in respect of OTCs and SFTs in both trading and banking books, needs to be met by the existing definition of capital base set out in paragraphs 49(i) to 49(xii) above (i.e. Tiers 1 and 2);

- Tier 3 capital will be limited to 250% of a bank's Tier 1 capital that is required to support market risks. This means that a minimum of about 28½% of market risks needs to be supported by Tier 1 capital that is not required to support risks in the remainder of the book;

- Tier 2 elements may be substituted for Tier 3 up to the same limit of 250% in so far as the overall limits set out in paragraph 49(iii) above are not breached, that is to say eligible Tier 2 capital may not exceed total Tier 1 capital, and long-term subordinated debt may not exceed 50% of Tier 1 capital;

- In addition, since the Committee believes that Tier 3 capital is only appropriate to meet market risk, a significant number of member countries are in favour of retaining the principle in the present Framework that Tier 1 capital should represent at least half of total eligible capital, i.e. that the sum total of Tier 2 plus Tier 3 capital should not exceed total Tier 1. However, the Committee has decided that any decision whether or not to apply such a rule should be a matter for national discretion. Some member countries may keep the constraint, except in cases where banking activities are proportionately very small. Additionally, national authorities will have discretion to refuse the use of short-term subordinated debt for individual banks or for their banking systems generally.

49(xiv). For short-term subordinated debt to be eligible as Tier 3 capital, it needs, if circumstances demand, to be capable of becoming part of a bank's permanent capital and thus be available to absorb losses in the event of insolvency. It must, therefore, at a minimum:

- be unsecured, subordinated and fully paid up;

- have an original maturity of at least two years;

- not be repayable before the agreed repayment date unless the supervisory authority agrees;

- be subject to a lock-in clause which stipulates that neither interest nor principal may be paid (even at maturity) if such payment means that the bank falls below or remains below its minimum capital requirement.

D. Deductions from capital

49(xv). It has been concluded that the following deductions should be made from the capital base for the purpose of calculating the risk-weighted capital ratio. The deductions will consist of:

(i) Goodwill, as a deduction from Tier 1 capital elements;

(ii) Increase in equity capital resulting from a securitisation exposure, as a deduction from Tier 1 capital elements, pursuant to paragraph 562 below;

(iii) Investments in subsidiaries engaged in banking and financial activities which are not consolidated in national systems. The normal practice will be to consolidate subsidiaries for the purpose of assessing the capital adequacy of banking groups. Where this is not done, deduction is essential to prevent the multiple use of the same capital resources in different parts of the group. The deduction for such investments will be made in accordance with paragraph 37 above. The assets representing the investments in subsidiary companies whose capital had been deducted from that of the parent would not be included in total assets for the purposes of computing the ratio.

49(xvi). The Committee carefully considered the possibility of requiring deduction of banks' holdings of capital issued by other banks or deposit-taking institutions, whether in the form of equity or of other capital instruments. Several G-10 supervisory authorities currently require such a deduction to be made in order to discourage the banking system as a whole from creating cross-holdings of capital, rather than drawing capital from outside investors. The Committee is very conscious that such double-gearing (or "double-leveraging") can have systemic dangers for the banking system by making it more vulnerable to the rapid transmission of problems from one institution to another and some members consider these dangers justify a policy of full deduction of such holdings.

49(xvii). Despite these concerns, however, the Committee as a whole is not presently in favour of a general policy of deducting all holdings of other banks' capital, on the grounds that to do so could impede certain significant and desirable changes taking place in the structure of domestic banking systems.

49(xviii). The Committee has nonetheless agreed that:

(a) Individual supervisory authorities should be free at their discretion to apply a policy of deduction, either for all holdings of other banks' capital, or for holdings which exceed material limits in relation to the holding bank's capital or the issuing bank's capital, or on a case-by-case basis;

(b) Where no deduction is applied, banks' holdings of other banks' capital instruments will bear a weight of 100%;

(c) The Committee considers that reciprocal cross-holdings of bank capital artificially designed to inflate the capital position of the banks will be deducted for capital adequacy purposes;

(d) The Committee will closely monitor the degree of double-gearing in the international banking system and does not preclude the possibility of introducing constraints at a later date. For this purpose, supervisory authorities intend to ensure that adequate statistics are made available to enable them and the Committee to monitor the development of banks' holdings of other banks' equity and debt instruments which rank as capital under the present agreement.

II. Credit Risk – The Standardised Approach

50. The Committee permits banks a choice between two broad methodologies for calculating their capital requirements for credit risk. One alternative, the Standardised Approach, will be to measure credit risk in a standardised manner, supported by external credit assessments.[14]

51. The other alternative, the Internal Ratings-based Approach, which is subject to the explicit approval of the bank's supervisor, would allow banks to use their internal rating systems for credit risk.

52. The following section sets out revisions to the 1988 Accord for risk weighting banking book exposures. Exposures that are not explicitly addressed in this section will retain the current treatment; however, exposures related to securitisation are dealt with in Section IV. Furthermore, the credit equivalent amount of Securities Financing Transactions (SFT)[15] and OTC derivatives that expose a bank to counterparty credit risk[16] is to be calculated under the rules set forth in Annex 4[17]. In determining the risk weights in the standardised approach, banks may use assessments by external credit assessment institutions recognised as eligible for capital purposes by national supervisors in accordance with the criteria defined in paragraphs 90 and 91. Exposures should be risk-weighted net of specific provisions.[18]

A. Individual claims

1. Claims on sovereigns

53. Claims on sovereigns and their central banks will be risk weighted as follows:

Credit Assessment	**AAA to AA-**	**A+ to A-**	**BBB+ to BBB-**	**BB+ to B-**	**Below B-**	**Unrated**
Risk Weight	0%	20%	50%	100%	150%	100%

---

[14] The notations follow the methodology used by one institution, Standard & Poor's. the use of Standard & Poor's credit ratings is an example only; those of some other external credit assessment institutions could equally well be used. The ratings used throughout this document, therefore, do not express any preferences or determinations on external assessment institutions by the Committee.

[15] Securities Financing Transactions (SFT) are transactions such as repurchase agreements, reverse repurchase agreements, security lending and borrowing, and margin lending transactions, where the value of the transactions depends on the market valuations and the transactions are often subject to margin agreements.

[16] The counterparty credit risk is defined as the risk that the counterparty to a transaction could default before the final settlement of the transaction's cash flows. An economic loss would occur if the transactions or portfolio of transactions with the counterparty has a positive economic value at the time of default. Unlike a firm's exposure to credit risk through a loan, where the exposure to credit risk is unilateral and only the lending bank faces the risk of loss, the counterparty credit risk creates a bilateral risk of loss: the market value of the transaction can be positive or negative to either counterparty to the transaction. The market value is uncertain and can vary over time with the movement of underlying market factors.

[17] Annex 4 of this Framework is based on the treatment of counterparty credit risk set out in Part 1 of the Committee's paper *The Application of Basel II to Trading Activities and the Treatment of Double Default Effects* (July 2005).

[18] A simplified standardised approach is outlined in Annex 11.

54. At national discretion, a lower risk weight may be applied to banks' exposures to their sovereign (or central bank) of incorporation denominated in domestic currency and funded[19] in that currency.[20] Where this discretion is exercised, other national supervisory authorities may also permit their banks to apply the same risk weight to domestic currency exposures to this sovereign (or central bank) funded in that currency.

55. For the purpose of risk weighting claims on sovereigns, supervisors may recognise the country risk scores assigned by Export Credit Agencies (ECAs). To qualify, an ECA must publish its risk scores and subscribe to the OECD agreed methodology. Banks may choose to use the risk scores published by individual ECAs that are recognised by their supervisor, or the consensus risk scores of ECAs participating in the "Arrangement on Officially Supported Export Credits".[21] The OECD agreed methodology establishes eight risk score categories associated with minimum export insurance premiums. These ECA risk scores will correspond to risk weight categories as detailed below.

ECA risk scores	0-1	2	3	4 to 6	7
Risk weight	0%	20%	50%	100%	150%

56. Claims on the Bank for International Settlements, the International Monetary Fund, the European Central Bank and the European Community may receive a 0% risk weight.

2. Claims on non-central government public sector entities (PSEs)

57. Claims on domestic PSEs will be risk-weighted at national discretion, according to either option 1 or option 2 for claims on banks.[22] When option 2 is selected, it is to be applied without the use of the preferential treatment for short-term claims.

58. Subject to national discretion, claims on certain domestic PSEs may also be treated as claims on the sovereigns in whose jurisdictions the PSEs are established.[23] Where this

---

[19] This is to say that the bank would also have corresponding liabilities denominated in the domestic currency.

[20] This lower risk weight may be extended to the risk weighting of collateral and guarantees. See Sections II.D.3 and II.D.5.

[21] The consensus country risk classification is available on the OECD's website (http://www.oecd.org) in the Export Credit Arrangement web-page of the Trade Directorate.

[22] This is regardless of the option chosen at national discretion for claims on banks of that country. It therefore does not imply that when one option has been chosen for claims on banks, the same option should also be applied to claims on PSEs.

[23] The following examples outline how PSEs might be categorised when focusing on one specific feature, namely revenue raising powers. However, there may be other ways of determining the different treatments applicable to different types of PSEs, for instance by focusing on the extent of guarantees provided by the central government:

- **Regional governments and local authorities** could qualify for the same treatment as claims on their sovereign or central government if these governments and local authorities have specific revenue raising powers and have specific institutional arrangements the effect of which is to reduce their risks of default.
- **Administrative bodies responsible to central governments, regional governments or to local authorities and other non-commercial undertakings** owned by the governments or local authorities may not warrant the same treatment as claims on their sovereign if the entities do not have revenue raising powers or other arrangements as described above. If strict lending rules apply to these entities and a declaration of bankruptcy is not possible because of their special public status, it may be appropriate to treat these claims in the same manner as claims on banks.

discretion is exercised, other national supervisors may allow their banks to risk weight claims on such PSEs in the same manner.

3. Claims on multilateral development banks (MDBs)

59. The risk weights applied to claims on MDBs will generally be based on external credit assessments as set out under option 2 for claims on banks but without the possibility of using the preferential treatment for short-term claims. A 0% risk weight will be applied to claims on highly rated MDBs that fulfil to the Committee's satisfaction the criteria provided below.[24] The Committee will continue to evaluate eligibility on a case-by-case basis. The eligibility criteria for MDBs risk weighted at 0% are:

- very high quality long-term issuer ratings, i.e. a majority of an MDB's external assessments must be AAA;
- shareholder structure is comprised of a significant proportion of sovereigns with long-term issuer credit assessments of AA- or better, or the majority of the MDB's fund-raising are in the form of paid-in equity/capital and there is little or no leverage;
- strong shareholder support demonstrated by the amount of paid-in capital contributed by the shareholders; the amount of further capital the MDBs have the right to call, if required, to repay their liabilities; and continued capital contributions and new pledges from sovereign shareholders;
- adequate level of capital and liquidity (a case-by-case approach is necessary in order to assess whether each MDB's capital and liquidity are adequate); and,
- strict statutory lending requirements and conservative financial policies, which would include among other conditions a structured approval process, internal creditworthiness and risk concentration limits (per country, sector, and individual exposure and credit category), large exposures approval by the board or a committee of the board, fixed repayment schedules, effective monitoring of use of proceeds, status review process, and rigorous assessment of risk and provisioning to loan loss reserve.

4. Claims on banks

60. There are two options for claims on banks. National supervisors will apply one option to all banks in their jurisdiction. No claim on an unrated bank may receive a risk weight lower than that applied to claims on its sovereign of incorporation.

61. Under the first option, all banks incorporated in a given country will be assigned a risk weight one category less favourable than that assigned to claims on the sovereign of that

---

- **Commercial undertakings** owned by central governments, regional governments or by local authorities may be treated as normal commercial enterprises. However, if these entities function as a corporate in competitive markets even though the state, a regional authority or a local authority is the major shareholder of these entities, supervisors should decide to consider them as corporates and therefore attach to them the applicable risk weights.

[24] MDBs currently eligible for a 0% risk weight are: the World Bank Group comprised of the International Bank for Reconstruction and Development (IBRD) and the International Finance Corporation (IFC), the Asian Development Bank (ADB), the African Development Bank (AfDB), the European Bank for Reconstruction and Development (EBRD), the Inter-American Development Bank (IADB), the European Investment Bank (EIB), the European Investment Fund (EIF), the Nordic Investment Bank (NIB), the Caribbean Development Bank (CDB), the Islamic Development Bank (IDB), and the Council of Europe Development Bank (CEDB).

country. However, for claims on banks in countries with sovereigns rated BB+ to B- and on banks in unrated countries the risk weight will be capped at 100%.

62. The second option bases the risk weighting on the external credit assessment of the bank itself with claims on unrated banks being risk-weighted at 50%. Under this option, a preferential risk weight that is one category more favourable may be applied to claims with an original maturity[25] of three months or less, subject to a floor of 20%. This treatment will be available to both rated and unrated banks, but not to banks risk weighted at 150%.

63. The two options are summarised in the tables below.

Option 1

Credit assessment of Sovereign	AAA to AA-	A+ to A-	BBB+ to BBB-	BB+ to B-	Below B-	Unrated
Risk weight under Option 1	20%	50%	100%	100%	150%	100%

Option 2

Credit assessment of Banks	AAA to AA-	A+ to A-	BBB+ to BBB-	BB+ to B-	Below B-	Unrated
Risk weight under Option 2	20%	50%	50%	100%	150%	50%
Risk weight for short-term claims[26] under Option 2	20%	20%	20%	50%	150%	20%

64. When the national supervisor has chosen to apply the preferential treatment for claims on the sovereign as described in paragraph 54, it can also assign, under both options 1 and 2, a risk weight that is one category less favourable than that assigned to claims on the sovereign, subject to a floor of 20%, to claims on banks of an original maturity of 3 months or less denominated and funded in the domestic currency.

5. Claims on securities firms

65. Claims on securities firms may be treated as claims on banks provided these firms are subject to supervisory and regulatory arrangements comparable to those under this

[25] Supervisors should ensure that claims with (contractual) original maturity under 3 months which are expected to be rolled over (i.e. where the effective maturity is longer than 3 months) do not qualify for this preferential treatment for capital adequacy purposes.

[26] Short-term claims in Option 2 are defined as having an original maturity of three months or less. These tables do not reflect the potential preferential risk weights for domestic currency claims that banks may be allowed to apply based on paragraph 64.

Framework (including, in particular, risk-based capital requirements).[27] Otherwise such claims would follow the rules for claims on corporates.

6. Claims on corporates

66. The table provided below illustrates the risk weighting of rated corporate claims, including claims on insurance companies. The standard risk weight for unrated claims on corporates will be 100%. No claim on an unrated corporate may be given a risk weight preferential to that assigned to its sovereign of incorporation.

Credit assessment	**AAA to AA-**	**A+ to A-**	**BBB+ to BB-**	**Below BB-**	**Unrated**
Risk weight	20%	50%	100%	150%	100%

67. Supervisory authorities should increase the standard risk weight for unrated claims where they judge that a higher risk weight is warranted by the overall default experience in their jurisdiction. As part of the supervisory review process, supervisors may also consider whether the credit quality of corporate claims held by individual banks should warrant a standard risk weight higher than 100%.

68. At national discretion, supervisory authorities may permit banks to risk weight all corporate claims at 100% without regard to external ratings. Where this discretion is exercised by the supervisor, it must ensure that banks apply a single consistent approach, i.e. either to use ratings wherever available or not at all. To prevent "cherry-picking" of external ratings, banks should obtain supervisory approval before utilising this option to risk weight all corporate claims at 100%.

7. Claims included in the regulatory retail portfolios

69. Claims that qualify under the criteria listed in paragraph 70 may be considered as retail claims for regulatory capital purposes and included in a regulatory retail portfolio. Exposures included in such a portfolio may be risk-weighted at 75%, except as provided in paragraph 75 for past due loans.

70. To be included in the regulatory retail portfolio, claims must meet the following four criteria:

- Orientation criterion — The exposure is to an individual person or persons or to a small business;

- Product criterion — The exposure takes the form of any of the following: revolving credits and lines of credit (including credit cards and overdrafts), personal term loans and leases (e.g. instalment loans, auto loans and leases, student and educational loans, personal finance) and small business facilities and commitments. Securities (such as bonds and equities), whether listed or not, are specifically

[27] That is, capital requirements that are comparable to those applied to banks in this Framework. Implicit in the meaning of the word "comparable" is that the securities firm (but not necessarily its parent) is subject to consolidated regulation and supervision with respect to any downstream affiliates.

excluded from this category. Mortgage loans are excluded to the extent that they qualify for treatment as claims secured by residential property (see paragraph 72).

- Granularity criterion – The supervisor must be satisfied that the regulatory retail portfolio is sufficiently diversified to a degree that reduces the risks in the portfolio, warranting the 75% risk weight. One way of achieving this may be to set a numerical limit that no aggregate exposure to one counterpart[28] can exceed 0.2% of the overall regulatory retail portfolio.

- Low value of individual exposures. The maximum aggregated retail exposure to one counterpart cannot exceed an absolute threshold of €1 million.

71. National supervisory authorities should evaluate whether the risk weights in paragraph 69 are considered to be too low based on the default experience for these types of exposures in their jurisdictions. Supervisors, therefore, may require banks to increase these risk weights as appropriate.

8. Claims secured by residential property

72. Lending fully secured by mortgages on residential property that is or will be occupied by the borrower, or that is rented, will be risk weighted at 35%. In applying the 35% weight, the supervisory authorities should satisfy themselves, according to their national arrangements for the provision of housing finance, that this concessionary weight is applied restrictively for residential purposes and in accordance with strict prudential criteria, such as the existence of substantial margin of additional security over the amount of the loan based on strict valuation rules. Supervisors should increase the standard risk weight where they judge the criteria are not met.

73. National supervisory authorities should evaluate whether the risk weights in paragraph 72 are considered to be too low based on the default experience for these types of exposures in their jurisdictions. Supervisors, therefore, may require banks to increase these risk weights as appropriate.

9. Claims secured by commercial real estate

74. In view of the experience in numerous countries that commercial property lending has been a recurring cause of troubled assets in the banking industry over the past few decades, the Committee holds to the view that mortgages on commercial real estate do not, in principle, justify other than a 100% weighting of the loans secured.[29]

---

[28] Aggregated exposure means gross amount (i.e. not taking any credit risk mitigation into account) of all forms of debt exposures (e.g. loans or commitments) that individually satisfy the three other criteria. In addition, "to one counterpart" means one or several entities that may be considered as a single beneficiary (e.g. in the case of a small business that is affiliated to another small business, the limit would apply to the bank's aggregated exposure on both businesses).

[29] The Committee, however, recognises that, in exceptional circumstances for well-developed and long-established markets, mortgages on office and/or multi-purpose commercial premises and/or multi-tenanted commercial premises may have the potential to receive a preferential risk weight of 50% for the tranche of the loan that does not exceed the lower of 50% of the market value or 60% of the mortgage lending value of the property securing the loan. Any exposure beyond these limits will receive a 100% risk weight. This exceptional treatment will be subject to very strict conditions. In particular, two tests must be fulfilled, namely that (i) losses stemming from commercial real estate lending up to the lower of 50% of the market value or 60% of loan-to-

10. Past due loans

75. The unsecured portion of any loan (other than a qualifying residential mortgage loan) that is past due for more than 90 days, net of specific provisions (including partial write-offs), will be risk-weighted as follows: [30]

- 150% risk weight when specific provisions are less than 20% of the outstanding amount of the loan;
- 100% risk weight when specific provisions are no less than 20% of the outstanding amount of the loan;
- 100% risk weight when specific provisions are no less than 50% of the outstanding amount of the loan, but with supervisory discretion to reduce the risk weight to 50%.

76. For the purpose of defining the secured portion of the past due loan, eligible collateral and guarantees will be the same as for credit risk mitigation purposes (see Section II.B).[31] Past due retail loans are to be excluded from the overall regulatory retail portfolio when assessing the granularity criterion specified in paragraph 70, for risk-weighting purposes.

77. In addition to the circumstances described in paragraph 75, where a past due loan is fully secured by those forms of collateral that are not recognised in paragraphs 145 and 146, a 100% risk weight may apply when provisions reach 15% of the outstanding amount of the loan. These forms of collateral are not recognised elsewhere in the standardised approach. Supervisors should set strict operational criteria to ensure the quality of collateral.

78. In the case of qualifying residential mortgage loans, when such loans are past due for more than 90 days they will be risk weighted at 100%, net of specific provisions. If such loans are past due but specific provisions are no less than 20% of their outstanding amount, the risk weight applicable to the remainder of the loan can be reduced to 50% at national discretion.

11. Higher-risk categories

79. The following claims will be risk weighted at 150% or higher:

- Claims on sovereigns, PSEs, banks, and securities firms rated below B-.
- Claims on corporates rated below BB-.
- Past due loans as set out in paragraph 75.

---

value (LTV) based on mortgage-lending-value (MLV) must not exceed 0.3% of the outstanding loans in any given year; and that (ii) overall losses stemming from commercial real estate lending must not exceed 0.5% of the outstanding loans in any given year. This is, if either of these tests is not satisfied in a given year, the eligibility to use this treatment will cease and the original eligibility criteria would need to be satisfied again before it could be applied in the future. Countries applying such a treatment must publicly disclose that these and other additional conditions (that are available from the Basel Committee Secretariat) are met. When claims benefiting from such an exceptional treatment have fallen past due, they will be risk-weighted at 100%.

[30] Subject to national discretion, supervisors may permit banks to treat non-past due loans extended to counterparties subject to a 150% risk weight in the same way as past due loans described in paragraphs 75 to 77.

[31] There will be a transitional period of three years during which a wider range of collateral may be recognised, subject to national discretion.

- Securitisation tranches that are rated between BB+ and BB- will be risk weighted at 350% as set out in paragraph 567.

80. National supervisors may decide to apply a 150% or higher risk weight reflecting the higher risks associated with some other assets, such as venture capital and private equity investments.

12. Other assets

81. The treatment of securitisation exposures is presented separately in Section IV. The standard risk weight for all other assets will be 100%.[32] Investments in equity or regulatory capital instruments issued by banks or securities firms will be risk weighted at 100%, unless deducted from the capital base according to Part 1.

13. Off-balance sheet items

82. Off-balance-sheet items under the standardised approach will be converted into credit exposure equivalents through the use of credit conversion factors (CCF). Counterparty risk weightings for OTC derivative transactions will not be subject to any specific ceiling.

83. Commitments with an original maturity up to one year and commitments with an original maturity over one year will receive a CCF of 20% and 50%, respectively. However, any commitments that are unconditionally cancellable at any time by the bank without prior notice, or that effectively provide for automatic cancellation due to deterioration in a borrower's creditworthiness, will receive a 0% CCF.[33]

83(i). Direct credit substitutes, e.g. general guarantees of indebtedness (including standby letters of credit serving as financial guarantees for loans and securities) and acceptances (including endorsements with the character of acceptances) will receive a CCF of 100%.

83(ii). Sale and repurchase agreements and asset sales with recourse,[34] where the credit risk remains with the bank will receive a CCF of 100%.

84. A CCF of 100% will be applied to the lending of banks' securities or the posting of securities as collateral by banks, including instances where these arise out of repo-style transactions (i.e. repurchase/reverse repurchase and securities lending/securities borrowing transactions). See Section II.D.3 for the calculation of risk-weighted assets where the credit converted exposure is secured by eligible collateral.

84(i). Forward asset purchases, forward forward deposits and partly-paid shares and securities[35], which represent commitments with certain drawdown will receive a CCF of 100%.

---

[32] However, at national discretion, gold bullion held in own vaults or on an allocated basis to the extent backed by bullion liabilities can be treated as cash and therefore risk-weighted at 0%. In addition, cash items in the process of collection can be risk-weighted at 20%.

[33] In certain countries, retail commitments are considered unconditionally cancellable if the terms permit the bank to cancel them to the full extent allowable under consumer protection and related legislation.

[34] These items are to be weighted according to the type of asset and not according to the type of counterparty with whom the transaction has been entered into.

84(ii). Certain transaction-related contingent items (e.g. performance bonds, bid bonds, warranties and standby letters of credit related to particular transactions) will receive a CCF of 50%.

84(iii). Note issuance facilities (NIFs) and revolving underwriting facilities (RUFs) will receive a CCF of 50%.

85. For short-term self-liquidating trade letters of credit arising from the movement of goods (e.g. documentary credits collateralised by the underlying shipment), a 20% CCF will be applied to both issuing and confirming banks.

86. Where there is an undertaking to provide a commitment on an off-balance sheet item, banks are to apply the lower of the two applicable CCFs.

87. The credit equivalent amount of OTC derivatives and SFTs that expose a bank to counterparty credit risk is to be calculated under the rules set forth in Annex 4 of this Framework.

88. Banks must closely monitor securities, commodities, and foreign exchange transactions that have failed, starting the first day they fail. A capital charge to failed transactions must be calculated in accordance with Annex 3 of this Framework.

89. With regard to unsettled securities, commodities, and foreign exchange transactions, the Committee is of the opinion that banks are exposed to counterparty credit risk from trade date, irrespective of the booking or the accounting of the transaction. Therefore, banks are encouraged to develop, implement and improve systems for tracking and monitoring the credit risk exposure arising from unsettled transactions as appropriate for producing management information that facilitates action on a timely basis. Furthermore, when such transactions are not processed through a delivery-versus-payment (DvP) or payment-versus-payment (PvP) mechanism, banks must calculate a capital charge as set forth in Annex 3 of this Framework.

B. External credit assessment

1. The recognition process

90. National supervisors are responsible for determining whether an external credit assessment institution (ECAI) meets the criteria listed in the paragraph below. The assessments of ECAIs may be recognised on a limited basis, e.g. by type of claims or by jurisdiction. The supervisory process for recognising ECAIs should be made public to avoid unnecessary barriers to entry.

2. Eligibility criteria

91. An ECAI must satisfy each of the following six criteria.

- ***Objectivity***: The methodology for assigning credit assessments must be rigorous, systematic, and subject to some form of validation based on historical experience.

---

[35] These items are to be weighted according to the type of asset and not according to the type of counterparty with whom the transaction has been entered into.

Moreover, assessments must be subject to ongoing review and responsive to changes in financial condition. Before being recognised by supervisors, an assessment methodology for each market segment, including rigorous backtesting, must have been established for at least one year and preferably three years.

- ***Independence***: An ECAI should be independent and should not be subject to political or economic pressures that may influence the rating. The assessment process should be as free as possible from any constraints that could arise in situations where the composition of the board of directors or the shareholder structure of the assessment institution may be seen as creating a conflict of interest.
- ***International access/Transparency***: The individual assessments should be available to both domestic and foreign institutions with legitimate interests and at equivalent terms. In addition, the general methodology used by the ECAI should be publicly available.
- ***Disclosure***: An ECAI should disclose the following information: its assessment methodologies, including the definition of default, the time horizon, and the meaning of each rating; the actual default rates experienced in each assessment category; and the transitions of the assessments, e.g. the likelihood of AA ratings becoming A over time.
- ***Resources***: An ECAI should have sufficient resources to carry out high quality credit assessments. These resources should allow for substantial ongoing contact with senior and operational levels within the entities assessed in order to add value to the credit assessments. Such assessments should be based on methodologies combining qualitative and quantitative approaches.
- ***Credibility***: To some extent, credibility is derived from the criteria above. In addition, the reliance on an ECAI's external credit assessments by independent parties (investors, insurers, trading partners) is evidence of the credibility of the assessments of an ECAI. The credibility of an ECAI is also underpinned by the existence of internal procedures to prevent the misuse of confidential information. In order to be eligible for recognition, an ECAI does not have to assess firms in more than one country.

C. Implementation considerations

1. The mapping process

92. Supervisors will be responsible for assigning eligible ECAIs' assessments to the risk weights available under the standardised risk weighting framework, i.e. deciding which assessment categories correspond to which risk weights. The mapping process should be objective and should result in a risk weight assignment consistent with that of the level of credit risk reflected in the tables above. It should cover the full spectrum of risk weights.

93. When conducting such a mapping process, factors that supervisors should assess include, among others, the size and scope of the pool of issuers that each ECAI covers, the range and meaning of the assessments that it assigns, and the definition of default used by the ECAI. In order to promote a more consistent mapping of assessments into the available risk weights and help supervisors in conducting such a process, Annex 2 provides guidance as to how such a mapping process may be conducted.

94. Banks must use the chosen ECAIs and their ratings consistently for each type of claim, for both risk weighting and risk management purposes. Banks will not be allowed to "cherry-pick" the assessments provided by different ECAIs.

95. Banks must disclose ECAIs that they use for the risk weighting of their assets by type of claims, the risk weights associated with the particular rating grades as determined by supervisors through the mapping process as well as the aggregated risk-weighted assets for each risk weight based on the assessments of each eligible ECAI.

2. Multiple assessments

96. If there is only one assessment by an ECAI chosen by a bank for a particular claim, that assessment should be used to determine the risk weight of the claim.

97. If there are two assessments by ECAIs chosen by a bank which map into different risk weights, the higher risk weight will be applied.

98. If there are three or more assessments with different risk weights, the assessments corresponding to the two lowest risk weights should be referred to and the higher of those two risk weights will be applied.

3. Issuer versus issues assessment

99. Where a bank invests in a particular issue that has an issue-specific assessment, the risk weight of the claim will be based on this assessment. Where the bank's claim is not an investment in a specific assessed issue, the following general principles apply.

- In circumstances where the borrower has a specific assessment for an issued debt — but the bank's claim is not an investment in this particular debt — a high quality credit assessment (one which maps into a risk weight lower than that which applies to an unrated claim) on that specific debt may only be applied to the bank's unassessed claim if this claim ranks *pari passu* or senior to the claim with an assessment in all respects. If not, the credit assessment cannot be used and the unassessed claim will receive the risk weight for unrated claims.
- In circumstances where the borrower has an issuer assessment, this assessment typically applies to senior unsecured claims on that issuer. Consequently, only senior claims on that issuer will benefit from a high quality issuer assessment. Other unassessed claims of a highly assessed issuer will be treated as unrated. If either the issuer or a single issue has a low quality assessment (mapping into a risk weight equal to or higher than that which applies to unrated claims), an unassessed claim on the same counterparty will be assigned the same risk weight as is applicable to the low quality assessment.

100. Whether the bank intends to rely on an issuer- or an issue-specific assessment, the assessment must take into account and reflect the entire amount of credit risk exposure the bank has with regard to all payments owed to it.[36]

101. In order to avoid any double counting of credit enhancement factors, no supervisory recognition of credit risk mitigation techniques will be taken into account if the credit enhancement is already reflected in the issue specific rating (see paragraph 114).

[36] For example, if a bank is owed both principal and interest, the assessment must fully take into account and reflect the credit risk associated with repayment of both principal and interest.

4. Domestic currency and foreign currency assessments

102. Where unrated exposures are risk weighted based on the rating of an equivalent exposure to that borrower, the general rule is that foreign currency ratings would be used for exposures in foreign currency. Domestic currency ratings, if separate, would only be used to risk weight claims denominated in the domestic currency.[37]

5. Short-term/long-term assessments

103. For risk-weighting purposes, short-term assessments are deemed to be issue-specific. They can only be used to derive risk weights for claims arising from the rated facility. They cannot be generalised to other short-term claims, except under the conditions of paragraph 105. In no event can a short-term rating be used to support a risk weight for an unrated long-term claim. Short-term assessments may only be used for short-term claims against banks and corporates. The table below provides a framework for banks' exposures to specific short-term facilities, such as a particular issuance of commercial paper:

Credit assessment	**A-1/P-1**[38]	**A-2/P-2**	**A-3/P-3**	**Others**[39]
Risk weight	20%	50%	100%	150%

104. If a short-term rated facility attracts a 50% risk-weight, unrated short-term claims cannot attract a risk weight lower than 100%. If an issuer has a short-term facility with an assessment that warrants a risk weight of 150%, all unrated claims, whether long-term or short-term, should also receive a 150% risk weight, unless the bank uses recognised credit risk mitigation techniques for such claims.

105. In cases where national supervisors have decided to apply option 2 under the standardised approach to short term interbank claims to banks in their jurisdiction, the interaction with specific short-term assessments is expected to be the following:

- The general preferential treatment for short-term claims, as defined under paragraphs 62 and 64, applies to all claims on banks of up to three months original maturity when there is no specific short-term claim assessment.
- When there is a short-term assessment and such an assessment maps into a risk weight that is more favourable (i.e. lower) or identical to that derived from the general preferential treatment, the short-term assessment should be used for the specific claim only. Other short-term claims would benefit from the general preferential treatment.

[37] However, when an exposure arises through a bank's participation in a loan that has been extended, or has been guaranteed against convertibility and transfer risk, by certain MDBs, its convertibility and transfer risk can be considered by national supervisory authorities to be effectively mitigated. To qualify, MDBs must have preferred creditor status recognised in the market and be included in footnote 24. In such cases, for risk weighting purposes, the borrower's domestic currency rating may be used instead of its foreign currency rating. In the case of a guarantee against convertibility and transfer risk, the local currency rating can be used only for the portion that has been guaranteed. The portion of the loan not benefiting from such a guarantee will be risk-weighted based on the foreign currency rating.

[38] The notations follow the methodology used by Standard & Poor's and by Moody's Investors Service. The A-1 rating of Standard & Poor's includes both A-1+ and A-1-.

[39] This category includes all non-prime and B or C ratings.

- When a specific short-term assessment for a short term claim on a bank maps into a less favourable (higher) risk weight, the general short-term preferential treatment for interbank claims cannot be used. All unrated short-term claims should receive the same risk weighting as that implied by the specific short-term assessment.

106. When a short-term assessment is to be used, the institution making the assessment needs to meet all of the eligibility criteria for recognising ECAIs as presented in paragraph 91 in terms of its short-term assessment.

6. Level of application of the assessment

107. External assessments for one entity within a corporate group cannot be used to risk weight other entities within the same group.

7. Unsolicited ratings

108. As a general rule, banks should use *solicited* ratings from eligible ECAIs. National supervisory authorities may, however, allow banks to use *unsolicited* ratings in the same way as solicited ratings. However, there may be the potential for ECAIs to use unsolicited ratings to put pressure on entities to obtain solicited ratings. Such behaviour, when identified, should cause supervisors to consider whether to continue recognising such ECAIs as eligible for capital adequacy purposes.

D. The standardised approach — credit risk mitigation

1. Overarching issues

(i) Introduction

109. Banks use a number of techniques to mitigate the credit risks to which they are exposed. For example, exposures may be collateralised by first priority claims, in whole or in part with cash or securities, a loan exposure may be guaranteed by a third party, or a bank may buy a credit derivative to offset various forms of credit risk. Additionally banks may agree to net loans owed to them against deposits from the same counterparty.

110. Where these techniques meet the requirements for legal certainty as described in paragraph 117 and 118 below, the revised approach to CRM allows a wider range of credit risk mitigants to be recognised for regulatory capital purposes than is permitted under the 1988 Accord.

(ii) General remarks

111. The framework set out in this Section II is applicable to the banking book exposures in the standardised approach. For the treatment of CRM in the IRB approach, see Section III.

112. The comprehensive approach for the treatment of collateral (see paragraphs 130 to 138 and 145 to 181) will also be applied to calculate the counterparty risk charges for OTC derivatives and repo-style transactions booked in the trading book.

113. No transaction in which CRM techniques are used should receive a higher capital requirement than an otherwise identical transaction where such techniques are not used.

114. The effects of CRM will not be double counted. Therefore, no additional supervisory recognition of CRM for regulatory capital purposes will be granted on claims for which an issue-specific rating is used that already reflects that CRM. As stated in paragraph 100 of the

section on the standardised approach, principal-only ratings will also not be allowed within the framework of CRM.

115. While the use of CRM techniques reduces or transfers credit risk, it simultaneously may increase other risks (residual risks). Residual risks include legal, operational, liquidity and market risks. Therefore, it is imperative that banks employ robust procedures and processes to control these risks, including strategy; consideration of the underlying credit; valuation; policies and procedures; systems; control of roll-off risks; and management of concentration risk arising from the bank's use of CRM techniques and its interaction with the bank's overall credit risk profile. Where these risks are not adequately controlled, supervisors may impose additional capital charges or take other supervisory actions as outlined in Pillar 2.

116. The Pillar 3 requirements must also be observed for banks to obtain capital relief in respect of any CRM techniques.

(iii) Legal certainty

117. In order for banks to obtain capital relief for any use of CRM techniques, the following minimum standards for legal documentation must be met.

118. All documentation used in collateralised transactions and for documenting on-balance sheet netting, guarantees and credit derivatives must be binding on all parties and legally enforceable in all relevant jurisdictions. Banks must have conducted sufficient legal review to verify this and have a well founded legal basis to reach this conclusion, and undertake such further review as necessary to ensure continuing enforceability.

2. Overview of Credit Risk Mitigation Techniques[40]

(i) Collateralised transactions

119. A collateralised transaction is one in which:

- banks have a credit exposure or potential credit exposure; and
- that credit exposure or potential credit exposure is hedged in whole or in part by collateral posted by a counterparty[41] or by a third party on behalf of the counterparty.

120. Where banks take eligible financial collateral (e.g. cash or securities, more specifically defined in paragraphs 145 and 146 below), they are allowed to reduce their credit exposure to a counterparty when calculating their capital requirements to take account of the risk mitigating effect of the collateral.

Overall framework and minimum conditions

121. Banks may opt for either the simple approach, which, similar to the 1988 Accord, substitutes the risk weighting of the collateral for the risk weighting of the counterparty for the

[40] See Annex 10 for an overview of methodologies for the capital treatment of transactions secured by financial collateral under the standardised and IRB approaches.

[41] In this section "counterparty" is used to denote a party to whom a bank has an on- or off-balance sheet credit exposure or a potential credit exposure. That exposure may, for example, take the form of a loan of cash or securities (where the counterparty would traditionally be called the borrower), of securities posted as collateral, of a commitment or of exposure under an OTC derivatives contract.

collateralised portion of the exposure (generally subject to a 20% floor), or for the comprehensive approach, which allows fuller offset of collateral against exposures, by effectively reducing the exposure amount by the value ascribed to the collateral. Banks may operate under either, but not both, approaches in the banking book, but only under the comprehensive approach in the trading book. Partial collateralisation is recognised in both approaches. Mismatches in the maturity of the underlying exposure and the collateral will only be allowed under the comprehensive approach.

122. However, before capital relief will be granted in respect of any form of collateral, the standards set out below in paragraphs 123 to 126 must be met under either approach.

123. In addition to the general requirements for legal certainty set out in paragraphs 117 and 118, the legal mechanism by which collateral is pledged or transferred must ensure that the bank has the right to liquidate or take legal possession of it, in a timely manner, in the event of the default, insolvency or bankruptcy (or one or more otherwise-defined credit events set out in the transaction documentation) of the counterparty (and, where applicable, of the custodian holding the collateral). Furthermore banks must take all steps necessary to fulfil those requirements under the law applicable to the bank's interest in the collateral for obtaining and maintaining an enforceable security interest, e.g. by registering it with a registrar, or for exercising a right to net or set off in relation to title transfer collateral.

124. In order for collateral to provide protection, the credit quality of the counterparty and the value of the collateral must not have a material positive correlation. For example, securities issued by the counterparty ─ or by any related group entity ─ would provide little protection and so would be ineligible.

125. Banks must have clear and robust procedures for the timely liquidation of collateral to ensure that any legal conditions required for declaring the default of the counterparty and liquidating the collateral are observed, and that collateral can be liquidated promptly.

126. Where the collateral is held by a custodian, banks must take reasonable steps to ensure that the custodian segregates the collateral from its own assets.

127. A capital requirement will be applied to a bank on either side of the collateralised transaction: for example, both repos and reverse repos will be subject to capital requirements. Likewise, both sides of a securities lending and borrowing transaction will be subject to explicit capital charges, as will the posting of securities in connection with a derivative exposure or other borrowing.

128. Where a bank, acting as an agent, arranges a repo-style transaction (i.e. repurchase/reverse repurchase and securities lending/borrowing transactions) between a customer and a third party and provides a guarantee to the customer that the third party will perform on its obligations, then the risk to the bank is the same as if the bank had entered into the transaction as a principal. In such circumstances, a bank will be required to calculate capital requirements as if it were itself the principal.

The simple approach

129. In the simple approach the risk weighting of the collateral instrument collateralising or partially collateralising the exposure is substituted for the risk weighting of the counterparty. Details of this framework are provided in paragraphs 182 to 185.

The comprehensive approach

130. In the comprehensive approach, when taking collateral, banks will need to calculate their adjusted exposure to a counterparty for capital adequacy purposes in order to take account of the effects of that collateral. Using haircuts, banks are required to adjust both the amount of the exposure to the counterparty and the value of any collateral received in support of that counterparty to take account of possible future fluctuations in the value of either,[42] occasioned by market movements. This will produce volatility adjusted amounts for both exposure and collateral. Unless either side of the transaction is cash, the volatility adjusted amount for the exposure will be higher than the exposure and for the collateral it will be lower.

131. Additionally where the exposure and collateral are held in different currencies an additional downwards adjustment must be made to the volatility adjusted collateral amount to take account of possible future fluctuations in exchange rates.

132. Where the volatility-adjusted exposure amount is greater than the volatility-adjusted collateral amount (including any further adjustment for foreign exchange risk), banks shall calculate their risk-weighted assets as the difference between the two multiplied by the risk weight of the counterparty. The framework for performing these calculations is set out in paragraphs 147 to 150.

133. In principle, banks have two ways of calculating the haircuts: (i) standard supervisory haircuts, using parameters set by the Committee, and (ii) own-estimate haircuts, using banks' own internal estimates of market price volatility. Supervisors will allow banks to use own-estimate haircuts only when they fulfil certain qualitative and quantitative criteria.

134. A bank may choose to use standard or own-estimate haircuts independently of the choice it has made between the standardised approach and the foundation IRB approach to credit risk. However, if banks seek to use their own-estimate haircuts, they must do so for the full range of instrument types for which they would be eligible to use own-estimates, the exception being immaterial portfolios where they may use the standard supervisory haircuts.

135. The size of the individual haircuts will depend on the type of instrument, type of transaction and the frequency of marking-to-market and remargining. For example, repo-style transactions subject to daily marking-to-market and to daily remargining will receive a haircut based on a 5-business day holding period and secured lending transactions with daily mark-to-market and no remargining clauses will receive a haircut based on a 20-business day holding period. These haircut numbers will be scaled up using the square root of time formula depending on the frequency of remargining or marking-to-market.

136. For certain types of repo-style transactions (broadly speaking government bond repos as defined in paragraphs 170 and 171) supervisors may allow banks using standard supervisory haircuts or own-estimate haircuts not to apply these in calculating the exposure amount after risk mitigation.

137. The effect of master netting agreements covering repo-style transactions can be recognised for the calculation of capital requirements subject to the conditions in paragraph 173.

[42] Exposure amounts may vary where, for example, securities are being lent.

138. As a further alternative to standard supervisory haircuts and own-estimate haircuts banks may use VaR models for calculating potential price volatility for repo-style transactions and other similar SFTs, as set out in paragraphs 178 to 181 (i) below. Alternatively, subject to supervisory approval, they may also calculate, for these transactions, an expected positive exposure, as set forth in Annex 4 of this Framework.

(ii) On-balance sheet netting

139. Where banks have legally enforceable netting arrangements for loans and deposits they may calculate capital requirements on the basis of net credit exposures subject to the conditions in paragraph 188.

(iii) Guarantees and credit derivatives

140. Where guarantees or credit derivatives are direct, explicit, irrevocable and unconditional, and supervisors are satisfied that banks fulfil certain minimum operational conditions relating to risk management processes they may allow banks to take account of such credit protection in calculating capital requirements.

141. A range of guarantors and protection providers are recognised. As under the 1988 Accord, a substitution approach will be applied. Thus only guarantees issued by or protection provided by entities with a lower risk weight than the counterparty will lead to reduced capital charges since the protected portion of the counterparty exposure is assigned the risk weight of the guarantor or protection provider, whereas the uncovered portion retains the risk weight of the underlying counterparty.

142. Detailed operational requirements are given below in paragraphs 189 to 193.

(iv) Maturity mismatch

143. Where the residual maturity of the CRM is less than that of the underlying credit exposure a maturity mismatch occurs. Where there is a maturity mismatch and the CRM has an original maturity of less than one year, the CRM is not recognised for capital purposes. In other cases where there is a maturity mismatch, partial recognition is given to the CRM for regulatory capital purposes as detailed below in paragraphs 202 to 205. Under the simple approach for collateral maturity mismatches will not be allowed.

(v) Miscellaneous

144. Treatments for pools of credit risk mitigants and first- and second-to-default credit derivatives are given in paragraphs 206 to 210 below.

3. Collateral

(i) Eligible financial collateral

145. The following collateral instruments are eligible for recognition in the simple approach:

(a)	Cash (as well as certificates of deposit or comparable instruments issued by the lending bank) on deposit with the bank which is incurring the counterparty exposure.[43, 44]
(b)	Gold.
(c)	Debt securities rated by a recognised external credit assessment institution where these are either:
•	at least BB- when issued by sovereigns or PSEs that are treated as sovereigns by the national supervisor; or
•	at least BBB- when issued by other entities (including banks and securities firms); or
•	at least A-3/P-3 for short-term debt instruments.
(d)	Debt securities not rated by a recognised external credit assessment institution where these are:
•	issued by a bank; and
•	listed on a recognised exchange; and
•	classified as senior debt; and
•	all rated issues of the same seniority by the issuing bank must be rated at least BBB- or A-3/P-3 by a recognised external credit assessment institution; and
•	the bank holding the securities as collateral has no information to suggest that the issue justifies a rating below BBB- or A-3/P-3 (as applicable); and
•	the supervisor is sufficiently confident about the market liquidity of the security.
(e)	Equities (including convertible bonds) that are included in a main index.
(f)	Undertakings for Collective Investments in Transferable Securities (UCITS) and mutual funds where:
•	a price for the units is publicly quoted daily; and
•	the UCITS/mutual fund is limited to investing in the instruments listed in this paragraph.[45]

146. The following collateral instruments are eligible for recognition in the comprehensive approach:

(a)	All of the instruments in paragraph 145;
(b)	Equities (including convertible bonds) which are not included in a main index but

[43] Cash funded credit linked notes issued by the bank against exposures in the banking book which fulfil the criteria for credit derivatives will be treated as cash collateralised transactions.

[44] When cash on deposit, certificates of deposit or comparable instruments issued by the lending bank are held as collateral at a third-party bank in a non-custodial arrangement, if they are openly pledged/assigned to the lending bank and if the pledge/assignment is unconditional and irrevocable, the exposure amount covered by the collateral (after any necessary haircuts for currency risk) will receive the risk weight of the third-party bank.

[45] However, the use or potential use by a UCITS/mutual fund of derivative instruments solely to hedge investments listed in this paragraph and paragraph 146 shall not prevent units in that UCITS/mutual fund from being eligible financial collateral.

	which are listed on a recognised exchange;
(c)	UCITS/mutual funds which include such equities.

(ii) The comprehensive approach

Calculation of capital requirement

147. For a collateralised transaction, the exposure amount after risk mitigation is calculated as follows:

E* = max {0, [E x (1 + He) – C x (1 – Hc – Hfx)]}

where:

E* = the exposure value after risk mitigation

E = current value of the exposure

He = haircut appropriate to the exposure

C = the current value of the collateral received

Hc = haircut appropriate to the collateral

Hfx = haircut appropriate for currency mismatch between the collateral and exposure

148. The exposure amount after risk mitigation will be multiplied by the risk weight of the counterparty to obtain the risk-weighted asset amount for the collateralised transaction.

149. The treatment for transactions where there is a mismatch between the maturity of the counterparty exposure and the collateral is given in paragraphs 202 to 205.

150. Where the collateral is a basket of assets, the haircut on the basket will be $H = \sum_i a_i H_i$, where a_i is the weight of the asset (as measured by units of currency) in the basket and H_i the haircut applicable to that asset.

Standard supervisory haircuts

151. These are the standard supervisory haircuts (assuming daily mark-to-market, daily remargining and a 10-business day holding period), expressed as percentages:

Issue rating for debt securities	Residual Maturity	Sovereigns[46, 47]	Other issuers[48]
AAA to AA-/A-1	≤ 1 year	0.5	1
	>1 year, ≤ 5 years	2	4
	> 5 years	4	8
A+ to BBB-/ A-2/A-3/P-3 and unrated bank securities per para. 145(d)	≤ 1 year	1	2
	>1 year, ≤ 5 years	3	6
	> 5 years	6	12
BB+ to BB-	All	15	
Main index equities (including convertible bonds) and Gold		15	
Other equities (including convertible bonds) listed on a recognised exchange		25	
UCITS/Mutual funds		Highest haircut applicable to any security in which the fund can invest	
Cash in the same currency[49]		0	

152. The standard supervisory haircut for currency risk where exposure and collateral are denominated in different currencies is 8% (also based on a 10-business day holding period and daily mark-to-market)

153. For transactions in which the bank lends non-eligible instruments (e.g. non-investment grade corporate debt securities), the haircut to be applied on the exposure should be the same as the one for equity traded on a recognised exchange that is not part of a main index.

Own estimates for haircuts

154. Supervisors may permit banks to calculate haircuts using their own internal estimates of market price volatility and foreign exchange volatility. Permission to do so will be conditional on the satisfaction of minimum qualitative and quantitative standards stated in paragraphs 156 to 165. When debt securities are rated BBB-/A-3 or higher, supervisors may allow banks to calculate a volatility estimate for each category of security. In determining relevant categories, institutions must take into account (a) the type of issuer of the security, (b) its rating, (c) its residual maturity, and (d) its modified duration. Volatility estimates must be representative of the securities actually included in the category for that bank. For debt securities rated below BBB-/A-3 or for equities eligible as collateral (lightly shaded boxes in the above table), the haircuts must be calculated for each individual security.

155. Banks must estimate the volatility of the collateral instrument or foreign exchange mismatch individually: estimated volatilities for each transaction must not take into account

46 Includes PSEs which are treated as sovereigns by the national supervisor.

47 Multilateral development banks receiving a 0% risk weight will be treated as sovereigns.

48 Includes PSEs which are not treated as sovereigns by the national supervisor.

49 Eligible cash collateral specified in paragraph 145 (a).

the correlations between unsecured exposure, collateral and exchange rates (see paragraphs 202 to 205 for the approach to maturity mismatches).

Quantitative criteria

156. In calculating the haircuts, a 99th percentile, one-tailed confidence interval is to be used.

157. The minimum holding period will be dependent on the type of transaction and the frequency of remargining or marking to market. The minimum holding periods for different types of transactions are presented in paragraph 167. Banks may use haircut numbers calculated according to shorter holding periods, scaled up to the appropriate holding period by the square root of time formula.

158. Banks must take into account the illiquidity of lower-quality assets. The holding period should be adjusted upwards in cases where such a holding period would be inappropriate given the liquidity of the collateral. They should also identify where historical data may understate potential volatility, e.g. a pegged currency. Such cases must be dealt with by subjecting the data to stress testing.

159. The choice of historical observation period (sample period) for calculating haircuts shall be a minimum of one year. For banks that use a weighting scheme or other methods for the historical observation period, the “effective” observation period must be at least one year (that is, the weighted average time lag of the individual observations cannot be less than 6 months).

160. Banks should update their data sets no less frequently than once every three months and should also reassess them whenever market prices are subject to material changes. This implies that haircuts must be computed at least every three months. The supervisor may also require a bank to calculate its haircuts using a shorter observation period if, in the supervisor's judgement, this is justified by a significant upsurge in price volatility.

161. No particular type of model is prescribed. So long as each model used captures all the material risks run by the bank, banks will be free to use models based on, for example, historical simulations and Monte Carlo simulations.

Qualitative criteria

162. The estimated volatility data (and holding period) must be used in the day-to-day risk management process of the bank.

163. Banks should have robust processes in place for ensuring compliance with a documented set of internal policies, controls and procedures concerning the operation of the risk measurement system.

164. The risk measurement system should be used in conjunction with internal exposure limits.

165. An independent review of the risk measurement system should be carried out regularly in the bank’s own internal auditing process. A review of the overall risk management process should take place at regular intervals (ideally not less than once a year) and should specifically address, at a minimum:

- the integration of risk measures into daily risk management;

- the validation of any significant change in the risk measurement process;
- the accuracy and completeness of position data;
- the verification of the consistency, timeliness and reliability of data sources used to run internal models, including the independence of such data sources; and
- the accuracy and appropriateness of volatility assumptions.

Adjustment for different holding periods and non daily mark-to-market or remargining

166. For some transactions, depending on the nature and frequency of the revaluation and remargining provisions, different holding periods are appropriate. The framework for collateral haircuts distinguishes between repo-style transactions (i.e. repo/reverse repos and securities lending/borrowing), "other capital-market-driven transactions" (i.e. OTC derivatives transactions and margin lending) and secured lending. In capital-market-driven transactions and repo-style transactions, the documentation contains remargining clauses; in secured lending transactions, it generally does not.

167. The minimum holding period for various products is summarised in the following table.

Transaction type	Minimum holding period	Condition
Repo-style transaction	five business days	daily remargining
Other capital market transactions	ten business days	daily remargining
Secured lending	twenty business days	daily revaluation

168. When the frequency of remargining or revaluation is longer than the minimum, the minimum haircut numbers will be scaled up depending on the actual number of business days between remargining or revaluation using the square root of time formula below:

$$H = H_M \sqrt{\frac{N_R + (T_M - 1)}{T_M}}$$

where:

H = haircut

H_M = haircut under the minimum holding period

T_M = minimum holding period for the type of transaction

N_R = actual number of business days between remargining for capital market transactions or revaluation for secured transactions.

When a bank calculates the volatility on a T_N day holding period which is different from the specified minimum holding period T_M, the H_M will be calculated using the square root of time formula:

$$H_M = H_N \sqrt{\frac{T_M}{T_N}}$$

T_N = holding period used by the bank for deriving H_N

H_N = haircut based on the holding period T_N

169. For example, for banks using the standard supervisory haircuts, the 10-business day haircuts provided in paragraph 151 will be the basis and this haircut will be scaled up or down depending on the type of transaction and the frequency of remargining or revaluation using the formula below:

$$H = H_{10} \sqrt{\frac{N_R + (T_M - 1)}{10}}$$

where:

H = haircut

H_{10} = 10-business day standard supervisory haircut for instrument

N_R = actual number of business days between remargining for capital market transactions or revaluation for secured transactions.

T_M = minimum holding period for the type of transaction

Conditions for zero H

170. For repo-style transactions where the following conditions are satisfied, and the counterparty is a *core market participant*, supervisors may choose not to apply the haircuts specified in the comprehensive approach and may instead apply a haircut of zero. This carve-out will not be available for banks using the modelling approaches as described in paragraphs 178 to 181 (i).

(a)	Both the exposure and the collateral are cash or a sovereign security or PSE security qualifying for a 0% risk weight in the standardised approach;[50]
(b)	Both the exposure and the collateral are denominated in the same currency;
(c)	Either the transaction is overnight or both the exposure and the collateral are marked-to-market daily and are subject to daily remargining;
(d)	Following a counterparty's failure to remargin, the time that is required between the last mark-to-market before the failure to remargin and the liquidation[51] of the collateral is considered to be no more than four business days;
(e)	The transaction is settled across a settlement system proven for that type of transaction;
(f)	The documentation covering the agreement is standard market documentation for repo-style transactions in the securities concerned;
(g)	The transaction is governed by documentation specifying that if the counterparty fails to satisfy an obligation to deliver cash or securities or to deliver margin or

[50] Note that where a supervisor has designated domestic-currency claims on its sovereign or central bank to be eligible for a 0% risk weight in the standardised approach, such claims will satisfy this condition.

[51] This does not require the bank to always liquidate the collateral but rather to have the capability to do so within the given time frame.

	otherwise defaults, then the transaction is immediately terminable; and
(h)	Upon any default event, regardless of whether the counterparty is insolvent or bankrupt, the bank has the unfettered, legally enforceable right to immediately seize and liquidate the collateral for its benefit.

171. *Core market participants* may include, at the discretion of the national supervisor, the following entities:

(a)	Sovereigns, central banks and PSEs;
(b)	Banks and securities firms;
(c)	Other financial companies (including insurance companies) eligible for a 20% risk weight in the standardised approach;
(d)	Regulated mutual funds that are subject to capital or leverage requirements;
(e)	Regulated pension funds; and
(f)	Recognised clearing organisations.

172. Where a supervisor applies a specific carve-out to repo-style transactions in securities issued by its domestic government, then other supervisors may choose to allow banks incorporated in their jurisdiction to adopt the same approach to the same transactions.

Treatment of repo-style transactions covered under master netting agreements

173. The effects of bilateral netting agreements covering repo-style transactions will be recognised on a counterparty-by-counterparty basis if the agreements are legally enforceable in each relevant jurisdiction upon the occurrence of an event of default and regardless of whether the counterparty is insolvent or bankrupt. In addition, netting agreements must:

(a)	provide the non-defaulting party the right to terminate and close-out in a timely manner all transactions under the agreement upon an event of default, including in the event of insolvency or bankruptcy of the counterparty;
(b)	provide for the netting of gains and losses on transactions (including the value of any collateral) terminated and closed out under it so that a single net amount is owed by one party to the other;
(c)	allow for the prompt liquidation or setoff of collateral upon the event of default; and
(d)	be, together with the rights arising from the provisions required in (a) to (c) above, legally enforceable in each relevant jurisdiction upon the occurrence of an event of default and regardless of the counterparty's insolvency or bankruptcy.

174. Netting across positions in the banking and trading book will only be recognised when the netted transactions fulfil the following conditions:

(a)	All transactions are marked to market daily;[52] and
(b)	The collateral instruments used in the transactions are recognised as eligible financial collateral in the banking book.

175. The formula in paragraph 147 will be adapted to calculate the capital requirements for transactions with netting agreements.

176. For banks using the standard supervisory haircuts or own-estimate haircuts, the framework below will apply to take into account the impact of master netting agreements.

$$E^* = \max \{0, [(\sum(E) - \sum(C)) + \sum (Es \times Hs) + \sum (Efx \times Hfx)]\}$$[53]

where:

E* = the exposure value after risk mitigation

E = current value of the exposure

C = the value of the collateral received

Es = absolute value of the net position in a given security

Hs = haircut appropriate to Es

Efx = absolute value of the net position in a currency different from the settlement currency

Hfx = haircut appropriate for currency mismatch

177. The intention here is to obtain a net exposure amount after netting of the exposures and collateral and have an add-on amount reflecting possible price changes for the securities involved in the transactions and for foreign exchange risk if any. The net long or short position of each security included in the netting agreement will be multiplied by the appropriate haircut. All other rules regarding the calculation of haircuts stated in paragraphs 147 to 172 equivalently apply for banks using bilateral netting agreements for repo-style transactions.

Use of models

178. As an alternative to the use of standard or own-estimate haircuts, banks may be permitted to use a VaR models approach to reflect the price volatility of the exposure and collateral for repo-style transactions, taking into account correlation effects between security positions. This approach would apply to repo-style transactions covered by bilateral netting agreements on a counterparty-by-counterparty basis. At the discretion of the national supervisor, firms are also eligible to use the VaR model approach for margin lending transactions, if the transactions are covered under a bilateral master netting agreement that

---

52 The holding period for the haircuts will depend as in other repo-style transactions on the frequency of margining.

53 The starting point for this formula is the formula in paragraph 147 which can also be presented as the following: $E^* = \max \{0, [(E - C) + (E \times He) + (C \times Hc) + (C \times Hfx)]\}$.

meets the requirements of paragraphs 173 and 174. The VaR models approach is available to banks that have received supervisory recognition for an internal market risk model according to paragraph 718 (LXX). Banks which have not received supervisory recognition for use of models according to paragraph 718 (LXX) can separately apply for supervisory recognition to use their internal VaR models for calculation of potential price volatility for repo-style transactions. Internal models will only be accepted when a bank can prove the quality of its model to the supervisor through the backtesting of its output using one year of historical data. Banks must meet the model validation requirement of paragraph 43 of Annex 4 to use VaR for repo-style and other SFTs. In addition, other transactions similar to repo-style transactions (like prime brokerage) and that meet the requirements for repo-style transactions, are also eligible to use the VaR models approach provided the model used meets the operational requirements set forth in Section I.F of Annex 4.

179. The quantitative and qualitative criteria for recognition of internal market risk models for repo-style transactions and other similar transactions are in principle the same as in paragraphs 718 (LXXIV) to 718 (LXXVI). With regard to the holding period, the minimum will be 5-business days for repo-style transactions, rather than the 10-business days in paragraph 718 (LXXVI) (c). For other transactions eligible for the VaR models approach, the 10-business day holding period will be retained. The minimum holding period should be adjusted upwards for market instruments where such a holding period would be inappropriate given the liquidity of the instrument concerned.

180. (Deleted)

181. The calculation of the exposure E* for banks using their internal model will be the following:

$$E^* = \max \{0, [(\sum E - \sum C) + \text{VaR output from internal model}]\}$$

In calculating capital requirements banks will use the previous business day's VaR number.

181 (i). Subject to supervisory approval, instead of using the VaR approach, banks may also calculate an expected positive exposure for repo-style and other similar SFTs, in accordance with the Internal Model Method set out in Annex 4 of this Framework.

(iii) The simple approach

Minimum conditions

182. For collateral to be recognised in the simple approach, the collateral must be pledged for at least the life of the exposure and it must be marked to market and revalued with a minimum frequency of six months. Those portions of claims collateralised by the market value of recognised collateral receive the risk weight applicable to the collateral instrument. The risk weight on the collateralised portion will be subject to a floor of 20% except under the conditions specified in paragraphs 183 to 185. The remainder of the claim should be assigned to the risk weight appropriate to the counterparty. A capital requirement will be applied to banks on either side of the collateralised transaction: for example, both repos and reverse repos will be subject to capital requirements.

Exceptions to the risk weight floor

183. Transactions which fulfil the criteria outlined in paragraph 170 and are with a core market participant, as defined in 171, receive a risk weight of 0%. If the counterparty to the transactions is not a core market participant the transaction should receive a risk weight of 10%.

184. OTC derivative transactions subject to daily mark-to-market, collateralised by cash and where there is no currency mismatch should receive a 0% risk weight. Such transactions collateralised by sovereign or PSE securities qualifying for a 0% risk weight in the standardised approach can receive a 10% risk weight.

185. The 20% floor for the risk weight on a collateralised transaction will not be applied and a 0% risk weight can be applied where the exposure and the collateral are denominated in the same currency, and either:

- the collateral is cash on deposit as defined in paragraph 145 (a); or
- the collateral is in the form of sovereign/PSE securities eligible for a 0% risk weight, and its market value has been discounted by 20%.

(iv) Collateralised OTC derivatives transactions

186. Under the Current Exposure Method, the calculation of the counterparty credit risk charge for an individual contract will be as follows:

counterparty charge = [(RC + add-on) – C_A] x r x 8%

where:

RC = the replacement cost,

add-on = the amount for potential future exposure calculated according to paragraph 92(i) and 92(ii) of Annex 4,

C_A = the volatility adjusted collateral amount under the comprehensive approach prescribed in paragraphs 147 to 172, or zero if no eligible collateral is applied to the transaction, and

r = the risk weight of the counterparty.

187. When effective bilateral netting contracts are in place, RC will be the net replacement cost and the add-on will be A_{Net} as calculated according to paragraphs 96(i) to 96(vi) of Annex 4. The haircut for currency risk (Hfx) should be applied when there is a mismatch between the collateral currency and the settlement currency. Even in the case where there are more than two currencies involved in the exposure, collateral and settlement currency, a single haircut assuming a 10-business day holding period scaled up as necessary depending on the frequency of mark-to-market will be applied.

187(i). As an alternative to the Current Exposure Method for the calculation of the counterparty credit risk charge, banks may also use the Standardised Method and, subject to supervisory approval, the Internal Model Method as set out in Annex 4 of this Framework.

4. On-balance sheet netting

188. Where a bank,

(a) has a well-founded legal basis for concluding that the netting or offsetting agreement is enforceable in each relevant jurisdiction regardless of whether the counterparty is insolvent or bankrupt;

(b) is able at any time to determine those assets and liabilities with the same counterparty that are subject to the netting agreement;

(c) monitors and controls its roll-off risks; and

(d) monitors and controls the relevant exposures on a net basis,

it may use the net exposure of loans and deposits as the basis for its capital adequacy calculation in accordance with the formula in paragraph 147. Assets (loans) are treated as exposure and liabilities (deposits) as collateral. The haircuts will be zero except when a currency mismatch exists. A 10-business day holding period will apply when daily mark-to-market is conducted and all the requirements contained in paragraphs 151, 169, and 202 to 205 will apply.

5. Guarantees and credit derivatives

(i) Operational requirements

Operational requirements common to guarantees and credit derivatives

189. A guarantee (counter-guarantee) or credit derivative must represent a direct claim on the protection provider and must be explicitly referenced to specific exposures or a pool of exposures, so that the extent of the cover is clearly defined and incontrovertible. Other than non-payment by a protection purchaser of money due in respect of the credit protection contract it must be irrevocable; there must be no clause in the contract that would allow the protection provider unilaterally to cancel the credit cover or that would increase the effective cost of cover as a result of deteriorating credit quality in the hedged exposure.[54] It must also be unconditional; there should be no clause in the protection contract outside the direct control of the bank that could prevent the protection provider from being obliged to pay out in a timely manner in the event that the original counterparty fails to make the payment(s) due.

Additional operational requirements for guarantees

190. In addition to the legal certainty requirements in paragraphs 117 and 118 above, in order for a guarantee to be recognised, the following conditions must be satisfied:

(a)	On the qualifying default/non-payment of the counterparty, the bank may in a timely manner pursue the guarantor for any monies outstanding under the documentation governing the transaction. The guarantor may make one lump sum payment of all monies under such documentation to the bank, or the guarantor may assume the future payment obligations of the counterparty covered by the guarantee. The bank must have the right to receive any such payments from the guarantor without first having to take legal actions in order to pursue the counterparty for payment.
(b)	The guarantee is an explicitly documented obligation assumed by the guarantor.
(c)	Except as noted in the following sentence, the guarantee covers all types of payments the underlying obligor is expected to make under the documentation governing the transaction, for example notional amount, margin payments etc. Where a guarantee covers payment of principal only, interests and other uncovered payments should be treated as an unsecured amount in accordance with paragraph 198.

[54] Note that the irrevocability condition does not require that the credit protection and the exposure be maturity matched; rather that the maturity agreed *ex ante* may not be reduced *ex post* by the protection provider. Paragraph 203 sets forth the treatment of call options in determining remaining maturity for credit protection.

Additional operational requirements for credit derivatives

191. In order for a credit derivative contract to be recognised, the following conditions must be satisfied:

(a)	The credit events specified by the contracting parties must at a minimum cover:
•	failure to pay the amounts due under terms of the underlying obligation that are in effect at the time of such failure (with a grace period that is closely in line with the grace period in the underlying obligation);
•	bankruptcy, insolvency or inability of the obligor to pay its debts, or its failure or admission in writing of its inability generally to pay its debts as they become due, and analogous events; and
•	restructuring of the underlying obligation involving forgiveness or postponement of principal, interest or fees that results in a credit loss event (i.e. charge-off, specific provision or other similar debit to the profit and loss account). When restructuring is not specified as a credit event, refer to paragraph 192.
(b)	If the credit derivative covers obligations that do not include the underlying obligation, section (g) below governs whether the asset mismatch is permissible.
(c)	The credit derivative shall not terminate prior to expiration of any grace period required for a default on the underlying obligation to occur as a result of a failure to pay, subject to the provisions of paragraph 203.
(d)	Credit derivatives allowing for cash settlement are recognised for capital purposes insofar as a robust valuation process is in place in order to estimate loss reliably. There must be a clearly specified period for obtaining post-credit-event valuations of the underlying obligation. If the reference obligation specified in the credit derivative for purposes of cash settlement is different than the underlying obligation, section (g) below governs whether the asset mismatch is permissible.
(e)	If the protection purchaser's right/ability to transfer the underlying obligation to the protection provider is required for settlement, the terms of the underlying obligation must provide that any required consent to such transfer may not be unreasonably withheld.
(f)	The identity of the parties responsible for determining whether a credit event has occurred must be clearly defined. This determination must not be the sole responsibility of the protection seller. The protection buyer must have the right/ability to inform the protection provider of the occurrence of a credit event.
(g)	A mismatch between the underlying obligation and the reference obligation under the credit derivative (i.e. the obligation used for purposes of determining cash settlement value or the deliverable obligation) is permissible if (1) the reference obligation ranks pari passu with or is junior to the underlying obligation, and (2) the underlying obligation and reference obligation share the same obligor (i.e. the same legal entity) and legally enforceable cross-default or cross-acceleration clauses are in place.
(h)	A mismatch between the underlying obligation and the obligation used for purposes of determining whether a credit event has occurred is permissible if (1) the latter obligation ranks pari passu with or is junior to the underlying obligation, and (2) the underlying obligation and reference obligation share the same obligor (i.e. the same legal entity) and legally enforceable cross-default or cross-acceleration clauses are in place.

192. When the restructuring of the underlying obligation is not covered by the credit derivative, but the other requirements in paragraph 191 are met, partial recognition of the credit derivative will be allowed. If the amount of the credit derivative is less than or equal to the amount of the underlying obligation, 60% of the amount of the hedge can be recognised as covered. If the amount of the credit derivative is larger than that of the underlying obligation, then the amount of eligible hedge is capped at 60% of the amount of the underlying obligation.[55]

193. Only credit default swaps and total return swaps that provide credit protection equivalent to guarantees will be eligible for recognition. The following exception applies. Where a bank buys credit protection through a total return swap and records the net payments received on the swap as net income, but does not record offsetting deterioration in the value of the asset that is protected (either through reductions in fair value or by an addition to reserves), the credit protection will not be recognised. The treatment of first-to-default and second-to-default products is covered separately in paragraphs 207 to 210.

194. Other types of credit derivatives will not be eligible for recognition at this time.[56]

(ii) Range of eligible guarantors (counter-guarantors)/protection providers

195. Credit protection given by the following entities will be recognised:

- sovereign entities,[57] PSEs, banks[58] and securities firms with a lower risk weight than the counterparty;
- other entities rated A- or better. This would include credit protection provided by parent, subsidiary and affiliate companies when they have a lower risk weight than the obligor.

(iii) Risk weights

196. The protected portion is assigned the risk weight of the protection provider. The uncovered portion of the exposure is assigned the risk weight of the underlying counterparty.

197. Materiality thresholds on payments below which no payment is made in the event of loss are equivalent to retained first loss positions and must be deducted in full from the capital of the bank purchasing the credit protection.

Proportional cover

198. Where the amount guaranteed, or against which credit protection is held, is less than the amount of the exposure, and the secured and unsecured portions are of equal seniority, i.e. the bank and the guarantor share losses on a pro-rata basis capital relief will be afforded on a proportional basis: i.e. the protected portion of the exposure will receive the

[55] The 60% recognition factor is provided as an interim treatment, which the Committee intends to refine prior to implementation after considering additional data.

[56] Cash funded credit linked notes issued by the bank against exposures in the banking book which fulfil the criteria for credit derivatives will be treated as cash collateralised transactions.

[57] This includes the Bank for International Settlements, the International Monetary Fund, the European Central Bank and the European Community, as well as those MDBs referred to in footnote 24.

[58] This includes other MDBs.

treatment applicable to eligible guarantees/credit derivatives, with the remainder treated as unsecured.

Tranched cover

199. Where the bank transfers a portion of the risk of an exposure in one or more tranches to a protection seller or sellers and retains some level of risk of the loan and the risk transferred and the risk retained are of different seniority, banks may obtain credit protection for either the senior tranches (e.g. second loss portion) or the junior tranche (e.g. first loss portion). In this case the rules as set out in Section IV (Credit risk – securitisation framework) will apply.

(iv) Currency mismatches

200. Where the credit protection is denominated in a currency different from that in which the exposure is denominated — i.e. there is a currency mismatch — the amount of the exposure deemed to be protected will be reduced by the application of a haircut H_{FX}, i.e.

$$G_A = G \times (1 - H_{FX})$$

where:

G = nominal amount of the credit protection

H_{FX} = haircut appropriate for currency mismatch between the credit protection and underlying obligation.

The appropriate haircut based on a 10-business day holding period (assuming daily marking-to-market) will be applied. If a bank uses the supervisory haircuts it will be 8%. The haircuts must be scaled up using the square root of time formula, depending on the frequency of revaluation of the credit protection as described in paragraph 168.

(v) Sovereign guarantees and counter-guarantees

201. As specified in paragraph 54, a lower risk weight may be applied at national discretion to a bank's exposures to the sovereign (or central bank) where the bank is incorporated and where the exposure is denominated in domestic currency and funded in that currency. National authorities may extend this treatment to portions of claims guaranteed by the sovereign (or central bank), where the guarantee is denominated in the domestic currency and the exposure is funded in that currency. A claim may be covered by a guarantee that is indirectly counter-guaranteed by a sovereign. Such a claim may be treated as covered by a sovereign guarantee provided that:

(a)	the sovereign counter-guarantee covers all credit risk elements of the claim;
(b)	both the original guarantee and the counter-guarantee meet all operational requirements for guarantees, except that the counter-guarantee need not be direct and explicit to the original claim; and
(c)	the supervisor is satisfied that the cover is robust and that no historical evidence suggests that the coverage of the counter-guarantee is less than effectively equivalent to that of a direct sovereign guarantee.

6. Maturity mismatches

202. For the purposes of calculating risk-weighted assets, a maturity mismatch occurs when the residual maturity of a hedge is less than that of the underlying exposure.

(i) Definition of maturity

203. The maturity of the underlying exposure and the maturity of the hedge should both be defined conservatively. The effective maturity of the underlying should be gauged as the longest possible remaining time before the counterparty is scheduled to fulfil its obligation, taking into account any applicable grace period. For the hedge, embedded options which may reduce the term of the hedge should be taken into account so that the shortest possible effective maturity is used. Where a call is at the discretion of the protection seller, the maturity will always be at the first call date. If the call is at the discretion of the protection buying bank but the terms of the arrangement at origination of the hedge contain a positive incentive for the bank to call the transaction before contractual maturity, the remaining time to the first call date will be deemed to be the effective maturity. For example, where there is a step-up in cost in conjunction with a call feature or where the effective cost of cover increases over time even if credit quality remains the same or increases, the effective maturity will be the remaining time to the first call.

(ii) Risk weights for maturity mismatches

204. As outlined in paragraph 143, hedges with maturity mismatches are only recognised when their original maturities are greater than or equal to one year. As a result, the maturity of hedges for exposures with original maturities of less than one year must be matched to be recognised. In all cases, hedges with maturity mismatches will no longer be recognised when they have a residual maturity of three months or less.

205. When there is a maturity mismatch with recognised credit risk mitigants (collateral, on-balance sheet netting, guarantees and credit derivatives) the following adjustment will be applied.

$$Pa = P \times (t - 0.25) / (T - 0.25)$$

where:

Pa = value of the credit protection adjusted for maturity mismatch

P = credit protection (e.g. collateral amount, guarantee amount) adjusted for any haircuts

t = min (T, residual maturity of the credit protection arrangement) expressed in years

T = min (5, residual maturity of the exposure) expressed in years

7. Other items related to the treatment of CRM techniques

(i) Treatment of pools of CRM techniques

206. In the case where a bank has multiple CRM techniques covering a single exposure (e.g. a bank has both collateral and guarantee partially covering an exposure), the bank will be required to subdivide the exposure into portions covered by each type of CRM technique (e.g. portion covered by collateral, portion covered by guarantee) and the risk-weighted assets of each portion must be calculated separately. When credit protection provided by a

single protection provider has differing maturities, they must be subdivided into separate protection as well.

(ii) First-to-default credit derivatives

207. There are cases where a bank obtains credit protection for a basket of reference names and where the first default among the reference names triggers the credit protection and the credit event also terminates the contract. In this case, the bank may recognise regulatory capital relief for the asset within the basket with the lowest risk-weighted amount, but only if the notional amount is less than or equal to the notional amount of the credit derivative.

208. With regard to the bank providing credit protection through such an instrument, if the product has an external credit assessment from an eligible credit assessment institution, the risk weight in paragraph 567 applied to securitisation tranches will be applied. If the product is not rated by an eligible external credit assessment institution, the risk weights of the assets included in the basket will be aggregated up to a maximum of 1250% and multiplied by the nominal amount of the protection provided by the credit derivative to obtain the risk-weighted asset amount.

(iii) Second-to-default credit derivatives

209. In the case where the second default among the assets within the basket triggers the credit protection, the bank obtaining credit protection through such a product will only be able to recognise any capital relief if first-default-protection has also be obtained or when one of the assets within the basket has already defaulted.

210. For banks providing credit protection through such a product, the capital treatment is the same as in paragraph 208 above with one exception. The exception is that, in aggregating the risk weights, the asset with the lowest risk weighted amount can be excluded from the calculation.

III. Credit Risk – The Internal Ratings-Based Approach

A. Overview

211. This section of the Framework describes the IRB approach to credit risk. Subject to certain minimum conditions and disclosure requirements, banks that have received supervisory approval to use the IRB approach may rely on their own internal estimates of risk components in determining the capital requirement for a given exposure. The risk components include measures of the probability of default (PD), loss given default (LGD), the exposure at default (EAD), and effective maturity (M). In some cases, banks may be required to use a supervisory value as opposed to an internal estimate for one or more of the risk components.

212. The IRB approach is based on measures of unexpected losses (UL) and expected losses (EL). The risk-weight functions produce capital requirements for the UL portion. Expected losses are treated separately, as outlined in paragraph 43 and Section III.G.

213. In this section, the asset classes are defined first. Adoption of the IRB approach across all asset classes is also discussed early in this section, as are transitional arrangements. The risk components, each of which is defined later in this section, serve as inputs to the risk-weight functions that have been developed for separate asset classes. For example, there is a risk-weight function for corporate exposures and another one for qualifying revolving retail exposures. The treatment of each asset class begins with a presentation of the relevant risk-weight function(s) followed by the risk components and other relevant factors, such as the treatment of credit risk mitigants. The legal certainty standards for recognising CRM as set out in Section II.D apply for both the foundation and advanced IRB approaches. The minimum requirements that banks must satisfy to use the IRB approach are presented at the end of this section starting at Section III.H, paragraph 387.

B. Mechanics of the IRB approach

214. In Section III.B.1, the risk components (e.g. PD and LGD) and asset classes (e.g. corporate exposures and retail exposures) of the IRB approach are defined. Section 2 provides a description of the risk components to be used by banks by asset class. Sections 3 and 4 discuss a bank's adoption of the IRB approach and transitional arrangements, respectively. In cases where an IRB treatment is not specified, the risk weight for those other exposures is 100%, except when a 0% risk weight applies under the standardised approach, and the resulting risk-weighted assets are assumed to represent UL only.

1. Categorisation of exposures

215. Under the IRB approach, banks must categorise banking-book exposures into broad classes of assets with different underlying risk characteristics, subject to the definitions set out below. The classes of assets are (a) corporate, (b) sovereign, (c) bank, (d) retail, and (e) equity. Within the corporate asset class, five sub-classes of specialised lending are separately identified. Within the retail asset class, three sub-classes are separately identified. Within the corporate and retail asset classes, a distinct treatment for purchased receivables may also apply provided certain conditions are met.

216. The classification of exposures in this way is broadly consistent with established bank practice. However, some banks may use different definitions in their internal risk management and measurement systems. While it is not the intention of the Committee to require banks to change the way in which they manage their business and risks, banks are required to apply the appropriate treatment to each exposure for the purposes of deriving

their minimum capital requirement. Banks must demonstrate to supervisors that their methodology for assigning exposures to different classes is appropriate and consistent over time.

217. For a discussion of the IRB treatment of securitisation exposures, see Section IV.

(i) Definition of corporate exposures

218. In general, a corporate exposure is defined as a debt obligation of a corporation, partnership, or proprietorship. Banks are permitted to distinguish separately exposures to small- and medium-sized entities (SME), as defined in paragraph 273.

219. Within the corporate asset class, five sub-classes of specialised lending (SL) are identified. Such lending possesses all the following characteristics, either in legal form or economic substance:

- The exposure is typically to an entity (often a special purpose entity (SPE)) which was created specifically to finance and/or operate physical assets;
- The borrowing entity has little or no other material assets or activities, and therefore little or no independent capacity to repay the obligation, apart from the income that it receives from the asset(s) being financed;
- The terms of the obligation give the lender a substantial degree of control over the asset(s) and the income that it generates; and
- As a result of the preceding factors, the primary source of repayment of the obligation is the income generated by the asset(s), rather than the independent capacity of a broader commercial enterprise.

220. The five sub-classes of specialised lending are project finance, object finance, commodities finance, income-producing real estate, and high-volatility commercial real estate. Each of these sub-classes is defined below.

Project finance

221. Project finance (PF) is a method of funding in which the lender looks primarily to the revenues generated by a single project, both as the source of repayment and as security for the exposure. This type of financing is usually for large, complex and expensive installations that might include, for example, power plants, chemical processing plants, mines, transportation infrastructure, environment, and telecommunications infrastructure. Project finance may take the form of financing of the construction of a new capital installation, or refinancing of an existing installation, with or without improvements.

222. In such transactions, the lender is usually paid solely or almost exclusively out of the money generated by the contracts for the facility's output, such as the electricity sold by a power plant. The borrower is usually an SPE that is not permitted to perform any function other than developing, owning, and operating the installation. The consequence is that repayment depends primarily on the project's cash flow and on the collateral value of the project's assets. In contrast, if repayment of the exposure depends primarily on a well established, diversified, credit-worthy, contractually obligated end user for repayment, it is considered a secured exposure to that end-user.

Object finance

223. Object finance (OF) refers to a method of funding the acquisition of physical assets (e.g. ships, aircraft, satellites, railcars, and fleets) where the repayment of the exposure is

dependent on the cash flows generated by the specific assets that have been financed and pledged or assigned to the lender. A primary source of these cash flows might be rental or lease contracts with one or several third parties. In contrast, if the exposure is to a borrower whose financial condition and debt-servicing capacity enables it to repay the debt without undue reliance on the specifically pledged assets, the exposure should be treated as a collateralised corporate exposure.

Commodities finance

224. Commodities finance (CF) refers to structured short-term lending to finance reserves, inventories, or receivables of exchange-traded commodities (e.g. crude oil, metals, or crops), where the exposure will be repaid from the proceeds of the sale of the commodity and the borrower has no independent capacity to repay the exposure. This is the case when the borrower has no other activities and no other material assets on its balance sheet. The structured nature of the financing is designed to compensate for the weak credit quality of the borrower. The exposure's rating reflects its self-liquidating nature and the lender's skill in structuring the transaction rather than the credit quality of the borrower.

225. The Committee believes that such lending can be distinguished from exposures financing the reserves, inventories, or receivables of other more diversified corporate borrowers. Banks are able to rate the credit quality of the latter type of borrowers based on their broader ongoing operations. In such cases, the value of the commodity serves as a risk mitigant rather than as the primary source of repayment.

Income-producing real estate

226. Income-producing real estate (IPRE) refers to a method of providing funding to real estate (such as, office buildings to let, retail space, multifamily residential buildings, industrial or warehouse space, and hotels) where the prospects for repayment and recovery on the exposure depend primarily on the cash flows generated by the asset. The primary source of these cash flows would generally be lease or rental payments or the sale of the asset. The borrower may be, but is not required to be, an SPE, an operating company focused on real estate construction or holdings, or an operating company with sources of revenue other than real estate. The distinguishing characteristic of IPRE versus other corporate exposures that are collateralised by real estate is the strong positive correlation between the prospects for repayment of the exposure and the prospects for recovery in the event of default, with both depending primarily on the cash flows generated by a property.

High-volatility commercial real estate

227. High-volatility commercial real estate (HVCRE) lending is the financing of commercial real estate that exhibits higher loss rate volatility (i.e. higher asset correlation) compared to other types of SL. HVCRE includes:

- Commercial real estate exposures secured by properties of types that are categorised by the national supervisor as sharing higher volatilities in portfolio default rates;
- Loans financing any of the land acquisition, development and construction (ADC) phases for properties of those types in such jurisdictions; and
- Loans financing ADC of any other properties where the source of repayment at origination of the exposure is either the future uncertain sale of the property or cash flows whose source of repayment is substantially uncertain (e.g. the property has not yet been leased to the occupancy rate prevailing in that geographic market for that type of commercial real estate), unless the borrower has substantial equity at

risk. Commercial ADC loans exempted from treatment as HVCRE loans on the basis of certainty of repayment of borrower equity are, however, ineligible for the additional reductions for SL exposures described in paragraph 277.

228. Where supervisors categorise certain types of commercial real estate exposures as HVCRE in their jurisdictions, they are required to make public such determinations. Other supervisors need to ensure that such treatment is then applied equally to banks under their supervision when making such HVCRE loans in that jurisdiction.

(ii) Definition of sovereign exposures

229. This asset class covers all exposures to counterparties treated as sovereigns under the standardised approach. This includes sovereigns (and their central banks), certain PSEs identified as sovereigns in the standardised approach, MDBs that meet the criteria for a 0% risk weight under the standardised approach, and the entities referred to in paragraph 56.

(iii) Definition of bank exposures

230. This asset class covers exposures to banks and those securities firms outlined in paragraph 65. Bank exposures also include claims on domestic PSEs that are treated like claims on banks under the standardised approach, and MDBs that do not meet the criteria for a 0% risk weight under the standardised approach.

(iv) Definition of retail exposures

231. An exposure is categorised as a retail exposure if it meets all of the following criteria:

Nature of borrower or low value of individual exposures

- Exposures to individuals — such as revolving credits and lines of credit (e.g. credit cards, overdrafts, and retail facilities secured by financial instruments) as well as personal term loans and leases (e.g. instalment loans, auto loans and leases, student and educational loans, personal finance, and other exposures with similar characteristics) — are generally eligible for retail treatment regardless of exposure size, although supervisors may wish to establish exposure thresholds to distinguish between retail and corporate exposures.
- Residential mortgage loans (including first and subsequent liens, term loans and revolving home equity lines of credit) are eligible for retail treatment regardless of exposure size so long as the credit is extended to an individual that is an owner-occupier of the property (with the understanding that supervisors exercise reasonable flexibility regarding buildings containing only a few rental units — otherwise they are treated as corporate). Loans secured by a single or small number of condominium or co-operative residential housing units in a single building or complex also fall within the scope of the residential mortgage category. National supervisors may set limits on the maximum number of housing units per exposure.
- Loans extended to small businesses and managed as retail exposures are eligible for retail treatment provided the total exposure of the banking group to a small business borrower (on a consolidated basis where applicable) is less than €1 million. Small business loans extended through or guaranteed by an individual are subject to the same exposure threshold.
- It is expected that supervisors provide flexibility in the practical application of such thresholds such that banks are not forced to develop extensive new information systems simply for the purpose of ensuring perfect compliance. It is, however,

important for supervisors to ensure that such flexibility (and the implied acceptance of exposure amounts in excess of the thresholds that are not treated as violations) is not being abused.

Large number of exposures

232. The exposure must be one of a large pool of exposures, which are managed by the bank on a pooled basis. Supervisors may choose to set a minimum number of exposures within a pool for exposures in that pool to be treated as retail.

- Small business exposures below €1 million may be treated as retail exposures if the bank treats such exposures in its internal risk management systems consistently over time and in the same manner as other retail exposures. This requires that such an exposure be originated in a similar manner to other retail exposures. Furthermore, it must not be managed individually in a way comparable to corporate exposures, but rather as part of a portfolio segment or pool of exposures with similar risk characteristics for purposes of risk assessment and quantification. However, this does not preclude retail exposures from being treated individually at some stages of the risk management process. The fact that an exposure is rated individually does not by itself deny the eligibility as a retail exposure.

233. Within the retail asset class category, banks are required to identify separately three sub-classes of exposures: (a) exposures secured by residential properties as defined above, (b) qualifying revolving retail exposures, as defined in the following paragraph, and (c) all other retail exposures.

(v) Definition of qualifying revolving retail exposures

234. All of the following criteria must be satisfied for a sub-portfolio to be treated as a qualifying revolving retail exposure (QRRE). These criteria must be applied at a sub-portfolio level consistent with the bank's segmentation of its retail activities generally. Segmentation at the national or country level (or below) should be the general rule.

(a) The exposures are revolving, unsecured, and uncommitted (both contractually and in practice). In this context, revolving exposures are defined as those where customers' outstanding balances are permitted to fluctuate based on their decisions to borrow and repay, up to a limit established by the bank.

(b) The exposures are to individuals.

(c) The maximum exposure to a single individual in the sub-portfolio is €100,000 or less.

(d) Because the asset correlation assumptions for the QRRE risk-weight function are markedly below those for the other retail risk-weight function at low PD values, banks must demonstrate that the use of the QRRE risk-weight function is constrained to portfolios that have exhibited low volatility of loss rates, relative to their average level of loss rates, especially within the low PD bands. Supervisors will review the relative volatility of loss rates across the QRRE subportfolios, as well as the aggregate QRRE portfolio, and intend to share information on the typical characteristics of QRRE loss rates across jurisdictions.

(e) Data on loss rates for the sub-portfolio must be retained in order to allow analysis of the volatility of loss rates.

(f) The supervisor must concur that treatment as a qualifying revolving retail exposure is consistent with the underlying risk characteristics of the sub-portfolio.

(vi) Definition of equity exposures

235. In general, equity exposures are defined on the basis of the economic substance of the instrument. They include both direct and indirect ownership interests,[59] whether voting or non-voting, in the assets and income of a commercial enterprise or of a financial institution that is not consolidated or deducted pursuant to Part 1 of this Framework.[60] An instrument is considered to be an equity exposure if it meets all of the following requirements:

- It is irredeemable in the sense that the return of invested funds can be achieved only by the sale of the investment or sale of the rights to the investment or by the liquidation of the issuer;
- It does not embody an obligation on the part of the issuer; and
- It conveys a residual claim on the assets or income of the issuer.

236. Additionally any of the following instruments must be categorised as an equity exposure:

- An instrument with the same structure as those permitted as Tier 1 capital for banking organisations.
- An instrument that embodies an obligation on the part of the issuer and meets any of the following conditions:
  (1) The issuer may defer indefinitely the settlement of the obligation;
  (2) The obligation requires (or permits at the issuer's discretion) settlement by issuance of a fixed number of the issuer's equity shares;
  (3) The obligation requires (or permits at the issuer's discretion) settlement by issuance of a variable number of the issuer's equity shares and (ceteris paribus) any change in the value of the obligation is attributable to, comparable to, and in the same direction as, the change in the value of a fixed number of the issuer's equity shares;[61] or,
  (4) The holder has the option to require that the obligation be settled in equity shares, unless either (i) in the case of a traded instrument, the supervisor is content that the bank has demonstrated that the instrument trades more like the debt of the issuer than like its equity, or (ii) in the case of non-traded instruments, the supervisor is content that the bank has demonstrated that the instrument should be treated as a debt position. In

---

[59] Indirect equity interests include holdings of derivative instruments tied to equity interests, and holdings in corporations, partnerships, limited liability companies or other types of enterprises that issue ownership interests and are engaged principally in the business of investing in equity instruments.

[60] Where some member countries retain their existing treatment as an exception to the deduction approach, such equity investments by IRB banks are to be considered eligible for inclusion in their IRB equity portfolios.

[61] For certain obligations that require or permit settlement by issuance of a variable number of the issuer's equity shares, the change in the monetary value of the obligation is equal to the change in the fair value of a fixed number of equity shares multiplied by a specified factor. Those obligations meet the conditions of item 3 if both the factor and the referenced number of shares are fixed. For example, an issuer may be required to settle an obligation by issuing shares with a value equal to three times the appreciation in the fair value of 1,000 equity shares. That obligation is considered to be the same as an obligation that requires settlement by issuance of shares equal to the appreciation in the fair value of 3,000 equity shares.

cases (i) and (ii), the bank may decompose the risks for regulatory purposes, with the consent of the supervisor.

237. Debt obligations and other securities, partnerships, derivatives or other vehicles structured with the intent of conveying the economic substance of equity ownership are considered an equity holding.[62] This includes liabilities from which the return is linked to that of equities.[63] Conversely, equity investments that are structured with the intent of conveying the economic substance of debt holdings or securitisation exposures would not be considered an equity holding.

238. The national supervisor has the discretion to re-characterise debt holdings as equities for regulatory purposes and to otherwise ensure the proper treatment of holdings under Pillar 2.

(vii) Definition of eligible purchased receivables

239. Eligible purchased receivables are divided into retail and corporate receivables as defined below.

Retail receivables

240. Purchased retail receivables, provided the purchasing bank complies with the IRB rules for retail exposures, are eligible for the top-down approach as permitted within the existing standards for retail exposures. The bank must also apply the minimum operational requirements as set forth in Sections III.F and III.H.

Corporate receivables

241. In general, for purchased corporate receivables, banks are expected to assess the default risk of individual obligors as specified in Section III.C.1 (starting with paragraph 271) consistent with the treatment of other corporate exposures. However, the top-down approach may be used, provided that the purchasing bank's programme for corporate receivables complies with both the criteria for eligible receivables and the minimum operational requirements of this approach. The use of the top-down purchased receivables treatment is limited to situations where it would be an undue burden on a bank to be subjected to the minimum requirements for the IRB approach to corporate exposures that would otherwise apply. Primarily, it is intended for receivables that are purchased for inclusion in asset-backed securitisation structures, but banks may also use this approach, with the approval of national supervisors, for appropriate on-balance sheet exposures that share the same features.

242. Supervisors may deny the use of the top-down approach for purchased corporate receivables depending on the bank's compliance with minimum requirements. In particular, to be eligible for the proposed 'top-down' treatment, purchased corporate receivables must satisfy the following conditions:

---

[62] Equities that are recorded as a loan but arise from a debt/equity swap made as part of the orderly realisation or restructuring of the debt are included in the definition of equity holdings. However, these instruments may not attract a lower capital charge than would apply if the holdings remained in the debt portfolio.

[63] Supervisors may decide not to require that such liabilities be included where they are directly hedged by an equity holding, such that the net position does not involve material risk.

- The receivables are purchased from unrelated, third party sellers, and as such the bank has not originated the receivables either directly or indirectly.
- The receivables must be generated on an arm's-length basis between the seller and the obligor. (As such, intercompany accounts receivable and receivables subject to contra-accounts between firms that buy and sell to each other are ineligible.[64])
- The purchasing bank has a claim on all proceeds from the pool of receivables or a *pro-rata* interest in the proceeds.[65]
- National supervisors must also establish concentration limits above which capital charges must be calculated using the minimum requirements for the bottom-up approach for corporate exposures. Such concentration limits may refer to one or a combination of the following measures: the size of one individual exposure relative to the total pool, the size of the pool of receivables as a percentage of regulatory capital, or the maximum size of an individual exposure in the pool.

243. The existence of full or partial recourse to the seller does not automatically disqualify a bank from adopting this top-down approach, as long as the cash flows from the purchased corporate receivables are the primary protection against default risk as determined by the rules in paragraphs 365 to 368 for purchased receivables and the bank meets the eligibility criteria and operational requirements.

2. Foundation and advanced approaches

244. For each of the asset classes covered under the IRB framework, there are three key elements:

- Risk components ─ estimates of risk parameters provided by banks some of which are supervisory estimates.
- Risk-weight functions ─ the means by which risk components are transformed into risk-weighted assets and therefore capital requirements.
- Minimum requirements ─ the minimum standards that must be met in order for a bank to use the IRB approach for a given asset class.

245. For many of the asset classes, the Committee has made available two broad approaches: a foundation and an advanced. Under the foundation approach, as a general rule, banks provide their own estimates of PD and rely on supervisory estimates for other risk components. Under the advanced approach, banks provide more of their own estimates of PD, LGD and EAD, and their own calculation of M, subject to meeting minimum standards. For both the foundation and advanced approaches, banks must always use the risk-weight functions provided in this Framework for the purpose of deriving capital requirements. The full suite of approaches is described below.

---

[64] Contra-accounts involve a customer buying from and selling to the same firm. The risk is that debts may be settled through payments in kind rather than cash. Invoices between the companies may be offset against each other instead of being paid. This practice can defeat a security interest when challenged in court.

[65] Claims on tranches of the proceeds (first loss position, second loss position, etc.) would fall under the securitisation treatment.

(i) Corporate, sovereign, and bank exposures

246. Under the foundation approach, banks must provide their own estimates of PD associated with each of their borrower grades, but must use supervisory estimates for the other relevant risk components. The other risk components are LGD, EAD and M.[66]

247. Under the advanced approach, banks must calculate the effective maturity (M)[67] and provide their own estimates of PD, LGD and EAD.

248. There is an exception to this general rule for the five sub-classes of assets identified as SL.

The SL categories: PF, OF, CF, IPRE, and HVCRE

249. Banks that do not meet the requirements for the estimation of PD under the corporate foundation approach for their SL assets are required to map their internal risk grades to five supervisory categories, each of which is associated with a specific risk weight. This version is termed the 'supervisory slotting criteria approach'.

250. Banks that meet the requirements for the estimation of PD are able to use the foundation approach to corporate exposures to derive risk weights for all classes of SL exposures except HVCRE. At national discretion, banks meeting the requirements for HVCRE exposure are able to use a foundation approach that is similar in all respects to the corporate approach, with the exception of a separate risk-weight function as described in paragraph 283.

251. Banks that meet the requirements for the estimation of PD, LGD and EAD are able to use the advanced approach to corporate exposures to derive risk weights for all classes of SL exposures except HVCRE. At national discretion, banks meeting these requirements for HVCRE exposure are able to use an advanced approach that is similar in all respects to the corporate approach, with the exception of a separate risk-weight function as described in paragraph 283.

(ii) Retail exposures

252. For retail exposures, banks must provide their own estimates of PD, LGD and EAD. There is no distinction between a foundation and advanced approach for this asset class.

(iii) Equity exposures

253. There are two broad approaches to calculate risk-weighted assets for equity exposures not held in the trading book: a market-based approach and a PD/LGD approach. These are set out in full in paragraphs 340 to 361.

254. The PD/LGD approach to equity exposures remains available for banks that adopt the advanced approach for other exposure types.

---

66 As noted in paragraph 318, some supervisors may require banks using the foundation approach to calculate M using the definition provided in paragraphs 320 to 324.

67 At the discretion of the national supervisor, certain domestic exposures may be exempt from the calculation of M (see paragraph 319).

(iv) Eligible purchased receivables

255. The treatment potentially straddles two asset classes. For eligible corporate receivables, both a foundation and advanced approach are available subject to certain operational requirements being met. For eligible retail receivables, as with the retail asset class, there is no distinction between a foundation and advanced approach.

3. Adoption of the IRB approach across asset classes

256. Once a bank adopts an IRB approach for part of its holdings, it is expected to extend it across the entire banking group. The Committee recognises however, that, for many banks, it may not be practicable for various reasons to implement the IRB approach across all material asset classes and business units at the same time. Furthermore, once on IRB, data limitations may mean that banks can meet the standards for the use of own estimates of LGD and EAD for some but not all of their asset classes/business units at the same time.

257. As such, supervisors may allow banks to adopt a phased rollout of the IRB approach across the banking group. The phased rollout includes (i) adoption of IRB across asset classes within the same business unit (or in the case of retail exposures across individual sub-classes); (ii) adoption of IRB across business units in the same banking group; and (iii) move from the foundation approach to the advanced approach for certain risk components. However, when a bank adopts an IRB approach for an asset class within a particular business unit (or in the case of retail exposures for an individual sub-class), it must apply the IRB approach to all exposures within that asset class (or sub-class) in that unit.

258. A bank must produce an implementation plan, specifying to what extent and when it intends to roll out IRB approaches across significant asset classes (or sub-classes in the case of retail) and business units over time. The plan should be exacting, yet realistic, and must be agreed with the supervisor. It should be driven by the practicality and feasibility of moving to the more advanced approaches, and not motivated by a desire to adopt a Pillar 1 approach that minimises its capital charge. During the roll-out period, supervisors will ensure that no capital relief is granted for intra-group transactions which are designed to reduce a banking group's aggregate capital charge by transferring credit risk among entities on the standardised approach, foundation and advanced IRB approaches. This includes, but is not limited to, asset sales or cross guarantees.

259. Some exposures in non-significant business units as well as asset classes (or sub-classes in the case of retail) that are immaterial in terms of size and perceived risk profile may be exempt from the requirements in the previous two paragraphs, subject to supervisory approval. Capital requirements for such operations will be determined according to the standardised approach, with the national supervisor determining whether a bank should hold more capital under Pillar 2 for such positions.

260. Notwithstanding the above, once a bank has adopted the IRB approach for all or part of any of the corporate, bank, sovereign, or retail asset classes, it will be required to adopt the IRB approach for its equity exposures at the same time, subject to materiality. Supervisors may require a bank to employ one of the IRB equity approaches if its equity exposures are a significant part of the bank's business, even though the bank may not employ an IRB approach in other business lines. Further, once a bank has adopted the general IRB approach for corporate exposures, it will be required to adopt the IRB approach for the SL sub-classes within the corporate exposure class.

261. Banks adopting an IRB approach are expected to continue to employ an IRB approach. A voluntary return to the standardised or foundation approach is permitted only in

extraordinary circumstances, such as divestiture of a large fraction of the bank's credit-related business, and must be approved by the supervisor.

262. Given the data limitations associated with SL exposures, a bank may remain on the supervisory slotting criteria approach for one or more of the PF, OF, CF, IPRE or HVCRE sub-classes, and move to the foundation or advanced approach for other sub-classes within the corporate asset class. However, a bank should not move to the advanced approach for the HVCRE sub-class without also doing so for material IPRE exposures at the same time.

4. Transition arrangements

(i) Parallel calculation

263. Banks adopting the foundation or advanced approaches are required to calculate their capital requirement using these approaches, as well as the 1988 Accord for the time period specified in paragraphs 45 to 49. Parallel calculation for banks adopting the foundation IRB approach to credit risk will start in the year beginning year-end 2005. Banks moving directly from the 1988 Accord to the advanced approaches to credit and/or operational risk will be subject to parallel calculations or impact studies for the year beginning year-end 2005 and to parallel calculations for the year beginning year-end 2006.

(ii) Corporate, sovereign, bank, and retail exposures

264. The transition period starts on the date of implementation of this Framework and will last for 3 years from that date. During the transition period, the following minimum requirements can be relaxed, subject to discretion of the national supervisor:

- For corporate, sovereign, and bank exposures under the foundation approach, paragraph 463, the requirement that, regardless of the data source, banks must use at least five years of data to estimate the PD; and
- For retail exposures, paragraph 466, the requirement that regardless of the data source banks must use at least five years of data to estimate loss characteristics (EAD, and either expected loss (EL) or PD and LGD).
- For corporate, sovereign, bank, and retail exposures, paragraph 445, the requirement that a bank must demonstrate it has been using a rating system that was broadly in line with the minimum requirements articulated in this document for at least three years prior to qualification.
- The applicable aforementioned transitional arrangements also apply to the PD/LGD approach to equity. There are no transitional arrangements for the market-based approach to equity.

265. Under these transitional arrangements banks are required to have a minimum of two years of data at the implementation of this Framework. This requirement will increase by one year for each of three years of transition.

266. Owing to the potential for very long-run cycles in house prices which short-term data may not adequately capture, during this transition period, LGDs for retail exposures secured by residential properties cannot be set below 10% for any sub-segment of exposures to

which the formula in paragraph 328 is applied.[68] During the transition period the Committee will review the potential need for continuation of this floor.

(iii) Equity exposures

267. For a maximum of ten years, supervisors may exempt from the IRB treatment particular equity investments held at the time of the publication of this Framework.[69] The exempted position is measured as the number of shares as of that date and any additional arising directly as a result of owning those holdings, as long as they do not increase the proportional share of ownership in a portfolio company.

268. If an acquisition increases the proportional share of ownership in a specific holding (e.g. due to a change of ownership initiated by the investing company subsequent to the publication of this Framework) the exceeding part of the holding is not subject to the exemption. Nor will the exemption apply to holdings that were originally subject to the exemption, but have been sold and then bought back.

269. Equity holdings covered by these transitional provisions will be subject to the capital requirements of the standardised approach.

C. Rules for corporate, sovereign, and bank exposures

270. Section III.C presents the method of calculating the unexpected loss (UL) capital requirements for corporate, sovereign and bank exposures. As discussed in Section C.1, one risk-weight function is provided for determining the capital requirement for all three asset classes with one exception. Supervisory risk weights are provided for each of the specialised lending sub-classes of corporates, and a separate risk-weight function is also provided for HVCRE. Section C.2 discusses the risk components. The method of calculating expected losses, and for determining the difference between that measure and provisions is described in Section III.G.

1. Risk-weighted assets for corporate, sovereign, and bank exposures

(i) Formula for derivation of risk-weighted assets

271. The derivation of risk-weighted assets is dependent on estimates of the PD, LGD, EAD and, in some cases, effective maturity (M), for a given exposure. Paragraphs 318 to 324 discuss the circumstances in which the maturity adjustment applies.

272. Throughout this section, PD and LGD are measured as decimals, and EAD is measured as currency (e.g. euros), except where explicitly noted otherwise. For exposures not in default, the formula for calculating risk-weighted assets is:[70, 71]

---

68 The 10% LGD floor shall not apply, however, to sub-segments that are subject to/benefit from sovereign guarantees. Further, the existence of the floor does not imply any waiver of the requirements of LGD estimation as laid out in the minimum requirements starting with paragraph 468.

69 This exemption does not apply to investments in entities where some countries will retain the existing risk weighting treatment, as referred to in Part 1, see footnote 9.

70 Ln denotes the natural logarithm.

71 N(x) denotes the cumulative distribution function for a standard normal random variable (i.e. the probability that a normal random variable with mean zero and variance of one is less than or equal to x). G(z) denotes the

Correlation (R) = $0.12 \times (1 - EXP(-50 \times PD)) / (1 - EXP(-50)) +$
$0.24 \times [1 - (1 - EXP(-50 \times PD)) / (1 - EXP(-50))]$

Maturity adjustment (b) = $(0.11852 - 0.05478 \times \ln(PD))^2$

Capital requirement[72] (K) = $[LGD \times N[(1 - R)^{-0.5} \times G(PD) + (R / (1 - R))^{0.5} \times G(0.999)] - PD \times LGD] \times (1 - 1.5 \times b)^{-1} \times (1 + (M - 2.5) \times b)$

Risk-weighted assets (RWA) = K x 12.5 x EAD

The capital requirement (K) for a defaulted exposure is equal to the greater of zero and the difference between its LGD (described in paragraph 468) and the bank's best estimate of expected loss (described in paragraph 471). The risk-weighted asset amount for the defaulted exposure is the product of K, 12.5, and the EAD.

Illustrative risk weights are shown in Annex 5.

(ii) Firm-size adjustment for small- and medium-sized entities (SME)

273. Under the IRB approach for corporate credits, banks will be permitted to separately distinguish exposures to SME borrowers (defined as corporate exposures where the reported sales for the consolidated group of which the firm is a part is less than €50 million) from those to large firms. A firm-size adjustment (i.e. $0.04 \times (1 - (S - 5) / 45)$) is made to the corporate risk weight formula for exposures to SME borrowers. S is expressed as total annual sales in millions of euros with values of S falling in the range of equal to or less than €50 million or greater than or equal to €5 million. Reported sales of less than €5 million will be treated as if they were equivalent to €5 million for the purposes of the firm-size adjustment for SME borrowers.

Correlation (R) = $0.12 \times (1 - EXP(-50 \times PD)) / (1 - EXP(-50)) +$
$0.24 \times [1 - (1 - EXP(-50 \times PD)) / (1 - EXP(-50))] - 0.04 \times (1 - (S-5) / 45)$

274. Subject to national discretion, supervisors may allow banks, as a failsafe, to substitute total assets of the consolidated group for total sales in calculating the SME threshold and the firm-size adjustment. However, total assets should be used only when total sales are not a meaningful indicator of firm size.

(iii) Risk weights for specialised lending

Risk weights for PF, OF, CF, and IPRE

275. Banks that do not meet the requirements for the estimation of PD under the corporate IRB approach will be required to map their internal grades to five supervisory categories, each of which is associated with a specific risk weight. The slotting criteria on which this mapping must be based are provided in Annex 6. The risk weights for unexpected losses associated with each supervisory category are:

inverse cumulative distribution function for a standard normal random variable (i.e. the value of x such that N(x) = z). The normal cumulative distribution function and the inverse of the normal cumulative distribution function are, for example, available in Excel as the functions NORMSDIST and NORMSINV.

72 If this calculation results in a negative capital charge for any individual sovereign exposure, banks should apply a zero capital charge for that exposure.

Supervisory categories and UL risk weights for other SL exposures

Strong	Good	Satisfactory	Weak	Default
70%	90%	115%	250%	0%

276. Although banks are expected to map their internal ratings to the supervisory categories for specialised lending using the slotting criteria provided in Annex 6, each supervisory category broadly corresponds to a range of external credit assessments as outlined below.

Strong	Good	Satisfactory	Weak	Default
BBB- or better	BB+ or BB	BB- or B+	B to C-	Not applicable

277. At national discretion, supervisors may allow banks to assign preferential risk weights of 50% to “strong” exposures, and 70% to “good” exposures, provided they have a remaining maturity of less than 2.5 years or the supervisor determines that banks’ underwriting and other risk characteristics are substantially stronger than specified in the slotting criteria for the relevant supervisory risk category.

278. Banks that meet the requirements for the estimation of PD will be able to use the general foundation approach for the corporate asset class to derive risk weights for SL sub-classes.

279. Banks that meet the requirements for the estimation of PD and LGD and/or EAD will be able to use the general advanced approach for the corporate asset class to derive risk weights for SL sub-classes.

Risk weights for HVCRE

280. Banks that do not meet the requirements for estimation of PD, or whose supervisor has chosen not to implement the foundation or advanced approaches to HVCRE, must map their internal grades to five supervisory categories, each of which is associated with a specific risk weight. The slotting criteria on which this mapping must be based are the same as those for IPRE, as provided in Annex 6. The risk weights associated with each category are:

Supervisory categories and UL risk weights for high-volatility commercial real estate

Strong	Good	Satisfactory	Weak	Default
95%	120%	140%	250%	0%

281. As indicated in paragraph 276, each supervisory category broadly corresponds to a range of external credit assessments.

282. At national discretion, supervisors may allow banks to assign preferential risk weights of 70% to “strong” exposures, and 95% to “good” exposures, provided they have a remaining maturity of less than 2.5 years or the supervisor determines that banks’

underwriting and other risk characteristics are substantially stronger than specified in the slotting criteria for the relevant supervisory risk category.

283. Banks that meet the requirements for the estimation of PD and whose supervisor has chosen to implement a foundation or advanced approach to HVCRE exposures will use the same formula for the derivation of risk weights that is used for other SL exposures, except that they will apply the following asset correlation formula:

Correlation (R) = 0.12 x (1 – EXP(-50 x PD)) / (1 – EXP(-50)) +
0.30 x [1 – (1 – EXP(-50 x PD)) / (1 – EXP(-50))]

284. Banks that do not meet the requirements for estimation of LGD and EAD for HVCRE exposures must use the supervisory parameters for LGD and EAD for corporate exposures.

(iv) Calculation of risk-weighted assets for exposures subject to the double default framework

284(i). For hedged exposures to be treated within the scope of the double default framework, capital requirements may be calculated according to paragraphs 284 (ii) and 284 (iii).

284(ii). The capital requirement for a hedged exposure subject to the double default treatment (K_{DD}) is calculated by multiplying K_0 as defined below by a multiplier depending on the PD of the protection provider (PD_g):

$$K_{DD} = K_0 \cdot \left(0.15 + 160 \cdot PD_g\right).$$

K_0 is calculated in the same way as a capital requirement for an unhedged corporate exposure (as defined in paragraphs 272 and 273), but using different parameters for LGD and the maturity adjustment.

$$K_0 = LGD_g \cdot \left[N\left(\frac{G\left(PD_o\right) + \sqrt{\rho_{os}} \cdot G\left(0.999\right)}{\sqrt{1-\rho_{os}}} \right) - PD_o \right] \cdot \frac{1 + \left(M - 2.5\right) \cdot b}{1 - 1.5 \cdot b}$$

PD_o and PD_g are the probabilities of default of the obligor and guarantor, respectively, both subject to the PD floor set out in paragraph 285. The correlation ρ_{os} is calculated according to the formula for correlation (R) in paragraph 272 (or, if applicable, paragraph 273), with PD being equal to PD_o, and LGD_g is the LGD of a comparable direct exposure to the guarantor (i.e. consistent with paragraph 301, the LGD associated with an unhedged facility to the guarantor or the unhedged facility to the obligor, depending upon whether in the event both the guarantor and the obligor default during the life of the hedged transaction available evidence and the structure of the guarantee indicate that the amount recovered would depend on the financial condition of the guarantor or obligor, respectively; in estimating either of these LGDs, a bank may recognise collateral posted exclusively against the exposure or credit protection, respectively, in a manner consistent with paragraphs 303 or 279 and 468 to 473, as applicable). There may be no consideration of double recovery in the LGD estimate. The maturity adjustment coefficient b is calculated according to the formula for maturity adjustment (b) in paragraph 272, with PD being the minimum of PD_o and PD_g. M is the effective maturity of the credit protection, which may under no circumstances be below the one-year floor if the double default framework is to be applied.

284(iii). The risk-weighted asset amount is calculated in the same way as for unhedged exposures, i.e.

$$RWA_{DD} = K_{DD} \cdot 12.5 \cdot EAD_g.$$

2. *Risk components*

(i) Probability of default (PD)

285. For corporate and bank exposures, the PD is the greater of the one-year PD associated with the internal borrower grade to which that exposure is assigned, or 0.03%. For sovereign exposures, the PD is the one-year PD associated with the internal borrower grade to which that exposure is assigned. The PD of borrowers assigned to a default grade(s), consistent with the reference definition of default, is 100%. The minimum requirements for the derivation of the PD estimates associated with each internal borrower grade are outlined in paragraphs 461 to 463.

(ii) Loss given default (LGD)

286. A bank must provide an estimate of the LGD for each corporate, sovereign and bank exposure. There are two approaches for deriving this estimate: a foundation approach and an advanced approach.

LGD under the foundation approach

Treatment of unsecured claims and non-recognised collateral

287. Under the foundation approach, senior claims on corporates, sovereigns and banks not secured by recognised collateral will be assigned a 45% LGD.

288. All subordinated claims on corporates, sovereigns and banks will be assigned a 75% LGD. A subordinated loan is a facility that is expressly subordinated to another facility. At national discretion, supervisors may choose to employ a wider definition of subordination. This might include economic subordination, such as cases where the facility is unsecured and the bulk of the borrower's assets are used to secure other exposures.

Collateral under the foundation approach

289. In addition to the eligible financial collateral recognised in the standardised approach, under the foundation IRB approach some other forms of collateral, known as eligible IRB collateral, are also recognised. These include receivables, specified commercial and residential real estate (CRE/RRE), and other collateral, where they meet the minimum requirements set out in paragraphs 509 to 524.[73] For eligible financial collateral, the requirements are identical to the operational standards as set out in Section II.D beginning with paragraph 111.

---

[73] The Committee, however, recognises that, in exceptional circumstances for well-developed and long-established markets, mortgages on office and/or multi-purpose commercial premises and/or multi-tenanted commercial premises may have the potential to receive alternative recognition as collateral in the corporate portfolio. Please refer to footnote 29 of paragraph 74 for a discussion of the eligibility criteria that would apply. The LGD applied to the collateralised portion of such exposures, subject to the limitations set out in paragraphs 119 to 181 (i) of the standardised approach, will be set at 35%. The LGD applied to the remaining portion of this exposure will be set at 45%. In order to ensure consistency with the capital charges in the standardised approach (while providing a small capital incentive in the IRB approach relative to the standardised approach), supervisors may apply a cap on the capital charge associated with such exposures so as to achieve comparable treatment in both approaches.

Methodology for recognition of eligible financial collateral under the foundation approach

290. The methodology for the recognition of eligible financial collateral closely follows that outlined in the comprehensive approach to collateral in the standardised approach in paragraphs 147 to 181(i). The simple approach to collateral presented in the standardised approach will not be available to banks applying the IRB approach.

291. Following the comprehensive approach, the effective loss given default (LGD*) applicable to a collateralised transaction can be expressed as follows, where:

- LGD is that of the senior unsecured exposure before recognition of collateral (45%);
- E is the current value of the exposure (i.e. cash lent or securities lent or posted);
- E* is the exposure value after risk mitigation as determined in paragraphs 147 to 150 of the standardised approach. This concept is only used to calculate LGD*. Banks must continue to calculate EAD without taking into account the presence of any collateral, unless otherwise specified.

$$LGD^* = LGD \times (E^* / E)$$

292. Banks that qualify for the foundation IRB approach may calculate E* using any of the ways specified under the comprehensive approach for collateralised transactions under the standardised approach.

293. Where repo-style transactions are subject to a master netting agreement, a bank may choose not to recognise the netting effects in calculating capital. Banks that want to recognise the effect of master netting agreements on such transactions for capital purposes must satisfy the criteria provided in paragraph 173 and 174 of the standardised approach. The bank must calculate E* in accordance with paragraphs 176 and 177 or 178 to 181 (i) and equate this to EAD. The impact of collateral on these transactions may not be reflected through an adjustment to LGD.

Carve out from the comprehensive approach

294. As in the standardised approach, for transactions where the conditions in paragraph 170 are met, and in addition, the counterparty is a core market participant as specified in paragraph 171, supervisors may choose not to apply the haircuts specified under the comprehensive approach, but instead to apply a zero H.

Methodology for recognition of eligible IRB collateral

295. The methodology for determining the effective LGD under the foundation approach for cases where banks have taken eligible IRB collateral to secure a corporate exposure is as follows.

- Exposures where the minimum eligibility requirements are met, but the ratio of the current value of the collateral received (C) to the current value of the exposure (E) is below a threshold level of C* (i.e. the required minimum collateralisation level for the exposure) would receive the appropriate LGD for unsecured exposures or those secured by collateral which is not eligible financial collateral or eligible IRB collateral.
- Exposures where the ratio of C to E exceeds a second, higher threshold level of C** (i.e. the required level of over-collateralisation for full LGD recognition) would be assigned an LGD according to the following table.

The following table displays the applicable LGD and required over-collateralisation levels for the secured parts of senior exposures:

Minimum LGD for secured portion of senior exposures

	Minimum LGD	Required minimum collateralisation level of the exposure (C*)	Required level of over-collateralisation for full LGD recognition (C**)
Eligible Financial collateral	0%	0%	n.a.
Receivables	35%	0%	125%
CRE/RRE	35%	30%	140%
Other collateral[74]	40%	30%	140%

- Senior exposures are to be divided into fully collateralised and uncollateralised portions.
- The part of the exposure considered to be fully collateralised, C/C**, receives the LGD associated with the type of collateral.
- The remaining part of the exposure is regarded as unsecured and receives an LGD of 45%.

Methodology for the treatment of pools of collateral

296. The methodology for determining the effective LGD of a transaction under the foundation approach where banks have taken both financial collateral and other eligible IRB collateral is aligned to the treatment in the standardised approach and based on the following guidance.

- In the case where a bank has obtained multiple forms of CRM, it will be required to subdivide the adjusted value of the exposure (after the haircut for eligible financial collateral) into portions each covered by only one CRM type. That is, the bank must divide the exposure into the portion covered by eligible financial collateral, the portion covered by receivables, the portion covered by CRE/RRE collateral, a portion covered by other collateral, and an unsecured portion, where relevant.
- Where the ratio of the sum of the value of CRE/RRE and other collateral to the reduced exposure (after recognising the effect of eligible financial collateral and receivables collateral) is below the associated threshold level (i.e. the minimum degree of collateralisation of the exposure), the exposure would receive the appropriate unsecured LGD value of 45%.
- The risk-weighted assets for each fully secured portion of exposure must be calculated separately.

[74] Other collateral excludes physical assets acquired by the bank as a result of a loan default.

LGD under the advanced approach

297. Subject to certain additional minimum requirements specified below, supervisors may permit banks to use their own internal estimates of LGD for corporate, sovereign and bank exposures. LGD must be measured as the loss given default as a percentage of the EAD. Banks eligible for the IRB approach that are unable to meet these additional minimum requirements must utilise the foundation LGD treatment described above.

298. The minimum requirements for the derivation of LGD estimates are outlined in paragraphs 468 to 473.

Treatment of certain repo-style transactions

299. Banks that want to recognise the effects of master netting agreements on repo-style transactions for capital purposes must apply the methodology outlined in paragraph 293 for determining E* for use as the EAD. For banks using the advanced approach, own LGD estimates would be permitted for the unsecured equivalent amount (E*).

Treatment of guarantees and credit derivatives

300. There are two approaches for recognition of CRM in the form of guarantees and credit derivatives in the IRB approach: a foundation approach for banks using supervisory values of LGD, and an advanced approach for those banks using their own internal estimates of LGD.

301. Under either approach, CRM in the form of guarantees and credit derivatives must not reflect the effect of double default (see paragraph 482). As such, to the extent that the CRM is recognised by the bank, the adjusted risk weight will not be less than that of a comparable direct exposure to the protection provider. Consistent with the standardised approach, banks may choose not to recognise credit protection if doing so would result in a higher capital requirement.

Recognition under the foundation approach

302. For banks using the foundation approach for LGD, the approach to guarantees and credit derivatives closely follows the treatment under the standardised approach as specified in paragraphs 189 to 201. The range of eligible guarantors is the same as under the standardised approach except that companies that are internally rated and associated with a PD equivalent to A- or better may also be recognised under the foundation approach. To receive recognition, the requirements outlined in paragraphs 189 to 194 must be met.

303. Eligible guarantees from eligible guarantors will be recognised as follows:

- For the covered portion of the exposure, a risk weight is derived by taking:
  - the risk-weight function appropriate to the type of guarantor, and
  - the PD appropriate to the guarantor's borrower grade, or some grade between the underlying obligor and the guarantor's borrower grade if the bank deems a full substitution treatment not to be warranted.
- The bank may replace the LGD of the underlying transaction with the LGD applicable to the guarantee taking into account seniority and any collateralisation of a guaranteed commitment.

304. The uncovered portion of the exposure is assigned the risk weight associated with the underlying obligor.

305. Where partial coverage exists, or where there is a currency mismatch between the underlying obligation and the credit protection, it is necessary to split the exposure into a covered and an uncovered amount. The treatment in the foundation approach follows that outlined in the standardised approach in paragraphs 198 to 200, and depends upon whether the cover is proportional or tranched.

Recognition under the advanced approach

306. Banks using the advanced approach for estimating LGDs may reflect the risk-mitigating effect of guarantees and credit derivatives through either adjusting PD or LGD estimates. Whether adjustments are done through PD or LGD, they must be done in a consistent manner for a given guarantee or credit derivative type. In doing so, banks must not include the effect of double default in such adjustments. Thus, the adjusted risk weight must not be less than that of a comparable direct exposure to the protection provider.

307. A bank relying on own-estimates of LGD has the option to adopt the treatment outlined above for banks under the foundation IRB approach (paragraphs 302 to 305), or to make an adjustment to its LGD estimate of the exposure to reflect the presence of the guarantee or credit derivative. Under this option, there are no limits to the range of eligible guarantors although the set of minimum requirements provided in paragraphs 483 and 484 concerning the type of guarantee must be satisfied. For credit derivatives, the requirements of paragraphs 488 and 489 must be satisfied.[75]

Operational requirements for recognition of double default

307(i). A bank using an IRB approach has the option of using the substitution approach in determining the appropriate capital requirement for an exposure. However, for exposures hedged by one of the following instruments the double default framework according to paragraphs 284 (i) to 284 (iii) may be applied subject to the additional operational requirements set out in paragraph 307 (ii). A bank may decide separately for each eligible exposure to apply either the double default framework or the substitution approach.

(a)	Single-name, unfunded credit derivatives (e.g. credit default swaps) or single-name guarantees.
(b)	First-to-default basket products — the double default treatment will be applied to the asset within the basket with the lowest risk-weighted amount.
(c)	n^{th}-to-default basket products — the protection obtained is only eligible for consideration under the double default framework if eligible $(n–1)^{th}$ default protection has also been obtained or where $(n–1)$ of the assets within the basket have already defaulted.

[75] When credit derivatives do not cover the restructuring of the underlying obligation, the partial recognition set out in paragraph 192 applies.

307(ii). The double default framework is only applicable where the following conditions are met.

(a)	The risk weight that is associated with the exposure prior to the application of the framework does not already factor in any aspect of the credit protection.
(b)	The entity selling credit protection is a bank[76], investment firm or insurance company (but only those that are in the business of providing credit protection, including mono-lines, re-insurers, and non-sovereign credit export agencies[77]), referred to as a financial firm, that: • is regulated in a manner broadly equivalent to that in this Framework (where there is appropriate supervisory oversight and transparency/ market discipline), or externally rated as at least investment grade by a credit rating agency deemed suitable for this purpose by supervisors; • had an internal rating with a PD equivalent to or lower than that associated with an external A– rating at the time the credit protection for an exposure was first provided or for any period of time thereafter; and • has an internal rating with a PD equivalent to or lower than that associated with an external investment-grade rating.
(c)	The underlying obligation is: • a corporate exposure as defined in paragraphs 218 to 228 (excluding specialised lending exposures for which the supervisory slotting criteria approach described in paragraphs 275 to 282 is being used); or • a claim on a PSE that is not a sovereign exposure as defined in paragraph 229; or • a loan extended to a small business and classified as a retail exposure as defined in paragraph 231.
(d)	The underlying obligor is not: • a financial firm as defined in (b); or • a member of the same group as the protection provider.
(e)	The credit protection meets the minimum operational requirements for such instruments as outlined in paragraphs 189 to 193.

[76] This does not include PSEs and MDBs, even though claims on these may be treated as claims on banks according to paragraph 230.

[77] By non-sovereign it is meant that credit protection in question does not benefit from any explicit sovereign counter-guarantee.

(f)	In keeping with paragraph 190 for guarantees, for any recognition of double default effects for both guarantees and credit derivatives a bank must have the right and expectation to receive payment from the credit protection provider without having to take legal action in order to pursue the counterparty for payment. To the extent possible, a bank should take steps to satisfy itself that the protection provider is willing to pay promptly if a credit event should occur.
(g)	The purchased credit protection absorbs all credit losses incurred on the hedged portion of an exposure that arise due to the credit events outlined in the contract.
(h)	If the payout structure provides for physical settlement, then there must be legal certainty with respect to the deliverability of a loan, bond, or contingent liability. If a bank intends to deliver an obligation other than the underlying exposure, it must ensure that the deliverable obligation is sufficiently liquid so that the bank would have the ability to purchase it for delivery in accordance with the contract.
(i)	The terms and conditions of credit protection arrangements must be legally confirmed in writing by both the credit protection provider and the bank.
(j)	In the case of protection against dilution risk, the seller of purchased receivables must not be a member of the same group as the protection provider.
(k)	There is no excessive correlation between the creditworthiness of a protection provider and the obligor of the underlying exposure due to their performance being dependent on common factors beyond the systematic risk factor. The bank has a process to detect such excessive correlation. An example of a situation in which such excessive correlation would arise is when a protection provider guarantees the debt of a supplier of goods or services and the supplier derives a high proportion of its income or revenue from the protection provider.

(iii) Exposure at default (EAD)

308. The following sections apply to both on and off-balance sheet positions. All exposures are measured gross of specific provisions or partial write-offs. The EAD on drawn amounts should not be less than the sum of (i) the amount by which a bank’s regulatory capital would be reduced if the exposure were written-off fully, and (ii) any specific provisions and partial write-offs. When the difference between the instrument’s EAD and the sum of (i) and (ii) is positive, this amount is termed a discount. The calculation of risk-weighted assets is independent of any discounts. Under the limited circumstances described in paragraph 380, discounts may be included in the measurement of total eligible provisions for purposes of the EL-provision calculation set out in Section III.G.

Exposure measurement for on-balance sheet items

309. On-balance sheet netting of loans and deposits will be recognised subject to the same conditions as under the standardised approach (see paragraph 188). Where currency or maturity mismatched on-balance sheet netting exists, the treatment follows the standardised approach, as set out in paragraphs 200 and 202 to 205.

Exposure measurement for off-balance sheet items (with the exception of FX and interest-rate, equity, and commodity-related derivatives)

310. For off-balance sheet items, exposure is calculated as the committed but undrawn amount multiplied by a CCF. There are two approaches for the estimation of CCFs: a foundation approach and an advanced approach.

EAD under the foundation approach

311. The types of instruments and the CCFs applied to them are the same as those in the standardised approach, as outlined in paragraphs 82 to 89 with the exception of commitments, Note Issuance Facilities (NIFs) and Revolving Underwriting Facilities (RUFs).

312. A CCF of 75% will be applied to commitments, NIFs and RUFs regardless of the maturity of the underlying facility. This does not apply to those facilities which are uncommitted, that are unconditionally cancellable, or that effectively provide for automatic cancellation, for example due to deterioration in a borrower's creditworthiness, at any time by the bank without prior notice. A CCF of 0% will be applied to these facilities.

313. The amount to which the CCF is applied is the lower of the value of the unused committed credit line, and the value that reflects any possible constraining availability of the facility, such as the existence of a ceiling on the potential lending amount which is related to a borrower's reported cash flow. If the facility is constrained in this way, the bank must have sufficient line monitoring and management procedures to support this contention.

314. In order to apply a 0% CCF for unconditionally and immediately cancellable corporate overdrafts and other facilities, banks must demonstrate that they actively monitor the financial condition of the borrower, and that their internal control systems are such that they could cancel the facility upon evidence of a deterioration in the credit quality of the borrower.

315. Where a commitment is obtained on another off-balance sheet exposure, banks under the foundation approach are to apply the lower of the applicable CCFs.

EAD under the advanced approach

316. Banks which meet the minimum requirements for use of their own estimates of EAD (see paragraphs 474 to 478) will be allowed to use their own internal estimates of CCFs across different product types provided the exposure is not subject to a CCF of 100% in the foundation approach (see paragraph 311).

Exposure measurement for transactions that expose banks to counterparty credit risk

317. Measures of exposure for SFTs and OTC derivatives that expose banks to counterparty credit risk under the IRB approach will be calculated as per the rules set forth in Annex 4 of this Framework.

(iv) Effective maturity (M)

318. For banks using the foundation approach for corporate exposures, effective maturity (M) will be 2.5 years except for repo-style transactions where the effective maturity will be 6 months. National supervisors may choose to require all banks in their jurisdiction (those using the foundation and advanced approaches) to measure M for each facility using the definition provided below.

319. Banks using any element of the advanced IRB approach are required to measure effective maturity for each facility as defined below. However, national supervisors may exempt facilities to certain smaller domestic corporate borrowers from the explicit maturity adjustment if the reported sales (i.e. turnover) as well as total assets for the consolidated group of which the firm is a part of are less than €500 million. The consolidated group has to be a domestic company based in the country where the exemption is applied. If adopted, national supervisors must apply such an exemption to all IRB banks using the advanced approach in that country, rather than on a bank-by-bank basis. If the exemption is applied, all exposures to qualifying smaller domestic firms will be assumed to have an average maturity of 2.5 years, as under the foundation IRB approach.

320. Except as noted in paragraph 321, M is defined as the greater of one year and the remaining effective maturity in years as defined below. In all cases, M will be no greater than 5 years.

- For an instrument subject to a determined cash flow schedule, effective maturity M is defined as:

  Effective Maturity (M) = $\sum_t t * CF_t / \sum_t CF_t$

  where CF_t denotes the cash flows (principal, interest payments and fees) contractually payable by the borrower in period t.

- If a bank is not in a position to calculate the effective maturity of the contracted payments as noted above, it is allowed to use a more conservative measure of M such as that it equals the maximum remaining time (in years) that the borrower is permitted to take to fully discharge its contractual obligation (principal, interest, and fees) under the terms of loan agreement. Normally, this will correspond to the nominal maturity of the instrument.
- For derivatives subject to a master netting agreement, the weighted average maturity of the transactions should be used when applying the explicit maturity adjustment. Further, the notional amount of each transaction should be used for weighting the maturity.

321. The one-year floor does not apply to certain short-term exposures, comprising fully or nearly-fully collateralised[78] capital market-driven transactions (i.e. OTC derivatives transactions and margin lending) and repo-style transactions (i.e. repos/reverse repos and securities lending/borrowing) with an original maturity of less then one year, where the documentation contains daily remargining clauses. For all eligible transactions the documentation must require daily revaluation, and must include provisions that must allow for the prompt liquidation or setoff of the collateral in the event of default or failure to re-margin. The maturity of such transactions must be calculated as the greater of one-day, and the effective maturity (M, consistent with the definition above).

322. In addition to the transactions considered in paragraph 321 above, other short-term exposures with an original maturity of less than one year that are not part of a bank's ongoing financing of an obligor may be eligible for exemption from the one-year floor. After a careful review of the particular circumstances in their jurisdictions, national supervisors

[78] The intention is to include both parties of a transaction meeting these conditions where neither of the parties is systematically under-collateralised.

should define the types of short-term exposures that might be considered eligible for this treatment. The results of these reviews might, for example, include transactions such as:

- Some capital market-driven transactions and repo-style transactions that might not fall within the scope of paragraph 321;
- Some short-term self-liquidating trade transactions. Import and export letters of credit and similar transactions could be accounted for at their actual remaining maturity;
- Some exposures arising from settling securities purchases and sales. This could also include overdrafts arising from failed securities settlements provided that such overdrafts do not continue more than a short, fixed number of business days;
- Some exposures arising from cash settlements by wire transfer, including overdrafts arising from failed transfers provided that such overdrafts do not continue more than a short, fixed number of business days;
- Some exposures to banks arising from foreign exchange settlements; and
- Some short-term loans and deposits.

323. For transactions falling within the scope of paragraph 321 subject to a master netting agreement, the weighted average maturity of the transactions should be used when applying the explicit maturity adjustment. A floor equal to the minimum holding period for the transaction type set out in paragraph 167 will apply to the average. Where more than one transaction type is contained in the master netting agreement a floor equal to the highest holding period will apply to the average. Further, the notional amount of each transaction should be used for weighting maturity.

324. Where there is no explicit adjustment, the effective maturity (M) assigned to all exposures is set at 2.5 years unless otherwise specified in paragraph 318.

Treatment of maturity mismatches

325. The treatment of maturity mismatches under IRB is identical to that in the standardised approach ─ see paragraphs 202 to 205.

D. Rules for Retail Exposures

326. Section D presents in detail the method of calculating the UL capital requirements for retail exposures. Section D.1 provides three risk-weight functions, one for residential mortgage exposures, a second for qualifying revolving retail exposures, and a third for other retail exposures. Section D.2 presents the risk components to serve as inputs to the risk-weight functions. The method of calculating expected losses, and for determining the difference between that measure and provisions is described in Section III.G.

1. Risk-weighted assets for retail exposures

327. There are three separate risk-weight functions for retail exposures, as defined in paragraphs 328 to 330. Risk weights for retail exposures are based on separate assessments of PD and LGD as inputs to the risk-weight functions. None of the three retail risk-weight functions contains an explicit maturity adjustment. Throughout this section, PD and LGD are measured as decimals, and EAD is measured as currency (e.g. euros).

(i) Residential mortgage exposures

328. For exposures defined in paragraph 231 that are not in default and are secured or partly secured[79] by residential mortgages, risk weights will be assigned based on the following formula:

Correlation (R) = 0.15

Capital requirement (K) = LGD × N[(1 – R)^-0.5 × G(PD) + (R / (1 – R))^0.5 × G(0.999)] – PD x LGD

Risk-weighted assets = K x 12.5 x EAD

The capital requirement (K) for a defaulted exposure is equal to the greater of zero and the difference between its LGD (described in paragraph 468) and the bank's best estimate of expected loss (described in paragraph 471). The risk-weighted asset amount for the defaulted exposure is the product of K, 12.5, and the EAD.

(ii) Qualifying revolving retail exposures

329. For qualifying revolving retail exposures as defined in paragraph 234 that are not in default, risk weights are defined based on the following formula:

Correlation (R) = 0.04

Capital requirement (K) = LGD × N[(1 – R)^-0.5 × G(PD) + (R / (1 – R))^0.5 × G(0.999)] – PD x LGD

Risk-weighted assets = K x 12.5 x EAD

The capital requirement (K) for a defaulted exposure is equal to the greater of zero and the difference between its LGD (described in paragraph 468) and the bank's best estimate of expected loss (described in paragraph 471). The risk-weighted asset amount for the defaulted exposure is the product of K, 12.5, and the EAD.

(iii) Other retail exposures

330. For all other retail exposures that are not in default, risk weights are assigned based on the following function, which allows correlation to vary with PD:

Correlation (R) = 0.03 × (1 – EXP(-35 × PD)) / (1 – EXP(-35)) + 0.16 × [1 – (1 – EXP(-35 × PD))/(1 – EXP(-35))]

Capital requirement (K) = LGD × N[(1 – R)^-0.5 × G(PD) + (R / (1 – R))^0.5 × G(0.999)] – PD x LGD

Risk-weighted assets = K x 12.5 x EAD

The capital requirement (K) for a defaulted exposure is equal to the greater of zero and the difference between its LGD (described in paragraph 468) and the bank's best estimate of

[79] This means that risk weights for residential mortgages also apply to the unsecured portion of such residential mortgages.

expected loss (described in paragraph 471). The risk-weighted asset amount for the defaulted exposure is the product of K, 12.5, and the EAD.

Illustrative risk weights are shown in Annex 5.

2. Risk components

(i) Probability of default (PD) and loss given default (LGD)

331. For each identified pool of retail exposures, banks are expected to provide an estimate of the PD and LGD associated with the pool, subject to the minimum requirements as set out in Section III.H. Additionally, the PD for retail exposures is the greater of the one-year PD associated with the internal borrower grade to which the pool of retail exposures is assigned or 0.03%.

(ii) Recognition of guarantees and credit derivatives

332. Banks may reflect the risk-reducing effects of guarantees and credit derivatives, either in support of an individual obligation or a pool of exposures, through an adjustment of either the PD or LGD estimate, subject to the minimum requirements in paragraphs 480 to 489. Whether adjustments are done through PD or LGD, they must be done in a consistent manner for a given guarantee or credit derivative type.

333. Consistent with the requirements outlined above for corporate, sovereign, and bank exposures, banks must not include the effect of double default in such adjustments. The adjusted risk weight must not be less than that of a comparable direct exposure to the protection provider. Consistent with the standardised approach, banks may choose not to recognise credit protection if doing so would result in a higher capital requirement.

(iii) Exposure at default (EAD)

334. Both on and off-balance sheet retail exposures are measured gross of specific provisions or partial write-offs. The EAD on drawn amounts should not be less than the sum of (i) the amount by which a bank's regulatory capital would be reduced if the exposure were written-off fully, and (ii) any specific provisions and partial write-offs. When the difference between the instrument's EAD and the sum of (i) and (ii) is positive, this amount is termed a discount. The calculation of risk-weighted assets is independent of any discounts. Under the limited circumstances described in paragraph 380, discounts may be included in the measurement of total eligible provisions for purposes of the EL-provision calculation set out in Section III.G.

335. On-balance sheet netting of loans and deposits of a bank to or from a retail customer will be permitted subject to the same conditions outlined in paragraph 188 of the standardised approach. For retail off-balance sheet items, banks must use their own estimates of CCFs provided the minimum requirements in paragraphs 474 to 477 and 479 are satisfied.

336. For retail exposures with uncertain future drawdown such as credit cards, banks must take into account their history and/or expectation of additional drawings prior to default in their overall calibration of loss estimates. In particular, where a bank does not reflect conversion factors for undrawn lines in its EAD estimates, it must reflect in its LGD estimates the likelihood of additional drawings prior to default. Conversely, if the bank does not incorporate the possibility of additional drawings in its LGD estimates, it must do so in its EAD estimates.

337. When only the drawn balances of retail facilities have been securitised, banks must ensure that they continue to hold required capital against their share (i.e. seller's interest) of undrawn balances related to the securitised exposures using the IRB approach to credit risk. This means that for such facilities, banks must reflect the impact of CCFs in their EAD estimates rather than in the LGD estimates. For determining the EAD associated with the seller's interest in the undrawn lines, the undrawn balances of securitised exposures would be allocated between the seller's and investors' interests on a pro rata basis, based on the proportions of the seller's and investors' shares of the securitised drawn balances. The investors' share of undrawn balances related to the securitised exposures is subject to the treatment in paragraph 643.

338. To the extent that foreign exchange and interest rate commitments exist within a bank's retail portfolio for IRB purposes, banks are not permitted to provide their internal assessments of credit equivalent amounts. Instead, the rules for the standardised approach continue to apply.

E. Rules for Equity Exposures

339. Section E presents the method of calculating the UL capital requirements for equity exposures. Section E.1 discusses (a) the market-based approach (which is further sub-divided into a simple risk weight method and an internal models method), and (b) the PD/LGD approach. The risk components are provided in Section E.2. The method of calculating expected losses, and for determining the difference between that measure and provisions is described in Section III.G.

1. Risk-weighted assets for equity exposures

340. Risk-weighted assets for equity exposures in the trading book are subject to the market risk capital rules.

341. There are two approaches to calculate risk-weighted assets for equity exposures not held in the trading book: a market-based approach and a PD/LGD approach. Supervisors will decide which approach or approaches will be used by banks, and in what circumstances. Certain equity holdings are excluded as defined in paragraphs 356 to 358 and are subject to the capital charges required under the standardised approach.

342. Where supervisors permit both methodologies, banks' choices must be made consistently, and in particular not determined by regulatory arbitrage considerations.

(i) Market-based approach

343. Under the market-based approach, institutions are permitted to calculate the minimum capital requirements for their banking book equity holdings using one or both of two separate and distinct methods: a simple risk weight method or an internal models method. The method used should be consistent with the amount and complexity of the institution's equity holdings and commensurate with the overall size and sophistication of the institution. Supervisors may require the use of either method based on the individual circumstances of an institution.

Simple risk weight method

344. Under the simple risk weight method, a 300% risk weight is to be applied to equity holdings that are publicly traded and a 400% risk weight is to be applied to all other equity

holdings. A publicly traded holding is defined as any equity security traded on a recognised security exchange.

345. Short cash positions and derivative instruments held in the banking book are permitted to offset long positions in the same individual stocks provided that these instruments have been explicitly designated as hedges of specific equity holdings and that they have remaining maturities of at least one year. Other short positions are to be treated as if they are long positions with the relevant risk weight applied to the absolute value of each position. In the context of maturity mismatched positions, the methodology is that for corporate exposures.

Internal models method

346. IRB banks may use, or may be required by their supervisor to use, internal risk measurement models to calculate the risk-based capital requirement. Under this alternative, banks must hold capital equal to the potential loss on the institution's equity holdings as derived using internal value-at-risk models subject to the 99th percentile, one-tailed confidence interval of the difference between quarterly returns and an appropriate risk-free rate computed over a long-term sample period. The capital charge would be incorporated into an institution's risk-based capital ratio through the calculation of risk-weighted equivalent assets.

347. The risk weight used to convert holdings into risk-weighted equivalent assets would be calculated by multiplying the derived capital charge by 12.5 (i.e. the inverse of the minimum 8% risk-based capital requirement). Capital charges calculated under the internal models method may be no less than the capital charges that would be calculated under the simple risk weight method using a 200% risk weight for publicly traded equity holdings and a 300% risk weight for all other equity holdings. These minimum capital charges would be calculated separately using the methodology of the simple risk weight approach. Further, these minimum risk weights are to apply at the individual exposure level rather than at the portfolio level.

348. A bank may be permitted by its supervisor to employ different market-based approaches to different portfolios based on appropriate considerations and where the bank itself uses different approaches internally.

349. Banks are permitted to recognise guarantees but not collateral obtained on an equity position wherein the capital requirement is determined through use of the market-based approach.

(ii) PD/LGD approach

350. The minimum requirements and methodology for the PD/LGD approach for equity exposures (including equity of companies that are included in the retail asset class) are the same as those for the IRB foundation approach for corporate exposures subject to the following specifications:[80]

- The bank's estimate of the PD of a corporate entity in which it holds an equity position must satisfy the same requirements as the bank's estimate of the PD of a

[80] There is no advanced approach for equity exposures, given the 90% LGD assumption.

corporate entity where the bank holds debt.[81] If a bank does not hold debt of the company in whose equity it has invested, and does not have sufficient information on the position of that company to be able to use the applicable definition of default in practice but meets the other standards, a 1.5 scaling factor will be applied to the risk weights derived from the corporate risk-weight function, given the PD set by the bank. If, however, the bank's equity holdings are material and it is permitted to use a PD/LGD approach for regulatory purposes but the bank has not yet met the relevant standards, the simple risk-weight method under the market-based approach will apply.

- An LGD of 90% would be assumed in deriving the risk weight for equity exposures.
- For these purposes, the risk weight is subject to a five-year maturity adjustment whether or not the bank is using the explicit approach to maturity elsewhere in its IRB portfolio.

351. Under the PD/LGD approach, minimum risk weights as set out in paragraphs 352 and 353 apply. When the sum of UL and EL associated with the equity exposure results in less capital than would be required from application of one of the minimum risk weights, the minimum risk weights must be used. In other words, the minimum risk weights must be applied, if the risk weights calculated according to paragraph 350 plus the EL associated with the equity exposure multiplied by 12.5 are smaller than the applicable minimum risk weights.

352. A minimum risk weight of 100% applies for the following types of equities for as long as the portfolio is managed in the manner outlined below:

- Public equities where the investment is part of a long-term customer relationship, any capital gains are not expected to be realised in the short term and there is no anticipation of (above trend) capital gains in the long term. It is expected that in almost all cases, the institution will have lending and/or general banking relationships with the portfolio company so that the estimated probability of default is readily available. Given their long-term nature, specification of an appropriate holding period for such investments merits careful consideration. In general, it is expected that the bank will hold the equity over the long term (at least five years).
- Private equities where the returns on the investment are based on regular and periodic cash flows not derived from capital gains and there is no expectation of future (above trend) capital gain or of realising any existing gain.

353. For all other equity positions, including net short positions (as defined in paragraph 345), capital charges calculated under the PD/LGD approach may be no less than the capital charges that would be calculated under a simple risk weight method using a 200% risk weight for publicly traded equity holdings and a 300% risk weight for all other equity holdings.

354. The maximum risk weight for the PD/LGD approach for equity exposures is 1250%. This maximum risk weight can be applied, if risk weights calculated according to paragraph 350 plus the EL associated with the equity exposure multiplied by 12.5 exceed the 1250% risk weight. Alternatively, banks may deduct the entire equity exposure amount, assuming it represents the EL amount, 50% from Tier 1 capital and 50% from Tier 2 capital.

---

[81] In practice, if there is both an equity exposure and an IRB credit exposure to the same counterparty, a default on the credit exposure would thus trigger a simultaneous default for regulatory purposes on the equity exposure.

355. Hedging for PD/LGD equity exposures is, as for corporate exposures, subject to an LGD of 90% on the exposure to the provider of the hedge. For these purposes equity positions will be treated as having a five-year maturity.

(iii) Exclusions to the market-based and PD/LGD approaches

356. Equity holdings in entities whose debt obligations qualify for a zero risk weight under the standardised approach to credit risk can be excluded from the IRB approaches to equity (including those publicly sponsored entities where a zero risk weight can be applied), at the discretion of the national supervisor. If a national supervisor makes such an exclusion this will be available to all banks.

357. To promote specified sectors of the economy, supervisors may exclude from the IRB capital charges equity holdings made under legislated programmes that provide significant subsidies for the investment to the bank and involve some form of government oversight and restrictions on the equity investments. Example of restrictions are limitations on the size and types of businesses in which the bank is investing, allowable amounts of ownership interests, geographical location and other pertinent factors that limit the potential risk of the investment to the bank. Equity holdings made under legislated programmes can only be excluded from the IRB approaches up to an aggregate of 10% of Tier 1 plus Tier 2 capital.

358. Supervisors may also exclude the equity exposures of a bank from the IRB treatment based on materiality. The equity exposures of a bank are considered material if their aggregate value, excluding all legislative programmes discussed in paragraph 357, exceeds, on average over the prior year, 10% of bank's Tier 1 plus Tier 2 capital. This materiality threshold is lowered to 5% of a bank's Tier 1 plus Tier 2 capital if the equity portfolio consists of less than 10 individual holdings. National supervisors may use lower materiality thresholds.

2. Risk components

359. In general, the measure of an equity exposure on which capital requirements is based is the value presented in the financial statements, which depending on national accounting and regulatory practices may include unrealised revaluation gains. Thus, for example, equity exposure measures will be:

- For investments held at fair value with changes in value flowing directly through income and into regulatory capital, exposure is equal to the fair value presented in the balance sheet.
- For investments held at fair value with changes in value not flowing through income but into a tax-adjusted separate component of equity, exposure is equal to the fair value presented in the balance sheet.
- For investments held at cost or at the lower of cost or market, exposure is equal to the cost or market value presented in the balance sheet.[82]

360. Holdings in funds containing both equity investments and other non-equity types of investments can be either treated, in a consistent manner, as a single investment based on

[82] This does not affect the existing allowance of 45% of unrealised gains to Tier 2 capital in the 1988 Accord.

the majority of the fund's holdings or, where possible, as separate and distinct investments in the fund's component holdings based on a look-through approach.

361. Where only the investment mandate of the fund is known, the fund can still be treated as a single investment. For this purpose, it is assumed that the fund first invests, to the maximum extent allowed under its mandate, in the asset classes attracting the highest capital requirement, and then continues making investments in descending order until the maximum total investment level is reached. The same approach can also be used for the look-through approach, but only where the bank has rated all the potential constituents of such a fund.

F. Rules for Purchased Receivables

362. Section F presents the method of calculating the UL capital requirements for purchased receivables. For such assets, there are IRB capital charges for both default risk and dilution risk. Section III.F.1 discusses the calculation of risk-weighted assets for default risk. The calculation of risk-weighted assets for dilution risk is provided in Section III.F.2. The method of calculating expected losses, and for determining the difference between that measure and provisions, is described in Section III.G.

1. Risk-weighted assets for default risk

363. For receivables belonging unambiguously to one asset class, the IRB risk weight for default risk is based on the risk-weight function applicable to that particular exposure type, as long as the bank can meet the qualification standards for this particular risk-weight function. For example, if banks cannot comply with the standards for qualifying revolving retail exposures (defined in paragraph 234), they should use the risk-weight function for other retail exposures. For hybrid pools containing mixtures of exposure types, if the purchasing bank cannot separate the exposures by type, the risk-weight function producing the highest capital requirements for the exposure types in the receivable pool applies.

(i) Purchased retail receivables

364. For purchased retail receivables, a bank must meet the risk quantification standards for retail exposures but can utilise external and internal reference data to estimate the PDs and LGDs. The estimates for PD and LGD (or EL) must be calculated for the receivables on a stand-alone basis; that is, without regard to any assumption of recourse or guarantees from the seller or other parties.

(ii) Purchased corporate receivables

365. For purchased corporate receivables the purchasing bank is expected to apply the existing IRB risk quantification standards for the bottom-up approach. However, for eligible purchased corporate receivables, and subject to supervisory permission, a bank may employ the following top-down procedure for calculating IRB risk weights for default risk:

- The purchasing bank will estimate the pool's one-year EL for default risk, expressed in percentage of the exposure amount (i.e. the total EAD amount to the bank by all obligors in the receivables pool). The estimated EL must be calculated for the receivables on a stand-alone basis; that is, without regard to any assumption of recourse or guarantees from the seller or other parties. The treatment of recourse or guarantees covering default risk (and/or dilution risk) is discussed separately below.

- Given the EL estimate for the pool's default losses, the risk weight for default risk is determined by the risk-weight function for corporate exposures.[83] As described below, the precise calculation of risk weights for default risk depends on the bank's ability to decompose EL into its PD and LGD components in a reliable manner. Banks can utilise external and internal data to estimate PDs and LGDs. However, the advanced approach will not be available for banks that use the foundation approach for corporate exposures.

Foundation IRB treatment

366. If the purchasing bank is unable to decompose EL into its PD and LGD components in a reliable manner, the risk weight is determined from the corporate risk-weight function using the following specifications: if the bank can demonstrate that the exposures are exclusively senior claims to corporate borrowers, an LGD of 45% can be used. PD will be calculated by dividing the EL using this LGD. EAD will be calculated as the outstanding amount minus the capital charge for dilution prior to credit risk mitigation ($K_{Dilution}$). Otherwise, PD is the bank's estimate of EL; LGD will be 100%; and EAD is the amount outstanding minus $K_{Dilution}$. EAD for a revolving purchase facility is the sum of the current amount of receivables purchased plus 75% of any undrawn purchase commitments minus $K_{Dilution}$. If the purchasing bank is able to estimate PD in a reliable manner, the risk weight is determined from the corporate risk-weight functions according to the specifications for LGD, M and the treatment of guarantees under the foundation approach as given in paragraphs 287 to 296, 299, 300 to 305, and 318.

Advanced IRB treatment

367. If the purchasing bank can estimate either the pool's default-weighted average loss rates given default (as defined in paragraph 468) or average PD in a reliable manner, the bank may estimate the other parameter based on an estimate of the expected long-run loss rate. The bank may (i) use an appropriate PD estimate to infer the long-run default-weighted average loss rate given default, or (ii) use a long-run default-weighted average loss rate given default to infer the appropriate PD. In either case, it is important to recognise that the LGD used for the IRB capital calculation for purchased receivables cannot be less than the long-run default-weighted average loss rate given default and must be consistent with the concepts defined in paragraph 468. The risk weight for the purchased receivables will be determined using the bank's estimated PD and LGD as inputs to the corporate risk-weight function. Similar to the foundation IRB treatment, EAD will be the amount outstanding minus $K_{Dilution}$. EAD for a revolving purchase facility will be the sum of the current amount of receivables purchased plus 75% of any undrawn purchase commitments minus $K_{Dilution}$ (thus, banks using the advanced IRB approach will not be permitted to use their internal EAD estimates for undrawn purchase commitments).

368. For drawn amounts, M will equal the pool's exposure-weighted average effective maturity (as defined in paragraphs 320 to 324). This same value of M will also be used for undrawn amounts under a committed purchase facility provided the facility contains effective covenants, early amortisation triggers, or other features that protect the purchasing bank

[83] The firm-size adjustment for SME, as defined in paragraph 273, will be the weighted average by individual exposure of the pool of purchased corporate receivables. If the bank does not have the information to calculate the average size of the pool, the firm-size adjustment will not apply.

against a significant deterioration in the quality of the future receivables it is required to purchase over the facility's term. Absent such effective protections, the M for undrawn amounts will be calculated as the sum of (a) the longest-dated potential receivable under the purchase agreement and (b) the remaining maturity of the purchase facility.

2. Risk-weighted assets for dilution risk

369. Dilution refers to the possibility that the receivable amount is reduced through cash or non-cash credits to the receivable's obligor.[84] For both corporate and retail receivables, unless the bank can demonstrate to its supervisor that the dilution risk for the purchasing bank is immaterial, the treatment of dilution risk must be the following: at the level of either the pool as a whole (top-down approach) or the individual receivables making up the pool (bottom-up approach), the purchasing bank will estimate the one-year EL for dilution risk, also expressed in percentage of the receivables amount. Banks can utilise external and internal data to estimate EL. As with the treatments of default risk, this estimate must be computed on a stand-alone basis; that is, under the assumption of no recourse or other support from the seller or third-party guarantors. For the purpose of calculating risk weights for dilution risk, the corporate risk-weight function must be used with the following settings: the PD must be set equal to the estimated EL, and the LGD must be set at 100%. An appropriate maturity treatment applies when determining the capital requirement for dilution risk. If a bank can demonstrate that the dilution risk is appropriately monitored and managed to be resolved within one year, the supervisor may allow the bank to apply a one-year maturity.

370. This treatment will be applied regardless of whether the underlying receivables are corporate or retail exposures, and regardless of whether the risk weights for default risk are computed using the standard IRB treatments or, for corporate receivables, the top-down treatment described above.

3. Treatment of purchase price discounts for receivables

371. In many cases, the purchase price of receivables will reflect a discount (not to be confused with the discount concept defined in paragraphs 308 and 334) that provides first loss protection for default losses, dilution losses or both (see paragraph 629). To the extent a portion of such a purchase price discount will be refunded to the seller, this refundable amount may be treated as first loss protection under the IRB securitisation framework. Non-refundable purchase price discounts for receivables do not affect either the EL-provision calculation in Section III.G or the calculation of risk-weighted assets.

372. When collateral or partial guarantees obtained on receivables provide first loss protection (collectively referred to as mitigants in this paragraph), and these mitigants cover default losses, dilution losses, or both, they may also be treated as first loss protection under the IRB securitisation framework (see paragraph 629). When the same mitigant covers both default and dilution risk, banks using the Supervisory Formula that are able to calculate an exposure-weighted LGD must do so as defined in paragraph 634.

[84] Examples include offsets or allowances arising from returns of goods sold, disputes regarding product quality, possible debts of the borrower to a receivables obligor, and any payment or promotional discounts offered by the borrower (e.g. a credit for cash payments within 30 days).

4. Recognition of credit risk mitigants

373. Credit risk mitigants will be recognised generally using the same type of framework as set forth in paragraphs 300 to 307.[85] In particular, a guarantee provided by the seller or a third party will be treated using the existing IRB rules for guarantees, regardless of whether the guarantee covers default risk, dilution risk, or both.

- If the guarantee covers both the pool's default risk *and* dilution risk, the bank will substitute the risk weight for an exposure to the guarantor in place of the pool's total risk weight for default and dilution risk.
- If the guarantee covers only default risk or dilution risk, but not both, the bank will substitute the risk weight for an exposure to the guarantor in place of the pool's risk weight for the corresponding risk component (default or dilution). The capital requirement for the other component will then be added.
- If a guarantee covers only a portion of the default and/or dilution risk, the uncovered portion of the default and/or dilution risk will be treated as per the existing CRM rules for proportional or tranched coverage (i.e. the risk weights of the uncovered risk components will be added to the risk weights of the covered risk components).

373 (i). If protection against dilution risk has been purchased, and the conditions of paragraphs 307 (i) and 307 (ii) are met, the double default framework may be used for the calculation of the risk-weighted asset amount for dilution risk. In this case, paragraphs 284 (i) to 284 (iii) apply with PD_o being equal to the estimated EL, LGD_g being equal to 100 percent, and effective maturity being set according to paragraph 369.

G. Treatment of Expected Losses and Recognition of Provisions

374. Section III.G discusses the method by which the difference between provisions (e.g. specific provisions, portfolio-specific general provisions such as country risk provisions or general provisions) and expected losses may be included in or must be deducted from regulatory capital, as outlined in paragraph 43.

1. Calculation of expected losses

375. A bank must sum the EL amount (defined as EL multiplied by EAD) associated with its exposures (excluding the EL amount associated with equity exposures under the PD/LGD approach and securitisation exposures) to obtain a total EL amount. While the EL amount associated with equity exposures subject to the PD/LGD approach is excluded from the total EL amount, paragraphs 376 and 386 apply to such exposures. The treatment of EL for securitisation exposures is described in paragraph 563.

(i) Expected loss for exposures other than SL subject to the supervisory slotting criteria

376. Banks must calculate an EL as PD x LGD for corporate, sovereign, bank, and retail exposures both not in default and not treated as hedged exposures under the double default treatment. For corporate, sovereign, bank, and retail exposures that are in default, banks must use their best estimate of expected loss as defined in paragraph 471 and banks on the foundation approach must use the supervisory LGD. For SL exposures subject to the

[85] At national supervisory discretion, banks may recognise guarantors that are internally rated and associated with a PD equivalent to less than A- under the foundation IRB approach for purposes of determining capital requirements for dilution risk.

supervisory slotting criteria EL is calculated as described in paragraphs 377 and 378. For equity exposures subject to the PD/LGD approach, the EL is calculated as PD x LGD unless paragraphs 351 to 354 apply. Securitisation exposures do not contribute to the EL amount, as set out in paragraph 563. For all other exposures, including hedged exposures under the double default treatment, the EL is zero.

(ii) Expected loss for SL exposures subject to the supervisory slotting criteria

377. For SL exposures subject to the supervisory slotting criteria, the EL amount is determined by multiplying 8% by the risk-weighted assets produced from the appropriate risk weights, as specified below, multiplied by EAD.

Supervisory categories and EL risk weights for other SL exposures

378. The risk weights for SL, other than HVCRE, are as follows:

Strong	Good	Satisfactory	Weak	Default
5%	10%	35%	100%	625%

Where, at national discretion, supervisors allow banks to assign preferential risk weights to other SL exposures falling into the “strong” and “good” supervisory categories as outlined in paragraph 277, the corresponding EL risk weight is 0% for “strong” exposures, and 5% for “good” exposures.

Supervisory categories and EL risk weights for HVCRE

379. The risk weights for HVCRE are as follows:

Strong	Good	Satisfactory	Weak	Default
5%	5%	35%	100%	625%

Even where, at national discretion, supervisors allow banks to assign preferential risk weights to HVCRE exposures falling into the “strong” and “good” supervisory categories as outlined in paragraph 282, the corresponding EL risk weight will remain at 5% for both “strong” and “good” exposures.

2. Calculation of provisions

(i) Exposures subject to IRB approach

380. Total eligible provisions are defined as the sum of all provisions (e.g. specific provisions, partial write-offs, portfolio-specific general provisions such as country risk provisions or general provisions) that are attributed to exposures treated under the IRB approach. In addition, total eligible provisions may include any discounts on defaulted assets. Specific provisions set aside against equity and securitisation exposures must not be included in total eligible provisions.

(ii) Portion of exposures subject to the standardised approach to credit risk

381. Banks using the standardised approach for a portion of their credit risk exposures, either on a transitional basis (as defined in paragraphs 257 and 258), or on a permanent

basis if the exposures subject to the standardised approach are immaterial (paragraph 259), must determine the portion of general provisions attributed to the standardised or IRB treatment of provisions (see paragraph 42) according to the methods outlined in paragraphs 382 and 383.

382. Banks should generally attribute total general provisions on a pro rata basis according to the proportion of credit risk-weighted assets subject to the standardised and IRB approaches. However, when one approach to determining credit risk-weighted assets (i.e. standardised or IRB approach) is used exclusively within an entity, general provisions booked within the entity using the standardised approach may be attributed to the standardised treatment. Similarly, general provisions booked within entities using the IRB approach may be attributed to the total eligible provisions as defined in paragraph 380.

383. At national supervisory discretion, banks using both the standardised and IRB approaches may rely on their internal methods for allocating general provisions for recognition in capital under either the standardised or IRB approach, subject to the following conditions. Where the internal allocation method is made available, the national supervisor will establish the standards surrounding their use. Banks will need to obtain prior approval from their supervisors to use an internal allocation method for this purpose.

3. Treatment of EL and provisions

384. As specified in paragraph 43, banks using the IRB approach must compare the total amount of total eligible provisions (as defined in paragraph 380) with the total EL amount as calculated within the IRB approach (as defined in paragraph 375). In addition, paragraph 42 outlines the treatment for that portion of a bank that is subject to the standardised approach to credit risk when the bank uses both the standardised and IRB approaches.

385. Where the calculated EL amount is lower than the provisions of the bank, its supervisors must consider whether the EL fully reflects the conditions in the market in which it operates before allowing the difference to be included in Tier 2 capital. If specific provisions exceed the EL amount on defaulted assets this assessment also needs to be made before using the difference to offset the EL amount on non-defaulted assets.

386. The EL amount for equity exposures under the PD/LGD approach is deducted 50% from Tier 1 and 50% from Tier 2. Provisions or write-offs for equity exposures under the PD/LGD approach will not be used in the EL-provision calculation. The treatment of EL and provisions related to securitisation exposures is outlined in paragraph 563.

H. Minimum Requirements for IRB Approach

387. Section III.H presents the minimum requirements for entry and on-going use of the IRB approach. The minimum requirements are set out in 12 separate sections concerning: (a) composition of minimum requirements, (b) compliance with minimum requirements, (c) rating system design, (d) risk rating system operations, (e) corporate governance and oversight, (f) use of internal ratings, (g) risk quantification, (h) validation of internal estimates, (i) supervisory LGD and EAD estimates, (j) requirements for recognition of leasing, (k) calculation of capital charges for equity exposures, and (l) disclosure requirements. It may be helpful to note that the minimum requirements cut across asset classes. Therefore, more than one asset class may be discussed within the context of a given minimum requirement.

1. Composition of minimum requirements

388. To be eligible for the IRB approach a bank must demonstrate to its supervisor that it meets certain minimum requirements at the outset and on an ongoing basis. Many of these requirements are in the form of objectives that a qualifying bank's risk rating systems must fulfil. The focus is on banks' abilities to rank order and quantify risk in a consistent, reliable and valid fashion.

389. The overarching principle behind these requirements is that rating and risk estimation systems and processes provide for a meaningful assessment of borrower and transaction characteristics; a meaningful differentiation of risk; and reasonably accurate and consistent quantitative estimates of risk. Furthermore, the systems and processes must be consistent with internal use of these estimates. The Committee recognises that differences in markets, rating methodologies, banking products, and practices require banks and supervisors to customise their operational procedures. It is not the Committee's intention to dictate the form or operational detail of banks' risk management policies and practices. Each supervisor will develop detailed review procedures to ensure that banks' systems and controls are adequate to serve as the basis for the IRB approach.

390. The minimum requirements set out in this document apply to all asset classes unless noted otherwise. The standards related to the process of assigning exposures to borrower or facility *grades* (and the related oversight, validation, etc.) apply equally to the process of assigning retail exposures to pools of homogenous exposures, unless noted otherwise.

391. The minimum requirements set out in this document apply to both foundation and advanced approaches unless noted otherwise. Generally, all IRB banks must produce their own estimates of PD[86] and must adhere to the overall requirements for rating system design, operations, controls, and corporate governance, as well as the requisite requirements for estimation and validation of PD measures. Banks wishing to use their own estimates of LGD and EAD must also meet the incremental minimum requirements for these risk factors included in paragraphs 468 to 489.

2. Compliance with minimum requirements

392. To be eligible for an IRB approach, a bank must demonstrate to its supervisor that it meets the IRB requirements in this document, at the outset and on an ongoing basis. Banks' overall credit risk management practices must also be consistent with the evolving sound practice guidelines issued by the Committee and national supervisors.

393. There may be circumstances when a bank is not in complete compliance with all the minimum requirements. Where this is the case, the bank must produce a plan for a timely return to compliance, and seek approval from its supervisor, or the bank must demonstrate that the effect of such non-compliance is immaterial in terms of the risk posed to the institution. Failure to produce an acceptable plan or satisfactorily implement the plan or to demonstrate immateriality will lead supervisors to reconsider the bank's eligibility for the IRB approach. Furthermore, for the duration of any non-compliance, supervisors will consider the need for the bank to hold additional capital under Pillar 2 or take other appropriate supervisory action.

---

[86] Banks are not required to produce their own estimates of PD for certain equity exposures and certain exposures that fall within the SL sub-class.

3. Rating system design

394. The term "rating system" comprises all of the methods, processes, controls, and data collection and IT systems that support the assessment of credit risk, the assignment of internal risk ratings, and the quantification of default and loss estimates.

395. Within each asset class, a bank may utilise multiple rating methodologies/systems. For example, a bank may have customised rating systems for specific industries or market segments (e.g. middle market, and large corporate). If a bank chooses to use multiple systems, the rationale for assigning a borrower to a rating system must be documented and applied in a manner that best reflects the level of risk of the borrower. Banks must not allocate borrowers across rating systems inappropriately to minimise regulatory capital requirements (i.e. cherry-picking by choice of rating system). Banks must demonstrate that each system used for IRB purposes is in compliance with the minimum requirements at the outset and on an ongoing basis.

(i) Rating dimensions

Standards for corporate, sovereign, and bank exposures

396. A qualifying IRB rating system must have two separate and distinct dimensions: (i) the risk of borrower default, and (ii) transaction-specific factors.

397. The first dimension must be oriented to the risk of borrower default. Separate exposures to the same borrower must be assigned to the same borrower grade, irrespective of any differences in the nature of each specific transaction. There are two exceptions to this. Firstly, in the case of country transfer risk, where a bank may assign different borrower grades depending on whether the facility is denominated in local or foreign currency. Secondly, when the treatment of associated guarantees to a facility may be reflected in an adjusted borrower grade. In either case, separate exposures may result in multiple grades for the same borrower. A bank must articulate in its credit policy the relationship between borrower grades in terms of the level of risk each grade implies. Perceived and measured risk must increase as credit quality declines from one grade to the next. The policy must articulate the risk of each grade in terms of both a description of the probability of default risk typical for borrowers assigned the grade and the criteria used to distinguish that level of credit risk.

398. The second dimension must reflect transaction-specific factors, such as collateral, seniority, product type, etc. For foundation IRB banks, this requirement can be fulfilled by the existence of a facility dimension, which reflects both borrower and transaction-specific factors. For example, a rating dimension that reflects EL by incorporating both borrower strength (PD) and loss severity (LGD) considerations would qualify. Likewise a rating system that exclusively reflects LGD would qualify. Where a rating dimension reflects EL and does not separately quantify LGD, the supervisory estimates of LGD must be used.

399. For banks using the advanced approach, facility ratings must reflect exclusively LGD. These ratings can reflect any and all factors that can influence LGD including, but not limited to, the type of collateral, product, industry, and purpose. Borrower characteristics may be included as LGD rating criteria only to the extent they are predictive of LGD. Banks may alter the factors that influence facility grades across segments of the portfolio as long as they can satisfy their supervisor that it improves the relevance and precision of their estimates.

400. Banks using the supervisory slotting criteria for the SL sub-class are exempt from this two-dimensional requirement for these exposures. Given the interdependence between borrower/transaction characteristics in SL, banks may satisfy the requirements under this heading through a single rating dimension that reflects EL by incorporating both borrower

strength (PD) and loss severity (LGD) considerations. This exemption does not apply to banks using either the general corporate foundation or advanced approach for the SL sub-class.

Standards for retail exposures

401. Rating systems for retail exposures must be oriented to both borrower and transaction risk, and must capture all relevant borrower and transaction characteristics. Banks must assign each exposure that falls within the definition of retail for IRB purposes into a particular pool. Banks must demonstrate that this process provides for a meaningful differentiation of risk, provides for a grouping of sufficiently homogenous exposures, and allows for accurate and consistent estimation of loss characteristics at pool level.

402. For each pool, banks must estimate PD, LGD, and EAD. Multiple pools may share identical PD, LGD and EAD estimates. At a minimum, banks should consider the following risk drivers when assigning exposures to a pool:

- Borrower risk characteristics (e.g. borrower type, demographics such as age/occupation);
- Transaction risk characteristics, including product and/or collateral types (e.g. loan to value measures, seasoning, guarantees; and seniority (first vs. second lien)). Banks must explicitly address cross-collateral provisions where present.
- Delinquency of exposure: Banks are expected to separately identify exposures that are delinquent and those that are not.

(ii) Rating structure

Standards for corporate, sovereign, and bank exposures

403. A bank must have a meaningful distribution of exposures across grades with no excessive concentrations, on both its borrower-rating and its facility-rating scales.

404. To meet this objective, a bank must have a minimum of seven borrower grades for non-defaulted borrowers and one for those that have defaulted. Banks with lending activities focused on a particular market segment may satisfy this requirement with the minimum number of grades; supervisors may require banks, which lend to borrowers of diverse credit quality, to have a greater number of borrower grades.

405. A borrower grade is defined as an assessment of borrower risk on the basis of a specified and distinct set of rating criteria, from which estimates of PD are derived. The grade definition must include both a description of the degree of default risk typical for borrowers assigned the grade and the criteria used to distinguish that level of credit risk. Furthermore, "+" or "-" modifiers to alpha or numeric grades will only qualify as distinct grades if the bank has developed complete rating descriptions and criteria for their assignment, and separately quantifies PDs for these modified grades.

406. Banks with loan portfolios concentrated in a particular market segment and range of default risk must have enough grades within that range to avoid undue concentrations of borrowers in particular grades. Significant concentrations within a single grade or grades must be supported by convincing empirical evidence that the grade or grades cover reasonably narrow PD bands and that the default risk posed by all borrowers in a grade fall within that band.

407. There is no specific minimum number of facility grades for banks using the advanced approach for estimating LGD. A bank must have a sufficient number of facility

grades to avoid grouping facilities with widely varying LGDs into a single grade. The criteria used to define facility grades must be grounded in empirical evidence.

408. Banks using the supervisory slotting criteria for the SL asset classes must have at least four grades for non-defaulted borrowers, and one for defaulted borrowers. The requirements for SL exposures that qualify for the corporate foundation and advanced approaches are the same as those for general corporate exposures.

Standards for retail exposures

409. For each pool identified, the bank must be able to provide quantitative measures of loss characteristics (PD, LGD, and EAD) for that pool. The level of differentiation for IRB purposes must ensure that the number of exposures in a given pool is sufficient so as to allow for meaningful quantification and validation of the loss characteristics at the pool level. There must be a meaningful distribution of borrowers and exposures across pools. A single pool must not include an undue concentration of the bank's total retail exposure.

(iii) Rating criteria

410. A bank must have specific rating definitions, processes and criteria for assigning exposures to grades within a rating system. The rating definitions and criteria must be both plausible and intuitive and must result in a meaningful differentiation of risk.

- The grade descriptions and criteria must be sufficiently detailed to allow those charged with assigning ratings to consistently assign the same grade to borrowers or facilities posing similar risk. This consistency should exist across lines of business, departments and geographic locations. If rating criteria and procedures differ for different types of borrowers or facilities, the bank must monitor for possible inconsistency, and must alter rating criteria to improve consistency when appropriate.
- Written rating definitions must be clear and detailed enough to allow third parties to understand the assignment of ratings, such as internal audit or an equally independent function and supervisors, to replicate rating assignments and evaluate the appropriateness of the grade/pool assignments.
- The criteria must also be consistent with the bank's internal lending standards and its policies for handling troubled borrowers and facilities.

411. To ensure that banks are consistently taking into account available information, they must use all relevant and material information in assigning ratings to borrowers and facilities. Information must be current. The less information a bank has, the more conservative must be its assignments of exposures to borrower and facility grades or pools. An external rating can be the primary factor determining an internal rating assignment; however, the bank must ensure that it considers other relevant information.

SL product lines within the corporate asset class

412. Banks using the supervisory slotting criteria for SL exposures must assign exposures to their internal rating grades based on their own criteria, systems and processes, subject to compliance with the requisite minimum requirements. Banks must then map these internal rating grades into the five supervisory rating categories. Tables 1 to 4 in Annex 6 provide, for each sub-class of SL exposures, the general assessment factors and characteristics exhibited by the exposures that fall under each of the supervisory categories. Each lending activity has a unique table describing the assessment factors and characteristics.

413. The Committee recognises that the criteria that banks use to assign exposures to internal grades will not perfectly align with criteria that define the supervisory categories; however, banks must demonstrate that their mapping process has resulted in an alignment of grades which is consistent with the preponderance of the characteristics in the respective supervisory category. Banks should take special care to ensure that any overrides of their internal criteria do not render the mapping process ineffective.

(iv) Rating assignment horizon

414. Although the time horizon used in PD estimation is one year (as described in paragraph 447), banks are expected to use a longer time horizon in assigning ratings.

415. A borrower rating must represent the bank's assessment of the borrower's ability and willingness to contractually perform despite adverse economic conditions or the occurrence of unexpected events. For example, a bank may base rating assignments on specific, appropriate stress scenarios. Alternatively, a bank may take into account borrower characteristics that are reflective of the borrower's vulnerability to adverse economic conditions or unexpected events, without explicitly specifying a stress scenario. The range of economic conditions that are considered when making assessments must be consistent with current conditions and those that are likely to occur over a business cycle within the respective industry/geographic region.

416. Given the difficulties in forecasting future events and the influence they will have on a particular borrower's financial condition, a bank must take a conservative view of projected information. Furthermore, where limited data are available, a bank must adopt a conservative bias to its analysis.

(v) Use of models

417. The requirements in this section apply to statistical models and other mechanical methods used to assign borrower or facility ratings or in estimation of PDs, LGDs, or EADs. Credit scoring models and other mechanical rating procedures generally use only a subset of available information. Although mechanical rating procedures may sometimes avoid some of the idiosyncratic errors made by rating systems in which human judgement plays a large role, mechanical use of limited information also is a source of rating errors. Credit scoring models and other mechanical procedures are permissible as the primary or partial basis of rating assignments, and may play a role in the estimation of loss characteristics. Sufficient human judgement and human oversight is necessary to ensure that all relevant and material information, including that which is outside the scope of the model, is also taken into consideration, and that the model is used appropriately.

- The burden is on the bank to satisfy its supervisor that a model or procedure has good predictive power and that regulatory capital requirements will not be distorted as a result of its use. The variables that are input to the model must form a reasonable set of predictors. The model must be accurate on average across the range of borrowers or facilities to which the bank is exposed and there must be no known material biases.
- The bank must have in place a process for vetting data inputs into a statistical default or loss prediction model which includes an assessment of the accuracy, completeness and appropriateness of the data specific to the assignment of an approved rating.
- The bank must demonstrate that the data used to build the model are representative of the population of the bank's actual borrowers or facilities.

- When combining model results with human judgement, the judgement must take into account all relevant and material information not considered by the model. The bank must have written guidance describing how human judgement and model results are to be combined.
- The bank must have procedures for human review of model-based rating assignments. Such procedures should focus on finding and limiting errors associated with known model weaknesses and must also include credible ongoing efforts to improve the model's performance.
- The bank must have a regular cycle of model validation that includes monitoring of model performance and stability; review of model relationships; and testing of model outputs against outcomes.

(vi) Documentation of rating system design

418. Banks must document in writing their rating systems' design and operational details. The documentation must evidence banks' compliance with the minimum standards, and must address topics such as portfolio differentiation, rating criteria, responsibilities of parties that rate borrowers and facilities, definition of what constitutes a rating exception, parties that have authority to approve exceptions, frequency of rating reviews, and management oversight of the rating process. A bank must document the rationale for its choice of internal rating criteria and must be able to provide analyses demonstrating that rating criteria and procedures are likely to result in ratings that meaningfully differentiate risk. Rating criteria and procedures must be periodically reviewed to determine whether they remain fully applicable to the current portfolio and to external conditions. In addition, a bank must document a history of major changes in the risk rating process, and such documentation must support identification of changes made to the risk rating process subsequent to the last supervisory review. The organisation of rating assignment, including the internal control structure, must also be documented.

419. Banks must document the specific definitions of default and loss used internally and demonstrate consistency with the reference definitions set out in paragraphs 452 to 460.

420. If the bank employs statistical models in the rating process, the bank must document their methodologies. This material must:

- Provide a detailed outline of the theory, assumptions and/or mathematical and empirical basis of the assignment of estimates to grades, individual obligors, exposures, or pools, and the data source(s) used to estimate the model;
- Establish a rigorous statistical process (including out-of-time and out-of-sample performance tests) for validating the model; and
- Indicate any circumstances under which the model does not work effectively.

421. Use of a model obtained from a third-party vendor that claims proprietary technology is not a justification for exemption from documentation or any other of the requirements for internal rating systems. The burden is on the model's vendor and the bank to satisfy supervisors.

4. Risk rating system operations

(i) Coverage of ratings

422. For corporate, sovereign, and bank exposures, each borrower and all recognised guarantors must be assigned a rating and each exposure must be associated with a facility

rating as part of the loan approval process. Similarly, for retail, each exposure must be assigned to a pool as part of the loan approval process.

423. Each separate legal entity to which the bank is exposed must be separately rated. A bank must have policies acceptable to its supervisor regarding the treatment of individual entities in a connected group including circumstances under which the same rating may or may not be assigned to some or all related entities.

(ii) Integrity of rating process

Standards for corporate, sovereign, and bank exposures

424. Rating assignments and periodic rating reviews must be completed or approved by a party that does not directly stand to benefit from the extension of credit. Independence of the rating assignment process can be achieved through a range of practices that will be carefully reviewed by supervisors. These operational processes must be documented in the bank's procedures and incorporated into bank policies. Credit policies and underwriting procedures must reinforce and foster the independence of the rating process.

425. Borrowers and facilities must have their ratings refreshed at least on an annual basis. Certain credits, especially higher risk borrowers or problem exposures, must be subject to more frequent review. In addition, banks must initiate a new rating if material information on the borrower or facility comes to light.

426. The bank must have an effective process to obtain and update relevant and material information on the borrower's financial condition, and on facility characteristics that affect LGDs and EADs (such as the condition of collateral). Upon receipt, the bank needs to have a procedure to update the borrower's rating in a timely fashion.

Standards for retail exposures

427. A bank must review the loss characteristics and delinquency status of each identified risk pool on at least an annual basis. It must also review the status of individual borrowers within each pool as a means of ensuring that exposures continue to be assigned to the correct pool. This requirement may be satisfied by review of a representative sample of exposures in the pool.

(iii) Overrides

428. For rating assignments based on expert judgement, banks must clearly articulate the situations in which bank officers may override the outputs of the rating process, including how and to what extent such overrides can be used and by whom. For model-based ratings, the bank must have guidelines and processes for monitoring cases where human judgement has overridden the model's rating, variables were excluded or inputs were altered. These guidelines must include identifying personnel that are responsible for approving these overrides. Banks must identify overrides and separately track their performance.

(iv) Data maintenance

429. A bank must collect and store data on key borrower and facility characteristics to provide effective support to its internal credit risk measurement and management process, to enable the bank to meet the other requirements in this document, and to serve as a basis for supervisory reporting. These data should be sufficiently detailed to allow retrospective re-allocation of obligors and facilities to grades, for example if increasing sophistication of the internal rating system suggests that finer segregation of portfolios can be achieved.

Furthermore, banks must collect and retain data on aspects of their internal ratings as required under Pillar 3 of this Framework.

For corporate, sovereign, and bank exposures

430. Banks must maintain rating histories on borrowers and recognised guarantors, including the rating since the borrower/guarantor was assigned an internal grade, the dates the ratings were assigned, the methodology and key data used to derive the rating and the person/model responsible. The identity of borrowers and facilities that default, and the timing and circumstances of such defaults, must be retained. Banks must also retain data on the PDs and realised default rates associated with rating grades and ratings migration in order to track the predictive power of the borrower rating system.

431. Banks using the advanced IRB approach must also collect and store a complete history of data on the LGD and EAD estimates associated with each facility and the key data used to derive the estimate and the person/model responsible. Banks must also collect data on the estimated and realised LGDs and EADs associated with each defaulted facility. Banks that reflect the credit risk mitigating effects of guarantees/credit derivatives through LGD must retain data on the LGD of the facility before and after evaluation of the effects of the guarantee/credit derivative. Information about the components of loss or recovery for each defaulted exposure must be retained, such as amounts recovered, source of recovery (e.g. collateral, liquidation proceeds and guarantees), time period required for recovery, and administrative costs.

432. Banks under the foundation approach which utilise supervisory estimates are encouraged to retain the relevant data (i.e. data on loss and recovery experience for corporate exposures under the foundation approach, data on realised losses for banks using the supervisory slotting criteria for SL).

For retail exposures

433. Banks must retain data used in the process of allocating exposures to pools, including data on borrower and transaction risk characteristics used either directly or through use of a model, as well as data on delinquency. Banks must also retain data on the estimated PDs, LGDs and EADs, associated with pools of exposures. For defaulted exposures, banks must retain the data on the pools to which the exposure was assigned over the year prior to default and the realised outcomes on LGD and EAD.

(v) Stress tests used in assessment of capital adequacy

434. An IRB bank must have in place sound stress testing processes for use in the assessment of capital adequacy. Stress testing must involve identifying possible events or future changes in economic conditions that could have unfavourable effects on a bank's credit exposures and assessment of the bank's ability to withstand such changes. Examples of scenarios that could be used are (i) economic or industry downturns; (ii) market-risk events; and (iii) liquidity conditions.

435. In addition to the more general tests described above, the bank must perform a credit risk stress test to assess the effect of certain specific conditions on its IRB regulatory capital requirements. The test to be employed would be one chosen by the bank, subject to supervisory review. The test to be employed must be meaningful and reasonably conservative. Individual banks may develop different approaches to undertaking this stress test requirement, depending on their circumstances. For this purpose, the objective is not to require banks to consider worst-case scenarios. The bank's stress test in this context should, however, consider at least the effect of mild recession scenarios. In this case, one example

might be to use two consecutive quarters of zero growth to assess the effect on the bank's PDs, LGDs and EADs, taking account — on a conservative basis — of the bank's international diversification.

435(i) Banks using the double default framework must consider as part of their stress testing framework the impact of a deterioration in the credit quality of protection providers, in particular the impact of protection providers falling outside the eligibility criteria due to rating changes. Banks should also consider the impact of the default of one but not both of the obligor and protection provider, and the consequent increase in risk and capital requirements at the time of that default.

436. Whatever method is used, the bank must include a consideration of the following sources of information. First, a bank's own data should allow estimation of the ratings migration of at least some of its exposures. Second, banks should consider information about the impact of smaller deterioration in the credit environment on a bank's ratings, giving some information on the likely effect of bigger, stress circumstances. Third, banks should evaluate evidence of ratings migration in external ratings. This would include the bank broadly matching its buckets to rating categories.

437. National supervisors may wish to issue guidance to their banks on how the tests to be used for this purpose should be designed, bearing in mind conditions in their jurisdiction. The results of the stress test may indicate no difference in the capital calculated under the IRB rules described in this section of this Framework if the bank already uses such an approach for its internal rating purposes. Where a bank operates in several markets, it does not need to test for such conditions in all of those markets, but a bank should stress portfolios containing the vast majority of its total exposures.

5. Corporate governance and oversight

(i) Corporate governance

438. All material aspects of the rating and estimation processes must be approved by the bank's board of directors or a designated committee thereof and senior management.[87] These parties must possess a general understanding of the bank's risk rating system and detailed comprehension of its associated management reports. Senior management must provide notice to the board of directors or a designated committee thereof of material changes or exceptions from established policies that will materially impact the operations of the bank's rating system.

439. Senior management also must have a good understanding of the rating system's design and operation, and must approve material differences between established procedure and actual practice. Management must also ensure, on an ongoing basis, that the rating system is operating properly. Management and staff in the credit control function must meet

[87] This standard refers to a management structure composed of a board of directors and senior management. The Committee is aware that there are significant differences in legislative and regulatory frameworks across countries as regards the functions of the board of directors and senior management. In some countries, the board has the main, if not exclusive, function of supervising the executive body (senior management, general management) so as to ensure that the latter fulfils its tasks. For this reason, in some cases, it is known as a supervisory board. This means that the board has no executive functions. In other countries, by contrast, the board has a broader competence in that it lays down the general framework for the management of the bank. Owing to these differences, the notions of the board of directors and senior management are used in this paper not to identify legal constructs but rather to label two decision-making functions within a bank.

regularly to discuss the performance of the rating process, areas needing improvement, and the status of efforts to improve previously identified deficiencies.

440. Internal ratings must be an essential part of the reporting to these parties. Reporting must include risk profile by grade, migration across grades, estimation of the relevant parameters per grade, and comparison of realised default rates (and LGDs and EADs for banks on advanced approaches) against expectations. Reporting frequencies may vary with the significance and type of information and the level of the recipient.

(ii) Credit risk control

441. Banks must have independent credit risk control units that are responsible for the design or selection, implementation and performance of their internal rating systems. The unit(s) must be functionally independent from the personnel and management functions responsible for originating exposures. Areas of responsibility must include:

- Testing and monitoring internal grades;
- Production and analysis of summary reports from the bank's rating system, to include historical default data sorted by rating at the time of default and one year prior to default, grade migration analyses, and monitoring of trends in key rating criteria;
- Implementing procedures to verify that rating definitions are consistently applied across departments and geographic areas;
- Reviewing and documenting any changes to the rating process, including the reasons for the changes; and
- Reviewing the rating criteria to evaluate if they remain predictive of risk. Changes to the rating process, criteria or individual rating parameters must be documented and retained for supervisors to review.

442. A credit risk control unit must actively participate in the development, selection, implementation and validation of rating models. It must assume oversight and supervision responsibilities for any models used in the rating process, and ultimate responsibility for the ongoing review and alterations to rating models.

(iii) Internal and external audit

443. Internal audit or an equally independent function must review at least annually the bank's rating system and its operations, including the operations of the credit function and the estimation of PDs, LGDs and EADs. Areas of review include adherence to all applicable minimum requirements. Internal audit must document its findings. Some national supervisors may also require an external audit of the bank's rating assignment process and estimation of loss characteristics.

6. Use of internal ratings

444. Internal ratings and default and loss estimates must play an essential role in the credit approval, risk management, internal capital allocations, and corporate governance functions of banks using the IRB approach. Ratings systems and estimates designed and implemented exclusively for the purpose of qualifying for the IRB approach and used only to provide IRB inputs are not acceptable. It is recognised that banks will not necessarily be using exactly the same estimates for both IRB and all internal purposes. For example, pricing models are likely to use PDs and LGDs relevant to the life of the asset. Where there are such

differences, a bank must document them and demonstrate their reasonableness to the supervisor.

445. A bank must have a credible track record in the use of internal ratings information. Thus, the bank must demonstrate that it has been using a rating system that was broadly in line with the minimum requirements articulated in this document for at least the three years prior to qualification. A bank using the advanced IRB approach must demonstrate that it has been estimating and employing LGDs and EADs in a manner that is broadly consistent with the minimum requirements for use of own estimates of LGDs and EADs for at least the three years prior to qualification. Improvements to a bank's rating system will not render a bank non-compliant with the three-year requirement.

7. Risk quantification

(i) Overall requirements for estimation

Structure and intent

446. This section addresses the broad standards for own-estimates of PD, LGD, and EAD. Generally, all banks using the IRB approaches must estimate a PD[88] for each internal borrower grade for corporate, sovereign and bank exposures or for each pool in the case of retail exposures.

447. PD estimates must be a long-run average of one-year default rates for borrowers in the grade, with the exception of retail exposures (see below). Requirements specific to PD estimation are provided in paragraphs 461 to 467. Banks on the advanced approach must estimate an appropriate LGD (as defined in paragraphs 468 to 473) for each of its facilities (or retail pools). Banks on the advanced approach must also estimate an appropriate long-run default-weighted average EAD for each of its facilities as defined in paragraphs 474 and 475. Requirements specific to EAD estimation appear in paragraphs 474 to 479. For corporate, sovereign and bank exposures, banks that do not meet the requirements for own-estimates of EAD or LGD, above, must use the supervisory estimates of these parameters. Standards for use of such estimates are set out in paragraphs 506 to 524.

448. Internal estimates of PD, LGD, and EAD must incorporate all relevant, material and available data, information and methods. A bank may utilise internal data and data from external sources (including pooled data). Where internal or external data is used, the bank must demonstrate that its estimates are representative of long run experience.

449. Estimates must be grounded in historical experience and empirical evidence, and not based purely on subjective or judgmental considerations. Any changes in lending practice or the process for pursuing recoveries over the observation period must be taken into account. A bank's estimates must promptly reflect the implications of technical advances and new data and other information, as it becomes available. Banks must review their estimates on a yearly basis or more frequently.

450. The population of exposures represented in the data used for estimation, and lending standards in use when the data were generated, and other relevant characteristics should be closely matched to or at least comparable with those of the bank's exposures and standards. The bank must also demonstrate that economic or market conditions that underlie

---

[88] Banks are not required to produce their own estimates of PD for certain equity exposures and certain exposures that fall within the SL sub-classes.

the data are relevant to current and foreseeable conditions. For estimates of LGD and EAD, banks must take into account paragraphs 468 to 479. The number of exposures in the sample and the data period used for quantification must be sufficient to provide the bank with confidence in the accuracy and robustness of its estimates. The estimation technique must perform well in out-of-sample tests.

451. In general, estimates of PDs, LGDs, and EADs are likely to involve unpredictable errors. In order to avoid over-optimism, a bank must add to its estimates a margin of conservatism that is related to the likely range of errors. Where methods and data are less satisfactory and the likely range of errors is larger, the margin of conservatism must be larger. Supervisors may allow some flexibility in application of the required standards for data that are collected prior to the date of implementation of this Framework. However, in such cases banks must demonstrate to their supervisors that appropriate adjustments have been made to achieve broad equivalence to the data without such flexibility. Data collected beyond the date of implementation must conform to the minimum standards unless otherwise stated.

(ii) Definition of default

452. A default is considered to have occurred with regard to a particular obligor when either or both of the two following events have taken place.

- The bank considers that the obligor is unlikely to pay its credit obligations to the banking group in full, without recourse by the bank to actions such as realising security (if held).
- The obligor is past due more than 90 days on any material credit obligation to the banking group.[89] Overdrafts will be considered as being past due once the customer has breached an advised limit or been advised of a limit smaller than current outstandings.

453. The elements to be taken as indications of unlikeliness to pay include:

- The bank puts the credit obligation on non-accrued status.
- The bank makes a charge-off or account-specific provision resulting from a significant perceived decline in credit quality subsequent to the bank taking on the exposure.[90]
- The bank sells the credit obligation at a material credit-related economic loss.
- The bank consents to a distressed restructuring of the credit obligation where this is likely to result in a diminished financial obligation caused by the material forgiveness, or postponement, of principal, interest or (where relevant) fees.[91]
- The bank has filed for the obligor's bankruptcy or a similar order in respect of the obligor's credit obligation to the banking group.

[89] In the case of retail and PSE obligations, for the 90 days figure, a supervisor may substitute a figure up to 180 days for different products, as it considers appropriate to local conditions. In one member country, local conditions make it appropriate to use a figure of up to 180 days also for lending by its banks to corporates; this applies for a transitional period of 5 years.

[90] In some jurisdictions, specific provisions on equity exposures are set aside for price risk and do not signal default.

[91] Including, in the case of equity holdings assessed under a PD/LGD approach, such distressed restructuring of the equity itself.

- The obligor has sought or has been placed in bankruptcy or similar protection where this would avoid or delay repayment of the credit obligation to the banking group.

454. National supervisors will provide appropriate guidance as to how these elements must be implemented and monitored.

455. For retail exposures, the definition of default can be applied at the level of a particular facility, rather than at the level of the obligor. As such, default by a borrower on one obligation does not require a bank to treat all other obligations to the banking group as defaulted.

456. A bank must record actual defaults on IRB exposure classes using this reference definition. A bank must also use the reference definition for its estimation of PDs, and (where relevant) LGDs and EADs. In arriving at these estimations, a bank may use external data available to it that is not itself consistent with that definition, subject to the requirements set out in paragraph 462. However, in such cases, banks must demonstrate to their supervisors that appropriate adjustments to the data have been made to achieve broad equivalence with the reference definition. This same condition would apply to any internal data used up to implementation of this Framework. Internal data (including that pooled by banks) used in such estimates beyond the date of implementation of this Framework must be consistent with the reference definition.

457. If the bank considers that a previously defaulted exposure's status is such that no trigger of the reference definition any longer applies, the bank must rate the borrower and estimate LGD as they would for a non-defaulted facility. Should the reference definition subsequently be triggered, a second default would be deemed to have occurred.

(iii) Re-ageing

458. The bank must have clearly articulated and documented policies in respect of the counting of days past due, in particular in respect of the re-ageing of the facilities and the granting of extensions, deferrals, renewals and rewrites to existing accounts. At a minimum, the re-ageing policy must include: (a) approval authorities and reporting requirements; (b) minimum age of a facility before it is eligible for re-ageing; (c) delinquency levels of facilities that are eligible for re-ageing; (d) maximum number of re-ageings per facility; and (e) a reassessment of the borrower's capacity to repay. These policies must be applied consistently over time, and must support the 'use test' (i.e. if a bank treats a re-aged exposure in a similar fashion to other delinquent exposures more than the past-due cut off point, this exposure must be recorded as in default for IRB purposes). Some supervisors may choose to establish more specific requirements on re-ageing for banks in their jurisdiction.

(iv) Treatment of overdrafts

459. Authorised overdrafts must be subject to a credit limit set by the bank and brought to the knowledge of the client. Any break of this limit must be monitored; if the account were not brought under the limit after 90 to 180 days (subject to the applicable past-due trigger), it would be considered as defaulted. Non-authorised overdrafts will be associated with a zero limit for IRB purposes. Thus, days past due commence once any credit is granted to an unauthorised customer; if such credit were not repaid within 90 to 180 days, the exposure would be considered in default. Banks must have in place rigorous internal policies for assessing the creditworthiness of customers who are offered overdraft accounts.

(v) Definition of loss for all asset classes

460. The definition of loss used in estimating LGD is economic loss. When measuring economic loss, all relevant factors should be taken into account. This must include material discount effects and material direct and indirect costs associated with collecting on the exposure. Banks must not simply measure the loss recorded in accounting records, although they must be able to compare accounting and economic losses. The bank's own workout and collection expertise significantly influences their recovery rates and must be reflected in their LGD estimates, but adjustments to estimates for such expertise must be conservative until the bank has sufficient internal empirical evidence of the impact of its expertise.

(vi) Requirements specific to PD estimation

Corporate, sovereign, and bank exposures

461. Banks must use information and techniques that take appropriate account of the long-run experience when estimating the average PD for each rating grade. For example, banks may use one or more of the three specific techniques set out below: internal default experience, mapping to external data, and statistical default models.

462. Banks may have a primary technique and use others as a point of comparison and potential adjustment. Supervisors will not be satisfied by mechanical application of a technique without supporting analysis. Banks must recognise the importance of judgmental considerations in combining results of techniques and in making adjustments for limitations of techniques and information.

- A bank may use data on internal default experience for the estimation of PD. A bank must demonstrate in its analysis that the estimates are reflective of underwriting standards and of any differences in the rating system that generated the data and the current rating system. Where only limited data are available, or where underwriting standards or rating systems have changed, the bank must add a greater margin of conservatism in its estimate of PD. The use of pooled data across institutions may also be recognised. A bank must demonstrate that the internal rating systems and criteria of other banks in the pool are comparable with its own.
- Banks may associate or map their internal grades to the scale used by an external credit assessment institution or similar institution and then attribute the default rate observed for the external institution's grades to the bank's grades. Mappings must be based on a comparison of internal rating criteria to the criteria used by the external institution and on a comparison of the internal and external ratings of any common borrowers. Biases or inconsistencies in the mapping approach or underlying data must be avoided. The external institution's criteria underlying the data used for quantification must be oriented to the risk of the borrower and not reflect transaction characteristics. The bank's analysis must include a comparison of the default definitions used, subject to the requirements in paragraph 452 to 457. The bank must document the basis for the mapping.
- A bank is allowed to use a simple average of default-probability estimates for individual borrowers in a given grade, where such estimates are drawn from statistical default prediction models. The bank's use of default probability models for this purpose must meet the standards specified in paragraph 417.

463. Irrespective of whether a bank is using external, internal, or pooled data sources, or a combination of the three, for its PD estimation, the length of the underlying historical observation period used must be at least five years for at least one source. If the available observation period spans a longer period for any source, and this data are relevant and material, this longer period must be used.

Retail exposures

464. Given the bank-specific basis of assigning exposures to pools, banks must regard internal data as the primary source of information for estimating loss characteristics. Banks are permitted to use external data or statistical models for quantification provided a strong link can be demonstrated between (a) the bank's process of assigning exposures to a pool and the process used by the external data source, and (b) between the bank's internal risk profile and the composition of the external data. In all cases banks must use all relevant and material data sources as points of comparison.

465. One method for deriving long-run average estimates of PD and default-weighted average loss rates given default (as defined in paragraph 468) for retail would be based on an estimate of the expected long-run loss rate. A bank may (i) use an appropriate PD estimate to infer the long-run default-weighted average loss rate given default, or (ii) use a long-run default-weighted average loss rate given default to infer the appropriate PD. In either case, it is important to recognise that the LGD used for the IRB capital calculation cannot be less than the long-run default-weighted average loss rate given default and must be consistent with the concepts defined in paragraph 468.

466. Irrespective of whether banks are using external, internal, pooled data sources, or a combination of the three, for their estimation of loss characteristics, the length of the underlying historical observation period used must be at least five years. If the available observation spans a longer period for any source, and these data are relevant, this longer period must be used. A bank need not give equal importance to historic data if it can convince its supervisor that more recent data are a better predictor of loss rates.

467. The Committee recognises that seasoning can be quite material for some long-term retail exposures characterised by seasoning effects that peak several years after origination. Banks should anticipate the implications of rapid exposure growth and take steps to ensure that their estimation techniques are accurate, and that their current capital level and earnings and funding prospects are adequate to cover their future capital needs. In order to avoid gyrations in their required capital positions arising from short-term PD horizons, banks are also encouraged to adjust PD estimates upward for anticipated seasoning effects, provided such adjustments are applied in a consistent fashion over time. Within some jurisdictions, such adjustments might be made mandatory, subject to supervisory discretion.

(vii) Requirements specific to own-LGD estimates

Standards for all asset classes

468. A bank must estimate an LGD for each facility that aims to reflect economic downturn conditions where necessary to capture the relevant risks. This LGD cannot be less than the long-run default-weighted average loss rate given default calculated based on the average economic loss of all observed defaults within the data source for that type of facility. In addition, a bank must take into account the potential for the LGD of the facility to be higher than the default-weighted average during a period when credit losses are substantially higher than average. For certain types of exposures, loss severities may not exhibit such cyclical variability and LGD estimates may not differ materially (or possibly at all) from the long-run default-weighted average. However, for other exposures, this cyclical variability in loss severities may be important and banks will need to incorporate it into their LGD estimates. For this purpose, banks may use averages of loss severities observed during periods of high credit losses, forecasts based on appropriately conservative assumptions, or other similar methods. Appropriate estimates of LGD during periods of high credit losses might be formed using either internal and/or external data. Supervisors will continue to monitor and encourage the development of appropriate approaches to this issue.

469. In its analysis, the bank must consider the extent of any dependence between the risk of the borrower and that of the collateral or collateral provider. Cases where there is a significant degree of dependence must be addressed in a conservative manner. Any currency mismatch between the underlying obligation and the collateral must also be considered and treated conservatively in the bank's assessment of LGD.

470. LGD estimates must be grounded in historical recovery rates and, when applicable, must not solely be based on the collateral's estimated market value. This requirement recognises the potential inability of banks to gain both control of their collateral and liquidate it expeditiously. To the extent, that LGD estimates take into account the existence of collateral, banks must establish internal requirements for collateral management, operational procedures, legal certainty and risk management process that are generally consistent with those required for the standardised approach.

471. Recognising the principle that realised losses can at times systematically exceed expected levels, the LGD assigned to a defaulted asset should reflect the possibility that the bank would have to recognise additional, unexpected losses during the recovery period. For each defaulted asset, the bank must also construct its best estimate of the expected loss on that asset based on current economic circumstances and facility status. The amount, if any, by which the LGD on a defaulted asset exceeds the bank's best estimate of expected loss on the asset represents the capital requirement for that asset, and should be set by the bank on a risk-sensitive basis in accordance with paragraphs 272 and 328 to 330. Instances where the best estimate of expected loss on a defaulted asset is less than the sum of specific provisions and partial charge-offs on that asset will attract supervisory scrutiny and must be justified by the bank.

Additional standards for corporate, sovereign, and bank exposures

472. Estimates of LGD must be based on a minimum data observation period that should ideally cover at least one complete economic cycle but must in any case be no shorter than a period of seven years for at least one source. If the available observation period spans a longer period for any source, and the data are relevant, this longer period must be used.

Additional standards for retail exposures

473. The minimum data observation period for LGD estimates for retail exposures is five years. The less data a bank has, the more conservative it must be in its estimation. A bank need not give equal importance to historic data if it can demonstrate to its supervisor that more recent data are a better predictor of loss rates.

(viii) Requirements specific to own-EAD estimates

Standards for all asset classes

474. EAD for an on-balance sheet or off-balance sheet item is defined as the expected gross exposure of the facility upon default of the obligor. For on-balance sheet items, banks must estimate EAD at no less than the current drawn amount, subject to recognising the effects of on-balance sheet netting as specified in the foundation approach. The minimum requirements for the recognition of netting are the same as those under the foundation approach. The additional minimum requirements for internal estimation of EAD under the advanced approach, therefore, focus on the estimation of EAD for off-balance sheet items (excluding transactions that expose banks to counterparty credit risk as set out in Annex 4). Advanced approach banks must have established procedures in place for the estimation of EAD for off-balance sheet items. These must specify the estimates of EAD to be used for each facility type. Banks estimates of EAD should reflect the possibility of additional drawings

by the borrower up to and after the time a default event is triggered. Where estimates of EAD differ by facility type, the delineation of these facilities must be clear and unambiguous.

475. Advanced approach banks must assign an estimate of EAD for each facility. It must be an estimate of the long-run default-weighted average EAD for similar facilities and borrowers over a sufficiently long period of time, but with a margin of conservatism appropriate to the likely range of errors in the estimate. If a positive correlation can reasonably be expected between the default frequency and the magnitude of EAD, the EAD estimate must incorporate a larger margin of conservatism. Moreover, for exposures for which EAD estimates are volatile over the economic cycle, the bank must use EAD estimates that are appropriate for an economic downturn, if these are more conservative than the long-run average. For banks that have been able to develop their own EAD models, this could be achieved by considering the cyclical nature, if any, of the drivers of such models. Other banks may have sufficient internal data to examine the impact of previous recession(s). However, some banks may only have the option of making conservative use of external data.

476. The criteria by which estimates of EAD are derived must be plausible and intuitive, and represent what the bank believes to be the material drivers of EAD. The choices must be supported by credible internal analysis by the bank. The bank must be able to provide a breakdown of its EAD experience by the factors it sees as the drivers of EAD. A bank must use all relevant and material information in its derivation of EAD estimates. Across facility types, a bank must review its estimates of EAD when material new information comes to light and at least on an annual basis.

477. Due consideration must be paid by the bank to its specific policies and strategies adopted in respect of account monitoring and payment processing. The bank must also consider its ability and willingness to prevent further drawings in circumstances short of payment default, such as covenant violations or other technical default events. Banks must also have adequate systems and procedures in place to monitor facility amounts, current outstandings against committed lines and changes in outstandings per borrower and per grade. The bank must be able to monitor outstanding balances on a daily basis.

477(i). For transactions that expose banks to counterparty credit risk, estimates of EAD must fulfil the requirements set forth in Annex 4 of this Framework.

Additional standards for corporate, sovereign, and bank exposures

478. Estimates of EAD must be based on a time period that must ideally cover a complete economic cycle but must in any case be no shorter than a period of seven years. If the available observation period spans a longer period for any source, and the data are relevant, this longer period must be used. EAD estimates must be calculated using a default-weighted average and not a time-weighted average.

Additional standards for retail exposures

479. The minimum data observation period for EAD estimates for retail exposures is five years. The less data a bank has, the more conservative it must be in its estimation. A bank need not give equal importance to historic data if it can demonstrate to its supervisor that more recent data are a better predictor of drawdowns.

(ix) Minimum requirements for assessing effect of guarantees and credit derivatives

Standards for corporate, sovereign, and bank exposures where own estimates of LGD are used and standards for retail exposures

Guarantees

480. When a bank uses its own estimates of LGD, it may reflect the risk-mitigating effect of guarantees through an adjustment to PD or LGD estimates. The option to adjust LGDs is available only to those banks that have been approved to use their own internal estimates of LGD. For retail exposures, where guarantees exist, either in support of an individual obligation or a pool of exposures, a bank may reflect the risk-reducing effect either through its estimates of PD or LGD, provided this is done consistently. In adopting one or the other technique, a bank must adopt a consistent approach, both across types of guarantees and over time.

481. In all cases, both the borrower and all recognised guarantors must be assigned a borrower rating at the outset and on an ongoing basis. A bank must follow all minimum requirements for assigning borrower ratings set out in this document, including the regular monitoring of the guarantor's condition and ability and willingness to honour its obligations. Consistent with the requirements in paragraphs 430 and 431, a bank must retain all relevant information on the borrower absent the guarantee and the guarantor. In the case of retail guarantees, these requirements also apply to the assignment of an exposure to a pool, and the estimation of PD.

482. In no case can the bank assign the guaranteed exposure an adjusted PD or LGD such that the adjusted risk weight would be lower than that of a comparable, direct exposure to the guarantor. Neither criteria nor rating processes are permitted to consider possible favourable effects of imperfect expected correlation between default events for the borrower and guarantor for purposes of regulatory minimum capital requirements. As such, the adjusted risk weight must not reflect the risk mitigation of "double default."

Eligible guarantors and guarantees

483. There are no restrictions on the types of eligible guarantors. The bank must, however, have clearly specified criteria for the types of guarantors it will recognise for regulatory capital purposes.

484. The guarantee must be evidenced in writing, non-cancellable on the part of the guarantor, in force until the debt is satisfied in full (to the extent of the amount and tenor of the guarantee) and legally enforceable against the guarantor in a jurisdiction where the guarantor has assets to attach and enforce a judgement. However, in contrast to the foundation approach to corporate, bank, and sovereign exposures, guarantees prescribing conditions under which the guarantor may not be obliged to perform (conditional guarantees) may be recognised under certain conditions. Specifically, the onus is on the bank to demonstrate that the assignment criteria adequately address any potential reduction in the risk mitigation effect.

Adjustment criteria

485. A bank must have clearly specified criteria for adjusting borrower grades or LGD estimates (or in the case of retail and eligible purchased receivables, the process of allocating exposures to pools) to reflect the impact of guarantees for regulatory capital purposes. These criteria must be as detailed as the criteria for assigning exposures to grades consistent with paragraphs 410 and 411, and must follow all minimum requirements for assigning borrower or facility ratings set out in this document.

486. The criteria must be plausible and intuitive, and must address the guarantor's ability and willingness to perform under the guarantee. The criteria must also address the likely timing of any payments and the degree to which the guarantor's ability to perform under the guarantee is correlated with the borrower's ability to repay. The bank's criteria must also consider the extent to which residual risk to the borrower remains, for example a currency mismatch between the guarantee and the underlying exposure.

487. In adjusting borrower grades or LGD estimates (or in the case of retail and eligible purchased receivables, the process of allocating exposures to pools), banks must take all relevant available information into account.

Credit derivatives

488. The minimum requirements for guarantees are relevant also for single-name credit derivatives. Additional considerations arise in respect of asset mismatches. The criteria used for assigning adjusted borrower grades or LGD estimates (or pools) for exposures hedged with credit derivatives must require that the asset on which the protection is based (the reference asset) cannot be different from the underlying asset, unless the conditions outlined in the foundation approach are met.

489. In addition, the criteria must address the payout structure of the credit derivative and conservatively assess the impact this has on the level and timing of recoveries. The bank must also consider the extent to which other forms of residual risk remain.

For banks using foundation LGD estimates

490. The minimum requirements outlined in paragraphs 480 to 489 apply to banks using the foundation LGD estimates with the following exceptions:

(1) The bank is not able to use an 'LGD-adjustment' option; and

(2) The range of eligible guarantees and guarantors is limited to those outlined in paragraph 302.

(x) Requirements specific to estimating PD and LGD (or EL) for qualifying purchased receivables

491. The following minimum requirements for risk quantification must be satisfied for any purchased receivables (corporate or retail) making use of the top-down treatment of default risk and/or the IRB treatments of dilution risk.

492. The purchasing bank will be required to group the receivables into sufficiently homogeneous pools so that accurate and consistent estimates of PD and LGD (or EL) for default losses and EL estimates of dilution losses can be determined. In general, the risk bucketing process will reflect the seller's underwriting practices and the heterogeneity of its customers. In addition, methods and data for estimating PD, LGD, and EL must comply with the existing risk quantification standards for retail exposures. In particular, quantification should reflect all information available to the purchasing bank regarding the quality of the underlying receivables, including data for similar pools provided by the seller, by the purchasing bank, or by external sources. The purchasing bank must determine whether the data provided by the seller are consistent with expectations agreed upon by both parties concerning, for example, the type, volume and on-going quality of receivables purchased. Where this is not the case, the purchasing bank is expected to obtain and rely upon more relevant data.

Minimum operational requirements

493. A bank purchasing receivables has to justify confidence that current and future advances can be repaid from the liquidation of (or collections against) the receivables pool. To qualify for the top-down treatment of default risk, the receivable pool and overall lending relationship should be closely monitored and controlled. Specifically, a bank will have to demonstrate the following:

Legal certainty

494. The structure of the facility must ensure that under all foreseeable circumstances the bank has effective ownership and control of the cash remittances from the receivables, including incidences of seller or servicer distress and bankruptcy. When the obligor makes payments directly to a seller or servicer, the bank must verify regularly that payments are forwarded completely and within the contractually agreed terms. As well, ownership over the receivables and cash receipts should be protected against bankruptcy 'stays' or legal challenges that could materially delay the lender's ability to liquidate/assign the receivables or retain control over cash receipts.

Effectiveness of monitoring systems

495. The bank must be able to monitor both the quality of the receivables and the financial condition of the seller and servicer. In particular:

- The bank must (a) assess the correlation among the quality of the receivables and the financial condition of both the seller and servicer, and (b) have in place internal policies and procedures that provide adequate safeguards to protect against such contingencies, including the assignment of an internal risk rating for each seller and servicer.
- The bank must have clear and effective policies and procedures for determining seller and servicer eligibility. The bank or its agent must conduct periodic reviews of sellers and servicers in order to verify the accuracy of reports from the seller/servicer, detect fraud or operational weaknesses, and verify the quality of the seller's credit policies and servicer's collection policies and procedures. The findings of these reviews must be well documented.
- The bank must have the ability to assess the characteristics of the receivables pool, including (a) over-advances; (b) history of the seller's arrears, bad debts, and bad debt allowances; (c) payment terms, and (d) potential contra accounts.
- The bank must have effective policies and procedures for monitoring on an aggregate basis single-obligor concentrations both within and across receivables pools.
- The bank must receive timely and sufficiently detailed reports of receivables ageings and dilutions to (a) ensure compliance with the bank's eligibility criteria and advancing policies governing purchased receivables, and (b) provide an effective means with which to monitor and confirm the seller's terms of sale (e.g. invoice date ageing) and dilution.

Effectiveness of work-out systems

496. An effective programme requires systems and procedures not only for detecting deterioration in the seller's financial condition and deterioration in the quality of the receivables at an early stage, but also for addressing emerging problems pro-actively. In particular,

- The bank should have clear and effective policies, procedures, and information systems to monitor compliance with (a) all contractual terms of the facility (including covenants, advancing formulas, concentration limits, early amortisation triggers, etc.) as well as (b) the bank's internal policies governing advance rates and receivables eligibility. The bank's systems should track covenant violations and waivers as well as exceptions to established policies and procedures.
- To limit inappropriate draws, the bank should have effective policies and procedures for detecting, approving, monitoring, and correcting over-advances.
- The bank should have effective policies and procedures for dealing with financially weakened sellers or servicers and/or deterioration in the quality of receivable pools. These include, but are not necessarily limited to, early termination triggers in revolving facilities and other covenant protections, a structured and disciplined approach to dealing with covenant violations, and clear and effective policies and procedures for initiating legal actions and dealing with problem receivables.

Effectiveness of systems for controlling collateral, credit availability, and cash

497. The bank must have clear and effective policies and procedures governing the control of receivables, credit, and cash. In particular,

- Written internal policies must specify all material elements of the receivables purchase programme, including the advancing rates, eligible collateral, necessary documentation, concentration limits, and how cash receipts are to be handled. These elements should take appropriate account of all relevant and material factors, including the seller's/servicer's financial condition, risk concentrations, and trends in the quality of the receivables and the seller's customer base.
- Internal systems must ensure that funds are advanced only against specified supporting collateral and documentation (such as servicer attestations, invoices, shipping documents, etc.).

Compliance with the bank's internal policies and procedures

498. Given the reliance on monitoring and control systems to limit credit risk, the bank should have an effective internal process for assessing compliance with all critical policies and procedures, including

- regular internal and/or external audits of all critical phases of the bank's receivables purchase programme.
- verification of the separation of duties (i) between the assessment of the seller/servicer and the assessment of the obligor and (ii) between the assessment of the seller/servicer and the field audit of the seller/servicer.

499. A bank's effective internal process for assessing compliance with all critical policies and procedures should also include evaluations of back office operations, with particular focus on qualifications, experience, staffing levels, and supporting systems.

8. Validation of internal estimates

500. Banks must have a robust system in place to validate the accuracy and consistency of rating systems, processes, and the estimation of all relevant risk components. A bank must demonstrate to its supervisor that the internal validation process enables it to assess the performance of internal rating and risk estimation systems consistently and meaningfully.

501. Banks must regularly compare realised default rates with estimated PDs for each grade and be able to demonstrate that the realised default rates are within the expected range for that grade. Banks using the advanced IRB approach must complete such analysis for their estimates of LGDs and EADs. Such comparisons must make use of historical data that are over as long a period as possible. The methods and data used in such comparisons by the bank must be clearly documented by the bank. This analysis and documentation must be updated at least annually.

502. Banks must also use other quantitative validation tools and comparisons with relevant external data sources. The analysis must be based on data that are appropriate to the portfolio, are updated regularly, and cover a relevant observation period. Banks' internal assessments of the performance of their own rating systems must be based on long data histories, covering a range of economic conditions, and ideally one or more complete business cycles.

503. Banks must demonstrate that quantitative testing methods and other validation methods do not vary systematically with the economic cycle. Changes in methods and data (both data sources and periods covered) must be clearly and thoroughly documented.

504. Banks must have well-articulated internal standards for situations where deviations in realised PDs, LGDs and EADs from expectations become significant enough to call the validity of the estimates into question. These standards must take account of business cycles and similar systematic variability in default experiences. Where realised values continue to be higher than expected values, banks must revise estimates upward to reflect their default and loss experience.

505. Where banks rely on supervisory, rather than internal, estimates of risk parameters, they are encouraged to compare realised LGDs and EADs to those set by the supervisors. The information on realised LGDs and EADs should form part of the bank's assessment of economic capital.

9. Supervisory LGD and EAD estimates

506. Banks under the foundation IRB approach, which do not meet the requirements for own-estimates of LGD and EAD, above, must meet the minimum requirements described in the standardised approach to receive recognition for eligible financial collateral (as set out in Section II.D: The standardised approach – credit risk mitigation). They must meet the following additional minimum requirements in order to receive recognition for additional collateral types.

(i) Definition of eligibility of CRE and RRE as collateral

507. Eligible CRE and RRE collateral for corporate, sovereign and bank exposures are defined as:

- Collateral where the risk of the borrower is not materially dependent upon the performance of the underlying property or project, but rather on the underlying capacity of the borrower to repay the debt from other sources. As such, repayment of the facility is not materially dependent on any cash flow generated by the underlying CRE/RRE serving as collateral;[92] and

- Additionally, the value of the collateral pledged must not be materially dependent on the performance of the borrower. This requirement is not intended to preclude situations where purely macro-economic factors affect both the value of the collateral and the performance of the borrower.

508. In light of the generic description above and the definition of corporate exposures, income producing real estate that falls under the SL asset class is specifically excluded from recognition as collateral for corporate exposures.[93]

(ii) Operational requirements for eligible CRE/RRE

509. Subject to meeting the definition above, CRE and RRE will be eligible for recognition as collateral for corporate claims only if all of the following operational requirements are met.

- *Legal enforceability*: any claim on a collateral taken must be legally enforceable in all relevant jurisdictions, and any claim on collateral must be properly filed on a timely basis. Collateral interests must reflect a perfected lien (i.e. all legal requirements for establishing the claim have been fulfilled). Furthermore, the collateral agreement and the legal process underpinning it must be such that they provide for the bank to realise the value of the collateral within a reasonable timeframe.
- *Objective market value of collateral*: the collateral must be valued at or less than the current fair value under which the property could be sold under private contract between a willing seller and an arm's-length buyer on the date of valuation.
- *Frequent revaluation*: the bank is expected to monitor the value of the collateral on a frequent basis and at a minimum once every year. More frequent monitoring is suggested where the market is subject to significant changes in conditions. Statistical methods of evaluation (e.g. reference to house price indices, sampling) may be used to update estimates or to identify collateral that may have declined in value and that may need re-appraisal. A qualified professional must evaluate the property when information indicates that the value of the collateral may have declined materially relative to general market prices or when a credit event, such as default, occurs.
- *Junior liens*: In some member countries, eligible collateral will be restricted to situations where the lender has a first charge over the property.[94] Junior liens may be taken into account where there is no doubt that the claim for collateral is legally

[92] The Committee recognises that in some countries where multifamily housing makes up an important part of the housing market and where public policy is supportive of that sector, including specially established public sector companies as major providers, the risk characteristics of lending secured by mortgage on such residential real estate can be similar to those of traditional corporate exposures. The national supervisor may under such circumstances recognise mortgage on multifamily residential real estate as eligible collateral for corporate exposures.

[93] As noted in footnote 73, in exceptional circumstances for well-developed and long-established markets, mortgages on office and/or multi-purpose commercial premises and/or multi-tenanted commercial premises may have the potential to receive recognition as collateral in the corporate portfolio. Please refer to footnote 29 of paragraph 74 for a discussion of the eligibility criteria that would apply.

[94] In some of these jurisdictions, first liens are subject to the prior right of preferential creditors, such as outstanding tax claims and employees' wages.

enforceable and constitutes an efficient credit risk mitigant. When recognised, junior liens are to be treated using the C*/C** threshold, which is used for senior liens. In such cases, the C* and C** are calculated by taking into account the sum of the junior lien and all more senior liens.

510. Additional collateral management requirements are as follows:

- The types of CRE and RRE collateral accepted by the bank and lending policies (advance rates) when this type of collateral is taken must be clearly documented.
- The bank must take steps to ensure that the property taken as collateral is adequately insured against damage or deterioration.
- The bank must monitor on an ongoing basis the extent of any permissible prior claims (e.g. tax) on the property.
- The bank must appropriately monitor the risk of environmental liability arising in respect of the collateral, such as the presence of toxic material on a property.

(iii) Requirements for recognition of financial receivables

Definition of eligible receivables

511. Eligible financial receivables are claims with an original maturity of less than or equal to one year where repayment will occur through the commercial or financial flows related to the underlying assets of the borrower. This includes both self-liquidating debt arising from the sale of goods or services linked to a commercial transaction and general amounts owed by buyers, suppliers, renters, national and local governmental authorities, or other non-affiliated parties not related to the sale of goods or services linked to a commercial transaction. Eligible receivables do not include those associated with securitisations, sub-participations or credit derivatives.

Operational requirements

Legal certainty

512. The legal mechanism by which collateral is given must be robust and ensure that the lender has clear rights over the proceeds from the collateral.

513. Banks must take all steps necessary to fulfil local requirements in respect of the enforceability of security interest, e.g. by registering a security interest with a registrar. There should be a framework that allows the potential lender to have a perfected first priority claim over the collateral.

514. All documentation used in collateralised transactions must be binding on all parties and legally enforceable in all relevant jurisdictions. Banks must have conducted sufficient legal review to verify this and have a well founded legal basis to reach this conclusion, and undertake such further review as necessary to ensure continuing enforceability.

515. The collateral arrangements must be properly documented, with a clear and robust procedure for the timely collection of collateral proceeds. Banks' procedures should ensure that any legal conditions required for declaring the default of the customer and timely collection of collateral are observed. In the event of the obligor's financial distress or default, the bank should have legal authority to sell or assign the receivables to other parties without consent of the receivables' obligors.

Risk management

516. The bank must have a sound process for determining the credit risk in the receivables. Such a process should include, among other things, analyses of the borrower's business and industry (e.g. effects of the business cycle) and the types of customers with whom the borrower does business. Where the bank relies on the borrower to ascertain the credit risk of the customers, the bank must review the borrower's credit policy to ascertain its soundness and credibility.

517. The margin between the amount of the exposure and the value of the receivables must reflect all appropriate factors, including the cost of collection, concentration within the receivables pool pledged by an individual borrower, and potential concentration risk within the bank's total exposures.

518. The bank must maintain a continuous monitoring process that is appropriate for the specific exposures (either immediate or contingent) attributable to the collateral to be utilised as a risk mitigant. This process may include, as appropriate and relevant, ageing reports, control of trade documents, borrowing base certificates, frequent audits of collateral, confirmation of accounts, control of the proceeds of accounts paid, analyses of dilution (credits given by the borrower to the issuers) and regular financial analysis of both the borrower and the issuers of the receivables, especially in the case when a small number of large-sized receivables are taken as collateral. Observance of the bank's overall concentration limits should be monitored. Additionally, compliance with loan covenants, environmental restrictions, and other legal requirements should be reviewed on a regular basis.

519. The receivables pledged by a borrower should be diversified and not be unduly correlated with the borrower. Where the correlation is high, e.g. where some issuers of the receivables are reliant on the borrower for their viability or the borrower and the issuers belong to a common industry, the attendant risks should be taken into account in the setting of margins for the collateral pool as a whole. Receivables from affiliates of the borrower (including subsidiaries and employees) will not be recognised as risk mitigants.

520. The bank should have a documented process for collecting receivable payments in distressed situations. The requisite facilities for collection should be in place, even when the bank normally looks to the borrower for collections.

Requirements for recognition of other collateral

521. Supervisors may allow for recognition of the credit risk mitigating effect of certain other physical collateral. Each supervisor will determine which, if any, collateral types in its jurisdiction meet the following two standards:

- Existence of liquid markets for disposal of collateral in an expeditious and economically efficient manner.
- Existence of well established, publicly available market prices for the collateral. Supervisors will seek to ensure that the amount a bank receives when collateral is realised does not deviate significantly from these market prices.

522. In order for a given bank to receive recognition for additional physical collateral, it must meet all the standards in paragraphs 509 and 510, subject to the following modifications.

- First Claim: With the sole exception of permissible prior claims specified in footnote 94, only first liens on, or charges over, collateral are permissible. As such, the bank must have priority over all other lenders to the realised proceeds of the collateral.

- The loan agreement must include detailed descriptions of the collateral plus detailed specifications of the manner and frequency of revaluation.
- The types of physical collateral accepted by the bank and policies and practices in respect of the appropriate amount of each type of collateral relative to the exposure amount must be clearly documented in internal credit policies and procedures and available for examination and/or audit review.
- Bank credit policies with regard to the transaction structure must address appropriate collateral requirements relative to the exposure amount, the ability to liquidate the collateral readily, the ability to establish objectively a price or market value, the frequency with which the value can readily be obtained (including a professional appraisal or valuation), and the volatility of the value of the collateral. The periodic revaluation process must pay particular attention to "fashion-sensitive" collateral to ensure that valuations are appropriately adjusted downward of fashion, or model-year, obsolescence as well as physical obsolescence or deterioration.
- In cases of inventories (e.g. raw materials, work-in-process, finished goods, dealers' inventories of autos) and equipment, the periodic revaluation process must include physical inspection of the collateral.

10. Requirements for recognition of leasing

523. Leases other than those that expose the bank to residual value risk (see paragraph 524) will be accorded the same treatment as exposures collateralised by the same type of collateral. The minimum requirements for the collateral type must be met (CRE/RRE or other collateral). In addition, the bank must also meet the following standards:

- Robust risk management on the part of the lessor with respect to the location of the asset, the use to which it is put, its age, and planned obsolescence;
- A robust legal framework establishing the lessor's legal ownership of the asset and its ability to exercise its rights as owner in a timely fashion; and
- The difference between the rate of depreciation of the physical asset and the rate of amortisation of the lease payments must not be so large as to overstate the CRM attributed to the leased assets.

524. Leases that expose the bank to residual value risk will be treated in the following manner. Residual value risk is the bank's exposure to potential loss due to the fair value of the equipment declining below its residual estimate at lease inception.

- The discounted lease payment stream will receive a risk weight appropriate for the lessee's financial strength (PD) and supervisory or own-estimate of LGD, which ever is appropriate.
- The residual value will be risk-weighted at 100%.

11. Calculation of capital charges for equity exposures

(i) The internal models market-based approach

525. To be eligible for the internal models market-based approach a bank must demonstrate to its supervisor that it meets certain quantitative and qualitative minimum requirements at the outset and on an ongoing basis. A bank that fails to demonstrate continued compliance with the minimum requirements must develop a plan for rapid return to compliance, obtain its supervisor's approval of the plan, and implement that plan in a timely fashion. In the interim, banks would be expected to compute capital charges using a simple risk weight approach.

526. The Committee recognises that differences in markets, measurement methodologies, equity investments and management practices require banks and supervisors to customise their operational procedures. It is not the Committee's intention to dictate the form or operational detail of banks' risk management policies and measurement practices for their banking book equity holdings. However, some of the minimum requirements are specific. Each supervisor will develop detailed examination procedures to ensure that banks' risk measurement systems and management controls are adequate to serve as the basis for the internal models approach.

(ii) Capital charge and risk quantification

527. The following minimum quantitative standards apply for the purpose of calculating minimum capital charges under the internal models approach.

(a) The capital charge is equivalent to the potential loss on the institution's equity portfolio arising from an assumed instantaneous shock equivalent to the 99th percentile, one-tailed confidence interval of the difference between quarterly returns and an appropriate risk-free rate computed over a long-term sample period.

(b) The estimated losses should be robust to adverse market movements relevant to the long-term risk profile of the institution's specific holdings. The data used to represent return distributions should reflect the longest sample period for which data are available and meaningful in representing the risk profile of the bank's specific equity holdings. The data used should be sufficient to provide conservative, statistically reliable and robust loss estimates that are not based purely on subjective or judgmental considerations. Institutions must demonstrate to supervisors that the shock employed provides a conservative estimate of potential losses over a relevant long-term market or business cycle. Models estimated using data not reflecting realistic ranges of long-run experience, including a period of reasonably severe declines in equity market values relevant to a bank's holdings, are presumed to produce optimistic results unless there is credible evidence of appropriate adjustments built into the model. In the absence of built-in adjustments, the bank must combine empirical analysis of available data with adjustments based on a variety of factors in order to attain model outputs that achieve appropriate realism and conservatism. In constructing Value at Risk (VaR) models estimating potential quarterly losses, institutions may use quarterly data or convert shorter horizon period data to a quarterly equivalent using an analytically appropriate method supported by empirical evidence. Such adjustments must be applied through a well-developed and well-documented thought process and analysis. In general, adjustments must be applied conservatively and consistently over time. Furthermore, where only limited data are available, or where technical limitations are such that estimates from any single method will be of uncertain quality, banks must add appropriate margins of conservatism in order to avoid over-optimism.

(c) No particular type of VaR model (e.g. variance-covariance, historical simulation, or Monte Carlo) is prescribed. However, the model used must be able to capture adequately all of the material risks embodied in equity returns including both the general market risk and specific risk exposure of the institution's equity portfolio. Internal models must adequately explain historical price variation, capture both the magnitude and changes in the composition of potential concentrations, and be robust to adverse market environments. The population of risk exposures represented in the data used for estimation must be closely matched to or at least comparable with those of the bank's equity exposures.

(d) Banks may also use modelling techniques such as historical scenario analysis to determine minimum capital requirements for banking book equity holdings. The use of such models is conditioned upon the institution demonstrating to its supervisor that the methodology and its output can be quantified in the form of the loss percentile specified under (a).

(e) Institutions must use an internal model that is appropriate for the risk profile and complexity of their equity portfolio. Institutions with material holdings with values that are highly non-linear in nature (e.g. equity derivatives, convertibles) must employ an internal model designed to capture appropriately the risks associated with such instruments.

(f) Subject to supervisory review, equity portfolio correlations can be integrated into a bank's internal risk measures. The use of explicit correlations (e.g. utilisation of a variance/covariance VaR model) must be fully documented and supported using empirical analysis. The appropriateness of implicit correlation assumptions will be evaluated by supervisors in their review of model documentation and estimation techniques.

(g) Mapping of individual positions to proxies, market indices, and risk factors should be plausible, intuitive, and conceptually sound. Mapping techniques and processes should be fully documented, and demonstrated with both theoretical and empirical evidence to be appropriate for the specific holdings. Where professional judgement is combined with quantitative techniques in estimating a holding's return volatility, the judgement must take into account the relevant and material information not considered by the other techniques utilised.

(h) Where factor models are used, either single or multi-factor models are acceptable depending upon the nature of an institution's holdings. Banks are expected to ensure that the factors are sufficient to capture the risks inherent in the equity portfolio. Risk factors should correspond to the appropriate equity market characteristics (for example, public, private, market capitalisation industry sectors and sub-sectors, operational characteristics) in which the bank holds significant positions. While banks will have discretion in choosing the factors, they must demonstrate through empirical analyses the appropriateness of those factors, including their ability to cover both general and specific risk.

(i) Estimates of the return volatility of equity investments must incorporate relevant and material available data, information, and methods. A bank may utilise independently reviewed internal data or data from external sources (including pooled data). The number of risk exposures in the sample, and the data period used for quantification must be sufficient to provide the bank with confidence in the accuracy and robustness of its estimates. Institutions should take appropriate measures to limit the potential of both sampling bias and survivorship bias in estimating return volatilities.

(j) A rigorous and comprehensive stress-testing programme must be in place. Banks are expected to subject their internal model and estimation procedures, including volatility computations, to either hypothetical or historical scenarios that reflect worst-case losses given underlying positions in both public and private equities. At a minimum, stress tests should be employed to provide information about the effect of tail events beyond the level of confidence assumed in the internal models approach.

(iii) Risk management process and controls

528. Banks' overall risk management practices used to manage their banking book equity investments are expected to be consistent with the evolving sound practice guidelines issued by the Committee and national supervisors. With regard to the development and use of internal models for capital purposes, institutions must have established policies, procedures, and controls to ensure the integrity of the model and modelling process used to derive regulatory capital standards. These policies, procedures, and controls should include the following:

(a) Full integration of the internal model into the overall management information systems of the institution and in the management of the banking book equity portfolio. Internal models should be fully integrated into the institution's risk management infrastructure including use in: (i) establishing investment hurdle rates and evaluating alternative investments; (ii) measuring and assessing equity portfolio performance (including the risk-adjusted performance); and (iii) allocating economic capital to equity holdings and evaluating overall capital adequacy as required under Pillar 2. The institution should be able to demonstrate, through for example, investment committee minutes, that internal model output plays an essential role in the investment management process.

(b) Established management systems, procedures, and control functions for ensuring the periodic and independent review of all elements of the internal modelling process, including approval of model revisions, vetting of model inputs, and review of model results, such as direct verification of risk computations. Proxy and mapping techniques and other critical model components should receive special attention. These reviews should assess the accuracy, completeness, and appropriateness of model inputs and results and focus on both finding and limiting potential errors associated with known weaknesses and identifying unknown model weaknesses. Such reviews may be conducted as part of internal or external audit programmes, by an independent risk control unit, or by an external third party.

(c) Adequate systems and procedures for monitoring investment limits and the risk exposures of equity investments.

(d) The units responsible for the design and application of the model must be functionally independent from the units responsible for managing individual investments.

(e) Parties responsible for any aspect of the modelling process must be adequately qualified. Management must allocate sufficient skilled and competent resources to the modelling function.

(iv) Validation and documentation

529. Institutions employing internal models for regulatory capital purposes are expected to have in place a robust system to validate the accuracy and consistency of the model and its inputs. They must also fully document all material elements of their internal models and modelling process. The modelling process itself as well as the systems used to validate internal models including all supporting documentation, validation results, and the findings of internal and external reviews are subject to oversight and review by the bank's supervisor.

Validation

530. Banks must have a robust system in place to validate the accuracy and consistency of their internal models and modelling processes. A bank must demonstrate to its supervisor

that the internal validation process enables it to assess the performance of its internal model and processes consistently and meaningfully.

531. Banks must regularly compare actual return performance (computed using realised and unrealised gains and losses) with modelled estimates and be able to demonstrate that such returns are within the expected range for the portfolio and individual holdings. Such comparisons must make use of historical data that are over as long a period as possible. The methods and data used in such comparisons must be clearly documented by the bank. This analysis and documentation should be updated at least annually.

532. Banks should make use of other quantitative validation tools and comparisons with external data sources. The analysis must be based on data that are appropriate to the portfolio, are updated regularly, and cover a relevant observation period. Banks' internal assessments of the performance of their own model must be based on long data histories, covering a range of economic conditions, and ideally one or more complete business cycles.

533. Banks must demonstrate that quantitative validation methods and data are consistent through time. Changes in estimation methods and data (both data sources and periods covered) must be clearly and thoroughly documented.

534. Since the evaluation of actual performance to expected performance over time provides a basis for banks to refine and adjust internal models on an ongoing basis, it is expected that banks using internal models will have established well-articulated model review standards. These standards are especially important for situations where actual results significantly deviate from expectations and where the validity of the internal model is called into question. These standards must take account of business cycles and similar systematic variability in equity returns. All adjustments made to internal models in response to model reviews must be well documented and consistent with the bank's model review standards.

535. To facilitate model validation through backtesting on an ongoing basis, institutions using the internal model approach must construct and maintain appropriate databases on the actual quarterly performance of their equity investments as well on the estimates derived using their internal models. Institutions should also backtest the volatility estimates used within their internal models and the appropriateness of the proxies used in the model. Supervisors may ask banks to scale their quarterly forecasts to a different, in particular shorter, time horizon, store performance data for this time horizon and perform backtests on this basis.

Documentation

536. The burden is on the bank to satisfy its supervisor that a model has good predictive power and that regulatory capital requirements will not be distorted as a result of its use. Accordingly, all critical elements of an internal model and the modelling process should be fully and adequately documented. Banks must document in writing their internal model's design and operational details. The documentation should demonstrate banks' compliance with the minimum quantitative and qualitative standards, and should address topics such as the application of the model to different segments of the portfolio, estimation methodologies, responsibilities of parties involved in the modelling, and the model approval and model review processes. In particular, the documentation should address the following points:

(a) A bank must document the rationale for its choice of internal modelling methodology and must be able to provide analyses demonstrating that the model and modelling procedures are likely to result in estimates that meaningfully identify the risk of the bank's equity holdings. Internal models and procedures must be periodically reviewed to determine whether they remain fully applicable to the current portfolio and to external conditions. In addition, a bank must document a history of major changes in the model over time and changes made to the modelling process subsequent to the last supervisory review. If changes have been made in response to the bank's internal review standards, the bank must document that these changes are consistent with its internal model review standards.

(b) In documenting their internal models banks should:

- provide a detailed outline of the theory, assumptions and/or mathematical and empirical basis of the parameters, variables, and data source(s) used to estimate the model;
- establish a rigorous statistical process (including out-of-time and out-of-sample performance tests) for validating the selection of explanatory variables; and
- indicate circumstances under which the model does not work effectively.

(c) Where proxies and mapping are employed, institutions must have performed and documented rigorous analysis demonstrating that all chosen proxies and mappings are sufficiently representative of the risk of the equity holdings to which they correspond. The documentation should show, for instance, the relevant and material factors (e.g. business lines, balance sheet characteristics, geographic location, company age, industry sector and subsector, operating characteristics) used in mapping individual investments into proxies. In summary, institutions must demonstrate that the proxies and mappings employed:

- are adequately comparable to the underlying holding or portfolio;
- are derived using historical economic and market conditions that are relevant and material to the underlying holdings or, where not, that an appropriate adjustment has been made; and,
- are robust estimates of the potential risk of the underlying holding.

12. Disclosure requirements

537. In order to be eligible for the IRB approach, banks must meet the disclosure requirements set out in Pillar 3. These are minimum requirements for use of IRB: failure to meet these will render banks ineligible to use the relevant IRB approach.

IV. Credit Risk — Securitisation Framework

A. Scope and definitions of transactions covered under the securitisation framework

538. Banks must apply the securitisation framework for determining regulatory capital requirements on exposures arising from traditional and synthetic securitisations or similar structures that contain features common to both. Since securitisations may be structured in many different ways, the capital treatment of a securitisation exposure must be determined on the basis of its economic substance rather than its legal form. Similarly, supervisors will look to the economic substance of a transaction to determine whether it should be subject to the securitisation framework for purposes of determining regulatory capital. Banks are encouraged to consult with their national supervisors when there is uncertainty about whether a given transaction should be considered a securitisation. For example, transactions involving cash flows from real estate (e.g. rents) may be considered specialised lending exposures, if warranted.

539. A *traditional securitisation* is a structure where the cash flow from an underlying pool of exposures is used to service at least two different stratified risk positions or tranches reflecting different degrees of credit risk. Payments to the investors depend upon the performance of the specified underlying exposures, as opposed to being derived from an obligation of the entity originating those exposures. The stratified/tranched structures that characterise securitisations differ from ordinary senior/subordinated debt instruments in that junior securitisation tranches can absorb losses without interrupting contractual payments to more senior tranches, whereas subordination in a senior/subordinated debt structure is a matter of priority of rights to the proceeds of liquidation.

540. A *synthetic securitisation* is a structure with at least two different stratified risk positions or tranches that reflect different degrees of credit risk where credit risk of an underlying pool of exposures is transferred, in whole or in part, through the use of funded (e.g. credit-linked notes) or unfunded (e.g. credit default swaps) credit derivatives or guarantees that serve to hedge the credit risk of the portfolio. Accordingly, the investors' potential risk is dependent upon the performance of the underlying pool.

541. Banks' exposures to a securitisation are hereafter referred to as "securitisation exposures". Securitisation exposures can include but are not restricted to the following: asset-backed securities, mortgage-backed securities, credit enhancements, liquidity facilities, interest rate or currency swaps, credit derivatives and tranched cover as described in paragraph 199. Reserve accounts, such as cash collateral accounts, recorded as an asset by the originating bank must also be treated as securitisation exposures.

542. Underlying instruments in the pool being securitised may include but are not restricted to the following: loans, commitments, asset-backed and mortgage-backed securities, corporate bonds, equity securities, and private equity investments. The underlying pool may include one or more exposures.

B. Definitions and general terminology

1. Originating bank

543. For risk-based capital purposes, a bank is considered to be an originator with regard to a certain securitisation if it meets either of the following conditions:

(a) The bank originates directly or indirectly underlying exposures included in the securitisation; or

(b) The bank serves as a sponsor of an asset-backed commercial paper (ABCP) conduit or similar programme that acquires exposures from third-party entities. In the context of such programmes, a bank would generally be considered a sponsor and, in turn, an originator if it, in fact or in substance, manages or advises the programme, places securities into the market, or provides liquidity and/or credit enhancements.

2. Asset-backed commercial paper (ABCP) programme

544. An asset-backed commercial paper (ABCP) programme predominately issues commercial paper with an original maturity of one year or less that is backed by assets or other exposures held in a bankruptcy-remote, special purpose entity.

3. Clean-up call

545. A clean-up call is an option that permits the securitisation exposures (e.g. asset-backed securities) to be called before all of the underlying exposures or securitisation exposures have been repaid. In the case of traditional securitisations, this is generally accomplished by repurchasing the remaining securitisation exposures once the pool balance or outstanding securities have fallen below some specified level. In the case of a synthetic transaction, the clean-up call may take the form of a clause that extinguishes the credit protection.

4. Credit enhancement

546. A credit enhancement is a contractual arrangement in which the bank retains or assumes a securitisation exposure and, in substance, provides some degree of added protection to other parties to the transaction.

5. Credit-enhancing interest-only strip

547. A credit-enhancing interest-only strip *(I/O)* is an on-balance sheet asset that (i) represents a valuation of cash flows related to future margin income, and (ii) is subordinated.

6. Early amortisation

548. Early amortisation provisions are mechanisms that, once triggered, allow investors to be paid out prior to the originally stated maturity of the securities issued. For risk-based capital purposes, an early amortisation provision will be considered either controlled or non-controlled. A controlled early amortisation provision must meet all of the following conditions.

(a) The bank must have an appropriate capital/liquidity plan in place to ensure that it has sufficient capital and liquidity available in the event of an early amortisation.

(b) Throughout the duration of the transaction, including the amortisation period, there is the same pro rata sharing of interest, principal, expenses, losses and recoveries based on the bank's and investors' relative shares of the receivables outstanding at the beginning of each month.

(c) The bank must set a period for amortisation that would be sufficient for at least 90% of the total debt outstanding at the beginning of the early amortisation period to have been repaid or recognised as in default; and

(d) The pace of repayment should not be any more rapid than would be allowed by straight-line amortisation over the period set out in criterion (c).

549. An early amortisation provision that does not satisfy the conditions for a controlled early amortisation provision will be treated as a non-controlled early amortisation provision.

7. Excess spread

550. Excess spread is generally defined as gross finance charge collections and other income received by the trust or special purpose entity (SPE, specified in paragraph 552) minus certificate interest, servicing fees, charge-offs, and other senior trust or SPE expenses.

8. Implicit support

551. Implicit support arises when a bank provides support to a securitisation in excess of its predetermined contractual obligation.

9. Special purpose entity (SPE)

552. An SPE is a corporation, trust, or other entity organised for a specific purpose, the activities of which are limited to those appropriate to accomplish the purpose of the SPE, and the structure of which is intended to isolate the SPE from the credit risk of an originator or seller of exposures. SPEs are commonly used as financing vehicles in which exposures are sold to a trust or similar entity in exchange for cash or other assets funded by debt issued by the trust.

C. Operational requirements for the recognition of risk transference

553. The following operational requirements are applicable to both the standardised and IRB approaches of the securitisation framework.

1. Operational requirements for traditional securitisations

554. An originating bank may exclude securitised exposures from the calculation of risk-weighted assets only if all of the following conditions have been met. Banks meeting these conditions must still hold regulatory capital against any securitisation exposures they retain.

(a) Significant credit risk associated with the securitised exposures has been transferred to third parties.

(b) The transferor does not maintain effective or indirect control over the transferred exposures. The assets are legally isolated from the transferor in such a way (e.g. through the sale of assets or through subparticipation) that the exposures are put beyond the reach of the transferor and its creditors, even in bankruptcy or receivership. These conditions must be supported by an opinion provided by a qualified legal counsel.

The transferor is deemed to have maintained effective control over the transferred credit risk exposures if it: (i) is able to repurchase from the transferee the previously transferred exposures in order to realise their benefits; or (ii) is obligated to retain the risk of the transferred exposures. The transferor's retention of servicing rights to the exposures will not necessarily constitute indirect control of the exposures.

(c) The securities issued are not obligations of the transferor. Thus, investors who purchase the securities only have claim to the underlying pool of exposures.

(d) The transferee is an SPE and the holders of the beneficial interests in that entity have the right to pledge or exchange them without restriction.

(e) Clean-up calls must satisfy the conditions set out in paragraph 557.

(f) The securitisation does not contain clauses that (i) require the originating bank to alter systematically the underlying exposures such that the pool's weighted average credit quality is improved unless this is achieved by selling assets to independent and unaffiliated third parties at market prices; (ii) allow for increases in a retained first loss position or credit enhancement provided by the originating bank after the transaction's inception; or (iii) increase the yield payable to parties other than the originating bank, such as investors and third-party providers of credit enhancements, in response to a deterioration in the credit quality of the underlying pool.

2. Operational requirements for synthetic securitisations

555. For synthetic securitisations, the use of CRM techniques (i.e. collateral, guarantees and credit derivatives) for hedging the underlying exposure may be recognised for risk-based capital purposes only if the conditions outlined below are satisfied:

(a) Credit risk mitigants must comply with the requirements as set out in Section II.D of this Framework.

(b) Eligible collateral is limited to that specified in paragraphs 145 and 146. Eligible collateral pledged by SPEs may be recognised.

(c) Eligible guarantors are defined in paragraph 195. Banks may not recognise SPEs as eligible guarantors in the securitisation framework.

(d) Banks must transfer significant credit risk associated with the underlying exposure to third parties.

(e) The instruments used to transfer credit risk may not contain terms or conditions that limit the amount of credit risk transferred, such as those provided below:

- Clauses that materially limit the credit protection or credit risk transference (e.g. significant materiality thresholds below which credit protection is deemed not to be triggered even if a credit event occurs or those that allow for the termination of the protection due to deterioration in the credit quality of the underlying exposures);
- Clauses that require the originating bank to alter the underlying exposures to improve the pool's weighted average credit quality;
- Clauses that increase the banks' cost of credit protection in response to deterioration in the pool's quality;
- Clauses that increase the yield payable to parties other than the originating bank, such as investors and third-party providers of credit enhancements, in response to a deterioration in the credit quality of the reference pool; and
- Clauses that provide for increases in a retained first loss position or credit enhancement provided by the originating bank after the transaction's inception.

(f) An opinion must be obtained from a qualified legal counsel that confirms the enforceability of the contracts in all relevant jurisdictions.

(g) Clean-up calls must satisfy the conditions set out in paragraph 557.

556. For synthetic securitisations, the effect of applying CRM techniques for hedging the underlying exposure are treated according to paragraphs 109 to 210. In case there is a maturity mismatch, the capital requirement will be determined in accordance with paragraphs 202 to 205. When the exposures in the underlying pool have different maturities, the longest maturity must be taken as the maturity of the pool. Maturity mismatches may arise in the context of synthetic securitisations when, for example, a bank uses credit derivatives to transfer part or all of the credit risk of a specific pool of assets to third parties. When the credit derivatives unwind, the transaction will terminate. This implies that the effective maturity of the tranches of the synthetic securitisation may differ from that of the underlying exposures. Originating banks of synthetic securitisations must treat such maturity mismatches in the following manner. A bank using the standardised approach for securitisation must deduct all retained positions that are unrated or rated below investment grade. A bank using the IRB approach must deduct unrated, retained positions if the treatment of the position is deduction specified in paragraphs 609 to 643. Accordingly, when deduction is required, maturity mismatches are not taken into account. For all other securitisation exposures, the bank must apply the maturity mismatch treatment set forth in paragraphs 202 to 205.

3. Operational requirements and treatment of clean-up calls

557. For securitisation transactions that include a clean-up call, no capital will be required due to the presence of a clean-up call if the following conditions are met: (i) the exercise of the clean-up call must not be mandatory, in form or in substance, but rather must be at the discretion of the originating bank; (ii) the clean-up call must not be structured to avoid allocating losses to credit enhancements or positions held by investors or otherwise structured to provide credit enhancement; and (iii) the clean-up call must only be exercisable when 10% or less of the original underlying portfolio, or securities issued remain, or, for synthetic securitisations, when 10% or less of the original reference portfolio value remains.

558. Securitisation transactions that include a clean-up call that does not meet all of the criteria stated in paragraph 557 result in a capital requirement for the originating bank. For a traditional securitisation, the underlying exposures must be treated as if they were not securitised. Additionally, banks must not recognise in regulatory capital any gain-on-sale, as defined in paragraph 562. For synthetic securitisations, the bank purchasing protection must hold capital against the entire amount of the securitised exposures as if they did not benefit from any credit protection. If a synthetic securitisation incorporates a call (other than a clean-up call) that effectively terminates the transaction and the purchased credit protection on a specific date, the bank must treat the transaction in accordance with paragraph 556 and paragraphs 202 to 205.

559. If a clean-up call, when exercised, is found to serve as a credit enhancement, the exercise of the clean-up call must be considered a form of implicit support provided by the bank and must be treated in accordance with the supervisory guidance pertaining to securitisation transactions.

D. Treatment of securitisation exposures

1. Calculation of capital requirements

560. Banks are required to hold regulatory capital against all of their securitisation exposures, including those arising from the provision of credit risk mitigants to a securitisation transaction, investments in asset-backed securities, retention of a subordinated tranche, and extension of a liquidity facility or credit enhancement, as set forth in the following sections. Repurchased securitisation exposures must be treated as retained securitisation exposures.

(i) Deduction

561. When a bank is required to deduct a securitisation exposure from regulatory capital, the deduction must be taken 50% from Tier 1 and 50% from Tier 2 with the one exception noted in paragraph 562. Credit enhancing I/Os (net of the amount that must be deducted from Tier 1 as in paragraph 562) are deducted 50% from Tier 1 and 50% from Tier 2. Deductions from capital may be calculated net of any specific provisions taken against the relevant securitisation exposures.

562. Banks must deduct from Tier 1 any increase in equity capital resulting from a securitisation transaction, such as that associated with expected future margin income (FMI) resulting in a gain-on-sale that is recognised in regulatory capital. Such an increase in capital is referred to as a "gain-on-sale" for the purposes of the securitisation framework.

563. For the purposes of the EL-provision calculation as set out in Section III.G, securitisation exposures do not contribute to the EL amount. Similarly, any specific provisions against securitisation exposures are not to be included in the measurement of eligible provisions.

(ii) Implicit support

564. When a bank provides implicit support to a securitisation, it must, at a minimum, hold capital against all of the exposures associated with the securitisation transaction as if they had not been securitised. Additionally, banks would not be permitted to recognise in regulatory capital any gain-on-sale, as defined in paragraph 562. Furthermore, the bank is required to disclose publicly that (a) it has provided non-contractual support and (b) the capital impact of doing so.

2. Operational requirements for use of external credit assessments

565. The following operational criteria concerning the use of external credit assessments apply in the standardised and IRB approaches of the securitisation framework:

(a) To be eligible for risk-weighting purposes, the external credit assessment must take into account and reflect the entire amount of credit risk exposure the bank has with regard to all payments owed to it. For example, if a bank is owed both principal and interest, the assessment must fully take into account and reflect the credit risk associated with timely repayment of both principal and interest.

(b) The external credit assessments must be from an eligible ECAI as recognised by the bank's national supervisor in accordance with paragraphs 90 to 108 with the following exception. In contrast with bullet three of paragraph 91, an eligible credit assessment must be publicly available. In other words, a rating must be published in an accessible form and included in the ECAI's transition matrix. Consequently, ratings that are made available only to the parties to a transaction do not satisfy this requirement.

(c) Eligible ECAIs must have a demonstrated expertise in assessing securitisations, which may be evidenced by strong market acceptance.

(d) A bank must apply external credit assessments from eligible ECAIs consistently across a given type of securitisation exposure. Furthermore, a bank cannot use the credit assessments issued by one ECAI for one or more tranches and those of another ECAI for other positions (whether retained or purchased) within the same securitisation structure that may or may not be rated by the first ECAI. Where two or more eligible ECAIs can be used and these assess the credit risk of the same securitisation exposure differently, paragraphs 96 to 98 will apply.

(e) Where CRM is provided directly to an SPE by an eligible guarantor defined in paragraph 195 and is reflected in the external credit assessment assigned to a securitisation exposure(s), the risk weight associated with that external credit assessment should be used. In order to avoid any double counting, no additional capital recognition is permitted. If the CRM provider is not recognised as an eligible guarantor in paragraph 195, the covered securitisation exposures should be treated as unrated.

(f) In the situation where a credit risk mitigant is not obtained by the SPE but rather applied to a specific securitisation exposure within a given structure (e.g. ABS tranche), the bank must treat the exposure as if it is unrated and then use the CRM treatment outlined in Section II.D or in the foundation IRB approach of Section III, to recognise the hedge.

3. Standardised approach for securitisation exposures

(i) Scope

566. Banks that apply the standardised approach to credit risk for the type of underlying exposure(s) securitised must use the standardised approach under the securitisation framework.

(ii) Risk weights

567. The risk-weighted asset amount of a securitisation exposure is computed by multiplying the amount of the position by the appropriate risk weight determined in accordance with the following tables. For off-balance sheet exposures, banks must apply a CCF and then risk weight the resultant credit equivalent amount. If such an exposure is rated, a CCF of 100% must be applied. For positions with long-term ratings of B+ and below and short-term ratings other than A-1/P-1, A-2/P-2, A-3/P-3, deduction from capital as defined in paragraph 561 is required. Deduction is also required for unrated positions with the exception of the circumstances described in paragraphs 571 to 575.

Long-term rating category[95]

External Credit Assessment	**AAA to AA-**	**A+ to A-**	**BBB+ to BBB-**	**BB+ to BB-**	**B+ and below or unrated**
Risk Weight	20%	50%	100%	350%	Deduction

Short-term rating category

External Credit Assessment	**A-1/P-1**	**A-2/P-2**	**A-3/P-3**	**All other ratings or unrated**
Risk Weight	20%	50%	100%	Deduction

568. The capital treatment of positions retained by originators, liquidity facilities, credit risk mitigants, and securitisations of revolving exposures are identified separately. The treatment of clean-up calls is provided in paragraphs 557 to 559.

Investors may recognise ratings on below-investment grade exposures

569. Only third-party investors, as opposed to banks that serve as originators, may recognise external credit assessments that are equivalent to BB+ to BB- for risk weighting purposes of securitisation exposures.

Originators to deduct below-investment grade exposures

570. Originating banks as defined in paragraph 543 must deduct all retained securitisation exposures rated below investment grade (i.e. BBB-).

(iii) Exceptions to general treatment of unrated securitisation exposures

571. As noted in the tables above, unrated securitisation exposures must be deducted with the following exceptions: (i) the most senior exposure in a securitisation, (ii) exposures that are in a second loss position or better in ABCP programmes and meet the requirements outlined in paragraph 574, and (iii) eligible liquidity facilities.

Treatment of unrated most senior securitisation exposures

572. If the most senior exposure in a securitisation of a traditional or synthetic securitisation is unrated, a bank that holds or guarantees such an exposure may determine the risk weight by applying the "look-through" treatment, provided the composition of the underlying pool is known at all times. Banks are not required to consider interest rate or currency swaps when determining whether an exposure is the most senior in a securitisation for the purpose of applying the "look-through" approach.

573. In the look-through treatment, the unrated most senior position receives the average risk weight of the underlying exposures subject to supervisory review. Where the bank is

95 The rating designations used in the following charts are for illustrative purposes only and do not indicate any preference for, or endorsement of, any particular external assessment system.

unable to determine the risk weights assigned to the underlying credit risk exposures, the unrated position must be deducted.

Treatment of exposures in a second loss position or better in ABCP programmes

574. Deduction is not required for those unrated securitisation exposures provided by sponsoring banks to ABCP programmes that satisfy the following requirements:

(a) The exposure is economically in a second loss position or better and the first loss position provides significant credit protection to the second loss position;

(b) The associated credit risk is the equivalent of investment grade or better; and

(c) The bank holding the unrated securitisation exposure does not retain or provide the first loss position.

575. Where these conditions are satisfied, the risk weight is the greater of (i) 100% or (ii) the highest risk weight assigned to any of the underlying individual exposures covered by the facility.

Risk weights for eligible liquidity facilities

576. For eligible liquidity facilities as defined in paragraph 578 and where the conditions for use of external credit assessments in paragraph 565 are not met, the risk weight applied to the exposure's credit equivalent amount is equal to the highest risk weight assigned to any of the underlying individual exposures covered by the facility.

(iv) Credit conversion factors for off-balance sheet exposures

577. For risk-based capital purposes, banks must determine whether, according to the criteria outlined below, an off-balance sheet securitisation exposure qualifies as an 'eligible liquidity facility' or an 'eligible servicer cash advance facility'. All other off-balance sheet securitisation exposures will receive a 100% CCF.

Eligible liquidity facilities

578. Banks are permitted to treat off-balance sheet securitisation exposures as eligible liquidity facilities if the following minimum requirements are satisfied:

(a) The facility documentation must clearly identify and limit the circumstances under which it may be drawn. Draws under the facility must be limited to the amount that is likely to be repaid fully from the liquidation of the underlying exposures and any seller-provided credit enhancements. In addition, the facility must not cover any losses incurred in the underlying pool of exposures prior to a draw, or be structured such that draw-down is certain (as indicated by regular or continuous draws);

(b) The facility must be subject to an asset quality test that precludes it from being drawn to cover credit risk exposures that are in default as defined in paragraphs 452 to 459. In addition, if the exposures that a liquidity facility is required to fund are externally rated securities, the facility can only be used to fund securities that are externally rated investment grade at the time of funding;

(c) The facility cannot be drawn after all applicable (e.g. transaction-specific and programme-wide) credit enhancements from which the liquidity would benefit have been exhausted; and

(d) Repayment of draws on the facility (i.e. assets acquired under a purchase agreement or loans made under a lending agreement) must not be subordinated to any interests of any note holder in the programme (e.g. ABCP programme) or subject to deferral or waiver.

579. Where these conditions are met, the bank may apply a 20% CCF to the amount of eligible liquidity facilities with an original maturity of one year or less, or a 50% CCF if the facility has an original maturity of more than one year. However, if an external rating of the facility itself is used for risk-weighting the facility, a 100% CCF must be applied.

Eligible liquidity facilities available only in the event of market disruption

580. Banks may apply a 0% CCF to eligible liquidity facilities that are only available in the event of a general market disruption (i.e. whereupon more than one SPE across different transactions are unable to roll over maturing commercial paper, and that inability is not the result of an impairment in the SPEs' credit quality or in the credit quality of the underlying exposures). To qualify for this treatment, the conditions provided in paragraph 578 must be satisfied. Additionally, the funds advanced by the bank to pay holders of the capital market instruments (e.g. commercial paper) when there is a general market disruption must be secured by the underlying assets, and must rank at least *pari passu* with the claims of holders of the capital market instruments.

Treatment of overlapping exposures

581. A bank may provide several types of facilities that can be drawn under various conditions. The same bank may be providing two or more of these facilities. Given the different triggers found in these facilities, it may be the case that a bank provides duplicative coverage to the underlying exposures. In other words, the facilities provided by a bank may overlap since a draw on one facility may preclude (in part) a draw under the other facility. In the case of overlapping facilities provided by the same bank, the bank does not need to hold additional capital for the overlap. Rather, it is only required to hold capital once for the position covered by the overlapping facilities (whether they are liquidity facilities or credit enhancements). Where the overlapping facilities are subject to different conversion factors, the bank must attribute the overlapping part to the facility with the highest conversion factor. However, if overlapping facilities are provided by different banks, each bank must hold capital for the maximum amount of the facility.

Eligible servicer cash advance facilities

582. Subject to national discretion, if contractually provided for, servicers may advance cash to ensure an uninterrupted flow of payments to investors so long as the servicer is entitled to full reimbursement and this right is senior to other claims on cash flows from the underlying pool of exposures. At national discretion, such undrawn servicer cash advances or facilities that are unconditionally cancellable without prior notice may be eligible for a 0% CCF.

(v) Treatment of credit risk mitigation for securitisation exposures

583. The treatment below applies to a bank that has obtained a credit risk mitigant on a securitisation exposure. Credit risk mitigants include guarantees, credit derivatives, collateral and on-balance sheet netting. Collateral in this context refers to that used to hedge the credit risk of a securitisation exposure rather than the underlying exposures of the securitisation transaction.

584. When a bank other than the originator provides credit protection to a securitisation exposure, it must calculate a capital requirement on the covered exposure as if it were an investor in that securitisation. If a bank provides protection to an unrated credit enhancement, it must treat the credit protection provided as if it were directly holding the unrated credit enhancement.

Collateral

585. Eligible collateral is limited to that recognised under the standardised approach for CRM (paragraphs 145 and 146). Collateral pledged by SPEs may be recognised.

Guarantees and credit derivatives

586. Credit protection provided by the entities listed in paragraph 195 may be recognised. SPEs cannot be recognised as eligible guarantors.

587. Where guarantees or credit derivatives fulfil the minimum operational conditions as specified in paragraphs 189 to 194, banks can take account of such credit protection in calculating capital requirements for securitisation exposures.

588. Capital requirements for the guaranteed/protected portion will be calculated according to CRM for the standardised approach as specified in paragraphs 196 to 201.

Maturity mismatches

589. For the purpose of setting regulatory capital against a maturity mismatch, the capital requirement will be determined in accordance with paragraphs 202 to 205. When the exposures being hedged have different maturities, the longest maturity must be used.

(vi) Capital requirement for early amortisation provisions

Scope

590. As described below, an originating bank is required to hold capital against all or a portion of the investors' interest (i.e. against both the drawn and undrawn balances related to the securitised exposures) when:

(a) It sells exposures into a structure that contains an early amortisation feature; and

(b) The exposures sold are of a revolving nature. These involve exposures where the borrower is permitted to vary the drawn amount and repayments within an agreed limit under a line of credit (e.g. credit card receivables and corporate loan commitments).

591. The capital requirement should reflect the type of mechanism through which an early amortisation is triggered.

592. For securitisation structures wherein the underlying pool comprises revolving and term exposures, a bank must apply the relevant early amortisation treatment (outlined below in paragraphs 594 to 605) to that portion of the underlying pool containing revolving exposures.

593. Banks are not required to calculate a capital requirement for early amortisations in the following situations:

(a) Replenishment structures where the underlying exposures do not revolve and the early amortisation ends the ability of the bank to add new exposures;

(b) Transactions of revolving assets containing early amortisation features that mimic term structures (i.e. where the risk on the underlying facilities does not return to the originating bank);

(c) Structures where a bank securitises one or more credit line(s) and where investors remain fully exposed to future draws by borrowers even after an early amortisation event has occurred;

(d) The early amortisation clause is solely triggered by events not related to the performance of the securitised assets or the selling bank, such as material changes in tax laws or regulations.

Maximum capital requirement

594. For a bank subject to the early amortisation treatment, the total capital charge for all of its positions will be subject to a maximum capital requirement (i.e. a 'cap') equal to the greater of (i) that required for retained securitisation exposures, or (ii) the capital requirement that would apply had the exposures not been securitised. In addition, banks must deduct the entire amount of any gain-on-sale and credit enhancing I/Os arising from the securitisation transaction in accordance with paragraphs 561 to 563.

Mechanics

595. The originator's capital charge for the investors' interest is determined as the product of (a) the investors' interest, (b) the appropriate CCF (as discussed below), and (c) the risk weight appropriate to the underlying exposure type, as if the exposures had not been securitised. As described below, the CCFs depend upon whether the early amortisation repays investors through a controlled or non-controlled mechanism. They also differ according to whether the securitised exposures are uncommitted retail credit lines (e.g. credit card receivables) or other credit lines (e.g. revolving corporate facilities). A line is considered uncommitted if it is unconditionally cancellable without prior notice.

(vii) Determination of CCFs for controlled early amortisation features

596. An early amortisation feature is considered controlled when the definition as specified in paragraph 548 is satisfied.

Uncommitted retail exposures

597. For uncommitted retail credit lines (e.g. credit card receivables) in securitisations containing controlled early amortisation features, banks must compare the three-month average excess spread defined in paragraph 550 to the point at which the bank is required to trap excess spread as economically required by the structure (i.e. excess spread trapping point).

598. In cases where such a transaction does not require excess spread to be trapped, the trapping point is deemed to be 4.5 percentage points.

599. The bank must divide the excess spread level by the transaction's excess spread trapping point to determine the appropriate segments and apply the corresponding conversion factors, as outlined in the following table.

Controlled early amortisation features

	Uncommitted	**Committed**
Retail credit lines	**3-month average excess spread Credit Conversion Factor (CCF)** 133.33% of trapping point or more 0% CCF less than 133.33% to 100% of trapping point 1% CCF less than 100% to 75% of trapping point 2% CCF less than 75% to 50% of trapping point 10% CCF less than 50% to 25% of trapping point 20% CCF less than 25% 40% CCF	90% CCF
Non-retail credit lines	90% CCF	90% CCF

600. Banks are required to apply the conversion factors set out above for controlled mechanisms to the investors' interest referred to in paragraph 595.

Other exposures

601. All other securitised revolving exposures (i.e. those that are committed and all non-retail exposures) with controlled early amortisation features will be subject to a CCF of 90% against the off-balance sheet exposures.

(viii) Determination of CCFs for non-controlled early amortisation features

602. Early amortisation features that do not satisfy the definition of a controlled early amortisation as specified in paragraph 548 will be considered non-controlled and treated as follows.

Uncommitted retail exposures

603. For uncommitted retail credit lines (e.g. credit card receivables) in securitisations containing non-controlled early amortisation features, banks must make the comparison described in paragraphs 597 and 598:

604. The bank must divide the excess spread level by the transaction's excess spread trapping point to determine the appropriate segments and apply the corresponding conversion factors, as outlined in the following table.

Non-controlled early amortisation features

	Uncommitted	Committed
Retail credit lines	**3-month average excess spread Credit Conversion Factor (CCF)** 133.33% or more of trapping point 0% CCF less than 133.33% to 100% of trapping point 5% CCF less than 100% to 75% of trapping point 15% CCF less than 75% to 50% of trapping point 50% CCF less than 50% of trapping point 100% CCF	100% CCF
Non-retail credit lines	100% CCF	100% CCF

Other exposures

605. All other securitised revolving exposures (i.e. those that are committed and all non-retail exposures) with non-controlled early amortisation features will be subject to a CCF of 100% against the off-balance sheet exposures.

4. Internal ratings-based approach for securitisation exposures

(i) Scope

606. Banks that have received approval to use the IRB approach for the type of underlying exposures securitised (e.g. for their corporate or retail portfolio) must use the IRB approach for securitisations. Conversely, banks may not use the IRB approach to securitisation unless they receive approval to use the IRB approach for the underlying exposures from their national supervisors.

607. If the bank is using the IRB approach for some exposures and the standardised approach for other exposures in the underlying pool, it should generally use the approach corresponding to the predominant share of exposures within the pool. The bank should consult with its national supervisors on which approach to apply to its securitisation exposures. To ensure appropriate capital levels, there may be instances where the supervisor requires a treatment other than this general rule.

608. Where there is no specific IRB treatment for the underlying asset type, originating banks that have received approval to use the IRB approach must calculate capital charges on their securitisation exposures using the standardised approach in the securitisation framework, and investing banks with approval to use the IRB approach must apply the RBA.

(ii) Hierarchy of approaches

609. The Ratings-Based Approach (RBA) must be applied to securitisation exposures that are rated, or where a rating can be inferred as described in paragraph 617. Where an external or an inferred rating is not available, either the Supervisory Formula (SF) or the Internal Assessment Approach (IAA) must be applied. The IAA is only available to exposures (e.g. liquidity facilities and credit enhancements) that banks (including third-party banks) extend to ABCP programmes. Such exposures must satisfy the conditions of paragraphs 619 and 620. For liquidity facilities to which none of these approaches can be applied, banks may apply the treatment specified in paragraph 639. Exceptional treatment for eligible servicer cash advance facilities is specified in paragraph 641. Securitisation exposures to which none of these approaches can be applied must be deducted.

(iii) Maximum capital requirement

610. For a bank using the IRB approach to securitisation, the maximum capital requirement for the securitisation exposures it holds is equal to the IRB capital requirement that would have been assessed against the underlying exposures had they not been securitised and treated under the appropriate sections of the IRB framework including Section III.G. In addition, banks must deduct the entire amount of any gain-on-sale and credit enhancing I/Os arising from the securitisation transaction in accordance with paragraphs 561 to 563.

(iv) Ratings-Based Approach (RBA)

611. Under the RBA, the risk-weighted assets are determined by multiplying the amount of the exposure by the appropriate risk weights, provided in the tables below.

612. The risk weights depend on (i) the external rating grade or an available inferred rating, (ii) whether the credit rating (external or inferred) represents a long-term or a short-term credit rating, (iii) the granularity of the underlying pool and (iv) the seniority of the position.

613. For purposes of the RBA, a securitisation exposure is treated as a senior tranche if it is effectively backed or secured by a first claim on the entire amount of the assets in the underlying securitised pool. While this generally includes only the most senior position within a securitisation transaction, in some instances there may be some other claim that, in a technical sense, may be more senior in the waterfall (e.g. a swap claim) but may be disregarded for the purpose of determining which positions are subject to the “senior tranches” column.

Examples:

(a) In a typical synthetic securitisation, the “super-senior” tranche would be treated as a senior tranche, provided that all of the conditions for inferring a rating from a lower tranche are fulfilled.

(b) In a traditional securitisation where all tranches above the first-loss piece are rated, the most highly rated position would be treated as a senior tranche. However, when there are several tranches that share the same rating, only the most senior one in the waterfall would be treated as senior.

(c) Usually a liquidity facility supporting an ABCP programme would not be the most senior position within the programme; the commercial paper, which benefits from the liquidity support, typically would be the most senior position. However, if the liquidity facility is sized to cover all of the outstanding commercial paper, it can be viewed as covering all losses on the underlying receivables pool that exceed the amount of over-collateralisation/reserves provided by the seller and as being most senior. As a result, the RBA risk weights in the left-most column can be used for such positions. On the other hand, if a liquidity or credit enhancement facility constituted a mezzanine position in economic substance rather than a senior position in the underlying pool, then the "Base risk weights" column is applicable.

614. The risk weights provided in the first table below apply when the external assessment represents a long-term credit rating, as well as when an inferred rating based on a long-term rating is available.

615. Banks may apply the risk weights for senior positions if the effective number of underlying exposures (N, as defined in paragraph 633) is 6 or more and the position is senior as defined above. When N is less than 6, the risk weights in column 4 of the first table below apply. In all other cases, the risk weights in column 3 of the first table below apply.

RBA risk weights when the external assessment represents a long-term credit rating and/or an inferred rating derived from a long-term assessment

<table>
<tr><th>External Rating (Illustrative)</th><th>Risk weights for senior positions and eligible senior IAA exposures</th><th>Base risk weights</th><th>Risk weights for tranches backed by non-granular pools</th></tr>
<tr><td>AAA</td><td>7%</td><td>12%</td><td>20%</td></tr>
<tr><td>AA</td><td>8%</td><td>15%</td><td>25%</td></tr>
<tr><td>A+</td><td>10%</td><td>18%</td><td rowspan="3">35%</td></tr>
<tr><td>A</td><td>12%</td><td>20%</td></tr>
<tr><td>A-</td><td>20%</td><td>35%</td></tr>
<tr><td>BBB+</td><td>35%</td><td colspan="2">50%</td></tr>
<tr><td>BBB</td><td>60%</td><td colspan="2">75%</td></tr>
<tr><td>BBB-</td><td colspan="3">100%</td></tr>
<tr><td>BB+</td><td colspan="3">250%</td></tr>
<tr><td>BB</td><td colspan="3">425%</td></tr>
<tr><td>BB-</td><td colspan="3">650%</td></tr>
<tr><td>Below BB- and unrated</td><td colspan="3">Deduction</td></tr>
</table>

616. The risk weights in the table below apply when the external assessment represents a short-term credit rating, as well as when an inferred rating based on a short-term rating is available. The decision rules outlined in paragraph 615 also apply for short-term credit ratings.

RBA risk weights when the external assessment represents a short-term credit rating and/or an inferred rating derived from a short-term assessment

External Rating (Illustrative)	Risk weights for senior positions and eligible senior IAA exposures	Base risk weights	Risk weights for tranches backed by non-granular pools
A-1/P-1	7%	12%	20%
A-2/P-2	12%	20%	35%
A-3/P-3	60%	75%	75%
All other ratings/unrated	Deduction	Deduction	Deduction

Use of inferred ratings

617. When the following minimum operational requirements are satisfied a bank must attribute an inferred rating to an unrated position. These requirements are intended to ensure that the unrated position is senior in all respects to an externally rated securitisation exposure termed the 'reference securitisation exposure'.

Operational requirements for inferred ratings

618. The following operational requirements must be satisfied to recognise inferred ratings.

(a) The reference securitisation exposure (e.g. ABS) must be subordinate in all respects to the unrated securitisation exposure. Credit enhancements, if any, must be taken into account when assessing the relative subordination of the unrated exposure and the reference securitisation exposure. For example, if the reference securitisation exposure benefits from any third-party guarantees or other credit enhancements that are not available to the unrated exposure, then the latter may not be assigned an inferred rating based on the reference securitisation exposure.

(b) The maturity of the reference securitisation exposure must be equal to or longer than that of the unrated exposure.

(c) On an ongoing basis, any inferred rating must be updated continuously to reflect any changes in the external rating of the reference securitisation exposure.

(d) The external rating of the reference securitisation exposure must satisfy the general requirements for recognition of external ratings as delineated in paragraph 565.

(v) Internal Assessment Approach (IAA)

619. A bank may use its internal assessments of the credit quality of the securitisation exposures the bank extends to ABCP programmes (e.g. liquidity facilities and credit enhancements) if the bank's internal assessment process meets the operational requirements below. Internal assessments of exposures provided to ABCP programmes must be mapped to equivalent external ratings of an ECAI. Those rating equivalents are used to determine the appropriate risk weights under the RBA for purposes of assigning the notional amounts of the exposures.

620. A bank's internal assessment process must meet the following operational requirements in order to use internal assessments in determining the IRB capital requirement

arising from liquidity facilities, credit enhancements, or other exposures extended to an ABCP programme.

(a) For the unrated exposure to qualify for the IAA, the ABCP must be externally rated. The ABCP itself is subject to the RBA.

(b) The internal assessment of the credit quality of a securitisation exposure to the ABCP programme must be based on an ECAI criteria for the asset type purchased and must be the equivalent of at least investment grade when initially assigned to an exposure. In addition, the internal assessment must be used in the bank's internal risk management processes, including management information and economic capital systems, and generally must meet all the relevant requirements of the IRB framework.

(c) In order for banks to use the IAA, their supervisors must be satisfied (i) that the ECAI meets the ECAI eligibility criteria outlined in paragraphs 90 to 108 and (ii) with the ECAI rating methodologies used in the process. In addition, banks have the responsibility to demonstrate to the satisfaction of their supervisors how these internal assessments correspond with the relevant ECAI's standards.

For instance, when calculating the credit enhancement level in the context of the IAA, supervisors may, if warranted, disallow on a full or partial basis any seller-provided recourse guarantees or excess spread, or any other first loss credit enhancements that provide limited protection to the bank.

(d) The bank's internal assessment process must identify gradations of risk. Internal assessments must correspond to the external ratings of ECAIs so that supervisors can determine which internal assessment corresponds to each external rating category of the ECAIs.

(e) The bank's internal assessment process, particularly the stress factors for determining credit enhancement requirements, must be at least as conservative as the publicly available rating criteria of the major ECAIs that are externally rating the ABCP programme's commercial paper for the asset type being purchased by the programme. However, banks should consider, to some extent, all publicly available ECAI ratings methodologies in developing their internal assessments.

- In the case where (i) the commercial paper issued by an ABCP programme is externally rated by two or more ECAIs and (ii) the different ECAIs' benchmark stress factors require different levels of credit enhancement to achieve the same external rating equivalent, the bank must apply the ECAI stress factor that requires the most conservative or highest level of credit protection. For example, if one ECAI required enhancement of 2.5 to 3.5 times historical losses for an asset type to obtain a single A rating equivalent and another required 2 to 3 times historical losses, the bank must use the higher range of stress factors in determining the appropriate level of seller-provided credit enhancement.

- When selecting ECAIs to externally rate an ABCP, a bank must not choose only those ECAIs that generally have relatively less restrictive rating methodologies. In addition, if there are changes in the methodology of one of the selected ECAIs, including the stress factors, that adversely affect the external rating of the programme's commercial paper, then the revised rating methodology must be considered in evaluating whether the internal assessments assigned to ABCP programme exposures are in need of revision.

- A bank cannot utilise an ECAI's rating methodology to derive an internal assessment if the ECAI's process or rating criteria is not publicly available. However, banks should consider the non-publicly available methodology — to the extent that they have access to such information – in developing their internal assessments, particularly if it is more conservative than the publicly available criteria.

- In general, if the ECAI rating methodologies for an asset or exposure are not publicly available, then the IAA may not be used. However, in certain instances, for example, for new or uniquely structured transactions, which are not currently addressed by the rating criteria of an ECAI rating the programme's commercial paper, a bank may discuss the specific transaction with its supervisor to determine whether the IAA may be applied to the related exposures.

(f) Internal or external auditors, an ECAI, or the bank's internal credit review or risk management function must perform regular reviews of the internal assessment process and assess the validity of those internal assessments. If the bank's internal audit, credit review, or risk management functions perform the reviews of the internal assessment process, then these functions must be independent of the ABCP programme business line, as well as the underlying customer relationships.

(g) The bank must track the performance of its internal assessments over time to evaluate the performance of the assigned internal assessments and make adjustments, as necessary, to its assessment process when the performance of the exposures routinely diverges from the assigned internal assessments on those exposures.

(h) The ABCP programme must have credit and investment guidelines, i.e. underwriting standards, for the ABCP programme. In the consideration of an asset purchase, the ABCP programme (i.e. the programme administrator) should develop an outline of the structure of the purchase transaction. Factors that should be discussed include the type of asset being purchased; type and monetary value of the exposures arising from the provision of liquidity facilities and credit enhancements; loss waterfall; and legal and economic isolation of the transferred assets from the entity selling the assets.

(i) A credit analysis of the asset seller's risk profile must be performed and should consider, for example, past and expected future financial performance; current market position; expected future competitiveness; leverage, cash flow, and interest coverage; and debt rating. In addition, a review of the seller's underwriting standards, servicing capabilities, and collection processes should be performed.

(j) The ABCP programme's underwriting policy must establish minimum asset eligibility criteria that, among other things,

- exclude the purchase of assets that are significantly past due or defaulted;

- limit excess concentration to individual obligor or geographic area; and

- limit the tenor of the assets to be purchased.

(k) The ABCP programme should have collections processes established that consider the operational capability and credit quality of the servicer. The programme should mitigate to the extent possible seller/servicer risk through various methods, such as triggers based on current credit quality that would preclude co-mingling of funds and impose lockbox arrangements that would help ensure the continuity of payments to the ABCP programme.

(l) The aggregate estimate of loss on an asset pool that the ABCP programme is considering purchasing must consider all sources of potential risk, such as credit and dilution risk. If the seller-provided credit enhancement is sized based on only credit-related losses, then a separate reserve should be established for dilution risk, if dilution risk is material for the particular exposure pool. In addition, in sizing the required enhancement level, the bank should review several years of historical information, including losses, delinquencies, dilutions, and the turnover rate of the receivables. Furthermore, the bank should evaluate the characteristics of the underlying asset pool, e.g. weighted average credit score, identify any concentrations to an individual obligor or geographic region, and the granularity of the asset pool.

(m) The ABCP programme must incorporate structural features into the purchase of assets in order to mitigate potential credit deterioration of the underlying portfolio. Such features may include wind down triggers specific to a pool of exposures.

621. The notional amount of the securitisation exposure to the ABCP programme must be assigned to the risk weight in the RBA appropriate to the credit rating equivalent assigned to the bank's exposure.

622. If a bank's internal assessment process is no longer considered adequate, the bank's supervisor may preclude the bank from applying the internal assessment approach to its ABCP exposures, both existing and newly originated, for determining the appropriate capital treatment until the bank has remedied the deficiencies. In this instance, the bank must revert to the SF or, if not available, to the method described in paragraph 639.

(vi) Supervisory Formula (SF)

623. As in the IRB approaches, risk-weighted assets generated through the use of the SF are calculated by multiplying the capital charge by 12.5. Under the SF, the capital charge for a securitisation tranche depends on five bank-supplied inputs: the IRB capital charge had the underlying exposures not been securitised (K_{IRB}); the tranche's credit enhancement level (L) and thickness (T); the pool's effective number of exposures (N); and the pool's exposure-weighted average loss-given-default (LGD). The inputs K_{IRB}, L, T and N are defined below. The capital charge is calculated as follows:

(1) *Tranche's IRB capital charge* = the amount of exposures that have been securitised *times* the greater of (a) 0.0056 x T, or (b) (S [L+T] – S [L]),

where the function S[.] (termed the 'Supervisory Formula') is defined in the following paragraph. When the bank holds only a proportional interest in the tranche, that position's capital charge equals the prorated share of the capital charge for the entire tranche.

624. The Supervisory Formula is given by the following expression:

(2)
$$S[L] = \begin{cases} L & \text{when } L \le K_{IRB} \\ K_{IRB} + K[L] - K[K_{IRB}] + (d \cdot K_{IRB}/\omega)\left(1 - e^{\omega(K_{IRB}-L)/K_{IRB}}\right) & \text{when } K_{IRB} < L \end{cases}$$

where

$$h = \left(1 - K_{IRB}/LGD\right)^{N}$$
$$c = K_{IRB}/\left(1 - h\right)$$
$$v = \frac{\left(LGD - K_{IRB}\right)K_{IRB} + 0.25\left(1 - LGD\right)K_{IRB}}{N}$$
$$f = \left(\frac{v + K_{IRB}{}^{2}}{1-h} - c^{2}\right) + \frac{\left(1 - K_{IRB}\right)K_{IRB} - v}{\left(1-h\right)\tau}$$
$$g = \frac{\left(1-c\right)c}{f} - 1$$
$$a = g \cdot c$$
$$b = g \cdot \left(1 - c\right)$$
$$d = 1 - \left(1-h\right) \cdot \left(1 - Beta\left[K_{IRB}; a, b\right]\right)$$
$$K\left[L\right] = \left(1-h\right) \cdot \left(\left(1 - Beta\left[L; a, b\right]\right)L + Beta\left[L; a+1, b\right]c\right).$$

625. In these expressions, Beta[L; a, b] refers to the cumulative beta distribution with parameters a and b evaluated at L.[96]

626. The supervisory-determined parameters in the above expressions are as follows:

$$\tau = 1000, \text{ and } \omega = 20$$

Definition of K_{IRB}

627. K_{IRB} is the ratio of (a) the IRB capital requirement including the EL portion for the underlying exposures in the pool to (b) the exposure amount of the pool (e.g. the sum of drawn amounts related to securitised exposures plus the EAD associated with undrawn commitments related to securitised exposures). Quantity (a) above must be calculated in accordance with the applicable minimum IRB standards (as set out in Section III of this document) as if the exposures in the pool were held directly by the bank. This calculation should reflect the effects of any credit risk mitigant that is applied on the underlying exposures (either individually or to the entire pool), and hence benefits all of the securitisation exposures. K_{IRB} is expressed in decimal form (e.g. a capital charge equal to 15% of the pool would be expressed as 0.15). For structures involving an SPE, all the assets of the SPE that are related to the securitisations are to be treated as exposures in the pool, including assets in which the SPE may have invested a reserve account, such as a cash collateral account.

628. If the risk weight resulting from the SF is 1250%, banks must deduct the securitisation exposure subject to that risk weight in accordance with paragraphs 561 to 563.

629. In cases where a bank has set aside a specific provision or has a non-refundable purchase price discount on an exposure in the pool, quantity (a) defined above and quantity (b) also defined above must be calculated using the gross amount of the exposure without the specific provision and/or non-refundable purchase price discount. In this case, the amount of the non-refundable purchase price discount on a defaulted asset or the specific

96 The cumulative beta distribution function is available, for example, in Excel as the function BETADIST.

provision can be used to reduce the amount of any deduction from capital associated with the securitisation exposure.

Credit enhancement level (L)

630. L is measured (in decimal form) as the ratio of (a) the amount of all securitisation exposures subordinate to the tranche in question to (b) the amount of exposures in the pool. Banks will be required to determine L before considering the effects of any tranche-specific credit enhancements, such as third-party guarantees that benefit only a single tranche. Any gain-on-sale and/or credit enhancing I/Os associated with the securitisation are not to be included in the measurement of L. The size of interest rate or currency swaps that are more junior than the tranche in question may be measured at their current values (without the potential future exposures) in calculating the enhancement level. If the current value of the instrument cannot be measured, the instrument should be ignored in the calculation of L.

631. If there is any reserve account funded by accumulated cash flows from the underlying exposures that is more junior than the tranche in question, this can be included in the calculation of L. Unfunded reserve accounts may not be included if they are to be funded from future receipts from the underlying exposures.

Thickness of exposure (T)

632. T is measured as the ratio of (a) the nominal size of the tranche of interest to (b) the notional amount of exposures in the pool. In the case of an exposure arising from an interest rate or currency swap, the bank must incorporate potential future exposure. If the current value of the instrument is non-negative, the exposure size should be measured by the current value plus the add-on as in Section VII of Annex 4. If the current value is negative, the exposure should be measured by using the potential future exposure only.

Effective number of exposures (N)

633. The effective number of exposures is calculated as:

(3) $$N = \frac{\left(\sum_i EAD_i\right)^2}{\sum_i EAD_i^2}$$

where EAD_i represents the exposure-at-default associated with the i^{th} instrument in the pool. Multiple exposures to the same obligor must be consolidated (i.e. treated as a single instrument). In the case of re-securitisation (securitisation of securitisation exposures), the formula applies to the number of securitisation exposures in the pool and not the number of underlying exposures in the original pools. If the portfolio share associated with the largest exposure, C_1, is available, the bank may compute N as $1/C_1$.

Exposure-weighted average LGD

634. The exposure-weighted average LGD is calculated as follows:

(4) $$LGD = \frac{\sum_i LGD_i \cdot EAD_i}{\sum_i EAD_i}$$

where LGD_i represents the average LGD associated with all exposures to the i^{th} obligor. In the case of re-securitisation, an LGD of 100% must be assumed for the underlying securitised exposures. When default and dilution risks for purchased receivables are treated in an aggregate manner (e.g. a single reserve or over-collateralisation is available to cover losses from either source) within a securitisation, the LGD input must be constructed as a weighted-average of the LGD for default risk and the 100% LGD for dilution risk. The weights are the stand-alone IRB capital charges for default risk and dilution risk, respectively.

Simplified method for computing N and LGD

635. For securitisations involving retail exposures, subject to supervisory review, the SF may be implemented using the simplifications: $h = 0$ and $v = 0$.

636. Under the conditions provided below, banks may employ a simplified method for calculating the effective number of exposures and the exposure-weighted average LGD. Let C_m in the simplified calculation denote the share of the pool corresponding to the sum of the largest 'm' exposures (e.g. a 15% share corresponds to a value of 0.15). The level of m is set by each bank.

- If the portfolio share associated with the largest exposure, C_1, is no more than 0.03 (or 3% of the underlying pool), then for purposes of the SF, the bank may set LGD=0.50 and N equal to the following amount

(5) $$N = \left(C_1 C_m + \left(\frac{C_m - C_1}{m-1} \right) \max\{1 - m C_1, 0\} \right)^{-1}$$

- Alternatively, if only C_1 is available and this amount is no more than 0.03, then the bank may set LGD=0.50 and N=1/ C_1.

(vii) Liquidity facilities

637. Liquidity facilities are treated as any other securitisation exposure and receive a CCF of 100% unless specified differently in paragraphs 638 to 641. If the facility is externally rated, the bank may rely on the external rating under the RBA. If the facility is not rated and an inferred rating is not available, the bank must apply the SF, unless the IAA can be applied.

638. An eligible liquidity facility that can only be drawn in the event of a general market disruption as defined in paragraph 580 is assigned a 20% CCF under the SF. That is, an IRB bank is to recognise 20% of the capital charge generated under the SF for the facility. If the eligible facility is externally rated, the bank may rely on the external rating under the RBA provided it assigns a 100% CCF rather than a 20% CCF to the facility.

639. When it is not practical for the bank to use either the bottom-up approach or the top-down approach for calculating K_{IRB}, the bank may, on an exceptional basis and subject to supervisory consent, temporarily be allowed to apply the following method. If the liquidity facility meets the definition in paragraph 578 or 580, the highest risk weight assigned under the standardised approach to any of the underlying individual exposures covered by the liquidity facility can be applied to the liquidity facility. If the liquidity facility meets the definition in paragraph 578, the CCF must be 50% for a facility with an original maturity of one year or less, or 100% if the facility has an original maturity of more than one year. If the liquidity facility meets the definition in paragraph 580, the CCF must be 20%. In all other cases, the notional amount of the liquidity facility must deducted.

(viii) Treatment of overlapping exposures

640. Overlapping exposures are treated as described in paragraph 581.

(ix) Eligible servicer cash advance facilities

641. Eligible servicer cash advance facilities are treated as specified in paragraph 582.

(x) Treatment of credit risk mitigation for securitisation exposures

642. As with the RBA, banks are required to apply the CRM techniques as specified in the foundation IRB approach of Section III when applying the SF. The bank may reduce the capital charge proportionally when the credit risk mitigant covers first losses or losses on a proportional basis. For all other cases, the bank must assume that the credit risk mitigant covers the most senior portion of the securitisation exposure (i.e. that the most junior portion of the securitisation exposure is uncovered). Examples for recognising collateral and guarantees under the SF are provided in Annex 7.

(xi) Capital requirement for early amortisation provisions

643. An originating bank must use the methodology and treatment described in paragraphs 590 to 605 for determining if any capital must be held against the investors' interest. For banks using the IRB approach to securitisation, investors' interest is defined as investors' drawn balances related to securitisation exposures and EAD associated with investors' undrawn lines related to securitisation exposures. For determining the EAD, the undrawn balances of securitised exposures would be allocated between the seller's and investors' interests on a pro rata basis, based on the proportions of the seller's and investors' shares of the securitised drawn balances. For IRB purposes, the capital charge attributed to the investors' interest is determined by the product of (a) the investors' interest, (b) the appropriate CCF, and (c) K_{IRB}.

V. Operational Risk

A. Definition of operational risk

644. Operational risk is defined as the risk of loss resulting from inadequate or failed internal processes, people and systems or from external events. This definition includes legal risk,[97] but excludes strategic and reputational risk.

B. The measurement methodologies

645. The framework outlined below presents three methods for calculating operational risk capital charges in a continuum of increasing sophistication and risk sensitivity: (i) the Basic Indicator Approach; (ii) the Standardised Approach; and (iii) Advanced Measurement Approaches (AMA).

646. Banks are encouraged to move along the spectrum of available approaches as they develop more sophisticated operational risk measurement systems and practices. Qualifying criteria for the Standardised Approach and AMA are presented below.

647. Internationally active banks and banks with significant operational risk exposures (for example, specialised processing banks) are expected to use an approach that is more sophisticated than the Basic Indicator Approach and that is appropriate for the risk profile of the institution.[98] A bank will be permitted to use the Basic Indicator or Standardised Approach for some parts of its operations and an AMA for others provided certain minimum criteria are met, see paragraphs 680 to 683.

648. A bank will not be allowed to choose to revert to a simpler approach once it has been approved for a more advanced approach without supervisory approval. However, if a supervisor determines that a bank using a more advanced approach no longer meets the qualifying criteria for this approach, it may require the bank to revert to a simpler approach for some or all of its operations, until it meets the conditions specified by the supervisor for returning to a more advanced approach.

1. The Basic Indicator Approach

649. Banks using the Basic Indicator Approach must hold capital for operational risk equal to the average over the previous three years of a fixed percentage (denoted alpha) of positive annual gross income. Figures for any year in which annual gross income is negative or zero should be excluded from both the numerator and denominator when calculating the average.[99] The charge may be expressed as follows:

$$K_{BIA} = \left[\sum\left(GI_{1\ldots n} \times \alpha\right)\right]/n$$

[97] Legal risk includes, but is not limited to, exposure to fines, penalties, or punitive damages resulting from supervisory actions, as well as private settlements.

[98] Supervisors will review the capital requirement produced by the operational risk approach used by a bank (whether Basic Indicator Approach, Standardised Approach or AMA) for general credibility, especially in relation to a firm's peers. In the event that credibility is lacking, appropriate supervisory action under Pillar 2 will be considered.

[99] If negative gross income distorts a bank's Pillar 1 capital charge, supervisors will consider appropriate supervisory action under Pillar 2.

where:

K_{BIA} = the capital charge under the Basic Indicator Approach

GI = annual gross income, where positive, over the previous three years

N = number of the previous three years for which gross income is positive

α = 15%, which is set by the Committee, relating the industry wide level of required capital to the industry wide level of the indicator.

650. Gross income is defined as net interest income plus net non-interest income.[100] It is intended that this measure should: (i) be gross of any provisions (e.g. for unpaid interest); (ii) be gross of operating expenses, including fees paid to outsourcing service providers;[101] (iii) exclude realised profits/losses from the sale of securities in the banking book;[102] and (iv) exclude extraordinary or irregular items as well as income derived from insurance.

651. As a point of entry for capital calculation, no specific criteria for use of the Basic Indicator Approach are set out in this Framework. Nevertheless, banks using this approach are encouraged to comply with the Committee's guidance on *Sound Practices for the Management and Supervision of Operational Risk*, February 2003.

---

[100] As defined by national supervisors and/or national accounting standards.

[101] In contrast to fees paid for services that are outsourced, fees received by banks that provide outsourcing services shall be included in the definition of gross income.

[102] Realised profits/losses from securities classified as "held to maturity" and "available for sale", which typically constitute items of the banking book (e.g. under certain accounting standards), are also excluded from the definition of gross income.

2. The Standardised Approach[103,104]

652. In the Standardised Approach, banks' activities are divided into eight business lines: corporate finance, trading & sales, retail banking, commercial banking, payment & settlement, agency services, asset management, and retail brokerage. The business lines are defined in detail in Annex 8.

653. Within each business line, gross income is a broad indicator that serves as a proxy for the scale of business operations and thus the likely scale of operational risk exposure within each of these business lines. The capital charge for each business line is calculated by multiplying gross income by a factor (denoted beta) assigned to that business line. Beta serves as a proxy for the industry-wide relationship between the operational risk loss experience for a given business line and the aggregate level of gross income for that business line. It should be noted that in the Standardised Approach gross income is measured for each business line, not the whole institution, i.e. in corporate finance, the indicator is the gross income generated in the corporate finance business line.

---

[103] The Committee intends to reconsider the calibration of the Basic Indicator and Standardised Approaches when more risk-sensitive data are available to carry out this recalibration. Any such recalibration would not be intended to affect significantly the overall calibration of the operational risk component of the Pillar 1 capital charge.

[104] **The Alternative Standardised Approach**

At national supervisory discretion a supervisor can choose to allow a bank to use the Alternative Standardised Approach (ASA) provided the bank is able to satisfy its supervisor that this alternative approach provides an improved basis by, for example, avoiding double counting of risks. Once a bank has been allowed to use the ASA, it will not be allowed to revert to use of the Standardised Approach without the permission of its supervisor. It is not envisaged that large diversified banks in major markets would use the ASA.

Under the ASA, the operational risk capital charge/methodology is the same as for the Standardised Approach except for two business lines — retail banking and commercial banking. For these business lines, loans and advances — multiplied by a fixed factor 'm' — replaces gross income as the exposure indicator. The betas for retail and commercial banking are unchanged from the Standardised Approach. The ASA operational risk capital charge for retail banking (with the same basic formula for commercial banking) can be expressed as:

$$\mathbf{K_{RB} = \beta_{RB} \times m \times LA_{RB}}$$

where

K_{RB} is the capital charge for the retail banking business line

β_{RB} is the beta for the retail banking business line

LA_{RB} is total outstanding retail loans and advances (non-risk weighted and gross of provisions), averaged over the past three years

m is 0.035

For the purposes of the ASA, total loans and advances in the retail banking business line consists of the total drawn amounts in the following credit portfolios: retail, SMEs treated as retail, and purchased retail receivables. For commercial banking, total loans and advances consists of the drawn amounts in the following credit portfolios: corporate, sovereign, bank, specialised lending, SMEs treated as corporate and purchased corporate receivables. The book value of securities held in the banking book should also be included.

Under the ASA, banks may aggregate retail and commercial banking (if they wish to) using a beta of 15%. Similarly, those banks that are unable to disaggregate their gross income into the other six business lines can aggregate the total gross income for these six business lines using a beta of 18%, with negative gross income treated as described in paragraph 654.

As under the Standardised Approach, the total capital charge for the ASA is calculated as the simple summation of the regulatory capital charges across each of the eight business lines.

654. The total capital charge is calculated as the three-year average of the simple summation of the regulatory capital charges across each of the business lines in each year. In any given year, negative capital charges (resulting from negative gross income) in any business line may offset positive capital charges in other business lines without limit.[105] However, where the aggregate capital charge across all business lines within a given year is negative, then the input to the numerator for that year will be zero.[106] The total capital charge may be expressed as:

$$K_{TSA} = \left\{ \sum_{\text{years } 1\text{-}3} \max\left[\sum \left(GI_{1\text{-}8} \times \beta_{1-8} \right), 0 \right] \right\} / 3$$

where:

K_{TSA} = the capital charge under the Standardised Approach

$GI_{1\text{-}8}$ = annual gross income in a given year, as defined above in the Basic Indicator Approach, for each of the eight business lines

$\beta_{1\text{-}8}$ = a fixed percentage, set by the Committee, relating the level of required capital to the level of the gross income for each of the eight business lines. The values of the betas are detailed below.

Business Lines	Beta Factors
Corporate finance (β_1)	18%
Trading and sales (β_2)	18%
Retail banking (β_3)	12%
Commercial banking (β_4)	15%
Payment and settlement (β_5)	18%
Agency services (β_6)	15%
Asset management (β_7)	12%
Retail brokerage (β_8)	12%

3. *Advanced Measurement Approaches (AMA)*

655. Under the AMA, the regulatory capital requirement will equal the risk measure generated by the bank's internal operational risk measurement system using the quantitative and qualitative criteria for the AMA discussed below. Use of the AMA is subject to supervisory approval.

656. A bank adopting the AMA may, with the approval of its host supervisors and the support of its home supervisor, use an allocation mechanism for the purpose of determining the regulatory capital requirement for internationally active banking subsidiaries that are not deemed to be significant relative to the overall banking group but are themselves subject to this Framework in accordance with Part 1. Supervisory approval would be conditional on the bank demonstrating to the satisfaction of the relevant supervisors that the allocation

[105] At national discretion, supervisors may adopt a more conservative treatment of negative gross income.

[106] As under the Basic Indicator Approach, if negative gross income distorts a bank's Pillar 1 capital charge under the Standardised Approach, supervisors will consider appropriate supervisory action under Pillar 2.

mechanism for these subsidiaries is appropriate and can be supported empirically. The board of directors and senior management of each subsidiary are responsible for conducting their own assessment of the subsidiary's operational risks and controls and ensuring the subsidiary is adequately capitalised in respect of those risks.

657. Subject to supervisory approval as discussed in paragraph 669(d), the incorporation of a well-reasoned estimate of diversification benefits may be factored in at the group-wide level or at the banking subsidiary level. However, any banking subsidiaries whose host supervisors determine that they must calculate stand-alone capital requirements (see Part 1) may not incorporate group-wide diversification benefits in their AMA calculations (e.g. where an internationally active banking subsidiary is deemed to be significant, the banking subsidiary may incorporate the diversification benefits of its own operations — those arising at the sub-consolidated level — but may not incorporate the diversification benefits of the parent).

658. The appropriateness of the allocation methodology will be reviewed with consideration given to the stage of development of risk-sensitive allocation techniques and the extent to which it reflects the level of operational risk in the legal entities and across the banking group. Supervisors expect that AMA banking groups will continue efforts to develop increasingly risk-sensitive operational risk allocation techniques, notwithstanding initial approval of techniques based on gross income or other proxies for operational risk.

659. Banks adopting the AMA will be required to calculate their capital requirement using this approach as well as the 1988 Accord as outlined in paragraph 46.

C. Qualifying criteria

1. The Standardised Approach[107]

660. In order to qualify for use of the Standardised Approach, a bank must satisfy its supervisor that, at a minimum:

- Its board of directors and senior management, as appropriate, are actively involved in the oversight of the operational risk management framework;
- It has an operational risk management system that is conceptually sound and is implemented with integrity; and
- It has sufficient resources in the use of the approach in the major business lines as well as the control and audit areas.

661. Supervisors will have the right to insist on a period of initial monitoring of a bank's Standardised Approach before it is used for regulatory capital purposes.

662. A bank must develop specific policies and have documented criteria for mapping gross income for current business lines and activities into the standardised framework. The criteria must be reviewed and adjusted for new or changing business activities as appropriate. The principles for business line mapping are set out in Annex 8.

[107] Supervisors allowing banks to use the Alternative Standardised Approach must decide on the appropriate qualifying criteria for that approach, as the criteria set forth in paragraphs 662 and 663 of this section may not be appropriate.

663. As some internationally active banks will wish to use the Standardised Approach, it is important that such banks have adequate operational risk management systems. Consequently, an internationally active bank using the Standardised Approach must meet the following additional criteria:[108]

(a) The bank must have an operational risk management system with clear responsibilities assigned to an operational risk management function. The operational risk management function is responsible for developing strategies to identify, assess, monitor and control/mitigate operational risk; for codifying firm-level policies and procedures concerning operational risk management and controls; for the design and implementation of the firm's operational risk assessment methodology; and for the design and implementation of a risk-reporting system for operational risk.

(b) As part of the bank's internal operational risk assessment system, the bank must systematically track relevant operational risk data including material losses by business line. Its operational risk assessment system must be closely integrated into the risk management processes of the bank. Its output must be an integral part of the process of monitoring and controlling the banks operational risk profile. For instance, this information must play a prominent role in risk reporting, management reporting, and risk analysis. The bank must have techniques for creating incentives to improve the management of operational risk throughout the firm.

(c) There must be regular reporting of operational risk exposures, including material operational losses, to business unit management, senior management, and to the board of directors. The bank must have procedures for taking appropriate action according to the information within the management reports.

(d) The bank's operational risk management system must be well documented. The bank must have a routine in place for ensuring compliance with a documented set of internal policies, controls and procedures concerning the operational risk management system, which must include policies for the treatment of non-compliance issues.

(e) The bank's operational risk management processes and assessment system must be subject to validation and regular independent review. These reviews must include both the activities of the business units and of the operational risk management function.

(f) The bank's operational risk assessment system (including the internal validation processes) must be subject to regular review by external auditors and/or supervisors.

2. Advanced Measurement Approaches (AMA)

(i) General standards

664. In order to qualify for use of the AMA a bank must satisfy its supervisor that, at a minimum:

---

[108] For other banks, these criteria are recommended, with national discretion to impose them as requirements.

- Its board of directors and senior management, as appropriate, are actively involved in the oversight of the operational risk management framework;
- It has an operational risk management system that is conceptually sound and is implemented with integrity; and
- It has sufficient resources in the use of the approach in the major business lines as well as the control and audit areas.

665. A bank's AMA will be subject to a period of initial monitoring by its supervisor before it can be used for regulatory purposes. This period will allow the supervisor to determine whether the approach is credible and appropriate. As discussed below, a bank's internal measurement system must reasonably estimate unexpected losses based on the combined use of internal and relevant external loss data, scenario analysis and bank-specific business environment and internal control factors. The bank's measurement system must also be capable of supporting an allocation of economic capital for operational risk across business lines in a manner that creates incentives to improve business line operational risk management.

(ii) Qualitative standards

666. A bank must meet the following qualitative standards before it is permitted to use an AMA for operational risk capital:

(a) The bank must have an independent operational risk management function that is responsible for the design and implementation of the bank's operational risk management framework. The operational risk management function is responsible for codifying firm-level policies and procedures concerning operational risk management and controls; for the design and implementation of the firm's operational risk measurement methodology; for the design and implementation of a risk-reporting system for operational risk; and for developing strategies to identify, measure, monitor and control/mitigate operational risk.

(b) The bank's internal operational risk measurement system must be closely integrated into the day-to-day risk management processes of the bank. Its output must be an integral part of the process of monitoring and controlling the bank's operational risk profile. For instance, this information must play a prominent role in risk reporting, management reporting, internal capital allocation, and risk analysis. The bank must have techniques for allocating operational risk capital to major business lines and for creating incentives to improve the management of operational risk throughout the firm.

(c) There must be regular reporting of operational risk exposures and loss experience to business unit management, senior management, and to the board of directors. The bank must have procedures for taking appropriate action according to the information within the management reports.

(d) The bank's operational risk management system must be well documented. The bank must have a routine in place for ensuring compliance with a documented set of internal policies, controls and procedures concerning the operational risk management system, which must include policies for the treatment of non-compliance issues.

(e) Internal and/or external auditors must perform regular reviews of the operational risk management processes and measurement systems. This review must include both the activities of the business units and of the independent operational risk management function.

(f) The validation of the operational risk measurement system by external auditors and/or supervisory authorities must include the following:

- Verifying that the internal validation processes are operating in a satisfactory manner; and
- Making sure that data flows and processes associated with the risk measurement system are transparent and accessible. In particular, it is necessary that auditors and supervisory authorities are in a position to have easy access, whenever they judge it necessary and under appropriate procedures, to the system's specifications and parameters.

(iii) Quantitative standards

AMA soundness standard

667. Given the continuing evolution of analytical approaches for operational risk, the Committee is not specifying the approach or distributional assumptions used to generate the operational risk measure for regulatory capital purposes. However, a bank must be able to demonstrate that its approach captures potentially severe 'tail' loss events. Whatever approach is used, a bank must demonstrate that its operational risk measure meets a soundness standard comparable to that of the internal ratings-based approach for credit risk, (i.e. comparable to a one year holding period and a 99.9^{th} percentile confidence interval).

668. The Committee recognises that the AMA soundness standard provides significant flexibility to banks in the development of an operational risk measurement and management system. However, in the development of these systems, banks must have and maintain rigorous procedures for operational risk model development and independent model validation. Prior to implementation, the Committee will review evolving industry practices regarding credible and consistent estimates of potential operational losses. It will also review accumulated data, and the level of capital requirements estimated by the AMA, and may refine its proposals if appropriate.

Detailed criteria

669. This section describes a series of quantitative standards that will apply to internally-generated operational risk measures for purposes of calculating the regulatory minimum capital charge.

(a) Any internal operational risk measurement system must be consistent with the scope of operational risk defined by the Committee in paragraph 644 and the loss event types defined in Annex 9.

(b) Supervisors will require the bank to calculate its regulatory capital requirement as the sum of expected loss (EL) and unexpected loss (UL), unless the bank can demonstrate that it is adequately capturing EL in its internal business practices. That is, to base the minimum regulatory capital requirement on UL alone, the bank must be able to demonstrate to the satisfaction of its national supervisor that it has measured and accounted for its EL exposure.

(c) A bank's risk measurement system must be sufficiently 'granular' to capture the major drivers of operational risk affecting the shape of the tail of the loss estimates.

(d) Risk measures for different operational risk estimates must be added for purposes of calculating the regulatory minimum capital requirement. However, the bank may be permitted to use internally determined correlations in operational risk losses across individual operational risk estimates, provided it can demonstrate to the satisfaction of the national supervisor that its systems for determining correlations are sound, implemented with integrity, and take into account the uncertainty surrounding any such correlation estimates (particularly in periods of stress). The bank must validate its correlation assumptions using appropriate quantitative and qualitative techniques.

(e) Any operational risk measurement system must have certain key features to meet the supervisory soundness standard set out in this section. These elements must include the use of internal data, relevant external data, scenario analysis and factors reflecting the business environment and internal control systems.

(f) A bank needs to have a credible, transparent, well-documented and verifiable approach for weighting these fundamental elements in its overall operational risk measurement system. For example, there may be cases where estimates of the 99.9^{th} percentile confidence interval based primarily on internal and external loss event data would be unreliable for business lines with a heavy-tailed loss distribution and a small number of observed losses. In such cases, scenario analysis, and business environment and control factors, may play a more dominant role in the risk measurement system. Conversely, operational loss event data may play a more dominant role in the risk measurement system for business lines where estimates of the 99.9^{th} percentile confidence interval based primarily on such data are deemed reliable. In all cases, the bank's approach for weighting the four fundamental elements should be internally consistent and avoid the double counting of qualitative assessments or risk mitigants already recognised in other elements of the framework.

Internal data

670. Banks must track internal loss data according to the criteria set out in this section. The tracking of internal loss event data is an essential prerequisite to the development and functioning of a credible operational risk measurement system. Internal loss data is crucial for tying a bank's risk estimates to its actual loss experience. This can be achieved in a number of ways, including using internal loss data as the foundation of empirical risk estimates, as a means of validating the inputs and outputs of the bank's risk measurement system, or as the link between loss experience and risk management and control decisions.

671. Internal loss data is most relevant when it is clearly linked to a bank's current business activities, technological processes and risk management procedures. Therefore, a bank must have documented procedures for assessing the on-going relevance of historical loss data, including those situations in which judgement overrides, scaling, or other adjustments may be used, to what extent they may be used and who is authorised to make such decisions.

672. Internally generated operational risk measures used for regulatory capital purposes must be based on a minimum five-year observation period of internal loss data, whether the internal loss data is used directly to build the loss measure or to validate it. When the bank first moves to the AMA, a three-year historical data window is acceptable (this includes the parallel calculations in paragraph 46).

673. To qualify for regulatory capital purposes, a bank's internal loss collection processes must meet the following standards:

- To assist in supervisory validation, a bank must be able to map its historical internal loss data into the relevant level 1 supervisory categories defined in Annexes 8 and 9 and to provide these data to supervisors upon request. It must have documented, objective criteria for allocating losses to the specified business lines and event types. However, it is left to the bank to decide the extent to which it applies these categorisations in its internal operational risk measurement system.
- A bank's internal loss data must be comprehensive in that it captures all material activities and exposures from all appropriate sub-systems and geographic locations. A bank must be able to justify that any excluded activities or exposures, both individually and in combination, would not have a material impact on the overall risk estimates. A bank must have an appropriate *de minimis* gross loss threshold for internal loss data collection, for example €10,000. The appropriate threshold may vary somewhat between banks, and within a bank across business lines and/or event types. However, particular thresholds should be broadly consistent with those used by peer banks.
- Aside from information on gross loss amounts, a bank should collect information about the date of the event, any recoveries of gross loss amounts, as well as some descriptive information about the drivers or causes of the loss event. The level of detail of any descriptive information should be commensurate with the size of the gross loss amount.
- A bank must develop specific criteria for assigning loss data arising from an event in a centralised function (e.g. an information technology department) or an activity that spans more than one business line, as well as from related events over time.
- Operational risk losses that are related to credit risk and have historically been included in banks' credit risk databases (e.g. collateral management failures) will continue to be treated as credit risk for the purposes of calculating minimum regulatory capital under this Framework. Therefore, such losses will not be subject to the operational risk capital charge.[109] Nevertheless, for the purposes of internal operational risk management, banks must identify all material operational risk losses consistent with the scope of the definition of operational risk (as set out in paragraph 644 and the loss event types outlined in Annex 9), including those related to credit risk. Such material operational risk-related credit risk losses should be flagged separately within a bank's internal operational risk database. The materiality of these losses may vary between banks, and within a bank across business lines and/or event types. Materiality thresholds should be broadly consistent with those used by peer banks.
- Operational risk losses that are related to market risk are treated as operational risk for the purposes of calculating minimum regulatory capital under this Framework and will therefore be subject to the operational risk capital charge.

External data

674. A bank's operational risk measurement system must use relevant external data (either public data and/or pooled industry data), especially when there is reason to believe that the bank is exposed to infrequent, yet potentially severe, losses. These external data should include data on actual loss amounts, information on the scale of business operations where the event occurred, information on the causes and circumstances of the loss events,

[109] This applies to all banks, including those that may only now be designing their credit risk and operational risk databases.

or other information that would help in assessing the relevance of the loss event for other banks. A bank must have a systematic process for determining the situations for which external data must be used and the methodologies used to incorporate the data (e.g. scaling, qualitative adjustments, or informing the development of improved scenario analysis). The conditions and practices for external data use must be regularly reviewed, documented, and subject to periodic independent review.

Scenario analysis

675. A bank must use scenario analysis of expert opinion in conjunction with external data to evaluate its exposure to high-severity events. This approach draws on the knowledge of experienced business managers and risk management experts to derive reasoned assessments of plausible severe losses. For instance, these expert assessments could be expressed as parameters of an assumed statistical loss distribution. In addition, scenario analysis should be used to assess the impact of deviations from the correlation assumptions embedded in the bank's operational risk measurement framework, in particular, to evaluate potential losses arising from multiple simultaneous operational risk loss events. Over time, such assessments need to be validated and re-assessed through comparison to actual loss experience to ensure their reasonableness.

Business environment and internal control factors

676. In addition to using loss data, whether actual or scenario-based, a bank's firm-wide risk assessment methodology must capture key business environment and internal control factors that can change its operational risk profile. These factors will make a bank's risk assessments more forward-looking, more directly reflect the quality of the bank's control and operating environments, help align capital assessments with risk management objectives, and recognise both improvements and deterioration in operational risk profiles in a more immediate fashion. To qualify for regulatory capital purposes, the use of these factors in a bank's risk measurement framework must meet the following standards:

- The choice of each factor needs to be justified as a meaningful driver of risk, based on experience and involving the expert judgment of the affected business areas. Whenever possible, the factors should be translatable into quantitative measures that lend themselves to verification.
- The sensitivity of a bank's risk estimates to changes in the factors and the relative weighting of the various factors need to be well reasoned. In addition to capturing changes in risk due to improvements in risk controls, the framework must also capture potential increases in risk due to greater complexity of activities or increased business volume.
- The framework and each instance of its application, including the supporting rationale for any adjustments to empirical estimates, must be documented and subject to independent review within the bank and by supervisors.
- Over time, the process and the outcomes need to be validated through comparison to actual internal loss experience, relevant external data, and appropriate adjustments made.

(iv) Risk mitigation[110]

677. Under the AMA, a bank will be allowed to recognise the risk mitigating impact of insurance in the measures of operational risk used for regulatory minimum capital requirements. The recognition of insurance mitigation will be limited to 20% of the total operational risk capital charge calculated under the AMA.

678. A bank's ability to take advantage of such risk mitigation will depend on compliance with the following criteria:

- The insurance provider has a minimum claims paying ability rating of A (or equivalent).
- The insurance policy must have an initial term of no less than one year. For policies with a residual term of less than one year, the bank must make appropriate haircuts reflecting the declining residual term of the policy, up to a full 100% haircut for policies with a residual term of 90 days or less.
- The insurance policy has a minimum notice period for cancellation of 90 days.
- The insurance policy has no exclusions or limitations triggered by supervisory actions or, in the case of a failed bank, that preclude the bank, receiver or liquidator from recovering for damages suffered or expenses incurred by the bank, except in respect of events occurring after the initiation of receivership or liquidation proceedings in respect of the bank, provided that the insurance policy may exclude any fine, penalty, or punitive damages resulting from supervisory actions.
- The risk mitigation calculations must reflect the bank's insurance coverage in a manner that is transparent in its relationship to, and consistent with, the actual likelihood and impact of loss used in the bank's overall determination of its operational risk capital.
- The insurance is provided by a third-party entity. In the case of insurance through captives and affiliates, the exposure has to be laid off to an independent third-party entity, for example through re-insurance, that meets the eligibility criteria.
- The framework for recognising insurance is well reasoned and documented.
- The bank discloses a description of its use of insurance for the purpose of mitigating operational risk.

679. A bank's methodology for recognising insurance under the AMA also needs to capture the following elements through appropriate discounts or haircuts in the amount of insurance recognition:

- The residual term of a policy, where less than one year, as noted above;
- A policy's cancellation terms, where less than one year; and
- The uncertainty of payment as well as mismatches in coverage of insurance policies.

[110] The Committee intends to continue an ongoing dialogue with the industry on the use of risk mitigants for operational risk and, in due course, may consider revising the criteria for and limits on the recognition of operational risk mitigants on the basis of growing experience.

D. Partial use

680. A bank will be permitted to use an AMA for some parts of its operations and the Basic Indicator Approach or Standardised Approach for the balance (partial use), provided that the following conditions are met:

- All operational risks of the bank's global, consolidated operations are captured;
- All of the bank's operations that are covered by the AMA meet the qualitative criteria for using an AMA, while those parts of its operations that are using one of the simpler approaches meet the qualifying criteria for that approach;
- On the date of implementation of an AMA, a significant part of the bank's operational risks are captured by the AMA; and
- The bank provides its supervisor with a plan specifying the timetable to which it intends to roll out the AMA across all but an immaterial part of its operations. The plan should be driven by the practicality and feasibility of moving to the AMA over time, and not for other reasons.

681. Subject to the approval of its supervisor, a bank opting for partial use may determine which parts of its operations will use an AMA on the basis of business line, legal structure, geography, or other internally determined basis.

682. Subject to the approval of its supervisor, where a bank intends to implement an approach other than the AMA on a global, consolidated basis and it does not meet the third and/or fourth conditions in paragraph 680, the bank may, in limited circumstances:

- Implement an AMA on a permanent partial basis; and
- Include in its global, consolidated operational risk capital requirements the results of an AMA calculation at a subsidiary where the AMA has been approved by the relevant host supervisor and is acceptable to the bank's home supervisor.

683. Approvals of the nature described in paragraph 682 should be granted only on an exceptional basis. Such exceptional approvals should generally be limited to circumstances where a bank is prevented from meeting these conditions due to implementation decisions of supervisors of the bank's subsidiary operations in foreign jurisdictions.

VI. Market Risk

A. The risk measurement framework

683(i). Market risk is defined as the risk of losses in on and off-balance-sheet positions arising from movements in market prices. The risks subject to this requirement are:

- The risks pertaining to interest rate related instruments and equities in the trading book;
- Foreign exchange risk and commodities risk throughout the bank.

1. Scope and coverage of the capital charges

683(ii). The capital charges for interest rate related instruments and equities will apply to the current trading book items prudently valued by banks, alongside paragraphs 690 to 701 below. The definition of trading book is set out in paragraphs 685 to 689(iii) below.

683(iii). The capital charges for foreign exchange risk and for commodities risk will apply to banks' total currency and commodity positions, subject to some discretion to exclude structural foreign exchange positions. It is understood that some of these positions will be reported and hence evaluated at market value, but some may be reported and evaluated at book value.

683(iv). For the time being, the Committee does not believe that it is necessary to allow any de minimis exemptions from the capital requirements for market risk, except for those for foreign exchange risk set out in paragraph 718(xLii) below, because this Framework applies only to internationally active banks, and then essentially on a consolidated basis; all of these banks are likely to be involved in trading to some extent.

683(v). In the same way as for credit risk, the capital requirements for market risk are to apply on a worldwide consolidated basis. Where appropriate, national authorities may permit banking and financial entities in a group which is running a global consolidated book and whose capital is being assessed on a global basis to report short and long positions in exactly the same instrument (e.g. currencies, commodities, equities or bonds), on a net basis, no matter where they are booked.[111] Moreover, the offsetting rules as set out in this section may also be applied on a consolidated basis. Nonetheless, there will be circumstances in which supervisory authorities demand that the individual positions be taken into the measurement system without any offsetting or netting against positions in the remainder of the group. This may be needed, for example, where there are obstacles to the quick repatriation of profits from a foreign subsidiary or where there are legal and procedural difficulties in carrying out the timely management of risks on a consolidated basis. Moreover, all national authorities will retain the right to continue to monitor the market risks of individual entities on a non-consolidated basis to ensure that significant imbalances within a group do not escape supervision. Supervisory authorities will be especially vigilant in ensuring that banks do not pass positions on reporting dates in such a way as to escape measurement.

684. (Deleted)

[111] The positions of less than wholly-owned subsidiaries would be subject to the generally accepted accounting principles in the country where the parent company is supervised.

685. A trading book consists of positions in financial instruments and commodities held either with trading intent or in order to hedge other elements of the trading book. To be eligible for trading book capital treatment, financial instruments must either be free of any restrictive covenants on their tradability or able to be hedged completely. In addition, positions should be frequently and accurately valued, and the portfolio should be actively managed.

686. A financial instrument is any contract that gives rise to both a financial asset of one entity and a financial liability or equity instrument of another entity. Financial instruments include both primary financial instruments (or cash instruments) and derivative financial instruments. A financial asset is any asset that is cash, the right to receive cash or another financial asset; or the contractual right to exchange financial assets on potentially favourable terms, or an equity instrument. A financial liability is the contractual obligation to deliver cash or another financial asset or to exchange financial liabilities under conditions that are potentially unfavourable.

687. Positions held with trading intent are those held intentionally for short-term resale and/or with the intent of benefiting from actual or expected short-term price movements or to lock in arbitrage profits, and may include for example proprietary positions, positions arising from client servicing (e.g. matched principal broking) and market making.

687(i). Banks must have clearly defined policies and procedures for determining which exposures to include in, and to exclude from, the trading book for purposes of calculating their regulatory capital, to ensure compliance with the criteria for trading book set forth in this Section and taking into account the bank's risk management capabilities and practices. Compliance with these policies and procedures must be fully documented and subject to periodic internal audit.

687(ii). These policies and procedures should, at a minimum, address the general considerations listed below. The list below is not intended to provide a series of tests that a product or group of related products must pass to be eligible for inclusion in the trading book. Rather, the list provides a minimum set of key points that must be addressed by the policies and procedures for overall management of a firm's trading book:

- The activities the bank considers to be trading and as constituting part of the trading book for regulatory capital purposes;
- The extent to which an exposure can be marked-to-market daily by reference to an active, liquid two-way market;
- For exposures that are marked-to-model, the extent to which the bank can:
  - (i) Identify the material risks of the exposure;
  - (ii) Hedge the material risks of the exposure and the extent to which hedging instruments would have an active, liquid two-way market;
  - (iii) Derive reliable estimates for the key assumptions and parameters used in the model.
- The extent to which the bank can and is required to generate valuations for the exposure that can be validated externally in a consistent manner;
- The extent to which legal restrictions or other operational requirements would impede the bank's ability to effect an immediate liquidation of the exposure;
- The extent to which the bank is required to, and can, actively risk manage the exposure within its trading operations; and

- The extent to which the bank may transfer risk or exposures between the banking and the trading books and criteria for such transfers.

688. The following will be the basic requirements for positions eligible to receive trading book capital treatment.

- Clearly documented trading strategy for the position/instrument or portfolios, approved by senior management (which would include expected holding horizon).
- Clearly defined policies and procedures for the active management of the position, which must include:
  - positions are managed on a trading desk;
  - position limits are set and monitored for appropriateness;
  - dealers have the autonomy to enter into/manage the position within agreed limits and according to the agreed strategy;
  - positions are marked to market at least daily and when marking to model the parameters must be assessed on a daily basis;
  - positions are reported to senior management as an integral part of the institution's risk management process; and
  - positions are actively monitored with reference to market information sources (assessment should be made of the market liquidity or the ability to hedge positions or the portfolio risk profiles). This would include assessing the quality and availability of market inputs to the valuation process, level of market turnover, sizes of positions traded in the market, etc.
- Clearly defined policy and procedures to monitor the positions against the bank's trading strategy including the monitoring of turnover and stale positions in the bank's trading book.

689. (deleted)

689(i). When a bank hedges a banking book credit risk exposure using a credit derivative booked in its trading book (i.e. using an internal hedge), the banking book exposure is not deemed to be hedged for capital purposes unless the bank purchases from an eligible third party protection provider a credit derivative meeting the requirements of paragraph 191 vis-à-vis the banking book exposure. Where such third party protection is purchased and is recognised as a hedge of a banking book exposure for regulatory capital purposes, neither the internal nor external credit derivative hedge would be included in the trading book for regulatory capital purposes.

689(ii). Positions in the bank's own eligible regulatory capital instruments are deducted from capital. Positions in other banks', securities firms', and other financial entities' eligible regulatory capital instruments, as well as intangible assets, will receive the same treatment as that set down by the national supervisor for such assets held in the banking book, which in many cases is deduction from capital. Where a bank demonstrates that it is an active market maker then a national supervisor may establish a dealer exception for holdings of other banks', securities firms', and other financial entities' capital instruments in the trading book. In order to qualify for the dealer exception, the bank must have adequate systems and controls surrounding the trading of financial institutions' eligible regulatory capital instruments.

689(iii). Term trading-related repo-style transactions that a bank accounts for in its banking book may be included in the bank's trading book for regulatory capital purposes so long as all such repo-style transactions are included. For this purpose, trading-related repo-style transactions are defined as only those that meet the requirements of paragraphs 687 and 688 and both legs are in the form of either cash or securities includable in the trading book. Regardless of where they are booked, all repo-style transactions are subject to a banking book counterparty credit risk charge.

2. Prudent valuation guidance

690. This section provides banks with guidance on prudent valuation for positions in the trading book. This guidance is especially important for less liquid positions which, although they will not be excluded from the trading book solely on grounds of lesser liquidity, raise supervisory concerns about prudent valuation.

691. A framework for prudent valuation practices should at a minimum include the following:

(i). Systems and controls

692. Banks must establish and maintain adequate systems and controls sufficient to give management and supervisors the confidence that their valuation estimates are prudent and reliable. These systems must be integrated with other risk management systems within the organisation (such as credit analysis). Such systems must include:

- Documented policies and procedures for the process of valuation. This includes clearly defined responsibilities of the various areas involved in the determination of the valuation, sources of market information and review of their appropriateness, frequency of independent valuation, timing of closing prices, procedures for adjusting valuations, end of the month and ad-hoc verification procedures; and
- Clear and independent (i.e. independent of front office) reporting lines for the department accountable for the valuation process. The reporting line should ultimately be to a main board executive director.

(ii). Valuation methodologies

Marking to market

693. Marking-to-market is at least the daily valuation of positions at readily available close out prices that are sourced independently. Examples of readily available close out prices include exchange prices, screen prices, or quotes from several independent reputable brokers.

694. Banks must mark-to-market as much as possible. The more prudent side of bid/offer must be used unless the institution is a significant market maker in a particular position type and it can close out at mid-market.

Marking to model

695. Where marking-to-market is not possible, banks may mark-to-model, where this can be demonstrated to be prudent. Marking-to-model is defined as any valuation which has to be benchmarked, extrapolated or otherwise calculated from a market input. When marking to model, an extra degree of conservatism is appropriate. Supervisory authorities will consider the following in assessing whether a mark-to-model valuation is prudent:

- Senior management should be aware of the elements of the trading book which are subject to mark to model and should understand the materiality of the uncertainty this creates in the reporting of the risk/performance of the business.
- Market inputs should be sourced, to the extent possible, in line with market prices (as discussed above). The appropriateness of the market inputs for the particular position being valued should be reviewed regularly.
- Where available, generally accepted valuation methodologies for particular products should be used as far as possible.
- Where the model is developed by the institution itself, it should be based on appropriate assumptions, which have been assessed and challenged by suitably qualified parties independent of the development process. The model should be developed or approved independently of the front office. It should be independently tested. This includes validating the mathematics, the assumptions and the software implementation.
- There should be formal change control procedures in place and a secure copy of the model should be held and periodically used to check valuations.
- Risk management should be aware of the weaknesses of the models used and how best to reflect those in the valuation output.
- The model should be subject to periodic review to determine the accuracy of its performance (e.g. assessing continued appropriateness of the assumptions, analysis of P&L versus risk factors, comparison of actual close out values to model outputs).
- Valuation adjustments should be made as appropriate, for example, to cover the uncertainty of the model valuation (see also valuation adjustments in 698 to 701).

Independent price verification

696. Independent price verification is distinct from daily mark-to-market. It is the process by which market prices or model inputs are regularly verified for accuracy. While daily marking-to-market may be performed by dealers, verification of market prices or model inputs should be performed by a unit independent of the dealing room, at least monthly (or, depending on the nature of the market/trading activity, more frequently). It need not be performed as frequently as daily mark-to-market, since the objective, i.e. independent, marking of positions, should reveal any error or bias in pricing, which should result in the elimination of inaccurate daily marks.

697. Independent price verification entails a higher standard of accuracy in that the market prices or model inputs are used to determine profit and loss figures, whereas daily marks are used primarily for management reporting in between reporting dates. For independent price verification, where pricing sources are more subjective, e.g. only one available broker quote, prudent measures such as valuation adjustments may be appropriate.

(iii). Valuation adjustments or reserves

698. Banks must establish and maintain procedures for considering valuation adjustments/reserves. Supervisory authorities expect banks using third-party valuations to consider whether valuation adjustments are necessary. Such considerations are also necessary when marking to model.

699. Supervisory authorities expect the following valuation adjustments/reserves to be formally considered at a minimum: unearned credit spreads, close-out costs, operational risks, early termination, investing and funding costs, and future administrative costs and, where appropriate, model risk.

700. Bearing in mind that the underlying 10-day assumption in paragraph 718 (LXXVI) (c) may not be consistent with the bank's ability to sell or hedge out positions under normal market conditions, banks must make downward valuation adjustments/reserves for these less liquid positions, and to review their continued appropriateness on an on-going basis. Reduced liquidity could arise from market events. Additionally, close-out prices for concentrated positions and/or stale positions should be considered in establishing those valuation adjustments/reserves. Banks must consider all relevant factors when determining the appropriateness of valuation adjustments/reserves for less liquid positions. These factors may include, but are not limited to, the amount of time it would take to hedge out the position/risks within the position, the average volatility of bid/offer spreads, the availability of independent market quotes (number and identity of market makers), the average and volatility of trading volumes, market concentrations, the aging of positions, the extent to which valuation relies on marking-to-model, and the impact of other model risks.

701. Valuation adjustments/reserves made under paragraph 700 must impact Tier 1 regulatory capital and may exceed those made under financial accounting standards.

3. Methods of measuring market risks

701(i). In measuring their market risks, a choice between two broad methodologies (described in paragraphs 709 to 718(LXIX) and 718(LXX) to 718(XCIX), respectively) will be permitted, subject to the approval of the national authorities. One alternative will be to measure the risks in a standardised manner, using the measurement frameworks described in paragraphs 709 to 718(LXIX) below. Paragraphs 709 to 718(LV) deal with the four risks addressed in this section, i.e. interest rate, equity position, foreign exchange and commodities risk. Paragraphs 718(LVI) to 718(LXIX) set out a number of possible methods for measuring the price risk in options of all kinds. The capital charge under the standardised measurement method will be the measures of risk obtained from paragraphs 709 to 718(LXIX), summed arithmetically.

701(ii). The alternative methodology, which is subject to the fulfilment of certain conditions and the use of which is therefore conditional upon the explicit approval of the bank's supervisory authority, is set out in 718(LXX) to 718(XCIX). This method allows banks to use risk measures derived from their own internal risk management models, subject to seven sets of conditions, namely:

- certain general criteria concerning the adequacy of the risk management system;
- qualitative standards for internal oversight of the use of models, notably by management;
- guidelines for specifying an appropriate set of market risk factors (i.e. the market rates and prices that affect the value of banks' positions);
- quantitative standards setting out the use of common minimum statistical parameters for measuring risk;
- guidelines for stress testing;
- validation procedures for external oversight of the use of models;
- rules for banks which use a mixture of models and the standardised approach.

701(iii). The standardised methodology uses a "building-block" approach in which specific risk and the general market risk arising from debt and equity positions are calculated separately. The focus of most internal models is a bank's general market risk exposure, typically leaving specific risk (i.e. exposures to specific issuers of debt securities or equities[112]) to be measured largely through separate credit risk measurement systems. Banks using models should be subject to capital charges for the specific risk not captured by their models. Accordingly, a separate capital charge for specific risk will apply to each bank using a model to the extent that the model does not capture specific risk. The capital charge for banks which are modelling specific risk is set out in paragraphs 718(Lxxxvii) to 718(XCviii) of this Framework.[113]

701(iv). In measuring the price risk in options under the standardised approach, where a number of alternatives with varying degrees of sophistication are provided (see paragraphs 718(Lvi) to 718(Lxix)), supervisory authorities will apply the rule that the more a bank is engaged in writing options, the more sophisticated its measurement method needs to be. In the longer term, banks which are significant traders in options will be expected to move to comprehensive value-at-risk models and become subject to the full range of quantitative and qualitative standards set out in paragraphs 718(Lxx) to 718(XCIX).

701(v). Each bank subject to capital charges for market risk will be expected to monitor and report the level of risk against which a capital requirement is to be applied. The bank's overall minimum capital requirement will be:

(a) the credit risk requirements laid down in this Framework, excluding debt and equity securities in the trading book and all positions in commodities, but including the credit counterparty risk on all over-the-counter derivatives whether in the trading or the banking books; plus

(b) the capital charges for operational risk described in paragraphs 644 to 683 of this Framework; plus

(c) either the capital charges for market risks described in paragraphs 709 to 718(Lxix), summed arithmetically; or

(d) the measure of market risk derived from the models approach set out in paragraphs 718(Lxx) to 718(XCix); or

(e) a mixture of (c) and (d) summed arithmetically.

701(vi). All transactions, including forward sales and purchases, shall be included in the calculation of capital requirements as from the date on which they were entered into. Although regular reporting will in principle take place only at intervals (in most countries quarterly), banks are expected to manage the market risk in their trading book in such a way

[112] Specific risk includes the risk that an individual debt or equity security moves by more or less than the general market in day-to-day trading (including periods when the whole market is volatile) and event risk (where the price of an individual debt or equity security moves precipitously relative to the general market, e.g. on a take-over bid or some other shock event; such events would also include the risk of "default").

[113] Banks that already have received specific risk model recognition for particular portfolios or lines of business according to the original version of the 1996 Market Risk Amendment should agree a timetable with their supervisors to bring their model in line with the new standards in a timely manner as is practicable, with an end date of 1 January 2010. Following that transition period, banks that have been unable to develop an acceptable methodology will have to use the standardised rules for specific risk.

that the capital requirements are being met on a continuous basis, i.e. at the close of each business day. Supervisory authorities have at their disposal a number of effective measures to ensure that banks do not "window-dress" by showing significantly lower market risk positions on reporting dates. Banks will also, of course, be expected to maintain strict risk management systems to ensure that intra-day exposures are not excessive. If a bank fails to meet the capital requirements, the national authority shall ensure that the bank takes immediate measures to rectify the situation.

4. Treatment of counterparty credit risk in the trading book

702. Banks will be required to calculate the counterparty credit risk charge for OTC derivatives, repo-style and other transactions booked in the trading book, separate from the capital charge for general market risk and specific risk.[114] The risk weights to be used in this calculation must be consistent with those used for calculating the capital requirements in the banking book. Thus, banks using the standardised approach in the banking book will use the standardised approach risk weights in the trading book and banks using the IRB approach in the banking book will use the IRB risk weights in the trading book in a manner consistent with the IRB roll out situation in the banking book as described in paragraphs 256 to 262. For counterparties included in portfolios where the IRB approach is being used the IRB risk weights will have to be applied.

703. In the trading book, for repo-style transactions, all instruments, which are included in the trading book, may be used as eligible collateral. Those instruments which fall outside the banking book definition of eligible collateral shall be subject to a haircut at the level applicable to non-main index equities listed on recognised exchanges (as noted in paragraph 151). However, where banks are using the own estimates approach to haircutting they may also apply it in the trading book in accordance with paragraphs 154 and 155. Consequently, for instruments that count as eligible collateral in the trading book, but not in the banking book, the haircuts must be calculated for each individual security. Where banks are using a VaR approach to measuring exposure for repo-style transactions, they also may apply this approach in the trading book in accordance with paragraphs 178 to 181 (i) and Annex 4.

704. The calculation of the counterparty credit risk charge for collateralised OTC derivative transactions is the same as the rules prescribed for such transactions booked in the banking book.

705. The calculation of the counterparty charge for repo-style transactions will be conducted using the rules in paragraphs 147 to 181 (i) and Annex 4 spelt out for such transactions booked in the banking book. The firm-size adjustment for SMEs as set out in paragraph 273 shall also be applicable in the trading book.

Credit derivatives

706. (deleted)

707. The counterparty credit risk charge for single name credit derivative transactions in the trading book will be calculated using the following potential future exposure add-on factors:

---

[114] The treatment for unsettled foreign exchange and securities trades is set forth in paragraph 88.

	Protection buyer	Protection seller
Total Return Swap		
"qualifying" reference obligation	5%	5%
"Non-qualifying" reference obligation	10%	10%
Credit Default Swap		
"qualifying" reference obligation	5%	5%**
"Non-qualifying" reference obligation	10%	10%**

There will be no difference depending on residual maturity.

The definition of "qualifying" is the same as for the "qualifying" category for the treatment of specific risk under the standardised measurement method in paragraph 711(i) and 711(ii).

** The protection seller of a credit default swap shall only be subject to the add-on factor where it is subject to closeout upon the insolvency of the protection buyer while the underlying is still solvent. Add-on should then be capped to the amount of unpaid premiums.

708. Where the credit derivative is a first to default transaction, the add-on will be determined by the lowest credit quality underlying in the basket, i.e. if there are any non-qualifying items in the basket, the non-qualifying reference obligation add-on should be used. For second and subsequent to default transactions, underlying assets should continue to be allocated according to the credit quality, i.e. the second lowest credit quality will determine the add-on for a second to default transaction etc.

5. Transitional arrangements

708(i). Banks will on a transitional basis be free to use a combination of the standardised measurement method and the internal models approach to measure their market risks. As a general rule, any such "partial" models should cover a complete risk category (e.g. interest rate risk or foreign exchange risk), i.e. a combination of the two methods will not be permitted within the same risk category.[115] However, as most banks are at present still implementing or further improving their risk management models, the Committee believes that the banks should be given – even within risk categories – some flexibility in including all their operations on a worldwide basis; this flexibility will be subject to approval by the national authority and reviewed by the Committee in the future (supervisory authorities will take precautions against "cherry-picking" between the standardised approach and the models approach within a risk factor category). Banks which adopt the modelling alternative for any single risk category will be expected over time to include all their operations, subject to the exceptions mentioned below, and to move towards a comprehensive model (i.e. one which captures all market risk categories). Banks which adopt a model will not be permitted, save in exceptional circumstances, to revert to the standardised approach. Notwithstanding these general principles, even banks using comprehensive models to measure their market risk may still incur risks in positions which are not captured by their internal trading risk management models, for example, in remote locations, in minor currencies or in negligible business

[115] This does not, however, apply to pre-processing techniques which are used to simplify the calculation and whose results become subject to the standardised methodology.

areas.[116] Any such risks that are not included in a model should be separately measured and reported using the methodologies described in paragraphs 709 to 718(xviii) below.

B. The capital requirement

1. Definition of capital

708(ii). The definition of capital to be used for market risk purposes is set out in paragraphs 49(xiii) and 49(xiv) of this Framework.

708(iii). In calculating eligible capital, it will be necessary first to calculate the bank's minimum capital requirement for credit and operational risks, and only afterwards its market risk requirement, to establish how much Tier 1 and Tier 2 capital is available to support market risk. Eligible capital will be the sum of the whole of the bank's Tier 1 capital, plus all of its Tier 2 capital under the limits imposed in paragraph 49(iii) of this Framework. Tier 3 capital will be regarded as eligible only if it can be used to support market risks under the conditions set out in paragraphs 49(xxi) and 49(xxii) above. The quoted capital ratio will thus represent capital that is available to meet credit risk, operational risk, and market risk. Where a bank has Tier 3 capital, within the limits set out in paragraph 49(xxi), which is not at present supporting market risks, it may report that excess as unused but eligible Tier 3 alongside its standard ratio.

C. Market risk – The standardised measurement method

1. Interest rate risk

709. (Deleted)

709(i). This section describes the standard framework for measuring the risk of holding or taking positions in debt securities and other interest rate related instruments in the trading book. The instruments covered include all fixed-rate and floating-rate debt securities and instruments that behave like them, including non-convertible preference shares.[117] Convertible bonds, i.e. debt issues or preference shares that are convertible, at a stated price, into common shares of the issuer, will be treated as debt securities if they trade like debt securities and as equities if they trade like equities. The basis for dealing with derivative products is considered in paragraphs 718(ix) to 718(xviii) below.

709(ii). The minimum capital requirement is expressed in terms of two separately calculated charges, one applying to the *"specific risk"* of each security, whether it is a short or a long position, and the other to the interest rate risk in the portfolio (termed *"general market risk"*) where long and short positions in different securities or instruments can be offset.

---

[116] For example, if a bank is hardly at all engaged in commodities it would not necessarily be expected to model its commodities risk.

[117] Traded mortgage securities and mortgage derivative products possess unique characteristics because of the risk of pre-payment. Accordingly, for the time being, no common treatment will apply to these securities, which will be dealt with at national discretion. A security which is the subject of a repurchase or securities lending agreement will be treated as if it were still owned by the lender of the security, i.e. it will be treated in the same manner as other securities positions.

(i) Specific risk

709(iii). The capital charge for specific risk is designed to protect against an adverse movement in the price of an individual security owing to factors related to the individual issuer. In measuring the risk, offsetting will be restricted to matched positions in the identical issue (including positions in derivatives). Even if the issuer is the same, no offsetting will be permitted between different issues since differences in coupon rates, liquidity, call features, etc. mean that prices may diverge in the short run.

Specific risk capital charges for issuer risk

710. The new capital charges for "government" and "other" categories will be as follows.

Categories	External credit assessment	Specific risk capital charge
Government	AAA to AA-	0%
	A+ to BBB-	0.25% (residual term to final maturity 6 months or less)
		1.00% (residual term to final maturity greater than 6 and up to and including 24 months)
		1.60% (residual term to final maturity exceeding 24 months)
	BB+ to B-	8.00%
	Below B-	12.00%
	Unrated	8.00%
Qualifying		0.25% (residual term to final maturity 6 months or less)
		1.00% (residual term to final maturity greater than 6 and up to and including 24 months)
		1.60% (residual term to final maturity exceeding 24 months)
Other	Similar to credit risk charges under the standardised approach of this Framework, e.g.:	
	BB+ to BB-	8.00%
	Below BB-	12.00%
	Unrated	8.00%

710(i). The category "government" will include all forms of government[118] paper including bonds, Treasury bills and other short-term instruments, but national authorities reserve the right to apply a specific risk weight to securities issued by certain foreign governments, especially to securities denominated in a currency other than that of the issuing government.

711. When the government paper is denominated in the domestic currency and funded by the bank in the same currency, at national discretion a lower specific risk charge may be applied.

[118] Including, at national discretion, local and regional governments subject to a zero credit risk weight in this Framework.

711(i). The *"qualifying"* category includes securities issued by public sector entities and multilateral development banks, plus other securities that are:

- rated investment-grade[119] by at least two credit rating agencies specified by the national authority; or
- rated investment-grade by one rating agency and not less than investment-grade by any other rating agency specified by the national authority (subject to supervisory oversight); or
- subject to supervisory approval, unrated, but deemed to be of comparable investment quality by the reporting bank, *and* the issuer has securities listed on a recognised stock exchange.

Each supervisory authority will be responsible for monitoring the application of these qualifying criteria, particularly in relation to the last criterion where the initial classification is essentially left to the reporting banks. National authorities will also have discretion to include within the qualifying category debt securities issued by banks in countries which have implemented this Framework, subject to the express understanding that supervisory authorities in such countries undertake prompt remedial action if a bank fails to meet the capital standards set forth in this Framework. Similarly, national authorities will have discretion to include within the qualifying category debt securities issued by securities firms that are subject to equivalent rules.

711(ii). Furthermore, the "qualifying" category shall include securities issued by institutions that are deemed to be equivalent to investment grade quality and subject to supervisory and regulatory arrangements comparable to those under this Framework.

Specific risk rules for unrated debt securities

712. Unrated securities may be included in the "qualifying" category when they are subject to supervisory approval, unrated, but deemed to be of comparable investment quality by the reporting bank, and the issuer has securities listed on a recognised stock exchange. This will remain unchanged for banks using the standardised approach. For banks using the IRB approach for a portfolio, unrated securities can be included in the "qualifying" category if both of the following conditions are met:

- the securities are rated equivalent[120] to investment grade under the reporting bank's internal rating system, which the national supervisor has confirmed complies with the requirements for an IRB approach; and
- the issuer has securities listed on a recognised stock exchange.

Specific risk rules for non-qualifying issuers

712(i). Instruments issued by a non-qualifying issuer will receive the same specific risk charge as a non-investment grade corporate borrower under the standardised approach for credit risk under this Framework.

[119] E.g. rated Baa or higher by Moody's and BBB or higher by Standard and Poor's.

[120] Equivalent means the debt security has a one-year PD equal to or less than the one year PD implied by the long-run average one-year PD of a security rated investment grade or better by a qualifying rating agency.

712(ii). However, since this may in certain cases considerably underestimate the specific risk for debt instruments which have a high yield to redemption relative to government debt securities, each national supervisor will have the discretion:

- To apply a higher specific risk charge to such instruments; and/or
- To disallow offsetting for the purposes of defining the extent of general market risk between such instruments and any other debt instruments.

In that respect, securitisation exposures that would be subject to a deduction treatment under the securitisation framework set forth in this Framework (e.g. equity tranches that absorb first loss), as well as securitisation exposures that are unrated liquidity lines or letters of credit should be subject to a capital charge that is no less than the charge set forth in the securitisation framework.

Specific risk capital charges for positions hedged by credit derivatives

713. Full allowance will be recognised when the values of two legs (i.e. long and short) always move in the opposite direction and broadly to the same extent. This would be the case in the following situations:

(a) the two legs consist of completely identical instruments, or

(b) a long cash position is hedged by a total rate of return swap (or vice versa) and there is an exact match between the reference obligation and the underlying exposure (i.e. the cash position).[121]

In these cases, no specific risk capital requirement applies to both sides of the position.

714. An 80% offset will be recognised when the value of two legs (i.e. long and short) always moves in the opposite direction but not broadly to the same extent. This would be the case when a long cash position is hedged by a credit default swap or a credit linked note (or vice versa) and there is an exact match in terms of the reference obligation, the maturity of both the reference obligation and the credit derivative, and the currency of the underlying exposure. In addition, key features of the credit derivative contract (e.g. credit event definitions, settlement mechanisms) should not cause the price movement of the credit derivative to materially deviate from the price movements of the cash position. To the extent that the transaction transfers risk (i.e. taking account of restrictive payout provisions such as fixed payouts and materiality thresholds), an 80% specific risk offset will be applied to the side of the transaction with the higher capital charge, while the specific risk requirement on the other side will be zero.

715. Partial allowance will be recognised when the value of the two legs (i.e. long and short) usually moves in the opposite direction. This would be the case in the following situations:

(a) the position is captured in paragraph 713 under (b), but there is an asset mismatch between the reference obligation and the underlying exposure. Nonetheless, the position meets the requirements in paragraph 191 (g).

[121] The maturity of the swap itself may be different from that of the underlying exposure.

(b) The position is captured in paragraph 713 under (a) or 714 but there is a currency or maturity mismatch[122] between the credit protection and the underlying asset.

(c) The position is captured in paragraph 714 but there is an asset mismatch between the cash position and the credit derivative. However, the underlying asset is included in the (deliverable) obligations in the credit derivative documentation.

716. In each of these cases in paragraphs 713 to 715, the following rule applies. Rather than adding the specific risk capital requirements for each side of the transaction (i.e. the credit protection and the underlying asset) only the higher of the two capital requirements will apply.

717. In cases not captured in paragraphs 713 to 715, a specific risk capital charge will be assessed against both sides of the position.

718. With regard to banks' first-to-default and second-to-default products in the trading book, the basic concepts developed for the banking book will also apply. Banks holding long positions in these products (e.g. buyers of basket credit linked notes) would be treated as if they were protection sellers and would be required to add the specific risk charges or use the external rating if available. Issuers of these notes would be treated as if they were protection buyers and are therefore allowed to off-set specific risk for one of the underlyings, i.e. the asset with the lowest specific risk charge.

(ii) General market risk

718(i). The capital requirements for general market risk are designed to capture the risk of loss arising from changes in market interest rates. A choice between two principal methods of measuring the risk is permitted, a "maturity" method and a "duration" method. In each method, the capital charge is the sum of four components:

- The net short or long position in the whole trading book;
- A small proportion of the matched positions in each time-band (the *"vertical disallowance"*);
- A larger proportion of the matched positions across different time-bands (the *"horizontal disallowance"*);
- A net charge for positions in options, where appropriate (see paragraphs 718(Lxvi) to 718(Lxix)).

718(ii). Separate maturity ladders should be used for each currency and capital charges should be calculated for each currency separately and then summed with no offsetting between positions of opposite sign. In the case of those currencies in which business is insignificant, separate maturity ladders for each currency are not required. Rather, the bank may construct a single maturity ladder and slot, within each appropriate time-band, the net long or short position for each currency. However, these individual net positions are to be summed within each time-band, irrespective of whether they are long or short positions, to produce a gross position figure.

[122] Currency mismatches should feed into the normal reporting of foreign exchange risk.

718(iii). In the **maturity method** (see paragraph 718(vii) for the duration method), long or short positions in debt securities and other sources of interest rate exposures including derivative instruments are slotted into a maturity ladder comprising thirteen time-bands (or fifteen time-bands in case of low coupon instruments). Fixed rate instruments should be allocated according to the residual term to maturity and floating-rate instruments according to the residual term to the next repricing date. Opposite positions of the same amount in the same issues (but not different issues by the same issuer), whether actual or notional, can be omitted from the interest rate maturity framework, as well as closely matched swaps, forwards, futures and FRAs which meet the conditions set out in paragraphs 718(xiii) and 718(xiv) below.

718(iv). The first step in the calculation is to weight the positions in each time-band by a factor designed to reflect the price sensitivity of those positions to assumed changes in interest rates. The weights for each time-band are set out in the table below. Zero-coupon bonds and deep-discount bonds (defined as bonds with a coupon of less than 3%) should be slotted according to the time-bands set out in the second column of the table.

Maturity method: time-bands and weights

Coupon 3% or more	Coupon less than 3%	Risk weight	Assumed changes in yield
1 month or less	1 month or less	0.00%	1.00
1 to 3 months	1 to 3 months	0.20%	1.00
3 to 6 months	3 to 6 months	0.40%	1.00
6 to 12 months	6 to 12 months	0.70%	1.00
1 to 2 years	1.0 to 1.9 years	1.25%	0.90
2 to 3 years	1.9 to 2.8 years	1.75%	0.80
3 to 4 years	2.8 to 3.6 years	2.25%	0.75
4 to 5 years	3.6 to 4.3 years	2.75%	0.75
5 to 7 years	4.3 to 5.7 years	3.25%	0.70
7 to 10 years	5.7 to 7.3 years	3.75%	0.65
10 to 15 years	7.3 to 9.3 years	4.50%	0.60
15 to 20 years	9.3 to 10.6 years	5.25%	0.60
over 20years	10.6 to 12 years	6.00%	0.60
	12 to 20 years	8.00%	0.60
	over 20 years	12.50%	0.60

718(v). The next step in the calculation is to offset the weighted longs and shorts in each time-band, resulting in a single short or long position for each band. Since, however, each band would include different instruments and different maturities, a 10% capital charge to reflect basis risk and gap risk will be levied on the smaller of the offsetting positions, be it long or short. Thus, if the sum of the weighted longs in a time-band is $100 million and the sum of the weighted shorts $90 million, the so-called “vertical disallowance” for that time-band would be 10% of $90 million (i.e. $9.0 million).

718(vi). The result of the above calculations is to produce two sets of weighted positions, the net long or short positions in each time-band ($10 million long in the example above) and the vertical disallowances, which have no sign. In addition, however, banks will be allowed to conduct two rounds of "horizontal offsetting", first between the net positions in each of three zones (zero to one year, one year to four years and four years and over),[123] and subsequently between the net positions in the three different zones. The offsetting will be subject to a scale of disallowances expressed as a fraction of the matched positions, as set out in the table below. The weighted long and short positions in each of three zones may be offset, subject to the matched portion attracting a disallowance factor that is part of the capital charge. The residual net position in each zone may be carried over and offset against opposite positions in other zones, subject to a second set of disallowance factors.

Horizontal disallowances

Zones[124]	Time-band	within the zone	between adjacent zones	between zones 1 and 3
Zone 1	0 - 1 month 1 - 3 months 3 - 6 months 6 - 12 months	40%	40%	100%
Zone 2	1 - 2 years 2 - 3 years 3 - 4 years 4 - 5 years	30%	40%	
Zone 3	5 - 7 years 7 - 10 years 10 - 15 years 15 - 20 years over 20 years	30%		

718(vii). Under the alternative **duration method**, banks with the necessary capability may, with their supervisors' consent, use a more accurate method of measuring all of their general market risk by calculating the price sensitivity of each position separately. Banks must elect and use the method on a continuous basis (unless a change in method is approved by the national authority) and will be subject to supervisory monitoring of the systems used. The mechanics of this method are as follows:

- First calculate the price sensitivity of each instrument in terms of a change in interest rates of between 0.6 and 1.0 percentage points depending on the maturity of the instrument (see the table below);

- Slot the resulting sensitivity measures into a duration-based ladder with the fifteen time-bands set out in the table below;

[123] The zones for coupons less than 3% are 0 to 1 year, 1 to 3.6 years, and 3.6 years and over.

[124] The zones for coupons less than 3% are 0 to 1 year, 1 to 3.6 years, and 3.6 years and over.

- Subject long and short positions in each time-band to a 5% vertical disallowance designed to capture basis risk;
- Carry forward the net positions in each time-band for horizontal offsetting subject to the disallowances set out in table paragraph 718(vi) above.

Duration method: time-bands and assumed changes in yield

	Assumed change in yield		Assumed change in yield
Zone 1		**Zone 3**	
1 month or less	1.00	3.6 to 4.3 years	0.75
1 to 3 months	1.00	4.3 to 5.7 years	0.70
3 to 6 months	1.00	5.7 to 7.3 years	0.65
6 to 12 months	1.00	7.3 to 9.3 years	0.60
		9.3 to 10.6 years	0.60
Zone 2		10.6 to 12 years	0.60
1.0 to 1.9 years	0.90	12 to 20 years	0.60
1.9 to 2.8 years	0.80	over 20 years	0.60
2.8 to 3.6 years	0.75		

718(viii). In the case of **residual currencies** (see paragraph 718(ii) above) the gross positions in each time-band will be subject to either the risk weightings set out in paragraph 718(iv), if positions are reported using the maturity method, or the assumed change in yield set out in paragraph 718(vii), if positions are reported using the duration method, with no further offsets.

(iii) Interest rate derivatives

718(ix). The measurement system should include all interest rate derivatives and off-balance-sheet instruments in the trading book which react to changes in interest rates, (e.g. forward rate agreements (FRAs), other forward contracts, bond futures, interest rate and cross-currency swaps and forward foreign exchange positions). Options can be treated in a variety of ways as described in paragraphs 718(Lvi) to 718(Lxix) below. A summary of the rules for dealing with interest rate derivatives is set out in paragraph 718(xviii) below.

Calculation of positions

718(x). The derivatives should be converted into positions in the relevant underlying and become subject to specific and general market risk charges as described above. In order to calculate the standard formula described above, the amounts reported should be the market value of the principal amount of the underlying or of the notional underlying resulting from the prudent valuation guidance set out in paragraphs 690 to 701 above.[125]

Futures and forward contracts, including forward rate agreements

718(xi). These instruments are treated as a combination of a long and a short position in a notional government security. The maturity of a future or a FRA will be the period until delivery or exercise of the contract, plus - where applicable - the life of the underlying

[125] For instruments where the apparent notional amount differs from the effective notional amount, banks must use the effective notional amount.

instrument. For example, a long position in a June three month interest rate future (taken in April) is to be reported as a long position in a government security with a maturity of five months and a short position in a government security with a maturity of two months. Where a range of deliverable instruments may be delivered to fulfil the contract, the bank has flexibility to elect which deliverable security goes into the maturity or duration ladder but should take account of any conversion factor defined by the exchange. In the case of a future on a corporate bond index, positions will be included at the market value of the notional underlying portfolio of securities.

Swaps

718(xii). Swaps will be treated as two notional positions in government securities with relevant maturities. For example, an interest rate swap under which a bank is receiving floating rate interest and paying fixed will be treated as a long position in a floating rate instrument of maturity equivalent to the period until the next interest fixing and a short position in a fixed-rate instrument of maturity equivalent to the residual life of the swap. For swaps that pay or receive a fixed or floating interest rate against some other reference price, e.g. a stock index, the interest rate component should be slotted into the appropriate repricing maturity category, with the equity component being included in the equity framework. The separate legs of cross-currency swaps are to be reported in the relevant maturity ladders for the currencies concerned.

Calculation of capital charges for derivatives under the standardised methodology

Allowable offsetting of matched positions

718(xiii). Banks may exclude from the interest rate maturity framework altogether (for both specific and general market risk) long and short positions (both actual and notional) in identical instruments with exactly the same issuer, coupon, currency and maturity. A matched position in a future or forward and its corresponding underlying may also be fully offset,[126] and thus excluded from the calculation. When the future or the forward comprises a range of deliverable instruments offsetting of positions in the future or forward contract and its underlying is only permissible in cases where there is a readily identifiable underlying security which is most profitable for the trader with a short position to deliver. The price of this security, sometimes called the "cheapest-to-deliver", and the price of the future or forward contract should in such cases move in close alignment. No offsetting will be allowed between positions in different currencies; the separate legs of cross-currency swaps or forward foreign exchange deals are to be treated as notional positions in the relevant instruments and included in the appropriate calculation for each currency.

718(xiv). In addition, opposite positions in the same category of instruments[127] can in certain circumstances be regarded as matched and allowed to offset fully. To qualify for this treatment the positions must relate to the same underlying instruments, be of the same nominal value and be denominated in the same currency.[128] In addition:

---

[126] The leg representing the time to expiry of the future should, however, be reported.

[127] This includes the delta-equivalent value of options. The delta equivalent of the legs arising out of the treatment of caps and floors as set out in paragraph 718(LX) can also be offset against each other under the rules laid down in this paragraph.

[128] The separate legs of different swaps may also be "matched" subject to the same conditions.

(i) **for futures**: offsetting positions in the notional or underlying instruments to which the futures contract relates must be for identical products and mature within seven days of each other;

(ii) **for swaps and FRAs**: the reference rate (for floating rate positions) must be identical and the coupon closely matched (i.e. within 15 basis points); and

(iii) **for swaps, FRAs and forwards**: the next interest fixing date or, for fixed coupon positions or forwards, the residual maturity must correspond within the following limits:

- less than one month hence: same day;
- between one month and one year hence: within seven days;
- over one year hence: within thirty days.

718(xv). Banks with large swap books may use alternative formulae for these swaps to calculate the positions to be included in the maturity or duration ladder. One method would be to first convert the payments required by the swap into their present values. For that purpose, each payment should be discounted using zero coupon yields, and a single net figure for the present value of the cash flows entered into the appropriate time-band using procedures that apply to zero (or low) coupon bonds; these figures should be slotted into the general market risk framework as set out above. An alternative method would be to calculate the sensitivity of the net present value implied by the change in yield used in the maturity or duration method and allocate these sensitivities into the time-bands set out in paragraph 718(iv) or paragraph 718(vii). Other methods which produce similar results could also be used. Such alternative treatments will, however, only be allowed if:

- the supervisory authority is fully satisfied with the accuracy of the systems being used;
- the positions calculated fully reflect the sensitivity of the cash flows to interest rate changes and are entered into the appropriate time-bands;
- the positions are denominated in the same currency.

Specific risk

718(xvi). Interest rate and currency swaps, FRAs, forward foreign exchange contracts and interest rate futures will not be subject to a specific risk charge. This exemption also applies to futures on an interest rate index (e.g. LIBOR). However, in the case of futures contracts where the underlying is a debt security, or an index representing a basket of debt securities, a specific risk charge will apply according to the credit risk of the issuer as set out in paragraphs 709(iii) to 718 above.

General market risk

718(xvii). General market risk applies to positions in all derivative products in the same manner as for cash positions, subject only to an exemption for fully or very closely matched positions in identical instruments as defined in paragraphs 718(xiii) and 718(xiv). The various categories of instruments should be slotted into the maturity ladder and treated according to the rules identified earlier.

718(xviii). The table below presents a summary of the regulatory treatment for interest rate derivatives, for market risk purposes.

Summary of treatment of interest rate derivatives

Instrument	Specific risk charge[129]	General market risk charge
Exchange-traded future		
- Government debt security	Yes[130]	Yes, as two positions
- Corporate debt security	Yes	Yes, as two positions
- Index on interest rates (e.g. LIBOR)	No	Yes, as two positions
OTC forward		
- Government debt security	Yes[130]	Yes, as two positions
- Corporate debt security	Yes	Yes, as two positions
- Index on interest rates	No	Yes, as two positions
FRAs, Swaps	No	Yes, as two positions
Forward foreign exchange	No	Yes, as one position in each currency
Options		Either
- Government debt security	Yes[130]	(a) Carve out together with the associated hedging positions - simplified approach - scenario analysis - internal models (Part B)
- Corporate debt security	Yes	(b) General market risk charge according to the delta-plus method (gamma and vega should receive separate capital charges)
- Index on interest rates	No	
- FRAs, Swaps	No	

2. *Equity position risk*

718(xix).This section sets out a minimum capital standard to cover the risk of holding or taking positions in equities in the trading book. It applies to long and short positions in all instruments that exhibit market behaviour similar to equities, but not to non-convertible preference shares (which are covered by the interest rate risk requirements described in paragraphs 709 to 718(xviii)). Long and short positions in the same issue may be reported on a net basis. The instruments covered include common stocks, whether voting or non-voting, convertible securities that behave like equities, and commitments to buy or sell equity securities. The treatment of derivative products, stock indices and index arbitrage is described in paragraphs 718(xxii) to 718(xxix) below.

[129] This is the specific risk charge relating to the issuer of the instrument. Under the existing credit risk rules, there remains a separate capital charge for the counterparty risk.

[130] The specific risk capital charge only applies to government debt securities that are rated below AA- (see paragraphs 710 and 710 (i)).

(i). Specific and general market risk

718(xx). As with debt securities, the minimum capital standard for equities is expressed in terms of two separately calculated charges for the "specific risk" of holding a long or short position in an individual equity and for the "general market risk" of holding a long or short position in the market as a whole. Specific risk is defined as the bank's gross equity positions (i.e. the sum of all long equity positions and of all short equity positions) and general market risk as the difference between the sum of the longs and the sum of the shorts (i.e. the overall net position in an equity market).The long or short position in the market must be calculated on a market-by-market basis, i.e. a separate calculation has to be carried out for each national market in which the bank holds equities.

718(xxi). The capital charge for *specific* risk will be 8%, unless the portfolio is both liquid and well-diversified, in which case the charge will be 4%. Given the different characteristics of national markets in terms of marketability and concentration, national authorities will have discretion to determine the criteria for liquid and diversified portfolios. The *general market risk* charge will be 8%.

(ii). Equity derivatives

718(xxii). Except for options, which are dealt with in paragraphs 718(Lvi) to 718(Lxix), equity derivatives and off-balance-sheet positions which are affected by changes in equity prices should be included in the measurement system.[131] This includes futures and swaps on both individual equities and on stock indices. The derivatives are to be converted into positions in the relevant underlying. The treatment of equity derivatives is summarised in paragraph 718(xxix) below.

Calculation of positions

718(xxiii). In order to calculate the standard formula for specific and general market risk, positions in derivatives should be converted into notional equity positions:

- Futures and forward contracts relating to individual equities should in principle be reported at current market prices;
- Futures relating to stock indices should be reported as the marked-to-market value of the notional underlying equity portfolio;
- Equity swaps are to be treated as two notional positions;[132]
- Equity options and stock index options should be either "carved out" together with the associated underlyings or be incorporated in the measure of general market risk described in this section according to the delta-plus method.

[131] Where equities are part of a forward contract, a future or an option (quantity of equities to be received or to be delivered), any interest rate or foreign currency exposure from the other leg of the contract should be reported as set out in paragraphs 709 to 718(xviii) and 718(xxx) to 718(xLii).

[132] For example, an equity swap in which a bank is receiving an amount based on the change in value of one particular equity or stock index and paying a different index will be treated as a long position in the former and a short position in the latter. Where one of the legs involves receiving/paying a fixed or floating interest rate, that exposure should be slotted into the appropriate repricing time-band for interest rate related instruments as set out in paragraphs 709 to 718(xviii). The stock index should be covered by the equity treatment.

Calculation of capital charges

Measurement of specific and general market risk

718(xxiv). Matched positions in each identical equity or stock index in each market may be fully offset, resulting in a single net short or long position to which the specific and general market risk charges will apply. For example, a future in a given equity may be offset against an opposite cash position in the same equity.[133]

Risk in relation to an index

718(xxv). Besides general market risk, a further capital charge of 2% will apply to the net long or short position in an index contract comprising a diversified portfolio of equities. This capital charge is intended to cover factors such as execution risk. National supervisory authorities will take care to ensure that this 2% risk weight applies only to well-diversified indices and not, for example, to sectoral indices.

Arbitrage

718(xxvi). In the case of the futures-related arbitrage strategies described below, the additional 2% capital charge described above may be applied to only one index with the opposite position exempt from a capital charge. The strategies are:

- When the bank takes an opposite position in exactly the same index at different dates or in different market centres;
- When the bank has an opposite position in contracts at the same date in different but similar indices, subject to supervisory oversight that the two indices contain sufficient common components to justify offsetting.

718(xxvii). Where a bank engages in a deliberate arbitrage strategy, in which a futures contract on a broadly-based index matches a basket of stocks, it will be allowed to carve out both positions from the standardised methodology on condition that:

- The trade has been deliberately entered into and separately controlled;
- The composition of the basket of stocks represents at least 90% of the index when broken down into its notional components.

In such a case the minimum capital requirement will be 4% (i.e. 2% of the gross value of the positions on each side) to reflect divergence and execution risks. This applies even if all of the stocks comprising the index are held in identical proportions. Any excess value of the stocks comprising the basket over the value of the futures contract or excess value of the futures contract over the value of the basket is to be treated as an open long or short position.

718(xxviii). If a bank takes a position in depository receipts against an opposite position in the underlying equity or identical equities in different markets, it may offset the position (i.e.

[133] The interest rate risk arising out of the future, however, should be reported as set out in paragraphs 709 to 718(xviii).

bear no capital charge) but only on condition that any costs on conversion are fully taken into account.[134]

718(xxix). The table below summarises the regulatory treatment of equity derivatives for market risk purposes.

Summary of treatment of equity derivatives

Instrument	Specific risk[135]	General market risk
Exchange-traded or OTC-Future		
- Individual equity	Yes	Yes, as underlying
- Index	2%	Yes, as underlying
Options		
- Individual equity	Yes	Either (a) Carve out together with the associated hedging positions - simplified approach - scenario analysis - internal models (Part B) (b) General market risk charge according to the delta-plus method (gamma and vega should receive separate capital charges)
- Index	2%	

3. *Foreign exchange risk*

718(xxx). This section sets out a minimum capital standard to cover the risk of holding or taking positions in foreign currencies, including gold.[136]

718(xxxi). Two processes are needed to calculate the capital requirement for foreign exchange risk. The first is to measure the exposure in a single currency position. The second is to measure the risks inherent in a bank's mix of long and short positions in different currencies.

(i). Measuring the exposure in a single currency

718(xxxii). The bank's net open position in each currency should be calculated by summing:

[134] Any foreign exchange risk arising out of these positions has to be reported as set out in paragraphs 718(xxx) to 718(xLvii).

[135] This is the specific risk charge relating to the issuer of the instrument. Under the existing credit risk rules, there remains a separate capital charge for the counterparty risk.

[136] Gold is to be dealt with as a foreign exchange position rather than a commodity because its volatility is more in line with foreign currencies and banks manage it in a similar manner to foreign currencies.

- The net spot position (i.e. all asset items less all liability items, including accrued interest, denominated in the currency in question);
- The net forward position (i.e. all amounts to be received less all amounts to be paid under forward foreign exchange transactions, including currency futures and the principal on currency swaps not included in the spot position);
- Guarantees (and similar instruments) that are certain to be called and are likely to be irrecoverable;
- Net future income/expenses not yet accrued but already fully hedged (at the discretion of the reporting bank);
- Depending on particular accounting conventions in different countries, any other item representing a profit or loss in foreign currencies;
- The net delta-based equivalent of the total book of foreign currency options.[137]

718(xxxiii). Positions in composite currencies need to be separately reported but, for measuring banks' open positions, may be either treated as a currency in their own right or split into their component parts on a consistent basis. Positions in gold should be measured in the same manner as described in paragraph 718(xLix).[138]

718(xxxiv). Three aspects call for more specific comment: the treatment of interest, other income and expenses; the measurement of forward currency positions and gold; and the treatment of "structural" positions.

The treatment of interest, other income and expenses

718(xxxv). Interest accrued (i.e. earned but not yet received) should be included as a position. Accrued expenses should also be included. Unearned but expected future interest and anticipated expenses may be excluded unless the amounts are certain and banks have taken the opportunity to hedge them. If banks include future income/expenses they should do so on a consistent basis, and not be permitted to select only those expected future flows which reduce their position.

The measurement of forward currency and gold positions

718(xxxvi). Forward currency and gold positions will normally be valued at current spot market exchange rates. Using forward exchange rates would be inappropriate since it would result in the measured positions reflecting current interest rate differentials to some extent. However, banks which base their normal management accounting on net present values are expected to use the net present values of each position, discounted using current interest rates and valued at current spot rates, for measuring their forward currency and gold positions.

---

[137] Subject to a separately calculated capital charge for gamma and vega as described in paragraphs 718(Lix) to 718(Lxii); alternatively, options and their associated underlyings are subject to one of the other methods described in paragraphs 718(Lvi) to 718(Lxix).

[138] Where gold is part of a forward contract (quantity of gold to be received or to be delivered), any interest rate or foreign currency exposure from the other leg of the contract should be reported as set out in paragraphs 709 to 718(xviii) and 718(xxxii) above.

The treatment of structural positions

718(xxxvii). A matched currency position will protect a bank against loss from movements in exchange rates, but will not necessarily protect its capital adequacy ratio. If a bank has its capital denominated in its domestic currency and has a portfolio of foreign currency assets and liabilities that is completely matched, its capital/asset ratio will fall if the domestic currency depreciates. By running a short position in the domestic currency the bank can protect its capital adequacy ratio, although the position would lead to a loss if the domestic currency were to appreciate.

718(xxxviii). Supervisory authorities are free to allow banks to protect their capital adequacy ratio in this way. Thus, any positions which a bank has deliberately taken in order to hedge partially or totally against the adverse effect of the exchange rate on its capital ratio may be excluded from the calculation of net open currency positions, subject to each of the following conditions being met:

- Such positions need to be of a “structural”, i.e. of a non-dealing, nature (the precise definition to be set by national authorities according to national accounting standards and practices);
- The national authority needs to be satisfied that the “structural” position excluded does no more than protect the bank’s capital adequacy ratio;
- Any exclusion of the position needs to be applied consistently, with the treatment of the hedge remaining the same for the life of the assets or other items.

718(xxxix). No capital charge need apply to positions related to items that are deducted from a bank’s capital when calculating its capital base, such as investments in non-consolidated subsidiaries, nor to other long-term participations denominated in foreign currencies which are reported in the published accounts at historic cost. These may also be treated as structural positions.

(ii). Measuring the foreign exchange risk in a portfolio of foreign currency positions and gold

718(xL). Banks will have a choice between two alternative measures at supervisory discretion; a “shorthand” method which treats all currencies equally; and the use of internal models which takes account of the actual degree of risk dependent on the composition of the bank’s portfolio. The conditions for the use of internal models are set out in paragraphs 718(Lxx) to 718(xcix) below.

718(xLi). Under the shorthand method, the nominal amount (or net present value) of the net position in each foreign currency and in gold is converted at spot rates into the reporting currency.[139] The overall net open position is measured by aggregating:

- The sum of the net short positions or the sum of the net long positions, whichever is the greater;[140] plus

139 Where the bank is assessing its foreign exchange risk on a consolidated basis, it may be technically impractical in the case of some marginal operations to include the currency positions of a foreign branch or subsidiary of the bank. In such cases the internal limit in each currency may be used as a proxy for the positions. Provided there is adequate ex post monitoring of actual positions against such limits, the limits should be added, without regard to sign, to the net open position in each currency.

- The net position (short or long) in gold, regardless of sign.

The capital charge will be 8% of the overall net open position (see example below).

Example of the shorthand measure of foreign exchange risk

YEN	EUR	GB£	CA$	US$	GOLD
+ 50	+ 100	+ 150	- 20	- 180	- 35
	+ 300		- 200		35

The capital charge would be 8% of the higher of either the net long currency positions or the net short currency positions (i.e. 300) and of the net position in gold (35) = 335 x 8% = 26.8.

718(xlii). A bank doing negligible business in foreign currency and which does not take foreign exchange positions for its own account may, at the discretion of its national authority, be exempted from capital requirements on these positions provided that:

- Its foreign currency business, defined as the greater of the sum of its gross long positions and the sum of its gross short positions in all foreign currencies, does not exceed 100% of eligible capital as defined in paragraphs 49(xxi) and 49(xxii); **and**

- Its overall net open position as defined in the paragraph above does not exceed 2% of its eligible capital as defined in paragraphs 49(xxi) and 49(xxii)

4. Commodities risk

718(xliii). This section establishes a minimum capital standard to cover the risk of holding or taking positions in commodities, including precious metals, but excluding gold (which is treated as a foreign currency according to the methodology set out in paragraphs 718(xxx) to 718(xlii) above). A commodity is defined as a physical product which is or can be traded on a secondary market, e.g. agricultural products, minerals (including oil) and precious metals.

718(xliv). The price risk in commodities is often more complex and volatile than that associated with currencies and interest rates. Commodity markets may also be less liquid than those for interest rates and currencies and, as a result, changes in supply and demand can have a more dramatic effect on price and volatility.[141] These market characteristics can make price transparency and the effective hedging of commodities risk more difficult.

718(xlv). For spot or physical trading, the directional risk arising from a change in the spot price is the most important risk. However, banks using portfolio strategies involving forward and derivative contracts are exposed to a variety of additional risks, which may well be larger than the risk of a change in spot prices. These include:

- Basis risk (the risk that the relationship between the prices of similar commodities alters through time);

---

[140] An alternative calculation, which produces an identical result, is to include the reporting currency as a residual and to take the sum of all the short (or long) positions.

[141] Banks need also to guard against the risk that arises when the short position falls due before the long position. Owing to a shortage of liquidity in some markets it might be difficult to close the short position and the bank might be squeezed by the market.

- Interest rate risk (the risk of a change in the cost of carry for forward positions and options);
- Forward gap risk (the risk that the forward price may change for reasons other than a change in interest rates);

In addition banks may face credit counterparty risk on over-the-counter derivatives, but this is captured by one of the methods set out in Annex 4 of this Framework. The funding of commodities positions may well open a bank to interest rate or foreign exchange exposure and if that is so the relevant positions should be included in the measures of interest rate and foreign exchange risk described in paragraphs 709 to 718(xviii) and paragraphs 718(xxx) to 718(xlii), respectively.[142]

718(xlvi). There are three alternatives for measuring commodities position risk which are described in paragraphs 718(xlviii) to 718(lv) below. As with other categories of market risk, banks may use models subject to the conditions set out in paragraphs 718(lxx) to 718(xcix). Commodities risk can also be measured in a standardised manner, using either a very simple framework (paragraphs 718(liv) and 718(lv) below) or a measurement system which captures forward gap and interest rate risk separately by basing the methodology on seven time-bands (paragraphs 718(xlix) to 718(liii) below). Both the simplified approach and the maturity ladder approach are appropriate only for banks which, in relative terms, conduct only a limited amount of commodities business. Major traders would be expected over time to adopt a models approach subject to the safeguards set out in paragraphs 718(lxx) to 718(xcix).

718(xlvii). For the maturity ladder approach and the simplified approach, long and short positions in each commodity may be reported on a net basis for the purposes of calculating open positions. However, positions in different commodities will as a general rule not be offsettable in this fashion. Nevertheless, national authorities will have discretion to permit netting between different sub-categories[143] of the same commodity in cases where the sub-categories are deliverable against each other. They can also be considered as offsettable if they are close substitutes against each other and a minimum correlation of 0.9 between the price movements can be clearly established over a minimum period of one year. However, a bank wishing to base its calculation of capital charges for commodities on correlations would have to satisfy the relevant supervisory authority of the accuracy of the method which has been chosen and obtain its prior approval. Where banks use the models approach they can offset long and short positions in different commodities to a degree which is determined by empirical correlations, in the same way as a limited degree of offsetting is allowed, for instance, between interest rates in different currencies.

---

[142] Where a commodity is part of a forward contract (quantity of commodities to be received or to be delivered), any interest rate or foreign currency exposure from the other leg of the contract should be reported as set out in paragraphs 709 to 718(xviii) and paragraphs 718(xxx) to 718(xlii). Positions which are purely stock financing (i.e. a physical stock has been sold forward and the cost of funding has been locked in until the date of the forward sale) may be omitted from the commodities risk calculation although they will be subject to interest rate and counterparty risk requirements.

[143] Commodities can be grouped into clans, families, sub-groups and individual commodities. For example, a clan might be Energy Commodities, within which Hydro-Carbons are a family with Crude Oil being a sub-group and West Texas Intermediate, Arabian Light and Brent being individual commodities.

(i) Models for measuring commodities risk

718(xLviii). Banks may choose to adopt the models approach as set out in paragraphs 718(Lxx) to 718(xcix). It is essential that the methodology used encompasses:

- Directional risk, to capture the exposure from changes in spot prices arising from net open positions;
- Forward gap and interest rate risk, to capture the exposure to changes in forward prices arising from maturity mismatches; and
- Basis risk, to capture the exposure to changes in the price relationships between two similar, but not identical, commodities.

It is also particularly important that models take proper account of market characteristics - notably delivery dates and the scope provided to traders to close out positions.

(ii) Maturity ladder approach

718(xLix). In calculating the capital charges under this approach banks will first have to express each commodity position (spot plus forward) in terms of the standard unit of measurement (barrels, kilos, grams etc.). The net position in each commodity will then be converted at current spot rates into the national currency.

718(L). Secondly, in order to capture forward gap and interest rate risk within a time-band (which, together, are sometimes referred to as curvature/spread risk), matched long and short positions in each time-band will carry a capital charge. The methodology will be rather similar to that used for interest rate related instruments as set out in paragraphs 709 to 718(xviii). Positions in the separate commodities (expressed in terms of the standard unit of measurement) will first be entered into a maturity ladder while physical stocks should be allocated to the first time-band. A separate maturity ladder will be used for each commodity as defined in paragraph 718(xLvii) above.[144] For each time-band, the sum of short and long positions which are matched will be multiplied first by the spot price for the commodity, and then by the appropriate spread rate for that band (as set out in the table below).

[144] For markets which have daily delivery dates, any contracts maturing within ten days of one another may be offset.

Time-bands and spread rates

Time-band	Spread rate
0 - 1 month	1.5%
1 - 3 months	1.5%
3 - 6 months	1.5%
6 - 12 months	1.5%
1 - 2 years	1.5%
2 - 3 years	1.5%
over 3 years	1.5%

718(Li). The residual net positions from nearer time-bands may then be carried forward to offset exposures in time-bands that are further out. However, recognising that such hedging of positions among different time-bands is imprecise, a surcharge equal to 0.6% of the net position carried forward will be added in respect of each time-band that the net position is carried forward. The capital charge for each matched amount created by carrying net positions forward will be calculated as in paragraph 718(L) above. At the end of this process a bank will have either only long or only short positions, to which a capital charge of 15% will apply.

718(Lii). Even though the Committee is aware that there are differences in volatility between different commodities, it has decided in the interest of simplicity, and given the fact that banks normally run rather small open positions in commodities, that one uniform capital charge for open positions in all commodities should apply. Those banks which desire to be more precise in this area may choose to adopt the models approach.

718(Liii). All commodity derivatives and off-balance-sheet positions which are affected by changes in commodity prices should be included in this measurement framework. This includes commodity futures, commodity swaps, and options where the "delta plus" method[145] is used (see paragraphs 718(Lix) to 718(Lxii) below). In order to calculate the risk, commodity derivatives should be converted into notional commodities positions and assigned to maturities as follows:

- *Futures and forward contracts relating to individual commodities* should be incorporated in the measurement system as notional amounts of barrels, kilos etc. and should be assigned a maturity with reference to expiry date;

- *Commodity swaps* where one leg is a fixed price and the other the current market price should be incorporated as a series of positions equal to the notional amount of the contract, with one position corresponding with each payment on the swap and slotted into the maturity ladder accordingly. The positions would be long positions if

[145] For banks using other approaches to measure options risk, all options and the associated underlyings should be excluded from both the maturity ladder approach and the simplified approach.

the bank is paying fixed and receiving floating, and short positions if the bank is receiving fixed and paying floating;[146]

- *Commodity swaps* where the legs are in different commodities are to be incorporated in the relevant maturity ladder. No offsetting will be allowed in this regard except where the commodities belong to the same sub-category as defined in paragraph 718(xLvii) above.

(iii) Simplified approach

718(Liv). In calculating the capital charge for directional risk, the same procedure will be adopted as in the maturity ladder approach above (see paragraphs 718(xLix) and 718(Liii)). Once again, all commodity derivatives and off-balance-sheet positions which are affected by changes in commodity prices should be included. The capital charge will equal 15% of the net position, long or short, in each commodity.

718(Lv). In order to protect the bank against basis risk, interest rate risk and forward gap risk, the capital charge for each commodity as described in paragraphs 718(xLix) and 718(Liii) above will be subject to an additional capital charge equivalent to 3% of the bank's gross positions, long plus short, in that particular commodity. In valuing the gross positions in commodity derivatives for this purpose, banks should use the current spot price.

5. Treatment of options

718(Lvi). In recognition of the wide diversity of banks' activities in options and the difficulties of measuring price risk for options, several alternative approaches will be permissible at the discretion of the national authority:

- Those banks which solely use purchased options[147] will be free to use the simplified approach described in paragraph 718(Lviii) below;

- Those banks which also write options will be expected to use one of the intermediate approaches as set out in paragraphs 718(Lix) to 718(Lxix) or a comprehensive risk management model under the terms of paragraphs 718(Lxx) to 718(xcix) of this Framework. The more significant its trading, the more the bank will be expected to use a sophisticated approach.

718(Lvii). In the *simplified approach*, the positions for the options and the associated underlying, cash or forward, are not subject to the standardised methodology but rather are "carved-out" and subject to separately calculated capital charges that incorporate both general market risk and specific risk. The risk numbers thus generated are then added to the capital charges for the relevant category, i.e. interest rate related instruments, equities, foreign exchange and commodities as described in paragraphs 709 to 718(Lv). The *delta-plus method* uses the sensitivity parameters or "Greek letters" associated with options to measure their market risk and capital requirements. Under this method, the delta-equivalent position of each option becomes part of the standardised methodology set out in paragraphs 709 to 718(Lv) with the delta-equivalent amount subject to the applicable general market risk

---

[146] If one of the legs involves receiving/paying a fixed or floating interest rate, that exposure should be slotted into the appropriate repricing maturity band in the maturity ladder covering interest rate related instruments.

[147] Unless all their written option positions are hedged by perfectly matched long positions in exactly the same options, in which case no capital charge for market risk is required.

charges. Separate capital charges are then applied to the gamma and vega risks of the option positions. The *scenario approach* uses simulation techniques to calculate changes in the value of an options portfolio for changes in the level and volatility of its associated underlyings. Under this approach, the general market risk charge is determined by the scenario "grid" (i.e. the specified combination of underlying and volatility changes) that produces the largest loss. For the delta-plus method and the scenario approach the specific risk capital charges are determined separately by multiplying the delta-equivalent of each option by the specific risk weights set out in paragraphs 709 to 718(xxix).

(i) Simplified approach

718(Lviii). Banks which handle a limited range of purchased options only will be free to use the simplified approach set out in the table below for particular trades. As an example of how the calculation would work, if a holder of 100 shares currently valued at $10 each holds an equivalent put option with a strike price of $11, the capital charge would be: $1,000 x 16% (i.e. 8% specific plus 8% general market risk) = $160, less the amount the option is in the money ($11 - $10) x 100 = $100, i.e. the capital charge would be $60. A similar methodology applies for options whose underlying is a foreign currency, an interest rate related instrument or a commodity.

Simplified approach: capital charges

Position	Treatment
Long cash and Long put or Short cash and Long call	The capital charge will be the market value of the underlying security[148] multiplied by the sum of specific and general market risk charges[149] for the underlying less the amount the option is in the money (if any) bounded at zero[150]
Long call or Long put	The capital charge will be the lesser of: (i) the market value of the underlying security multiplied by the sum of specific and general market risk charges[149] for the underlying (ii) the market value of the option[151]

[148] In some cases such as foreign exchange, it may be unclear which side is the "underlying security"; this should be taken to be the asset which would be received if the option were exercised. In addition the nominal value should be used for items where the market value of the underlying instrument could be zero, e.g. caps and floors, swaptions etc.

[149] Some options (e.g. where the underlying is an interest rate, a currency or a commodity) bear no specific risk but specific risk will be present in the case of options on certain interest rate related instruments (e.g. options on a corporate debt security or corporate bond index; see paragraphs 709 to 718(xviii) for the relevant capital charges) and for options on equities and stock indices (see paragraphs 718(xix) to 718(xxix)). The charge under this measure for currency options will be 8% and for options on commodities 15%.

[150] For options with a residual maturity of more than six months the strike price should be compared with the forward, not current, price. A bank unable to do this must take the in the money amount to be zero.

[151] Where the position does not fall within the trading book (i.e. options on certain foreign exchange or commodities positions not belonging to the trading book), it may be acceptable to use the book value instead.

(ii) Intermediate approaches

Delta-plus method

718(Lix). Banks which write options will be allowed to include delta-weighted options positions within the standardised methodology set out in paragraphs 709 to 718(Lv). Such options should be reported as a position equal to the market value of the underlying multiplied by the delta. However, since delta does not sufficiently cover the risks associated with options positions, banks will also be required to measure gamma (which measures the rate of change of delta) and vega (which measures the sensitivity of the value of an option with respect to a change in volatility) sensitivities in order to calculate the total capital charge. These sensitivities will be calculated according to an approved exchange model or to the bank's proprietary options pricing model subject to oversight by the national authority.[152]

718(Lx). Delta-weighted positions with *debt securities or interest rates as the underlying* will be slotted into the interest rate time-bands, as set out in paragraphs 709 to 718(xviii), under the following procedure. A two-legged approach should be used as for other derivatives, requiring one entry at the time the underlying contract takes effect and a second at the time the underlying contract matures. For instance, a bought call option on a June three-month interest-rate future will in April be considered, on the basis of its delta-equivalent value, to be a long position with a maturity of five months and a short position with a maturity of two months.[153] The written option will be similarly slotted as a long position with a maturity of two months and a short position with a maturity of five months. Floating rate instruments with caps or floors will be treated as a combination of floating rate securities and a series of European-style options. For example, the holder of a three-year floating rate bond indexed to six month LIBOR with a cap of 15% will treat it as:

(i) A debt security that reprices in six months; and

(ii) A series of five written call options on a FRA with a reference rate of 15%, each with a negative sign at the time the underlying FRA takes effect and a positive sign at the time the underlying FRA matures.[154]

718(Lxi). The capital charge for *options with equities as the underlying* will also be based on the delta-weighted positions which will be incorporated in the measure of market risk described in paragraphs 718(xix) to 718(xxix). For purposes of this calculation each national market is to be treated as a separate underlying. The capital charge for *options on foreign exchange and gold positions* will be based on the method set out in paragraphs 718(xxx) to 718(xLii). For delta risk, the net delta-based equivalent of the foreign currency and gold options will be incorporated into the measurement of the exposure for the respective currency (or gold) position. The capital charge for *options on commodities* will be based on the simplified or the maturity ladder approach set out in paragraphs 718(xLiii) to 718(Lv). The delta-weighted positions will be incorporated in one of the measures described in that section.

[152] National authorities may wish to require banks doing business in certain classes of exotic options (e.g. barriers, digitals) or in options at the money that are close to expiry to use either the scenario approach or the internal models alternative, both of which can accommodate more detailed revaluation approaches.

[153] A two months call option on a bond future where delivery of the bond takes place in September would be considered in April as being long the bond and short a five months deposit, both positions being delta-weighted.

[154] The rules applying to closely matched positions set out in paragraph 718(xiv) will also apply in this respect.

718(LXII). In addition to the above capital charges arising from delta risk, there will be further capital charges for *gamma* and for *vega risk.* Banks using the delta-plus method will be required to calculate the gamma and vega for each option position (including hedge positions) separately. The capital charges should be calculated in the following way:

(i) for **each individual option** a "gamma impact" should be calculated according to a Taylor series expansion as:

$$\textit{Gamma impact} = \tfrac{1}{2} \times \textit{Gamma} \times VU^2$$

where VU = Variation of the underlying of the option.

(ii) VU will be calculated as follows:

- For interest rate options if the underlying is a bond, the market value of the underlying should be multiplied by the risk weights set out in paragraph 718(iv). An equivalent calculation should be carried out where the underlying is an interest rate, again based on the assumed changes in the corresponding yield in paragraph 718(iv);
- For options on equities and equity indices: the market value of the underlying should be multiplied by 8%;[155]
- For foreign exchange and gold options: the market value of the underlying should be multiplied by 8%;
- For options on commodities: the market value of the underlying should be multiplied by 15%.

(iii) For the purpose of this calculation the following positions should be treated as **the same underlying**:

- for interest rates,[156] each time-band as set out in paragraph 718(iv);[157]
- for equities and stock indices, each national market;
- for foreign currencies and gold, each currency pair and gold;
- for commodities, each individual commodity as defined in paragraph 718(XLVII).

(iv) Each option on the same underlying will have a gamma impact that is either positive or negative. These individual gamma impacts will be summed, resulting in a net gamma impact for each underlying that is either positive or negative. Only those net gamma impacts that are negative will be included in the capital calculation.

[155] The basic rules set out here for interest rate and equity options do not attempt to capture specific risk when calculating gamma capital charges. However, national authorities may wish to require specific banks to do so.

[156] Positions have to be slotted into separate maturity ladders by currency.

[157] Banks using the duration method should use the time-bands as set out in paragraph 718(vii).

(v) The total gamma capital charge will be the sum of the absolute value of the net negative gamma impacts as calculated above.

(vi) For **volatility risk**, banks will be required to calculate the capital charges by multiplying the sum of the vegas for all options on the same underlying, as defined above, by a proportional shift in volatility of ± 25%.

(vii) The **total capital charge** for vega risk will be the sum of the absolute value of the individual capital charges that have been calculated for vega risk.

Scenario approach

718(LXiii). More sophisticated banks will also have the right to base the market risk capital charge for options portfolios and associated hedging positions on *scenario matrix analysis*. This will be accomplished by specifying a fixed range of changes in the option portfolio's risk factors and calculating changes in the value of the option portfolio at various points along this "grid". For the purpose of calculating the capital charge, the bank will revalue the option portfolio using matrices for simultaneous changes in the option's underlying rate or price and in the volatility of that rate or price. A different matrix will be set up for each individual underlying as defined in paragraph 718(LXii) above. As an alternative, at the discretion of each national authority, banks which are significant traders in options will for interest rate options be permitted to base the calculation on a minimum of six sets of time-bands. When using this method, not more than three of the time-bands as defined in paragraphs 718(iv) and 718(vii) should be combined into any one set.

718(LXiv). The options and related hedging positions will be evaluated over a specified range above and below the current value of the underlying. The range for interest rates is consistent with the assumed changes in yield in paragraph 718(iv). Those banks using the alternative method for interest rate options set out in paragraph 718(LXiii) above should use, for each set of time-bands, the highest of the assumed changes in yield applicable to the group to which the time-bands belong.[158] The other ranges are ± 8% for equities[155], ± 8% for foreign exchange and gold, and ± 15% for commodities. For all risk categories, at least seven observations (including the current observation) should be used to divide the range into equally spaced intervals.

718(LXv). The second dimension of the matrix entails a change in the volatility of the underlying rate or price. A single change in the volatility of the underlying rate or price equal to a shift in volatility of + 25% and - 25% is expected to be sufficient in most cases. As circumstances warrant, however, the supervisory authority may choose to require that a different change in volatility be used and/or that intermediate points on the grid be calculated.

718(LXvi). After calculating the matrix each cell contains the net profit or loss of the option and the underlying hedge instrument. The capital charge for each underlying will then be calculated as the largest loss contained in the matrix.

718(LXvii). The application of the scenario analysis by any specific bank will be subject to supervisory consent, particularly as regards the precise way that the analysis is constructed. Banks' use of scenario analysis as part of the standardised methodology will also be subject to validation by the national authority, and to those of the qualitative standards listed in paragraphs 718(LXxiv) and 718(LXxv) which are appropriate given the nature of the business.

[158] If, for example, the time-bands 3 to 4 years, 4 to 5 years and 5 to 7 years are combined the highest assumed change in yield of these three bands would be 0.75.

718(lxviii). In drawing up these intermediate approaches the Committee has sought to cover the major risks associated with options. In doing so, it is conscious that so far as specific risk is concerned, only the delta-related elements are captured; to capture other risks would necessitate a much more complex regime. On the other hand, in other areas the simplifying assumptions used have resulted in a relatively conservative treatment of certain options positions. For these reasons, the Committee intends to keep this area under close review.

718(lxix). Besides the options risks mentioned above, the Committee is conscious of the other risks also associated with options, e.g. rho (rate of change of the value of the option with respect to the interest rate) and theta (rate of change of the value of the option with respect to time). While not proposing a measurement system for those risks at present, it expects banks undertaking significant options business at the very least to monitor such risks closely. Additionally, banks will be permitted to incorporate rho into their capital calculations for interest rate risk, if they wish to do so.

D. Market Risk – The Internal Models Approach

1. General criteria

718(lxx). The use of an internal model will be conditional upon the explicit approval of the bank's supervisory authority. Home and host country supervisory authorities of banks that carry out material trading activities in multiple jurisdictions intend to work co-operatively to ensure an efficient approval process.

718(lxxi). The supervisory authority will only give its approval if at a minimum:

- It is satisfied that the bank's risk management system is conceptually sound and is implemented with integrity;
- The bank has in the supervisory authority's view sufficient numbers of staff skilled in the use of sophisticated models not only in the trading area but also in the risk control, audit, and if necessary, back office areas;
- The bank's models have in the supervisory authority's judgement a proven track record of reasonable accuracy in measuring risk;
- The bank regularly conducts stress tests along the lines discussed in paragraphs 718(lxxvii) to 718(lxxxiv) below.

718(lxxii). Supervisory authorities will have the right to insist on a period of initial monitoring and live testing of a bank's internal model before it is used for supervisory capital purposes.

718(lxxiii). In addition to these general criteria, banks using internal models for capital purposes will be subject to the requirements detailed in paragraphs 718(lxxiv) to 718(xcix).

2. Qualitative standards

718(lxxiv). It is important that supervisory authorities are able to assure themselves that banks using models have market risk management systems that are conceptually sound and implemented with integrity. Accordingly, the supervisory authority will specify a number of *qualitative criteria* that banks would have to meet before they are permitted to use a models-based approach. The extent to which banks meet the qualitative criteria may influence the level at which supervisory authorities will set the multiplication factor referred to in paragraph 718(lxxvi) (j) below. Only those banks whose models are in full compliance with the qualitative criteria will be eligible for application of the minimum multiplication factor. The qualitative criteria include:

(a) The bank should have an independent risk control unit that is responsible for the design and implementation of the bank's risk management system. The unit should produce and analyse daily reports on the output of the bank's risk measurement model, including an evaluation of the relationship between measures of risk exposure and trading limits. This unit must be independent from business trading units and should report directly to senior management of the bank.

(b) The unit should conduct a regular back-testing programme, i.e. an ex-post comparison of the risk measure generated by the model against actual daily changes in portfolio value over longer periods of time, as well as hypothetical changes based on static positions.

(c) The unit should also conduct the initial and on-going validation of the internal model.[159]

(d) Board of directors and senior management should be actively involved in the risk control process and must regard risk control as an essential aspect of the business to which significant resources need to be devoted.[160] In this regard, the daily reports prepared by the independent risk control unit must be reviewed by a level of management with sufficient seniority and authority to enforce both reductions of positions taken by individual traders and reductions in the bank's overall risk exposure.

(e) The bank's internal risk measurement model must be closely integrated into the day-to-day risk management process of the bank. Its output should accordingly be an integral part of the process of planning, monitoring and controlling the bank's market risk profile.

(f) The risk measurement system should be used in conjunction with internal trading and exposure limits. In this regard, trading limits should be related to the bank's risk measurement model in a manner that is consistent over time and that is well-understood by both traders and senior management.

(g) A routine and rigorous programme of stress testing[161] should be in place as a supplement to the risk analysis based on the day-to-day output of the bank's risk measurement model. The results of stress testing should be reviewed periodically by senior management, used in the internal assessment of capital adequacy, and reflected in the policies and limits set by management and the board of directors. Where stress tests reveal particular vulnerability to a given set of circumstances, prompt steps should be taken to manage those risks appropriately (e.g. by hedging against that outcome or reducing the size of the bank's exposures, or increasing capital).

---

[159] Further guidance regarding the standards that supervisory authorities will expect can be found in paragraph 718(xcix).

[160] The report, *Risk management guidelines for derivatives,* issued by the Basel Committee in July 1994 further discusses the responsibilities of the board of directors and senior management.

[161] Though banks will have some discretion as to how they conduct stress tests, their supervisory authorities will wish to see that they follow the general lines set out in paragraphs 718(Lxxvii) to 718(Lxxxiiii).

(h) Banks should have a routine in place for ensuring compliance with a documented set of internal policies, controls and procedures concerning the operation of the risk measurement system. The bank's risk measurement system must be well documented, for example, through a risk management manual that describes the basic principles of the risk management system and that provides an explanation of the empirical techniques used to measure market risk.

(i) An independent review of the risk measurement system should be carried out regularly in the bank's own internal auditing process. This review should include both the activities of the business trading units and of the independent risk control unit. A review of the overall risk management process should take place at regular intervals (ideally not less than once a year) and should specifically address, at a minimum:

- The adequacy of the documentation of the risk management system and process;
- The organisation of the risk control unit;
- The integration of market risk measures into daily risk management;
- The approval process for risk pricing models and valuation systems used by front and back-office personnel;
- The validation of any significant change in the risk measurement process;
- The scope of market risks captured by the risk measurement model;
- The integrity of the management information system;
- The accuracy and completeness of position data;
- The verification of the consistency, timeliness and reliability of data sources used to run internal models, including the independence of such data sources;
- The accuracy and appropriateness of volatility and correlation assumptions;
- The accuracy of valuation and risk transformation calculations;
- The verification of the model's accuracy through frequent back-testing as described in 718(LXXIV) (b) above and in the accompanying document: *Supervisory framework for the use of backtesting in conjunction with the internal models approach to market risk capital requirements*.

3. Specification of market risk factors

718(LXXV). An important part of a bank's internal market risk measurement system is the specification of an appropriate set of market risk factors, i.e. the market rates and prices that affect the value of the bank's trading positions. The risk factors contained in a market risk measurement system should be sufficient to capture the risks inherent in the bank's portfolio of on- and off-balance sheet trading positions. Although banks will have some discretion in specifying the risk factors for their internal models, the following guidelines should be fulfilled.

(a) For *interest rates*, there must be a set of risk factors corresponding to interest rates in each currency in which the bank has interest-rate-sensitive on- or off-balance sheet positions.

- The risk measurement system should model the yield curve using one of a number of generally accepted approaches, for example, by estimating forward rates of zero coupon yields. The yield curve should be divided into various maturity segments in order to capture variation in the volatility of rates along the yield curve; there will typically be one risk factor corresponding to each maturity segment. For material exposures to interest rate movements in the major currencies and markets, banks must model the yield curve using a minimum of six risk factors. However, the number of risk factors used should ultimately be driven by the nature of the bank's trading strategies. For instance, a bank with a portfolio of various types of securities across many points of the yield curve and that engages in complex arbitrage strategies would require a greater number of risk factors to capture interest rate risk accurately.

- The risk measurement system must incorporate separate risk factors to capture spread risk (e.g. between bonds and swaps). A variety of approaches may be used to capture the spread risk arising from less than perfectly correlated movements between government and other fixed-income interest rates, such as specifying a completely separate yield curve for non-government fixed-income instruments (for instance, swaps or municipal securities) or estimating the spread over government rates at various points along the yield curve.

(b) For *exchange rates* (which may include gold), the risk measurement system should incorporate risk factors corresponding to the individual foreign currencies in which the bank's positions are denominated. Since the value-at-risk figure calculated by the risk measurement system will be expressed in the bank's domestic currency, any net position denominated in a foreign currency will introduce a foreign exchange risk. Thus, there must be risk factors corresponding to the exchange rate between the domestic currency and each foreign currency in which the bank has a significant exposure.

(c) For *equity prices*, there should be risk factors corresponding to each of the equity markets in which the bank holds significant positions:

- At a minimum, there should be a risk factor that is designed to capture market-wide movements in equity prices (e.g. a market index). Positions in individual securities or in sector indices could be expressed in "beta-equivalents"[162] relative to this market-wide index;

- A somewhat more detailed approach would be to have risk factors corresponding to various sectors of the overall equity market (for instance, industry sectors or cyclical and non-cyclical sectors). As above, positions in

[162] A "beta-equivalent" position would be calculated from a market model of equity price returns (such as the CAPM model) by regressing the return on the individual stock or sector index on the risk-free rate of return and the return on the market index.

individual stocks within each sector could be expressed in beta-equivalents[49] relative to the sector index;

- The most extensive approach would be to have risk factors corresponding to the volatility of individual equity issues.

- The sophistication and nature of the modelling technique for a given market should correspond to the bank's exposure to the overall market as well as its concentration in individual equity issues in that market.

(d) For *commodity prices*, there should be risk factors corresponding to each of the commodity markets in which the bank holds significant positions (also see paragraph 718(xLvii) above):

- For banks with relatively limited positions in commodity-based instruments, a straightforward specification of risk factors would be acceptable. Such a specification would likely entail one risk factor for each commodity price to which the bank is exposed. In cases where the aggregate positions are quite small, it might be acceptable to use a single risk factor for a relatively broad sub-category of commodities (for instance, a single risk factor for all types of oil);

- For more active trading, the model must also take account of variation in the "convenience yield"[163] between derivatives positions such as forwards and swaps and cash positions in the commodity.

4. *Quantitative standards*

718(Lxxvi). Banks will have flexibility in devising the precise nature of their models, but the following minimum standards will apply for the purpose of calculating their capital charge. Individual banks or their supervisory authorities will have discretion to apply stricter standards.

(a) *"Value-at-risk"* must be computed on a daily basis.

(b) In calculating the value-at-risk, a 99th percentile, one-tailed *confidence interval* is to be used.

(c) In calculating value-at-risk, an instantaneous price shock equivalent to a 10 day movement in prices is to be used, i.e. the minimum *"holding period"* will be ten trading days. Banks may use value-at-risk numbers calculated according to shorter holding periods scaled up to ten days by the square root of time (for the treatment of options, also see 718(Lxxvi) (h) below).

(d) The choice of *historical observation period* (sample period) for calculating value-at-risk will be constrained to a minimum length of one year. For banks that use a weighting scheme or other methods for the historical observation period, the

[163] The convenience yield reflects the benefits from direct ownership of the physical commodity (for example, the ability to profit from temporary market shortages), and is affected both by market conditions and by factors such as physical storage costs.

"effective" observation period must be at least one year (that is, the weighted average time lag of the individual observations cannot be less than 6 months).

(e) Banks should update their *data sets* no less frequently than once every three months and should also reassess them whenever market prices are subject to material changes. The supervisory authority may also require a bank to calculate its value-at-risk using a shorter observation period if, in the supervisor's judgement, this is justified by a significant upsurge in price volatility.

(f) No particular *type of model* is prescribed. So long as each model used captures all the material risks run by the bank, as set out in paragraph 718(LXXV), banks will be free to use models based, for example, on variance-covariance matrices, historical simulations, or Monte Carlo simulations.

(g) Banks will have discretion to recognise empirical *correlations* within broad risk categories (e.g. interest rates, exchange rates, equity prices and commodity prices, including related options volatilities in each risk factor category). The supervisory authority may also recognise empirical correlations across broad risk factor categories, provided that the supervisory authority is satisfied that the bank's system for measuring correlations is sound and implemented with integrity.

(h) Banks' models must accurately capture the unique risks associated with *options* within each of the broad risk categories. The following criteria apply to the measurement of options risk:

- Banks' models must capture the *non-linear price characteristics* of options positions;
- Banks are expected to ultimately move towards the application of a full 10 day price shock to options positions or positions that display option-like characteristics. In the interim, national authorities may require banks to adjust their capital measure for options risk through other methods, e.g. periodic simulations or stress testing;
- Each bank's risk measurement system must have a set of risk factors that captures the *volatilities of the rates and prices* underlying option positions, i.e. vega risk. Banks with relatively large and/or complex options portfolios should have detailed specifications of the relevant volatilities. This means that banks should measure the volatilities of options positions broken down by different maturities.

(i) Each bank must meet, on a daily basis, a *capital requirement* expressed as the higher of (i) its previous day's value-at-risk number measured according to the parameters specified in this section and (ii) an average of the daily value-at-risk measures on each of the preceding sixty business days, multiplied by a multiplication factor.

(j) The multiplication factor will be set by individual supervisory authorities on the basis of their assessment of the quality of the bank's risk management system, subject to an absolute minimum of 3. Banks will be required to add to this factor a "plus" directly related to the ex-post performance of the model, thereby introducing a built-in positive incentive to maintain the predictive quality of the model. The plus will range from 0 to 1 based on the outcome of so-called "backtesting." If the backtesting results are satisfactory and the bank meets all of the qualitative standards set out in paragraph 718(LXXIV) above, the plus factor could be zero. The Annex 10a of this

Framework presents in detail the approach to be applied for backtesting and the plus factor. Supervisors will have national discretion to require banks to perform backtesting on either hypothetical (i.e. using changes in portfolio value that would occur were end-of-day positions to remain unchanged), or actual trading (i.e. excluding fees, commissions, and net interest income) outcomes, or both.

(k) Banks using models will also be subject to a capital charge to cover *specific risk* (as defined under the standardised approach for market risk) of interest rate related instruments and equity securities. The manner in which the specific risk capital charge is to be calculated is set out in paragraphs 718(Lxxxvii) to 718(xcviii).

5. Stress testing

718(Lxxvii). Banks that use the internal models approach for meeting market risk capital requirements must have in place a rigorous and comprehensive stress testing program. Stress testing to identify events or influences that could greatly impact banks is a key component of a bank's assessment of its capital position.

718(Lxxviii). Banks' stress scenarios need to cover a range of factors that can create extraordinary losses or gains in trading portfolios, or make the control of risk in those portfolios very difficult. These factors include low-probability events in all major types of risks, including the various components of market, credit, and operational risks. Stress scenarios need to shed light on the impact of such events on positions that display both linear and non-linear price characteristics (i.e. options and instruments that have options-like characteristics).

718(Lxxix). Banks' stress tests should be both of a quantitative and qualitative nature, incorporating both market risk and liquidity aspects of market disturbances. Quantitative criteria should identify plausible stress scenarios to which banks could be exposed. Qualitative criteria should emphasise that two major goals of stress testing are to evaluate the capacity of the bank's capital to absorb potential large losses and to identify steps the bank can take to reduce its risk and conserve capital. This assessment is integral to setting and evaluating the bank's management strategy and the results of stress testing should be routinely communicated to senior management and, periodically, to the bank's board of directors.

718(Lxxx). Banks should combine the use of supervisory stress scenarios with stress tests developed by banks themselves to reflect their specific risk characteristics. Specifically, supervisory authorities may ask banks to provide information on stress testing in three broad areas, which are discussed in turn below.

(i) Supervisory scenarios requiring no simulations by the bank

718(Lxxxi). Banks should have information on the largest losses experienced during the reporting period available for supervisory review. This loss information could be compared to the level of capital that results from a bank's internal measurement system. For example, it could provide supervisory authorities with a picture of how many days of peak day losses would have been covered by a given value-at-risk estimate.

(ii) Scenarios requiring a simulation by the bank

718(Lxxxii). Banks should subject their portfolios to a series of simulated stress scenarios and provide supervisory authorities with the results. These scenarios could include testing the current portfolio against past periods of significant disturbance, for example, the 1987 equity crash, the ERM crises of 1992 and 1993 or the fall in bond markets in the first quarter of 1994, incorporating both the large price movements and the sharp reduction in liquidity associated with these events. A second type of scenario would evaluate the sensitivity of the bank's market risk exposure to changes in the assumptions about volatilities and correlations. Applying this test would require an evaluation of the historical range of variation for volatilities and correlations and evaluation of the bank's current positions against the extreme values of the historical range. Due consideration should be given to the sharp variation that at times has occurred in a matter of days in periods of significant market disturbance. The 1987 equity crash, the suspension of the ERM, or the fall in bond markets in the first quarter of 1994, for example, all involved correlations within risk factors approaching the extreme values of 1 or -1 for several days at the height of the disturbance.

(iii) Scenarios developed by the bank itself to capture the specific characteristics of its portfolio.

718(LXXXiii). In addition to the scenarios prescribed by supervisory authorities under paragraphs 718(LXXXi) and 718(LXXXii) above, a bank should also develop its own stress tests which it identifies as most adverse based on the characteristics of its portfolio (e.g. problems in a key region of the world combined with a sharp move in oil prices). Banks should provide supervisory authorities with a description of the methodology used to identify and carry out the scenarios as well as with a description of the results derived from these scenarios.

718(LXXXiv). The results should be reviewed periodically by senior management and should be reflected in the policies and limits set by management and the board of directors. Moreover, if the testing reveals particular vulnerability to a given set of circumstances, the national authorities would expect the bank to take prompt steps to manage those risks appropriately (e.g. by hedging against that outcome or reducing the size of its exposures).

6. External validation

718(LXXXV). The validation of models' accuracy by external auditors and/or supervisory authorities should at a minimum include the following steps:

(a) Verifying that the *internal validation processes* described in paragraph 718(LXXiv) (i) are operating in a satisfactory manner;

(b) Ensuring that the *formulae* used in the calculation process as well as for the pricing of options and other complex instruments are validated by a qualified unit, which in all cases should be independent from the trading area;

(c) Checking that the *structure* of internal models is adequate with respect to the bank's activities and geographical coverage;

(d) Checking the results of the banks' *back-testing* of its internal measurement system (i.e. comparing value-at-risk estimates with actual profits and losses) to ensure that the model provides a reliable measure of potential losses over time. This means that banks should make the results as well as the underlying inputs to their value-at-risk calculations available to their supervisory authorities and/or external auditors on request;

(e) Making sure that data flows and processes associated with the risk measurement system are *transparent and accessible*. In particular, it is necessary that auditors or supervisory authorities are in a position to have easy access, whenever they judge it necessary and under appropriate procedures, to the models' specifications and parameters.

7. Combination of internal models and the standardised methodology

718(Lxxxvi). Unless a bank's exposure to a particular risk factor, such as commodity prices, is insignificant, the internal models approach will in principle require banks to have an integrated risk measurement system that captures the broad risk factor categories (i.e. interest rates, exchange rates (which may include gold), equity prices and commodity prices, with related options volatilities being included in each risk factor category). Thus, banks which start to use models for one or more risk factor categories will, over time, be expected to extend the models to all their market risks. A bank which has developed one or more models will no longer be able to revert to measuring the risk measured by those models according to the standardised methodology (unless the supervisory authority withdraws approval for that model). However, pending further experience regarding the process of changing to a models-based approach, no specific time limit will be set for banks which use a combination of internal models and the standardised methodology to move to a comprehensive model. The following conditions will apply to banks using such combinations:

(a) Each broad risk factor category must be assessed using a single approach (either internal models or the standardised approach), i.e. no combination of the two methods will in principle be permitted within a risk category or across banks' different entities for the same type of risk (but see paragraph 708(i) above);[164]

(b) All the criteria laid down in paragraphs 718(Lxx) to 718(xcix) of this Framework will apply to the models being used;

(c) Banks may not modify the combination of the two approaches they use without justifying to their supervisory authority that they have a good reason for doing so;

(d) No element of market risk may escape measurement, i.e. the exposure for all the various risk factors, whether calculated according to the standardised approach or internal models, would have to be captured;

(e) The capital charges assessed under the standardised approach and under the models approach are to be aggregated according to the simple sum method.

8. Treatment of specific risk

718(Lxxxvii). Where a bank has a VaR measure that incorporates specific risk and that meets all the qualitative and quantitative requirements for general risk models, it may base its charge on modelled estimates, provided the measure is based on models that meet the additional criteria and requirements set out below. Banks which are unable to meet these additional criteria and requirements will be required to base their specific risk capital charge on the full amount of the specific risk charge calculated under the standardised method.

718(Lxxxviii). The criteria for supervisory recognition of banks' modelling of specific risk require that a bank's model must capture all material components of price risk and be responsive to changes in market conditions and compositions of portfolios. In particular, the model must:

[164] However, banks may incur risks in positions which are not captured by their models, for example, in remote locations, in minor currencies or in negligible business areas. Such risks should be measured according to the standardised methodology.

- explain the historical price variation in the portfolio;[165]
- capture concentrations (magnitude and changes in composition);[166]
- be robust to an adverse environment;[167]
- capture name-related basis risk;[168]
- capture event risk;[169]
- be validated through backtesting.[170]

718(Lxxxix). Where a bank is subject to event risk that is not reflected in its VaR measure, because it is beyond the 10-day holding period and 99 percent confidence interval (i.e. low probability and high severity events), banks must ensure that the impact of such events is factored in to its internal capital assessment, for example through its stress testing.

718(xc). The bank's model must conservatively assess the risk arising from less liquid positions and/or positions with limited price transparency under realistic market scenarios. In addition, the model must meet minimum data standards. Proxies may be used only where available data is insufficient or is not reflective of the true volatility of a position or portfolio, and only where they are appropriately conservative.

718(xci). Further, as techniques and best practices evolve, banks should avail themselves of these advances.

718(xcii). In addition, the bank must have an approach in place to capture in its regulatory capital default risk of its trading book positions that is incremental to the risk captured by the VaR-based calculation as specified in paragraph 718(Lxxxviii) above. To avoid double counting a bank may, when calculating its incremental default charge, take into account the

[165] The key ex ante measures of model quality are “goodness-of-fit” measures which address the question of how much of the historical variation in price value is explained by the risk factors included within the model. One measure of this type which can often be used is an R-squared measure from regression methodology. If this measure is to be used, the risk factors included in the bank’s model would be expected to be able to explain a high percentage, such as 90%, of the historical price variation or the model should explicitly include estimates of the residual variability not captured in the factors included in this regression. For some types of models, it may not be feasible to calculate a goodness-of-fit measure. In such instance, a bank is expected to work with its national supervisor to define an acceptable alternative measure which would meet this regulatory objective.

[166] The bank would be expected to demonstrate that the model is sensitive to changes in portfolio construction and that higher capital charges are attracted for portfolios that have increasing concentrations in particular names or sectors.

[167] The bank should be able to demonstrate that the model will signal rising risk in an adverse environment. This could be achieved by incorporating in the historical estimation period of the model at least one full credit cycle and ensuring that the model would not have been inaccurate in the downward portion of the cycle. Another approach for demonstrating this is through simulation of historical or plausible worst-case environments.

[168] Banks should be able to demonstrate that the model is sensitive to material idiosyncratic differences between similar but not identical positions, for example debt positions with different levels of subordination, maturity mismatches, or credit derivatives with different default events.

[169] For debt positions, this should include migration risk. For equity positions, events that are reflected in large changes or jumps in prices must be captured, e.g. merger break-ups/takeovers. In particular, firms must consider issues related to survivorship bias.

[170] Aimed at assessing whether specific risk, as well as general market risk, is being captured adequately.

extent to which default risk has already been incorporated into the VaR calculation, especially for risk positions that could and would be closed within 10 days in the event of adverse market conditions or other indications of deterioration in the credit environment. No specific approach for capturing the incremental default risk is prescribed; it may be part of the bank's internal model or a surcharge from a separate calculation. Where a bank captures its incremental risk through a surcharge, the surcharge will not be subject to a multiplier or regulatory backtesting, although the bank should be able to demonstrate that the surcharge meets its aim.

718(xciii). Whichever approach is used, the bank must demonstrate that it meets a soundness standard comparable to that of the internal-ratings based approach for credit risk as set forth in this Framework, under the assumption of a constant level of risk, and adjusted where appropriate to reflect the impact of liquidity, concentrations, hedging, and optionality. A bank that does not capture the incremental default risk through an internally developed approach must use the fallback of calculating the surcharge through an approach consistent with that for credit risk as set forth in this Framework.

718(xciv). Whichever approach is used, cash or synthetic exposures that would be subject to a deduction treatment under the securitisation framework set forth in this Framework (e.g. equity tranches that absorb first losses),[171] as well as securitisation exposures that are unrated liquidity lines or letters of credit, would be subject to a capital charge that is no less than that set forth in the securitisation framework.

718(xcv). An exception to this treatment could be afforded to banks that are dealers in the above exposures where they can demonstrate, in addition to trading intent, that a liquid two-way market exists for the securitisation exposures or, in the case of synthetic securitisations that rely solely on credit derivatives, for the securitisation exposures themselves or all their constituent risk components. For purposes of this section, a two-way market is deemed to exist where there are independent bona fide offers to buy and sell so that a price reasonably related to the last sales price or current bona fide competitive bid and offer quotations can be determined within one day and settled at such price within a relatively short time conforming to trade custom. In addition, for a bank to apply this exception, it must have sufficient market data to ensure that it fully captures the concentrated default risk of these exposures in its internal approach for measuring the incremental default risk in accordance with the standards set forth above.

718(xcvi). Banks that already have received specific risk model recognition for particular portfolios or lines of business should agree a timetable with their supervisors to bring their model in line with the new standards in a timely manner as is practicable.

718(xcvii). Banks which apply modelled estimates of specific risk are required to conduct backtesting aimed at assessing whether specific risk is being accurately captured. The methodology a bank should use for validating its specific risk estimates is to perform separate backtests on sub-portfolios using daily data on sub-portfolios subject to specific risk. The key sub-portfolios for this purpose are traded-debt and equity positions. However, if a bank itself decomposes its trading portfolio into finer categories (e.g. emerging markets, traded corporate debt, etc.), it is appropriate to keep these distinctions for sub-portfolio backtesting purposes. Banks are required to commit to a sub-portfolio structure and stick to it

[171] These include risk equivalent positions, e.g. inventories of credit exposures that the bank intends to sell through cash securitisations and for which it has in place tranched credit protections so that it retains an exposure that would be subject to deduction under the securitisation framework.

unless it can be demonstrated to the supervisor that it would make sense to change the structure.

718(xcviii). Banks are required to have in place a process to analyse exceptions identified through the backtesting of specific risk. This process is intended to serve as the fundamental way in which banks correct their models of specific risk in the event they become inaccurate. There will be a presumption that models that incorporate specific risk are "unacceptable" if the results at the sub-portfolio level produce a number of exceptions commensurate with the *Red Zone* as defined in Annex 10a of this Framework. Banks with "unacceptable" specific risk models are expected to take immediate action to correct the problem in the model and to ensure that there is a sufficient capital buffer to absorb the risk that the backtest showed had not been adequately captured.

9. Model validation standards

718(xcix). It is important that banks have processes in place to ensure that their internal models have been adequately validated by suitably qualified parties independent of the development process to ensure that they are conceptually sound and adequately capture all material risks. This validation should be conducted when the model is initially developed and when any significant changes are made to the model. The validation should also be conducted on a periodic basis but especially where there have been any significant structural changes in the market or changes to the composition of the portfolio which might lead to the model no longer being adequate. More extensive model validation is particularly important where specific risk is also modelled and is required to meet the further specific risk criteria. As techniques and best practices evolve, banks should avail themselves of these advances. Model validation should not be limited to backtesting, but should, at a minimum, also include the following:

(a) Tests to demonstrate that any assumptions made within the internal model are appropriate and do not underestimate risk. This may include the assumption of the normal distribution, the use of the square root of time to scale from a one day holding period to a 10 day holding period or where extrapolation or interpolation techniques are used, or pricing models;

(b) Further to the regulatory backtesting programmes, testing for model validation should be carried out using additional tests, which may include, for instance:

- Testing carried out using hypothetical changes in portfolio value that would occur were end-of-day positions to remain unchanged. It therefore excludes fees, commissions, bid-ask spreads, net interest income and intra-day trading;

- Testing carried out for longer periods than required for the regular backtesting programme (e.g. 3 years). The longer time period generally improves the power of the backtesting. A longer time period may not be desirable if the VaR model or market conditions have changed to the extent that historical data is no longer relevant;

- Testing carried out using confidence intervals other than the 99 percent interval required under the quantitative standards;

- Testing of portfolios below the overall bank level;

(c) The use of hypothetical portfolios to ensure that the model is able to account for particular structural features that may arise, for example:

- Where data histories for a particular instrument do not meet the quantitative standards in paragraph 718(LXXVI) and where the bank has to map these positions to proxies, then the bank must ensure that the proxies produce conservative results under relevant market scenarios;

- Ensuring that material basis risks are adequately captured. This may include mismatches between long and short positions by maturity or by issuer;

- Ensuring that the model captures concentration risk that may arise in an undiversified portfolio.

Part 3: The Second Pillar – Supervisory Review Process

719. This section discusses the key principles of supervisory review, risk management guidance and supervisory transparency and accountability produced by the Committee with respect to banking risks, including guidance relating to, among other things, the treatment of interest rate risk in the banking book, credit risk (stress testing, definition of default, residual risk, and credit concentration risk), operational risk, enhanced cross-border communication and cooperation, and securitisation.

I. Importance of supervisory review

720. The supervisory review process of the Framework is intended not only to ensure that banks have adequate capital to support all the risks in their business, but also to encourage banks to develop and use better risk management techniques in monitoring and managing their risks.

721. The supervisory review process recognises the responsibility of bank management in developing an internal capital assessment process and setting capital targets that are commensurate with the bank's risk profile and control environment. In the Framework, bank management continues to bear responsibility for ensuring that the bank has adequate capital to support its risks beyond the core minimum requirements.

722. Supervisors are expected to evaluate how well banks are assessing their capital needs relative to their risks and to intervene, where appropriate. This interaction is intended to foster an active dialogue between banks and supervisors such that when deficiencies are identified, prompt and decisive action can be taken to reduce risk or restore capital. Accordingly, supervisors may wish to adopt an approach to focus more intensely on those banks with risk profiles or operational experience that warrants such attention.

723. The Committee recognises the relationship that exists between the amount of capital held by the bank against its risks and the strength and effectiveness of the bank's risk management and internal control processes. However, increased capital should not be viewed as the only option for addressing increased risks confronting the bank. Other means for addressing risk, such as strengthening risk management, applying internal limits, strengthening the level of provisions and reserves, and improving internal controls, must also be considered. Furthermore, capital should not be regarded as a substitute for addressing fundamentally inadequate control or risk management processes.

724. There are three main areas that might be particularly suited to treatment under Pillar 2: risks considered under Pillar 1 that are not fully captured by the Pillar 1 process (e.g. credit concentration risk); those factors not taken into account by the Pillar 1 process (e.g. interest rate risk in the banking book, business and strategic risk); and factors external to the bank (e.g. business cycle effects). A further important aspect of Pillar 2 is the assessment of compliance with the minimum standards and disclosure requirements of the more advanced methods in Pillar 1, in particular the IRB framework for credit risk and the Advanced Measurement Approaches for operational risk. Supervisors must ensure that these requirements are being met, both as qualifying criteria and on a continuing basis.

II. Four key principles of supervisory review

725. The Committee has identified four key principles of supervisory review, which complement those outlined in the extensive supervisory guidance that has been developed by the Committee, the keystone of which is the Core Principles for Effective Banking Supervision and the Core Principles Methodology.[172] A list of the specific guidance relating to the management of banking risks is provided at the end of this Part of the Framework.

Principle 1: Banks should have a process for assessing their overall capital adequacy in relation to their risk profile and a strategy for maintaining their capital levels.

726. Banks must be able to demonstrate that chosen internal capital targets are well founded and that these targets are consistent with their overall risk profile and current operating environment. In assessing capital adequacy, bank management needs to be mindful of the particular stage of the business cycle in which the bank is operating. Rigorous, forward-looking stress testing that identifies possible events or changes in market conditions that could adversely impact the bank should be performed. Bank management clearly bears primary responsibility for ensuring that the bank has adequate capital to support its risks.

727. The five main features of a rigorous process are as follows:

- Board and senior management oversight;
- Sound capital assessment;
- Comprehensive assessment of risks;
- Monitoring and reporting; and
- Internal control review.

1. Board and senior management oversight[173]

728. A sound risk management process is the foundation for an effective assessment of the adequacy of a bank's capital position. Bank management is responsible for understanding the nature and level of risk being taken by the bank and how this risk relates to adequate capital levels. It is also responsible for ensuring that the formality and sophistication of the risk management processes are appropriate in light of the risk profile and business plan.

[172] *Core Principles for Effective Banking Supervision,* Basel Committee on Banking Supervision (September 1997 and April 2006 – for comment), and *Core Principles Methodology,* Basel Committee on Banking Supervision (October 1999 and April 2006 – for comment).

[173] This section of the paper refers to a management structure composed of a board of directors and senior management. The Committee is aware that there are significant differences in legislative and regulatory frameworks across countries as regards the functions of the board of directors and senior management. In some countries, the board has the main, if not exclusive, function of supervising the executive body (senior management, general management) so as to ensure that the latter fulfils its tasks. For this reason, in some cases, it is known as a supervisory board. This means that the board has no executive functions. In other countries, by contrast, the board has a broader competence in that it lays down the general framework for the management of the bank. Owing to these differences, the notions of the board of directors and senior management are used in this section not to identify legal constructs but rather to label two decision-making functions within a bank.

729. The analysis of a bank's current and future capital requirements in relation to its strategic objectives is a vital element of the strategic planning process. The strategic plan should clearly outline the bank's capital needs, anticipated capital expenditures, desirable capital level, and external capital sources. Senior management and the board should view capital planning as a crucial element in being able to achieve its desired strategic objectives.

730. The bank's board of directors has responsibility for setting the bank's tolerance for risks. It should also ensure that management establishes a framework for assessing the various risks, develops a system to relate risk to the bank's capital level, and establishes a method for monitoring compliance with internal policies. It is likewise important that the board of directors adopts and supports strong internal controls and written policies and procedures and ensures that management effectively communicates these throughout the organisation.

2. Sound capital assessment

731. Fundamental elements of sound capital assessment include:

- Policies and procedures designed to ensure that the bank identifies, measures, and reports all material risks;
- A process that relates capital to the level of risk;
- A process that states capital adequacy goals with respect to risk, taking account of the bank's strategic focus and business plan; and
- A process of internal controls, reviews and audit to ensure the integrity of the overall management process.

3. Comprehensive assessment of risks

732. All material risks faced by the bank should be addressed in the capital assessment process. While the Committee recognises that not all risks can be measured precisely, a process should be developed to estimate risks. Therefore, the following risk exposures, which by no means constitute a comprehensive list of *all* risks, should be considered.

733. ***Credit risk:*** Banks should have methodologies that enable them to assess the credit risk involved in exposures to individual borrowers or counterparties as well as at the portfolio level. For more sophisticated banks, the credit review assessment of capital adequacy, at a minimum, should cover four areas: risk rating systems, portfolio analysis/aggregation, securitisation/complex credit derivatives, and large exposures and risk concentrations.

734. Internal risk ratings are an important tool in monitoring credit risk. Internal risk ratings should be adequate to support the identification and measurement of risk from all credit exposures, and should be integrated into an institution's overall analysis of credit risk and capital adequacy. The ratings system should provide detailed ratings for all assets, not only for criticised or problem assets. Loan loss reserves should be included in the credit risk assessment for capital adequacy.

735. The analysis of credit risk should adequately identify any weaknesses at the portfolio level, including any concentrations of risk. It should also adequately take into consideration the risks involved in managing credit concentrations and other portfolio issues through such mechanisms as securitisation programmes and complex credit derivatives. Further, the analysis of counterparty credit risk should include consideration of public

evaluation of the supervisor's compliance with the Core Principles for Effective Banking Supervision.

736. ***Operational risk:*** The Committee believes that similar rigour should be applied to the management of operational risk, as is done for the management of other significant banking risks. The failure to properly manage operational risk can result in a misstatement of an institution's risk/return profile and expose the institution to significant losses.

737. A bank should develop a framework for managing operational risk and evaluate the adequacy of capital given this framework. The framework should cover the bank's appetite and tolerance for operational risk, as specified through the policies for managing this risk, including the extent and manner in which operational risk is transferred outside the bank. It should also include policies outlining the bank's approach to identifying, assessing, monitoring and controlling/mitigating the risk.

738. ***Market risk***: Banks should have methodologies that enable them to assess and actively manage all material market risks, wherever they arise, at position, desk, business line and firm-wide level. For more sophisticated banks, their assessment of internal capital adequacy for market risk, at a minimum, should be based on both VaR modelling and stress testing, including an assessment of concentration risk and the assessment of illiquidity under stressful market scenarios, although all firms' assessments should include stress testing appropriate to their trading activity.

738(i). VaR is an important tool in monitoring aggregate market risk exposures and provides a common metric for comparing the risk being run by different desks and business lines. A bank's VaR model should be adequate to identify and measure risks arising from all its trading activities and should be integrated into the bank's overall internal capital assessment as well as subject to rigorous on-going validation. A VaR model estimates should be sensitive to changes in the trading book risk profile.

738(ii). Banks must supplement their VaR model with stress tests (factor shocks or integrated scenarios whether historic or hypothetical) and other appropriate risk management techniques. In the bank's internal capital assessment it must demonstrate that it has enough capital to not only meet the minimum capital requirements but also to withstand a range of severe but plausible market shocks. In particular, it must factor in, where appropriate:

- Illiquidity/gapping of prices;
- Concentrated positions (in relation to market turnover);
- One-way markets;
- Non-linear products/deep out-of-the money positions;
- Events and jumps-to-defaults;
- Significant shifts in correlations;
- Other risks that may not be captured appropriately in VaR (e.g. recovery rate uncertainty, implied correlations, or skew risk).

The stress tests applied by a bank and, in particular, the calibration of those tests (e.g. the parameters of the shocks or types of events considered) should be reconciled back to a clear statement setting out the premise upon which the bank's internal capital assessment is based (e.g. ensuring there is adequate capital to manage the traded portfolios within stated limits through what may be a prolonged period of market stress and illiquidity, or that there is adequate capital to ensure that, over a given time horizon to a specified confidence level, all positions can be liquidated or the risk hedged in an orderly fashion). The market shocks applied in the tests must reflect the nature of portfolios and the time it could take to hedge out or manage risks under severe market conditions.

738(iii). Concentration risk should be pro-actively managed and assessed by firms and concentrated positions should be routinely reported to senior management.

738(iv). Banks should design their risk management systems, including the VaR methodology and stress tests, to properly measure the material risks in instruments they trade as well as the trading strategies they pursue. As their instruments and trading strategies change, the VaR methodologies and stress tests should also evolve to accommodate the changes.

738(v). Banks must demonstrate how they combine their risk measurement approaches to arrive at the overall internal capital for market risk.

739. ***Interest rate risk in the banking book:*** The measurement process should include all material interest rate positions of the bank and consider all relevant repricing and maturity data. Such information will generally include current balance and contractual rate of interest associated with the instruments and portfolios, principal payments, interest reset dates, maturities, the rate index used for repricing, and contractual interest rate ceilings or floors for adjustable-rate items. The system should also have well-documented assumptions and techniques.

740. Regardless of the type and level of complexity of the measurement system used, bank management should ensure the adequacy and completeness of the system. Because the quality and reliability of the measurement system is largely dependent on the quality of the data and various assumptions used in the model, management should give particular attention to these items.

741. ***Liquidity risk:*** Liquidity is crucial to the ongoing viability of any banking organisation. Banks' capital positions can have an effect on their ability to obtain liquidity, especially in a crisis. Each bank must have adequate systems for measuring, monitoring and controlling liquidity risk. Banks should evaluate the adequacy of capital given their own liquidity profile and the liquidity of the markets in which they operate.

742***.*** ***Other risks:*** Although the Committee recognises that 'other' risks, such as reputational and strategic risk, are not easily measurable, it expects industry to further develop techniques for managing all aspects of these risks.

4. Monitoring and reporting

743. The bank should establish an adequate system for monitoring and reporting risk exposures and assessing how the bank's changing risk profile affects the need for capital. The bank's senior management or board of directors should, on a regular basis, receive reports on the bank's risk profile and capital needs. These reports should allow senior management to:

- Evaluate the level and trend of material risks and their effect on capital levels;
- Evaluate the sensitivity and reasonableness of key assumptions used in the capital assessment measurement system;
- Determine that the bank holds sufficient capital against the various risks and is in compliance with established capital adequacy goals; and

- Assess its future capital requirements based on the bank's reported risk profile and make necessary adjustments to the bank's strategic plan accordingly.

5. Internal control review

744. The bank's internal control structure is essential to the capital assessment process. Effective control of the capital assessment process includes an independent review and, where appropriate, the involvement of internal or external audits. The bank's board of directors has a responsibility to ensure that management establishes a system for assessing the various risks, develops a system to relate risk to the bank's capital level, and establishes a method for monitoring compliance with internal policies. The board should regularly verify whether its system of internal controls is adequate to ensure well-ordered and prudent conduct of business.

745. The bank should conduct periodic reviews of its risk management process to ensure its integrity, accuracy, and reasonableness. Areas that should be reviewed include:

- Appropriateness of the bank's capital assessment process given the nature, scope and complexity of its activities;
- Identification of large exposures and risk concentrations;
- Accuracy and completeness of data inputs into the bank's assessment process;
- Reasonableness and validity of scenarios used in the assessment process; and
- Stress testing and analysis of assumptions and inputs.

Principle 2: Supervisors should review and evaluate banks' internal capital adequacy assessments and strategies, as well as their ability to monitor and ensure their compliance with regulatory capital ratios. Supervisors should take appropriate supervisory action if they are not satisfied with the result of this process.

746. The supervisory authorities should regularly review the process by which a bank assesses its capital adequacy, risk position, resulting capital levels, and quality of capital held. Supervisors should also evaluate the degree to which a bank has in place a sound internal process to assess capital adequacy. The emphasis of the review should be on the quality of the bank's risk management and controls and should not result in supervisors functioning as bank management. The periodic review can involve some combination of:

- On-site examinations or inspections;
- Off-site review;
- Discussions with bank management;
- Review of work done by external auditors (provided it is adequately focused on the necessary capital issues); and
- Periodic reporting.

747. The substantial impact that errors in the methodology or assumptions of formal analyses can have on resulting capital requirements requires a detailed review by supervisors of each bank's internal analysis.

1. Review of adequacy of risk assessment

748. Supervisors should assess the degree to which internal targets and processes incorporate the full range of material risks faced by the bank. Supervisors should also review the adequacy of risk measures used in assessing internal capital adequacy and the extent to which these risk measures are also used operationally in setting limits, evaluating business line performance, and evaluating and controlling risks more generally. Supervisors should consider the results of sensitivity analyses and stress tests conducted by the institution and how these results relate to capital plans.

2. Assessment of capital adequacy

749. Supervisors should review the bank's processes to determine that:

- Target levels of capital chosen are comprehensive and relevant to the current operating environment;
- These levels are properly monitored and reviewed by senior management; and
- The composition of capital is appropriate for the nature and scale of the bank's business.

750. Supervisors should also consider the extent to which the bank has provided for unexpected events in setting its capital levels. This analysis should cover a wide range of external conditions and scenarios, and the sophistication of techniques and stress tests used should be commensurate with the bank's activities.

3. Assessment of the control environment

751. Supervisors should consider the quality of the bank's management information reporting and systems, the manner in which business risks and activities are aggregated, and management's record in responding to emerging or changing risks.

752. In all instances, the capital level at an individual bank should be determined according to the bank's risk profile and adequacy of its risk management process and internal controls. External factors such as business cycle effects and the macroeconomic environment should also be considered.

4. Supervisory review of compliance with minimum standards

753. In order for certain internal methodologies, credit risk mitigation techniques and asset securitisations to be recognised for regulatory capital purposes, banks will need to meet a number of requirements, including risk management standards and disclosures. In particular, banks will be required to disclose features of their internal methodologies used in calculating minimum capital requirements. As part of the supervisory review process, supervisors must ensure that these conditions are being met on an ongoing basis.

754. The Committee regards this review of minimum standards and qualifying criteria as an integral part of the supervisory review process under Principle 2. In setting the minimum criteria the Committee has considered current industry practice and so anticipates that these minimum standards will provide supervisors with a useful set of benchmarks that are aligned with bank management expectations for effective risk management and capital allocation.

755. There is also an important role for supervisory review of compliance with certain conditions and requirements set for standardised approaches. In this context, there will be a particular need to ensure that use of various instruments that can reduce Pillar 1 capital requirements are utilised and understood as part of a sound, tested, and properly documented risk management process.

5. Supervisory response

756. Having carried out the review process described above, supervisors should take appropriate action if they are not satisfied with the results of the bank's own risk assessment and capital allocation. Supervisors should consider a range of actions, such as those set out under Principles 3 and 4 below.

Principle 3: Supervisors should expect banks to operate above the minimum regulatory capital ratios and should have the ability to require banks to hold capital in excess of the minimum.

757. Pillar 1 capital requirements will include a buffer for uncertainties surrounding the Pillar 1 regime that affect the banking population as a whole. Bank-specific uncertainties will be treated under Pillar 2. It is anticipated that such buffers under Pillar 1 will be set to provide reasonable assurance that a bank with good internal systems and controls, a well-diversified risk profile and a business profile well covered by the Pillar 1 regime, and which operates with capital equal to Pillar 1 requirements, will meet the minimum goals for soundness embodied in Pillar 1. However, supervisors will need to consider whether the particular features of the markets for which they are responsible are adequately covered. Supervisors will typically require (or encourage) banks to operate with a buffer, over and above the Pillar 1 standard. Banks should maintain this buffer for a combination of the following:

(a) Pillar 1 minimums are anticipated to be set to achieve a level of bank creditworthiness in markets that is below the level of creditworthiness sought by many banks for their own reasons. For example, most international banks appear to prefer to be highly rated by internationally recognised rating agencies. Thus, banks are likely to choose to operate above Pillar 1 minimums for competitive reasons.

(b) In the normal course of business, the type and volume of activities will change, as will the different risk exposures, causing fluctuations in the overall capital ratio.

(c) It may be costly for banks to raise additional capital, especially if this needs to be done quickly or at a time when market conditions are unfavourable.

(d) For banks to fall below minimum regulatory capital requirements is a serious matter. It may place banks in breach of the relevant law and/or prompt non-discretionary corrective action on the part of supervisors.

(e) There may be risks, either specific to individual banks, or more generally to an economy at large, that are not taken into account in Pillar 1.

758. There are several means available to supervisors for ensuring that individual banks are operating with adequate levels of capital. Among other methods, the supervisor may set trigger and target capital ratios or define categories above minimum ratios (e.g. well capitalised and adequately capitalised) for identifying the capitalisation level of the bank.

Principle 4: Supervisors should seek to intervene at an early stage to prevent capital from falling below the minimum levels required to support the risk characteristics of a particular bank and should require rapid remedial action if capital is not maintained or restored.

759. Supervisors should consider a range of options if they become concerned that a bank is not meeting the requirements embodied in the supervisory principles outlined above. These actions may include intensifying the monitoring of the bank, restricting the payment of dividends, requiring the bank to prepare and implement a satisfactory capital adequacy restoration plan, and requiring the bank to raise additional capital immediately. Supervisors should have the discretion to use the tools best suited to the circumstances of the bank and its operating environment.

760. The permanent solution to banks' difficulties is not always increased capital. However, some of the required measures (such as improving systems and controls) may take a period of time to implement. Therefore, increased capital might be used as an interim measure while permanent measures to improve the bank's position are being put in place. Once these permanent measures have been put in place and have been seen by supervisors to be effective, the interim increase in capital requirements can be removed.

III. Specific issues to be addressed under the supervisory review process

761. The Committee has identified a number of important issues that banks and supervisors should particularly focus on when carrying out the supervisory review process. These issues include some key risks which are not directly addressed under Pillar 1 and important assessments that supervisors should make to ensure the proper functioning of certain aspects of Pillar 1.

A. Interest rate risk in the banking book

762. The Committee remains convinced that interest rate risk in the banking book is a potentially significant risk which merits support from capital. However, comments received from the industry and additional work conducted by the Committee have made it clear that there is considerable heterogeneity across internationally active banks in terms of the nature of the underlying risk and the processes for monitoring and managing it. In light of this, the Committee has concluded that it is at this time most appropriate to treat interest rate risk in the banking book under Pillar 2 of the Framework. Nevertheless, supervisors who consider that there is sufficient homogeneity within their banking populations regarding the nature and methods for monitoring and measuring this risk could establish a mandatory minimum capital requirement.

763. The revised guidance on interest rate risk recognises banks' internal systems as the principal tool for the measurement of interest rate risk in the banking book and the supervisory response. To facilitate supervisors' monitoring of interest rate risk exposures across institutions, banks would have to provide the results of their internal measurement systems, expressed in terms of economic value relative to capital, using a standardised interest rate shock.

764. If supervisors determine that banks are not holding capital commensurate with the level of interest rate risk, they must require the bank to reduce its risk, to hold a specific additional amount of capital or some combination of the two. Supervisors should be

particularly attentive to the sufficiency of capital of 'outlier banks' where economic value declines by more than 20% of the sum of Tier 1 and Tier 2 capital as a result of a standardised interest rate shock (200 basis points) or its equivalent, as described in the supporting document *Principles for the Management and Supervision of Interest Rate Risk*.

B. Credit risk

1. Stress tests under the IRB approaches

765. A bank should ensure that it has sufficient capital to meet the Pillar 1 requirements and the results (where a deficiency has been indicated) of the credit risk stress test performed as part of the Pillar 1 IRB minimum requirements (paragraphs 434 to 437). Supervisors may wish to review how the stress test has been carried out. The results of the stress test will thus contribute directly to the expectation that a bank will operate above the Pillar 1 minimum regulatory capital ratios. Supervisors will consider whether a bank has sufficient capital for these purposes. To the extent that there is a shortfall, the supervisor will react appropriately. This will usually involve requiring the bank to reduce its risks and/or to hold additional capital/provisions, so that existing capital resources could cover the Pillar 1 requirements plus the result of a recalculated stress test.

2. Definition of default

766. A bank must use the reference definition of default for its internal estimations of PD and/or LGD and EAD. However, as detailed in paragraph 454, national supervisors will issue guidance on how the reference definition of default is to be interpreted in their jurisdictions. Supervisors will assess individual banks' application of the reference definition of default and its impact on capital requirements. In particular, supervisors will focus on the impact of deviations from the reference definition according to paragraph 456 (use of external data or historic internal data not fully consistent with the reference definition of default).

3. Residual risk

767. The Framework allows banks to offset credit or counterparty risk with collateral, guarantees or credit derivatives, leading to reduced capital charges. While banks use credit risk mitigation (CRM) techniques to reduce their credit risk, these techniques give rise to risks that may render the overall risk reduction less effective. Accordingly these risks (e.g. legal risk, documentation risk, or liquidity risk) to which banks are exposed are of supervisory concern. Where such risks arise, and irrespective of fulfilling the minimum requirements set out in Pillar 1, a bank could find itself with greater credit risk exposure to the underlying counterparty than it had expected. Examples of these risks include:

- Inability to seize, or realise in a timely manner, collateral pledged (on default of the counterparty);
- Refusal or delay by a guarantor to pay; and
- Ineffectiveness of untested documentation.

768. Therefore, supervisors will require banks to have in place appropriate written CRM policies and procedures in order to control these residual risks. A bank may be required to submit these policies and procedures to supervisors and must regularly review their appropriateness, effectiveness and operation.

769. In its CRM policies and procedures, a bank must consider whether, when calculating capital requirements, it is appropriate to give the full recognition of the value of the credit risk

mitigant as permitted in Pillar 1 and must demonstrate that its CRM management policies and procedures are appropriate to the level of capital benefit that it is recognising. Where supervisors are not satisfied as to the robustness, suitability or application of these policies and procedures they may direct the bank to take immediate remedial action or hold additional capital against residual risk until such time as the deficiencies in the CRM procedures are rectified to the satisfaction of the supervisor. For example, supervisors may direct a bank to:

- Make adjustments to the assumptions on holding periods, supervisory haircuts, or volatility (in the own haircuts approach);
- Give less than full recognition of credit risk mitigants (on the whole credit portfolio or by specific product line); and/or
- Hold a specific additional amount of capital.

4. Credit concentration risk

770. A risk concentration is any single exposure or group of exposures with the potential to produce losses large enough (relative to a bank's capital, total assets, or overall risk level) to threaten a bank's health or ability to maintain its core operations. Risk concentrations are arguably the single most important cause of major problems in banks.

771. Risk concentrations can arise in a bank's assets, liabilities, or off-balance sheet items, through the execution or processing of transactions (either product or service), or through a combination of exposures across these broad categories. Because lending is the primary activity of most banks, credit risk concentrations are often the most material risk concentrations within a bank.

772. Credit risk concentrations, by their nature, are based on common or correlated risk factors, which, in times of stress, have an adverse effect on the creditworthiness of each of the individual counterparties making up the concentration. Concentration risk arises in both direct exposures to obligors and may also occur through exposures to protection providers. Such concentrations are not addressed in the Pillar 1 capital charge for credit risk.

773. Banks should have in place effective internal policies, systems and controls to identify, measure, monitor, and control their credit risk concentrations. Banks should explicitly consider the extent of their credit risk concentrations in their assessment of capital adequacy under Pillar 2. These policies should cover the different forms of credit risk concentrations to which a bank may be exposed. Such concentrations include:

- Significant exposures to an individual counterparty or group of related counterparties. In many jurisdictions, supervisors define a limit for exposures of this nature, commonly referred to as a large exposure limit. Banks might also establish an aggregate limit for the management and control of all of its large exposures as a group;
- Credit exposures to counterparties in the same economic sector or geographic region;
- Credit exposures to counterparties whose financial performance is dependent on the same activity or commodity; and
- Indirect credit exposures arising from a bank's CRM activities (e.g. exposure to a single collateral type or to credit protection provided by a single counterparty).

774. A bank's framework for managing credit risk concentrations should be clearly documented and should include a definition of the credit risk concentrations relevant to the

bank and how these concentrations and their corresponding limits are calculated. Limits should be defined in relation to a bank's capital, total assets or, where adequate measures exist, its overall risk level.

775. A bank's management should conduct periodic stress tests of its major credit risk concentrations and review the results of those tests to identify and respond to potential changes in market conditions that could adversely impact the bank's performance.

776. A bank should ensure that, in respect of credit risk concentrations, it complies with the Committee document *Principles for the Management of Credit Risk* (September 2000) and the more detailed guidance in the Appendix to that paper.

777. In the course of their activities, supervisors should assess the extent of a bank's credit risk concentrations, how they are managed, and the extent to which the bank considers them in its internal assessment of capital adequacy under Pillar 2. Such assessments should include reviews of the results of a bank's stress tests. Supervisors should take appropriate actions where the risks arising from a bank's credit risk concentrations are not adequately addressed by the bank.

5. Counterparty credit risk

777(i). As counterparty credit risk (CCR) represents a form of credit risk, this would include meeting this Framework's standards regarding their approaches to stress testing, "residual risks" associated with credit risk mitigation techniques, and credit concentrations, as specified in the paragraphs above.

777(ii). The bank must have counterparty credit risk management policies, processes and systems that are conceptually sound and implemented with integrity relative to the sophistication and complexity of a firm's holdings of exposures that give rise to CCR. A sound counterparty credit risk management framework shall include the identification, measurement, management, approval and internal reporting of CCR.

777(iii). The bank's risk management policies must take account of the market, liquidity, legal and operational risks that can be associated with CCR and, to the extent practicable, interrelationships among those risks. The bank must not undertake business with a counterparty without assessing its creditworthiness and must take due account of both settlement and pre-settlement credit risk. These risks must be managed as comprehensively as practicable at the counterparty level (aggregating counterparty exposures with other credit exposures) and at the firm-wide level.

777(iv). The board of directors and senior management must be actively involved in the CCR control process and must regard this as an essential aspect of the business to which significant resources need to be devoted. Where the bank is using an internal model for CCR, senior management must be aware of the limitations and assumptions of the model used and the impact these can have on the reliability of the output. They should also consider the uncertainties of the market environment (e.g. timing of realisation of collateral) and operational issues (e.g. pricing feed irregularities) and be aware of how these are reflected in the model.

777(v). In this regard, the daily reports prepared on a firm's exposures to CCR must be reviewed by a level of management with sufficient seniority and authority to enforce both reductions of positions taken by individual credit managers or traders and reductions in the firm's overall CCR exposure.

777(vi). The bank's CCR management system must be used in conjunction with internal credit and trading limits. In this regard, credit and trading limits must be related to the firm's risk measurement model in a manner that is consistent over time and that is well understood by credit managers, traders and senior management.

777(vii). The measurement of CCR must include monitoring daily and intra-day usage of credit lines. The bank must measure current exposure gross and net of collateral held where such measures are appropriate and meaningful (e.g. OTC derivatives, margin lending, etc.). Measuring and monitoring peak exposure or potential future exposure (PFE) at a confidence level chosen by the bank at both the portfolio and counterparty levels is one element of a robust limit monitoring system. Banks must take account of large or concentrated positions, including concentrations by groups of related counterparties, by industry, by market, customer investment strategies, etc.

777(viii). The bank must have a routine and rigorous program of stress testing in place as a supplement to the CCR analysis based on the day-to-day output of the firm's risk measurement model. The results of this stress testing must be reviewed periodically by senior management and must be reflected in the CCR policies and limits set by management and the board of directors. Where stress tests reveal particular vulnerability to a given set of circumstances, management should explicitly consider appropriate risk management strategies (e.g. by hedging against that outcome, or reducing the size of the firm's exposures).

777(ix). The bank must have a routine in place for ensuring compliance with a documented set of internal policies, controls and procedures concerning the operation of the CCR management system. The firm's CCR management system must be well documented, for example, through a risk management manual that describes the basic principles of the risk management system and that provides an explanation of the empirical techniques used to measure CCR.

777(x). The bank must conduct an independent review of the CCR management system regularly through its own internal auditing process. This review must include both the activities of the business credit and trading units and of the independent CCR control unit. A review of the overall CCR management process must take place at regular intervals (ideally not less than once a year) and must specifically address, at a minimum:

- the adequacy of the documentation of the CCR management system and process;
- the organisation of the CCR control unit;
- the integration of CCR measures into daily risk management;
- the approval process for risk pricing models and valuation systems used by front and back-office personnel;
- the validation of any significant change in the CCR measurement process;
- the scope of counterparty credit risks captured by the risk measurement model;
- the integrity of the management information system;
- the accuracy and completeness of CCR data;
- the verification of the consistency, timeliness and reliability of data sources used to run internal models, including the independence of such data sources;
- the accuracy and appropriateness of volatility and correlation assumptions;
- the accuracy of valuation and risk transformation calculations;
- the verification of the model's accuracy through frequent backtesting.

777(xi). A bank that receives approval to use an internal model to estimate its exposure amount or EAD for CCR exposures must monitor the appropriate risks and have processes to adjust its estimation of EPE when those risks become significant. This includes the following:

- Banks must identify and manage their exposures to specific wrong-way risk.
- For exposures with a rising risk profile after one year, banks must compare on a regular basis the estimate of EPE over one year with the EPE over the life of the exposure.
- For exposures with a short-term maturity (below one year), banks must compare on a regular basis the replacement cost (current exposure) and the realised exposure profile, and/or store data that allow such a comparisons.

777(xii). When assessing an internal model used to estimate EPE, and especially for banks that receive approval to estimate the value of the alpha factor, supervisors must review the characteristics of the firm's portfolio of exposures that give rise to CCR. In particular, supervisors must consider the following characteristics, namely:

- the diversification of the portfolio (number of risk factors the portfolio is exposed to);
- the correlation of default across counterparties; and
- the number and granularity of counterparty exposures.

777(xiii). Supervisors will take appropriate action where the firm's estimates of exposure or EAD under the Internal Model Method or alpha do not adequately reflect its exposure to CCR. Such action might include directing the bank to revise its estimates; directing the bank to apply a higher estimate of exposure or EAD under the IMM or alpha; or disallowing a bank from recognising internal estimates of EAD for regulatory capital purposes.

777(xiv). For banks that make use of the standardised method, supervisors should review the bank's evaluation of the risks contained in the transactions that give rise to CCR and the bank's assessment of whether the standardised method captures those risks appropriately and satisfactorily. If the standardised method does not capture the risk inherent in the bank's relevant transactions (as could be the case with structured, more complex OTC derivatives), supervisors may require the bank to apply the CEM or the SM on a transaction-by-transaction basis (i.e. no netting will be recognised).

C. Operational risk

778. Gross income, used in the Basic Indicator and Standardised Approaches for operational risk, is only a proxy for the scale of operational risk exposure of a bank and can in some cases (e.g. for banks with low margins or profitability) underestimate the need for capital for operational risk. With reference to the Committee document on *Sound Practices for the Management and Supervision of Operational Risk* (February 2003), the supervisor should consider whether the capital requirement generated by the Pillar 1 calculation gives a consistent picture of the individual bank's operational risk exposure, for example in comparison with other banks of similar size and with similar operations.

D. Market risk

1. Policies and procedures for trading book eligibility

778(i). Clear policies and procedures used to determine the exposures that may be included in, and those that should be excluded from, the trading book for purposes of calculating regulatory capital are critical to ensure the consistency and integrity of firms' trading book. Such policies must conform to paragraph 687(i) of this Framework. Supervisors should be satisfied that the policies and procedures clearly delineate the boundaries of the firm's trading book, in compliance with the general principles set forth in paragraphs 684 to 689(iii) of this Framework, and consistent with the bank's risk management capabilities and practices. Supervisors should also be satisfied that transfers of positions between banking and trading books can only occur in a very limited set of circumstances. A supervisor will require a firm to modify its policies and procedures when they prove insufficient for preventing the booking in the trading book of positions that are not compliant with the general principles set forth in paragraphs 684 to 689(iii) of this Framework, or not consistent with the bank's risk management capabilities and practices.

2. Valuation

778(ii). Prudent valuation policies and procedures form the foundation on which any robust assessment of market risk capital adequacy should be built. For a well diversified portfolio consisting of highly liquid cash instruments, and without market concentration, the valuation of the portfolio, combined with the minimum quantitative standards set out in paragraph 718(Lxxvi), as revised in this section, may deliver sufficient capital to enable a bank, in adverse market conditions, to close out or hedge its positions within 10 days in an orderly fashion. However, for less well diversified portfolios, for portfolios containing less liquid instruments, for portfolios with concentrations in relation to market turnover, and/or for portfolios which contain large numbers of positions that are marked-to-model this is less likely to be the case. In such circumstances, supervisors will consider whether a bank has sufficient capital. To the extent there is a shortfall the supervisor will react appropriately. This will usually require the bank to reduce its risks and/or hold an additional amount of capital.

3. Stress testing under the internal models approach

778(iii). A bank must ensure that it has sufficient capital to meet the minimum capital requirements set out in paragraphs 718(Lxx) to 718(xciv) and to cover the results of its stress testing required by paragraph 718(Lxxiv) (g), taking into account the principles set forth in paragraphs 738(ii) and 738(iv). Supervisors will consider whether a bank has sufficient capital for these purposes, taking into account the nature and scale of the bank's trading activities and any other relevant factors such as valuation adjustments made by the bank. To the extent that there is a shortfall, or if supervisors are not satisfied with the premise upon which the bank's assessment of internal market risk capital adequacy is based, supervisors will take the appropriate measures. This will usually involve requiring the bank to reduce its risk exposures and/or to hold an additional amount of capital, so that its overall capital resources at least cover the Pillar 1 requirements plus the result of a stress test acceptable to the supervisor.

4. Specific risk modelling under the internal models approach

778(iv). For banks wishing to model the specific risk arising from their trading activities, additional criteria have been set out in paragraph 718(Lxxxix) , including conservatively assessing the risk arising from less liquid positions and/or positions with limited price transparency under realistic market scenarios. Where supervisors consider that limited liquidity or price transparency undermines the effectiveness of a bank's model to capture the specific risk, they will take appropriate measures, including requiring the exclusion of positions from the bank's specific risk model. Supervisors should review the adequacy of the bank's measure of the default risk surcharge; where the bank's approach is inadequate, the use of the standardised specific risk charges will be required.

IV. Other aspects of the supervisory review process

A. Supervisory transparency and accountability

779. The supervision of banks is not an exact science, and therefore, discretionary elements within the supervisory review process are inevitable. Supervisors must take care to carry out their obligations in a transparent and accountable manner. Supervisors should make publicly available the criteria to be used in the review of banks' internal capital assessments. If a supervisor chooses to set target or trigger ratios or to set categories of capital in excess of the regulatory minimum, factors that may be considered in doing so should be publicly available. Where the capital requirements are set above the minimum for an individual bank, the supervisor should explain to the bank the risk characteristics specific to the bank which resulted in the requirement and any remedial action necessary.

B. Enhanced cross-border communication and cooperation

780. Effective supervision of large banking organisations necessarily entails a close and continuous dialogue between industry participants and supervisors. In addition, the Framework will require enhanced cooperation between supervisors, on a practical basis, especially for the cross-border supervision of complex international banking groups.

781. The Framework will not change the legal responsibilities of national supervisors for the regulation of their domestic institutions or the arrangements for consolidated supervision as set out in the existing Basel Committee standards. The home country supervisor is responsible for the oversight of the implementation of the Framework for a banking group on a consolidated basis; host country supervisors are responsible for supervision of those entities operating in their countries. In order to reduce the compliance burden and avoid regulatory arbitrage, the methods and approval processes used by a bank at the group level may be accepted by the host country supervisor at the local level, provided that they adequately meet the local supervisor's requirements. Wherever possible, supervisors should avoid performing redundant and uncoordinated approval and validation work in order to reduce the implementation burden on banks, and conserve supervisory resources.

782. In implementing the Framework, supervisors should communicate the respective roles of home country and host country supervisors as clearly as possible to banking groups with significant cross-border operations in multiple jurisdictions. The home country supervisor would lead this coordination effort in cooperation with the host country supervisors. In communicating the respective supervisory roles, supervisors will take care to clarify that existing supervisory legal responsibilities remain unchanged.

783. The Committee supports a pragmatic approach of mutual recognition for internationally active banks as a key basis for international supervisory co-operation. This approach implies recognising common capital adequacy approaches when considering the entities of internationally active banks in host jurisdictions, as well as the desirability of minimising differences in the national capital adequacy regulations between home and host jurisdictions so that subsidiary banks are not subjected to excessive burden.

V. Supervisory review process for securitisation

784. Further to the Pillar 1 principle that banks should take account of the economic substance of transactions in their determination of capital adequacy, supervisory authorities will monitor, as appropriate, whether banks have done so adequately. As a result, regulatory

capital treatments for specific securitisation exposures might differ from those specified in Pillar 1 of the Framework, particularly in instances where the general capital requirement would not adequately and sufficiently reflect the risks to which an individual banking organisation is exposed.

785. Amongst other things, supervisory authorities may review where relevant a bank's own assessment of its capital needs and how that has been reflected in the capital calculation as well as the documentation of certain transactions to determine whether the capital requirements accord with the risk profile (e.g. substitution clauses). Supervisors will also review the manner in which banks have addressed the issue of maturity mismatch in relation to retained positions in their economic capital calculations. In particular, they will be vigilant in monitoring for the structuring of maturity mismatches in transactions to artificially reduce capital requirements. Additionally, supervisors may review the bank's economic capital assessment of actual correlation between assets in the pool and how they have reflected that in the calculation. Where supervisors consider that a bank's approach is not adequate, they will take appropriate action. Such action might include denying or reducing capital relief in the case of originated assets, or increasing the capital required against securitisation exposures acquired.

A. Significance of risk transfer

786. Securitisation transactions may be carried out for purposes other than credit risk transfer (e.g. funding). Where this is the case, there might still be a limited transfer of credit risk. However, for an originating bank to achieve reductions in capital requirements, the risk transfer arising from a securitisation has to be deemed significant by the national supervisory authority. If the risk transfer is considered to be insufficient or non existent, the supervisory authority can require the application of a higher capital requirement than prescribed under Pillar 1 or, alternatively, may deny a bank from obtaining any capital relief from the securitisations. Therefore, the capital relief that can be achieved will correspond to the amount of credit risk that is effectively transferred. The following includes a set of examples where supervisors may have concerns about the degree of risk transfer, such as retaining or repurchasing significant amounts of risk or "cherry picking" the exposures to be transferred via a securitisation.

787. Retaining or repurchasing significant securitisation exposures, depending on the proportion of risk held by the originator, might undermine the intent of a securitisation to transfer credit risk. Specifically, supervisory authorities might expect that a significant portion of the credit risk and of the nominal value of the pool be transferred to at least one independent third party at inception and on an ongoing basis. Where banks repurchase risk for market making purposes, supervisors could find it appropriate for an originator to buy part of a transaction but not, for example, to repurchase a whole tranche. Supervisors would expect that where positions have been bought for market making purposes, these positions should be resold within an appropriate period, thereby remaining true to the initial intention to transfer risk.

788. Another implication of realising only a non-significant risk transfer, especially if related to good quality unrated exposures, is that both the poorer quality unrated assets and most of the credit risk embedded in the exposures underlying the securitised transaction are likely to remain with the originator. Accordingly, and depending on the outcome of the supervisory review process, the supervisory authority may increase the capital requirement for particular exposures or even increase the overall level of capital the bank is required to hold.

B. Market innovations

789. As the minimum capital requirements for securitisation may not be able to address all potential issues, supervisory authorities are expected to consider new features of securitisation transactions as they arise. Such assessments would include reviewing the impact new features may have on credit risk transfer and, where appropriate, supervisors will be expected to take appropriate action under Pillar 2. A Pillar 1 response may be formulated to take account of market innovations. Such a response may take the form of a set of operational requirements and/or a specific capital treatment.

C. Provision of implicit support

790. Support to a transaction, whether contractual (i.e. credit enhancements provided at the inception of a securitised transaction) or non-contractual (implicit support) can take numerous forms. For instance, contractual support can include over collateralisation, credit derivatives, spread accounts, contractual recourse obligations, subordinated notes, credit risk mitigants provided to a specific tranche, the subordination of fee or interest income or the deferral of margin income, and clean-up calls that exceed 10 percent of the initial issuance. Examples of implicit support include the purchase of deteriorating credit risk exposures from the underlying pool, the sale of discounted credit risk exposures into the pool of securitised credit risk exposures, the purchase of underlying exposures at above market price or an increase in the first loss position according to the deterioration of the underlying exposures.

791. The provision of implicit (or non-contractual) support, as opposed to contractual credit support (i.e. credit enhancements), raises significant supervisory concerns. For traditional securitisation structures the provision of implicit support undermines the clean break criteria, which when satisfied would allow banks to exclude the securitised assets from regulatory capital calculations. For synthetic securitisation structures, it negates the significance of risk transference. By providing implicit support, banks signal to the market that the risk is still with the bank and has not in effect been transferred. The institution's capital calculation therefore understates the true risk. Accordingly, national supervisors are expected to take appropriate action when a banking organisation provides implicit support.

792. When a bank has been found to provide implicit support to a securitisation, it will be required to hold capital against all of the underlying exposures associated with the structure as if they had not been securitised. It will also be required to disclose publicly that it was found to have provided non-contractual support, as well as the resulting increase in the capital charge (as noted above). The aim is to require banks to hold capital against exposures for which they assume the credit risk, and to discourage them from providing non-contractual support.

793. If a bank is found to have provided implicit support on more than one occasion, the bank is required to disclose its transgression publicly and national supervisors will take appropriate action that may include, but is not limited to, one or more of the following:

- The bank may be prevented from gaining favourable capital treatment on securitised assets for a period of time to be determined by the national supervisor;
- The bank may be required to hold capital against all securitised assets as though the bank had created a commitment to them, by applying a conversion factor to the risk weight of the underlying assets;
- For purposes of capital calculations, the bank may be required to treat all securitised assets as if they remained on the balance sheet;

- The bank may be required by its national supervisory authority to hold regulatory capital in excess of the minimum risk-based capital ratios.

794. Supervisors will be vigilant in determining implicit support and will take appropriate supervisory action to mitigate the effects. Pending any investigation, the bank may be prohibited from any capital relief for planned securitisation transactions (moratorium). National supervisory response will be aimed at changing the bank's behaviour with regard to the provision of implicit support, and to correct market perception as to the willingness of the bank to provide future recourse beyond contractual obligations.

D. Residual risks

795. As with credit risk mitigation techniques more generally, supervisors will review the appropriateness of banks' approaches to the recognition of credit protection. In particular, with regard to securitisations, supervisors will review the appropriateness of protection recognised against first loss credit enhancements. On these positions, expected loss is less likely to be a significant element of the risk and is likely to be retained by the protection buyer through the pricing. Therefore, supervisors will expect banks' policies to take account of this in determining their economic capital. Where supervisors do not consider the approach to protection recognised is adequate, they will take appropriate action. Such action may include increasing the capital requirement against a particular transaction or class of transactions.

E. Call provisions

796. Supervisors expect a bank not to make use of clauses that entitles it to call the securitisation transaction or the coverage of credit protection prematurely if this would increase the bank's exposure to losses or deterioration in the credit quality of the underlying exposures.

797. Besides the general principle stated above, supervisors expect banks to only execute clean-up calls for economic business purposes, such as when the cost of servicing the outstanding credit exposures exceeds the benefits of servicing the underlying credit exposures.

798. Subject to national discretion, supervisory authorities may require a review prior to the bank exercising a call which can be expected to include consideration of:

- The rationale for the bank's decision to exercise the call; and
- The impact of the exercise of the call on the bank's regulatory capital ratio.

799. The supervisory authority may also require the bank to enter into a follow-up transaction, if necessary, depending on the bank's overall risk profile, and existing market conditions.

800. Date related calls should be set at a date no earlier than the duration or the weighted average life of the underlying securitisation exposures. Accordingly, supervisory authorities may require a minimum period to elapse before the first possible call date can be set, given, for instance, the existence of up-front sunk costs of a capital market securitisation transaction.

F. Early amortisation

801. Supervisors should review how banks internally measure, monitor, and manage risks associated with securitisations of revolving credit facilities, including an assessment of the risk and likelihood of early amortisation of such transactions. At a minimum, supervisors should ensure that banks have implemented reasonable methods for allocating economic capital against the economic substance of the credit risk arising from revolving securitisations and should expect banks to have adequate capital and liquidity contingency plans that evaluate the probability of an early amortisation occurring and address the implications of both scheduled and early amortisation. In addition, the capital contingency plan should address the possibility that the bank will face higher levels of required capital under the early amortisation Pillar 1 capital requirement.

802. Because most early amortisation triggers are tied to excess spread levels, the factors affecting these levels should be well understood, monitored, and managed, to the extent possible (see paragraphs 790 to 794 on implicit support), by the originating bank. For example, the following factors affecting excess spread should generally be considered:

- Interest payments made by borrowers on the underlying receivable balances;
- Other fees and charges to be paid by the underlying obligors (e.g. late-payment fees, cash advance fees, over-limit fees);
- Gross charge-offs;
- Principal payments;
- Recoveries on charged-off loans;
- Interchange income;
- Interest paid on investors' certificates;
- Macroeconomic factors such as bankruptcy rates, interest rate movements, unemployment rates; etc.

803. Banks should consider the effects that changes in portfolio management or business strategies may have on the levels of excess spread and on the likelihood of an early amortisation event. For example, marketing strategies or underwriting changes that result in lower finance charges or higher charge-offs, might also lower excess spread levels and increase the likelihood of an early amortisation event.

804. Banks should use techniques such as static pool cash collections analyses and stress tests to better understand pool performance. These techniques can highlight adverse trends or potential adverse impacts. Banks should have policies in place to respond promptly to adverse or unanticipated changes. Supervisors will take appropriate action where they do not consider these policies adequate. Such action may include, but is not limited to, directing a bank to obtain a dedicated liquidity line or raising the early amortisation credit conversion factor, thus, increasing the bank's capital requirements.

805. While the early amortisation capital charge described in Pillar 1 is meant to address potential supervisory concerns associated with an early amortisation event, such as the inability of excess spread to cover potential losses, the policies and monitoring described in this section recognise that a given level of excess spread is not, by itself, a perfect proxy for credit performance of the underlying pool of exposures. In some circumstances, for example, excess spread levels may decline so rapidly as to not provide a timely indicator of underlying credit deterioration. Further, excess spread levels may reside far above trigger levels, but still exhibit a high degree of volatility which could warrant supervisory attention. In addition, excess spread levels can fluctuate for reasons unrelated to underlying credit risk, such as a

mismatch in the rate at which finance charges reprice relative to investor certificate rates. Routine fluctuations of excess spread might not generate supervisory concerns, even when they result in different capital requirements. This is particularly the case as a bank moves in or out of the first step of the early amortisation credit conversion factors. On the other hand, existing excess spread levels may be maintained by adding (or designating) an increasing number of new accounts to the master trust, an action that would tend to mask potential deterioration in a portfolio. For all of these reasons, supervisors will place particular emphasis on internal management, controls, and risk monitoring activities with respect to securitisations with early amortisation features.

806. Supervisors expect that the sophistication of a bank's system in monitoring the likelihood and risks of an early amortisation event will be commensurate with the size and complexity of the bank's securitisation activities that involve early amortisation provisions.

807. For controlled amortisations specifically, supervisors may also review the process by which a bank determines the minimum amortisation period required to pay down 90% of the outstanding balance at the point of early amortisation. Where a supervisor does not consider this adequate it will take appropriate action, such as increasing the conversion factor associated with a particular transaction or class of transactions.

Part 4: The Third Pillar – Market Discipline

I. General considerations

A. Disclosure requirements

808. The Committee believes that the rationale for Pillar 3 is sufficiently strong to warrant the introduction of disclosure requirements for banks using the Framework. Supervisors have an array of measures that they can use to require banks to make such disclosures. Some of these disclosures will be qualifying criteria for the use of particular methodologies or the recognition of particular instruments and transactions.

B. Guiding principles

809. The purpose of Pillar 3 ─ market discipline is to complement the minimum capital requirements (Pillar 1) and the supervisory review process (Pillar 2). The Committee aims to encourage market discipline by developing a set of disclosure requirements which will allow market participants to assess key pieces of information on the scope of application, capital, risk exposures, risk assessment processes, and hence the capital adequacy of the institution. The Committee believes that such disclosures have particular relevance under the Framework, where reliance on internal methodologies gives banks more discretion in assessing capital requirements.

810. In principle, banks' disclosures should be consistent with how senior management and the board of directors assess and manage the risks of the bank. Under Pillar 1, banks use specified approaches/methodologies for measuring the various risks they face and the resulting capital requirements. The Committee believes that providing disclosures that are based on this common framework is an effective means of informing the market about a bank's exposure to those risks and provides a consistent and understandable disclosure framework that enhances comparability.

C. Achieving appropriate disclosure

811. The Committee is aware that supervisors have different powers available to them to achieve the disclosure requirements. Market discipline can contribute to a safe and sound banking environment, and supervisors require firms to operate in a safe and sound manner. Under safety and soundness grounds, supervisors could require banks to disclose information. Alternatively, supervisors have the authority to require banks to provide information in regulatory reports. Some supervisors could make some or all of the information in these reports publicly available. Further, there are a number of existing mechanisms by which supervisors may enforce requirements. These vary from country to country and range from "moral suasion" through dialogue with the bank's management (in order to change the latter's behaviour), to reprimands or financial penalties. The nature of the exact measures used will depend on the legal powers of the supervisor and the seriousness of the disclosure deficiency. However, it is not intended that direct additional capital requirements would be a response to non-disclosure, except as indicated below.

812. In addition to the general intervention measures outlined above, this Framework also anticipates a role for specific measures. Where disclosure is a qualifying criterion under Pillar 1 to obtain lower risk weightings and/or to apply specific methodologies, there would be a direct sanction (not being allowed to apply the lower weighting or the specific methodology).

D. Interaction with accounting disclosures

813. The Committee recognises the need for a Pillar 3 disclosure framework that does not conflict with requirements under accounting standards, which are broader in scope. The Committee has made a considerable effort to see that the narrower focus of Pillar 3, which is aimed at disclosure of bank capital adequacy, does not conflict with the broader accounting requirements. Going forward, the Committee intends to maintain an ongoing relationship with the accounting authorities, given that their continuing work may have implications for the disclosures required in Pillar 3. The Committee will consider future modifications to Pillar 3 as necessary in light of its ongoing monitoring of this area and industry developments.

814. Management should use its discretion in determining the appropriate medium and location of the disclosure. In situations where the disclosures are made under accounting requirements or are made to satisfy listing requirements promulgated by securities regulators, banks may rely on them to fulfil the applicable Pillar 3 expectations. In these situations, banks should explain material differences between the accounting or other disclosure and the supervisory basis of disclosure. This explanation does not have to take the form of a line by line reconciliation.

815. For those disclosures that are not mandatory under accounting or other requirements, management may choose to provide the Pillar 3 information through other means (such as on a publicly accessible internet website or in public regulatory reports filed with bank supervisors), consistent with requirements of national supervisory authorities. However, institutions are encouraged to provide all related information in one location to the degree feasible. In addition, if information is not provided with the accounting disclosure, institutions should indicate where the additional information can be found.

816. The recognition of accounting or other mandated disclosure in this manner is also expected to help clarify the requirements for validation of disclosures. For example, information in the annual financial statements would generally be audited and additional material published with such statements must be consistent with the audited statements. In addition, supplementary material (such as Management's Discussion and Analysis) that is published to satisfy other disclosure regimes (e.g. listing requirements promulgated by securities regulators) is generally subject to sufficient scrutiny (e.g. internal control assessments, etc.) to satisfy the validation issue. If material is not published under a validation regime, for instance in a stand alone report or as a section on a website, then management should ensure that appropriate verification of the information takes place, in accordance with the general disclosure principle set out below. Accordingly, Pillar 3 disclosures will not be required to be audited by an external auditor, unless otherwise required by accounting standards setters, securities regulators or other authorities.

E. Materiality

817. A bank should decide which disclosures are relevant for it based on the materiality concept. Information would be regarded as material if its omission or misstatement could change or influence the assessment or decision of a user relying on that information for the purpose of making economic decisions. This definition is consistent with International Accounting Standards and with many national accounting frameworks. The Committee recognises the need for a qualitative judgement of whether, in light of the particular circumstances, a user of financial information would consider the item to be material (user test). The Committee is not setting specific thresholds for disclosure as these can be open to manipulation and are difficult to determine, and it believes that the user test is a useful benchmark for achieving sufficient disclosure.

F. Frequency

818. The disclosures set out in Pillar 3 should be made on a semi-annual basis, subject to the following exceptions. Qualitative disclosures that provide a general summary of a bank's risk management objectives and policies, reporting system and definitions may be published on an annual basis. In recognition of the increased risk sensitivity of the Framework and the general trend towards more frequent reporting in capital markets, large internationally active banks and other significant banks (and their significant bank subsidiaries) must disclose their Tier 1 and total capital adequacy ratios, and their components,[174] on a quarterly basis. Furthermore, if information on risk exposure or other items is prone to rapid change, then banks should also disclose information on a quarterly basis. In all cases, banks should publish material information as soon as practicable and not later than deadlines set by like requirements in national laws.[175]

G. Proprietary and confidential information

819. Proprietary information encompasses information (for example on products or systems), that if shared with competitors would render a bank's investment in these products/systems less valuable, and hence would undermine its competitive position. Information about customers is often confidential, in that it is provided under the terms of a legal agreement or counterparty relationship. This has an impact on what banks should reveal in terms of information about their customer base, as well as details on their internal arrangements, for instance methodologies used, parameter estimates, data etc. The Committee believes that the requirements set out below strike an appropriate balance between the need for meaningful disclosure and the protection of proprietary and confidential information. In exceptional cases, disclosure of certain items of information required by Pillar 3 may prejudice seriously the position of the bank by making public information that is either proprietary or confidential in nature. In such cases, a bank need not disclose those specific items, but must disclose more general information about the subject matter of the requirement, together with the fact that, and the reason why, the specific items of information have not been disclosed. This limited exemption is not intended to conflict with the disclosure requirements under the accounting standards.

II. The disclosure requirements[176]

820. The following sections set out in tabular form the disclosure requirements under Pillar 3. Additional definitions and explanations are provided in a series of footnotes.

A. General disclosure principle

821. Banks should have a formal disclosure policy approved by the board of directors that addresses the bank's approach for determining what disclosures it will make and the

---

[174] These components include Tier 1 capital, total capital and total required capital.

[175] For some small banks with stable risk profiles, annual reporting may be acceptable. Where a bank publishes information on only an annual basis, it should state clearly why this is appropriate.

[176] In this section of this Framework, disclosures marked with an asterisk are conditions for use of a particular approach or methodology for the calculation of regulatory capital.

internal controls over the disclosure process. In addition, banks should implement a process for assessing the appropriateness of their disclosures, including validation and frequency of them.

B. Scope of application

822. Pillar 3 applies at the top consolidated level of the banking group to which this Framework applies (as indicated above in Part 1: Scope of Application). Disclosures related to individual banks within the groups would not generally be required to fulfil the disclosure requirements set out below. An exception to this arises in the disclosure of Total and Tier 1 Capital Ratios by the top consolidated entity where an analysis of significant bank subsidiaries within the group is appropriate, in order to recognise the need for these subsidiaries to comply with this Framework and other applicable limitations on the transfer of funds or capital within the group.

Table 1

Scope of application

Qualitative Disclosures	(a)	The name of the top corporate entity in the group to which this Framework applies.
	(b)	An outline of differences in the basis of consolidation for accounting and regulatory purposes, with a brief description of the entities[177] within the group (a) that are fully consolidated;[178] (b) that are pro-rata consolidated;[179] (c) that are given a deduction treatment;[180] and (d) from which surplus capital is recognised[180] plus (e) that are neither consolidated nor deducted (e.g. where the investment is risk-weighted).
	(c)	Any restrictions, or other major impediments, on transfer of funds or regulatory capital within the group.
Quantitative Disclosures	(d)	The aggregate amount of surplus capital[181] of insurance subsidiaries (whether deducted or subjected to an alternative method[182]) included in the capital of the consolidated group.

[177] Entity = securities, insurance and other financial subsidiaries, commercial subsidiaries, significant minority equity investments in insurance, financial and commercial entities.

[178] Following the listing of significant subsidiaries in consolidated accounting, e.g. IAS 27.

[179] Following the listing of subsidiaries in consolidated accounting, e.g. IAS 31.

[180] May be provided as an extension (extension of entities only if they are significant for the consolidating bank) to the listing of significant subsidiaries in consolidated accounting, e.g. IAS 27 and 32.

[181] Surplus capital in unconsolidated regulated subsidiaries is the difference between the amount of the investment in those entities and their regulatory capital requirements.

[182] See paragraphs 30 and 33.

	(e)	The aggregate amount of capital deficiencies[183] in all subsidiaries not included in the consolidation i.e. that are deducted and the name(s) of such subsidiaries.
	(f)	The aggregate amounts (e.g. current book value) of the firm's total interests in insurance entities, which are risk-weighted[184] rather than deducted from capital or subjected to an alternate group-wide method,[185] as well as their name, their country of incorporation or residence, the proportion of ownership interest and, if different, the proportion of voting power in these entities. In addition, indicate the quantitative impact on regulatory capital of using this method versus using the deduction or alternate group-wide method.

C. Capital

Table 2

Capital structure

Qualitative Disclosures	(a)	Summary information on the terms and conditions of the main features of all capital instruments, especially in the case of innovative, complex or hybrid capital instruments.
Quantitative Disclosures	(b)	The amount of Tier 1 capital, with separate disclosure of: • paid-up share capital/common stock; • reserves; • minority interests in the equity of subsidiaries; • innovative instruments; [186] • other capital instruments; • surplus capital from insurance companies;[187] • regulatory calculation differences deducted from Tier 1 capital; [188] and • other amounts deducted from Tier 1 capital, including goodwill and investments.
	(c)	The total amount of Tier 2 and Tier 3 capital.
	(d)	Other deductions from capital. [189]
	(e)	Total eligible capital.

[183] A capital deficiency is the amount by which actual capital is less than the regulatory capital requirement. Any deficiencies which have been deducted on a group level in addition to the investment in such subsidiaries are not to be included in the aggregate capital deficiency.

[184] See paragraph 31.

[185] See paragraph 30.

[186] Innovative instruments are covered under the Committee's press release, *Instruments eligible for inclusion in Tier 1 capital* (27 October 1998).

[187] See paragraph 33.

[188] Representing 50% of the difference (when expected losses as calculated within the IRB approach exceed total provisions) to be deducted from Tier 1 capital.

[189] Including 50% of the difference (when expected losses as calculated within the IRB approach exceed total provisions) to be deducted from Tier 2 capital.

Table 3

Capital Adequacy

Qualitative disclosures	(a)	A summary discussion of the bank's approach to assessing the adequacy of its capital to support current and future activities.

Quantitative disclosures	(b)	Capital requirements for credit risk:
		• Portfolios subject to standardised or simplified standardised approach, disclosed separately for each portfolio;
		• Portfolios subject to the IRB approaches, disclosed separately for each portfolio under the foundation IRB approach and for each portfolio under the advanced IRB approach:
		    • Corporate (including SL not subject to supervisory slotting criteria), sovereign and bank;
		    • Residential mortgage;
		    • Qualifying revolving retail;[190] and
		    • Other retail;
		• Securitisation exposures.

	(c)	Capital requirements for equity exposures in the IRB approach:
		• Equity portfolios subject to the market-based approaches;
		    • Equity portfolios subject to simple risk weight method; and
		    • Equities in the banking book under the internal models approach (for banks using IMA for banking book equity exposures).
		• Equity portfolios subject to PD/LGD approaches.

	(d)	Capital requirements for market risk[191]: • Standardised approach; • Internal models approach — Trading book.
	(e)	Capital requirements for operational risk[191]: • Basic indicator approach; • Standardised approach; • Advanced measurement approach (AMA).
	(f)	Total and Tier 1[192] capital ratio: • For the top consolidated group; and • For significant bank subsidiaries (stand alone or sub-consolidated depending on how the Framework is applied).

D. Risk exposure and assessment

823. The risks to which banks are exposed and the techniques that banks use to identify, measure, monitor and control those risks are important factors market participants consider in their assessment of an institution. In this section, several key banking risks are considered: credit risk, market risk, interest rate risk and equity risk in the banking book and operational risk. Also included in this section are disclosures relating to credit risk mitigation and asset

[190] Banks should distinguish between the separate non-mortgage retail portfolios used for the Pillar 1 capital calculation (i.e. qualifying revolving retail exposures and other retail exposures) unless these portfolios are insignificant in size (relative to overall credit exposures) and the risk profile of each portfolio is sufficiently similar such that separate disclosure would not help users' understanding of the risk profile of the banks' retail business.

[191] Capital requirements are to be disclosed only for the approaches used.

[192] Including proportion of innovative capital instruments.

securitisation, both of which alter the risk profile of the institution. Where applicable, separate disclosures are set out for banks using different approaches to the assessment of regulatory capital.

1. General qualitative disclosure requirement

824. For each separate risk area (e.g. credit, market, operational, banking book interest rate risk, equity) banks must describe their risk management objectives and policies, including:

- strategies and processes;
- the structure and organisation of the relevant risk management function;
- the scope and nature of risk reporting and/or measurement systems;
- policies for hedging and/or mitigating risk and strategies and processes for monitoring the continuing effectiveness of hedges/mitigants.

2. Credit risk

825. General disclosures of credit risk provide market participants with a range of information about overall credit exposure and need not necessarily be based on information prepared for regulatory purposes. Disclosures on the capital assessment techniques give information on the specific nature of the exposures, the means of capital assessment and data to assess the reliability of the information disclosed.

Table 4[193]

Credit risk: general disclosures for all banks

Qualitative Disclosures	(a)	The general qualitative disclosure requirement (paragraph 824) with respect to credit risk, including: • Definitions of past due and impaired (for accounting purposes); • Description of approaches followed for specific and general allowances and statistical methods; • Discussion of the bank's credit risk management policy; and • For banks that have partly, but not fully adopted either the foundation IRB or the advanced IRB approach, a description of the nature of exposures within each portfolio that are subject to the 1) standardised, 2) foundation IRB, and 3) advanced IRB approaches and of management's plans and timing for migrating exposures to full implementation of the applicable approach.

[193] Table 4 does not include equities.

Quantitative Disclosures	(b)	Total gross credit risk exposures,[194] plus average gross exposure[195] over the period[196] broken down by major types of credit exposure.[197]
	(c)	Geographic[198] distribution of exposures, broken down in significant areas by major types of credit exposure.
	(d)	Industry or counterparty type distribution of exposures, broken down by major types of credit exposure.
	(e)	Residual contractual maturity breakdown of the whole portfolio,[199] broken down by major types of credit exposure.
	(f)	By major industry or counterparty type: • Amount of impaired loans and if available, past due loans, provided separately;[200] • Specific and general allowances; and • Charges for specific allowances and charge-offs during the period.
	(g)	Amount of impaired loans and, if available, past due loans provided separately broken down by significant geographic areas including, if practical, the amounts of specific and general allowances related to each geographical area.[201]
	(h)	Reconciliation of changes in the allowances for loan impairment.[202]
	(i)	For each portfolio, the amount of exposures (for IRB banks, drawn plus EAD on undrawn) subject to the 1) standardised, 2) foundation IRB, and 3) advanced IRB approaches.

[194] That is, after accounting offsets in accordance with the applicable accounting regime and without taking into account the effects of credit risk mitigation techniques, e.g. collateral and netting.

[195] Where the period end position is representative of the risk positions of the bank during the period, average gross exposures need not be disclosed.

[196] Where average amounts are disclosed in accordance with an accounting standard or other requirement which specifies the calculation method to be used, that method should be followed. Otherwise, the average exposures should be calculated using the most frequent interval that an entity's systems generate for management, regulatory or other reasons, provided that the resulting averages are representative of the bank's operations. The basis used for calculating averages need be stated only if not on a daily average basis.

[197] This breakdown could be that applied under accounting rules, and might, for instance, be (a) loans, commitments and other non-derivative off balance sheet exposures, (b) debt securities, and (c) OTC derivatives.

[198] Geographical areas may comprise individual countries, groups of countries or regions within countries. Banks might choose to define the geographical areas based on the way the bank's portfolio is geographically managed. The criteria used to allocate the loans to geographical areas should be specified.

[199] This may already be covered by accounting standards, in which case banks may wish to use the same maturity groupings used in accounting.

[200] Banks are encouraged also to provide an analysis of the ageing of past-due loans.

[201] The portion of general allowance that is not allocated to a geographical area should be disclosed separately.

[202] The reconciliation shows separately specific and general allowances; the information comprises: a description of the type of allowance; the opening balance of the allowance; charge-offs taken against the allowance during the period; amounts set aside (or reversed) for estimated probable loan losses during the period, any other adjustments (e.g. exchange rate differences, business combinations, acquisitions and disposals of subsidiaries), including transfers between allowances; and the closing of the allowance. Charge-offs and recoveries that have been recorded directly to the income statement should be disclosed separately.

Table 5

Credit risk: disclosures for portfolios subject to the standardised approach and supervisory risk weights in the IRB approaches[203]

Qualitative Disclosures	(a)	For portfolios under the standardised approach: • Names of ECAIs and ECAs used, plus reasons for any changes;* • Types of exposure for which each agency is used; • A description of the process used to transfer public issue ratings onto comparable assets in the banking book; and • The alignment of the alphanumerical scale of each agency used with risk buckets.[204]
Quantitative Disclosures	(b)	• For exposure amounts after risk mitigation subject to the standardised approach, amount of a bank's outstandings (rated and unrated) in each risk bucket as well as those that are deducted; and • For exposures subject to the supervisory risk weights in IRB (HVCRE, any SL products subject to supervisory slotting criteria and equities under the simple risk weight method) the aggregate amount of a bank's outstandings in each risk bucket.

Credit risk: disclosures for portfolios subject to IRB approaches

826. An important part of this Framework is the introduction of an IRB approach for the assessment of regulatory capital for credit risk. To varying degrees, banks will have discretion to use internal inputs in their regulatory capital calculations. In this sub-section, the IRB approach is used as the basis for a set of disclosures intended to provide market participants with information about asset quality. In addition, these disclosures are important to allow market participants to assess the resulting capital in light of the exposures. There are two categories of quantitative disclosures: those focussing on an analysis of risk exposure and assessment (i.e. the inputs) and those focussing on the actual outcomes (as the basis for providing an indication of the likely reliability of the disclosed information). These are supplemented by a qualitative disclosure regime which provides background information on the assumptions underlying the IRB framework, the use of the IRB system as part of a risk management framework and the means for validating the results of the IRB system. The disclosure regime is intended to enable market participants to assess the credit risk exposure of IRB banks and the overall application and suitability of the IRB framework, without revealing proprietary information or duplicating the role of the supervisor in validating the detail of the IRB framework in place.

[203] A *de minimis* exception would apply where ratings are used for less than 1% of the total loan portfolio.

[204] This information need not be disclosed if the bank complies with a standard mapping which is published by the relevant supervisor.

Table 6

Credit risk: disclosures for portfolios subject to IRB approaches

Qualitative disclosures*	(a)	Supervisor's acceptance of approach/ supervisory approved transition
	(b)	Explanation and review of the: • Structure of internal rating systems and relation between internal and external ratings; • use of internal estimates other than for IRB capital purposes; • process for managing and recognising credit risk mitigation; and • Control mechanisms for the rating system including discussion of independence, accountability, and rating systems review.
	(c)	Description of the internal ratings process, provided separately for five distinct portfolios: • Corporate (including SMEs, specialised lending and purchased corporate receivables), sovereign and bank; • Equities;[205] • Residential mortgages; • Qualifying revolving retail;[206] and • Other retail. The description should include, for each portfolio: • The types of exposure included in the portfolio; • The definitions, methods and data for estimation and validation of PD, and (for portfolios subject to the IRB advanced approach) LGD and/or EAD, including assumptions employed in the derivation of these variables;[207] and • Description of deviations as permitted under paragraph 456 and footnote 89 from the reference definition of default where determined to be material, including the broad segments of the portfolio(s) affected by such deviations.[208]

[205] Equities need only be disclosed here as a separate portfolio where the bank uses the PD/LGD approach for equities held in the banking book.

[206] In both the qualitative disclosures and quantitative disclosures that follow, banks should distinguish between the qualifying revolving retail exposures and other retail exposures unless these portfolios are insignificant in size (relative to overall credit exposures) and the risk profile of each portfolio is sufficiently similar such that separate disclosure would not help users' understanding of the risk profile of the banks' retail business.

[207] This disclosure does not require a detailed description of the model in full — it should provide the reader with a broad overview of the model approach, describing definitions of the variables, and methods for estimating and validating those variables set out in the quantitative risk disclosures below. This should be done for each of the five portfolios. Banks should draw out any significant differences in approach to estimating these variables within each portfolio.

[208] This is to provide the reader with context for the quantitative disclosures that follow. Banks need only describe main areas where there has been material divergence from the reference definition of default such that it would affect the readers' ability to compare and understand the disclosure of exposures by PD grade.

Quantitative disclosures: risk assessment*	(d)	For each portfolio (as defined above) except retail, present the following information across a sufficient number of PD grades (including default) to allow for a meaningful differentiation of credit risk:[209] • Total exposures (for corporate, sovereign and bank, outstanding loans and EAD on undrawn commitments;[210] for equities, outstanding amount); • For banks on the IRB advanced approach, exposure-weighted average LGD (percentage); and • Exposure-weighted average risk-weight. For banks on the IRB advanced approach, amount of undrawn commitments and exposure-weighted average EAD for each portfolio;[211] For each retail portfolio (as defined above), either:[212] • Disclosures as outlined above on a pool basis (i.e. same as for non-retail portfolios); or • Analysis of exposures on a pool basis (outstanding loans and EAD on commitments) against a sufficient number of EL grades to allow for a meaningful differentiation of credit risk.
Quantitative disclosures: historical results*	(e)	Actual losses (e.g. charge-offs and specific provisions) in the preceding period for each portfolio (as defined above) and how this differs from past experience. A discussion of the factors that impacted on the loss experience in the preceding period — for example, has the bank experienced higher than average default rates, or higher than average LGDs and EADs.
	(f)	Banks' estimates against actual outcomes over a longer period.[213] At a minimum, this should include information on estimates of losses against actual losses in each portfolio (as defined above) over a period sufficient to allow for a meaningful assessment of the performance of the internal rating processes for each portfolio.[214] Where appropriate, banks should further decompose this to provide analysis of PD and, for banks on the advanced IRB approach, LGD and EAD outcomes against estimates provided in the quantitative risk assessment disclosures above.[215]

209 The PD, LGD and EAD disclosures below should reflect the effects of collateral, netting and guarantees/credit derivatives, where recognised under Part 2. Disclosure of each PD grade should include the exposure weighted-average PD for each grade. Where banks are aggregating PD grades for the purposes of disclosure, this should be a representative breakdown of the distribution of PD grades used in the IRB approach.

210 Outstanding loans and EAD on undrawn commitments can be presented on a combined basis for these disclosures.

211 Banks need only provide one estimate of EAD for each portfolio. However, where banks believe it is helpful, in order to give a more meaningful assessment of risk, they may also disclose EAD estimates across a number of EAD categories, against the undrawn exposures to which these relate.

212 Banks would normally be expected to follow the disclosures provided for the non-retail portfolios. However, banks may choose to adopt EL grades as the basis of disclosure where they believe this can provide the reader with a meaningful differentiation of credit risk. Where banks are aggregating internal grades (either PD/LGD or EL) for the purposes of disclosure, this should be a representative breakdown of the distribution of those grades used in the IRB approach.

213 These disclosures are a way of further informing the reader about the reliability of the information provided in the "quantitative disclosures: risk assessment" over the long run. The disclosures are requirements from year-end 2009; In the meantime, early adoption would be encouraged. The phased implementation is to allow banks sufficient time to build up a longer run of data that will make these disclosures meaningful.

214 The Committee will not be prescriptive about the period used for this assessment. Upon implementation, it might be expected that banks would provide these disclosures for as long run of data as possible — for example, if banks have 10 years of data, they might choose to disclose the average default rates for each PD grade over that 10-year period. Annual amounts need not be disclosed.

215 Banks should provide this further decomposition where it will allow users greater insight into the reliability of the estimates provided in the 'quantitative disclosures: risk assessment'. In particular, banks should provide this information where there are material differences between the PD, LGD or EAD estimates given by banks compared to actual outcomes over the long run. Banks should also provide explanations for such differences.

Table 7

Credit risk mitigation: disclosures for standardised and IRB approaches[216,217]

Qualitative Disclosures*	(a)	The general qualitative disclosure requirement (paragraph 824) with respect to credit risk mitigation including: • policies and processes for, and an indication of the extent to which the bank makes use of, on- and off-balance sheet netting; • policies and processes for collateral valuation and management; • a description of the main types of collateral taken by the bank; • the main types of guarantor/credit derivative counterparty and their creditworthiness; and • information about (market or credit) risk concentrations within the mitigation taken.
Quantitative Disclosures*	(b)	For each separately disclosed credit risk portfolio under the standardised and/or foundation IRB approach, the total exposure (after, where applicable, on- or off-balance sheet netting) that is covered by: • eligible financial collateral; and • other eligible IRB collateral; after the application of haircuts.[218]
	(c)	For each separately disclosed portfolio under the standardised and/or IRB approach, the total exposure (after, where applicable, on- or off-balance sheet netting) that is covered by guarantees/credit derivatives.

[216] At a minimum, banks must give the disclosures below in relation to credit risk mitigation that has been recognised for the purposes of reducing capital requirements under this Framework. Where relevant, banks are encouraged to give further information about mitigants that have not been recognised for that purpose.

[217] Credit derivatives that are treated, for the purposes of this Framework, as part of synthetic securitisation structures should be excluded from the credit risk mitigation disclosures and included within those relating to securitisation.

[218] If the comprehensive approach is applied, where applicable, the total exposure covered by collateral after haircuts should be reduced further to remove any positive adjustments that were applied to the exposure, as permitted under Part 2.

Table 8

General disclosure for exposures related to counterparty credit risk

Qualitative Disclosures	(a)	The general qualitative disclosure requirement (paragraphs 824 and 825) with respect to derivatives and CCR, including: • Discussion of methodology used to assign economic capital and credit limits for counterparty credit exposures; • Discussion of policies for securing collateral and establishing credit reserves; • Discussion of policies with respect to wrong-way risk exposures; • Discussion of the impact of the amount of collateral the bank would have to provide given a credit rating downgrade.
Quantitative Disclosures	(b)	Gross positive fair value of contracts, netting benefits, netted current credit exposure, collateral held (including type, e.g. cash, government securities, etc.), and net derivatives credit exposure.[219] Also report measures for exposure at default, or exposure amount, under the IMM, SM or CEM, whichever is applicable. The notional value of credit derivative hedges, and the distribution of current credit exposure by types of credit exposure.[220]
	(c)	Credit derivative transactions that create exposures to CCR (notional value), segregated between use for the institution's own credit portfolio, as well as in its intermediation activities, including the distribution of the credit derivatives products used[221], broken down further by protection bought and sold within each product group.
	(d)	The estimate of alpha if the bank has received supervisory approval to estimate alpha.

[219] *Net credit exposure* is the credit exposure on derivatives transactions after considering both the benefits from legally enforceable netting agreements and collateral arrangements. The notional amount of credit derivative hedges alerts market participants to an additional source of credit risk mitigation.

[220] This might be interest rate contracts, FX contracts, equity contracts, credit derivatives, and commodity/other contracts.

[221] This might be Credit Default Swaps, Total Return Swaps, Credit options, and other.

Table 9

Securitisation: disclosure for standardised and IRB approaches[217]

Qualitative disclosures*	(a)	The general qualitative disclosure requirement (paragraph 824) with respect to securitisation (including synthetics), including a discussion of: • the bank's objectives in relation to securitisation activity, including the extent to which these activities transfer credit risk of the underlying securitised exposures away from the bank to other entities; • the roles played by the bank in the securitisation process[222] and an indication of the extent of the bank's involvement in each of them; and the regulatory capital approaches (e.g. RBA, IAA and SFA) that the bank follows for its securitisation activities.
	(b)	Summary of the bank's accounting policies for securitisation activities, including: • whether the transactions are treated as sales or financings; • recognition of gain on sale; • key assumptions for valuing retained interests, including any significant changes since the last reporting period and the impact of such changes; and • treatment of synthetic securitisations if this is not covered by other accounting policies (e.g. on derivatives).
	(c)	Names of ECAIs used for securitisations and the types of securitisation exposure for which each agency is used.
Quantitative disclosures*	(d)	The total outstanding exposures securitised by the bank and subject to the securitisation framework (broken down into traditional/synthetic), by exposure type.[223,224,225]
	(e)	For exposures securitised by the bank and subject to the securitisation framework:[225] • amount of impaired/past due assets securitised; and • losses recognised by the bank during the current period[226] broken down by exposure type.
	(f)	Aggregate amount of securitisation exposures retained or purchased[227] broken down by exposure type.[223]
	(g)	Aggregate amount of securitisation exposures retained or purchased[227] and the associated IRB capital charges for these exposures broken down into a meaningful number of risk weight bands. Exposures that have been deducted entirely from Tier 1 capital, credit enhancing I/Os deducted from Total Capital, and other exposures deducted from total capital should be disclosed separately by type of underlying asset.

[222] For example: originator, investor, servicer, provider of credit enhancement, sponsor of asset backed commercial paper facility, liquidity provider, swap provider.

[223] For example, credit cards, home equity, auto, etc.

[224] Securitisation transactions in which the originating bank does not retain any securitisation exposure should be shown separately but need only be reported for the year of inception.

[225] Where relevant, banks are encouraged to differentiate between exposures resulting from activities in which they act only as sponsors, and exposures that result from all other bank securitisation activities that are subject to the securitisation framework.

[226] For example, charge-offs/allowances (if the assets remain on the bank's balance sheet) or write-downs of I/O strips and other residual interests.

[227] Securitisation exposures, as noted in Part 2, Section IV, include, but are not restricted to, securities, liquidity facilities, other commitments and credit enhancements such as I/O strips, cash collateral accounts and other subordinated assets.

	(h)	For securitisations subject to the early amortisation treatment, the following items by underlying asset type for securitised facilities: • the aggregate drawn exposures attributed to the seller's and investors' interests; • the aggregate IRB capital charges incurred by the bank against its retained (i.e. the seller's) shares of the drawn balances and undrawn lines; and • the aggregate IRB capital charges incurred by the bank against the investor's shares of drawn balances and undrawn lines.
	(i)	Banks using the standardised approach are also subject to disclosures (g) and (h), but should use the capital charges for the standardised approach.
	(j)	Summary of current year's securitisation activity, including the amount of exposures securitised (by exposure type), and recognised gain or loss on sale by asset type.

3. Market risk

Table 10

Market risk: disclosures for banks using the standardised approach[228]

Qualitative disclosures	(a)	The general qualitative disclosure requirement (paragraph 824) for market risk including the portfolios covered by the standardised approach.
Quantitative disclosures	(b)	The capital requirements for: • interest rate risk; • equity position risk; • foreign exchange risk; and • commodity risk.

[228] The standardised approach here refers to the "standardised measurement method" as defined in Part 2, Section VI C.

Table 11

Market risk: disclosures for banks using the internal models approach (IMA) for trading portfolios

Qualitative disclosures	(a)	The general qualitative disclosure requirement (paragraph 824) for market risk including the portfolios covered by the IMA. In addition, a discussion of the extent of and methodologies for compliance with the "Prudent valuation guidance" for positions held in the trading book (paragraphs 690 to 701).
	(b)	The discussion should include an articulation of the soundness standards on which the bank's internal capital adequacy assessment is based. It should also include a description of the methodologies used to achieve a capital adequacy assessment that is consistent with the soundness standards.
	(c)	For each portfolio covered by the IMA: • the characteristics of the models used; • a description of stress testing applied to the portfolio; and • a description of the approach used for backtesting/validating the accuracy and consistency of the internal models and modelling processes.
	(d)	The scope of acceptance by the supervisor.
Quantitative disclosures	(e)	For trading portfolios under the IMA: • The high, mean and low VaR values over the reporting period and period-end; and • A comparison of VaR estimates with actual gains/losses experienced by the bank, with analysis of important "outliers" in backtest results.

4. *Operational risk*

Table 12

Operational risk

Qualitative disclosures	(a)	In addition to the general qualitative disclosure requirement (paragraph 824), the approach(es) for operational risk capital assessment for which the bank qualifies.
	(b)	Description of the AMA, if used by the bank, including a discussion of relevant internal and external factors considered in the bank's measurement approach. In the case of partial use, the scope and coverage of the different approaches used.
	(c) *	For banks using the AMA, a description of the use of insurance for the purpose of mitigating operational risk.

5. *Equities*

Table 13

Equities: disclosures for banking book positions

Qualitative Disclosures	(a)	The general qualitative disclosure requirement (paragraph 824) with respect to equity risk, including: • differentiation between holdings on which capital gains are expected and those taken under other objectives including for relationship and strategic reasons; and • discussion of important policies covering the valuation and accounting of equity holdings in the banking book. This includes the accounting techniques and valuation methodologies used, including key assumptions and practices affecting valuation as well as significant changes in these practices.
Quantitative Disclosures*	(b)	Value disclosed in the balance sheet of investments, as well as the fair value of those investments; for quoted securities, a comparison to publicly quoted share values where the share price is materially different from fair value.
	(c)	The types and nature of investments, including the amount that can be classified as: • Publicly traded; and • Privately held.
	(d)	The cumulative realised gains (losses) arising from sales and liquidations in the reporting period.
	(e)	• Total unrealised gains (losses)[229] • Total latent revaluation gains (losses)[230] • any amounts of the above included in Tier 1 and/or Tier 2 capital.
	(f)	Capital requirements broken down by appropriate equity groupings, consistent with the bank's methodology, as well as the aggregate amounts and the type of equity investments subject to any supervisory transition or grandfathering provisions regarding regulatory capital requirements.

6. *Interest rate risk in the banking book*

Table 14

Interest rate risk in the banking book (IRRBB)

Qualitative disclosures	(a)	The general qualitative disclosure requirement (paragraph 824), including the nature of IRRBB and key assumptions, including assumptions regarding loan prepayments and behaviour of non-maturity deposits, and frequency of IRRBB measurement.
Quantitative disclosures	(b)	The increase (decline) in earnings or economic value (or relevant measure used by management) for upward and downward rate shocks according to management's method for measuring IRRBB, broken down by currency (as relevant).

[229] Unrealised gains (losses) recognised in the balance sheet but not through the profit and loss account.

[230] Unrealised gains (losses) not recognised either in the balance sheet or through the profit and loss account.

Annex 1

The 15% of Tier 1 Limit on Innovative Instruments

1. This Annex is meant to clarify the calculation of the 15% limit on innovative instruments agreed by the Committee in its press release of October 1998.

2. Innovative instruments will be limited to 15% of Tier 1 capital, net of goodwill. To determine the allowable amount of innovative instruments, banks and supervisors should multiply the amount of non-innovative Tier 1 by 17.65%. This number is derived from the proportion of 15% to 85% (i.e. 15%/85% = 17.65%).

3. As an example, take a bank with €75 of common equity, €15 of non-cumulative perpetual preferred stock, €5 of minority interest in the common equity account of a consolidated subsidiary, and €10 of goodwill. The net amount of non-innovative Tier 1 is €75+€15+€5-€10 = €85.

4. The allowable amount of innovative instruments this bank may include in Tier 1 capital is €85 x 17.65% = €15. If the bank issues innovative Tier 1 instruments up to its limit, total Tier 1 will amount to €85 + €15 = €100. The percentage of innovative instruments to total Tier 1 would equal 15%.

Annex 1a

Definition of Capital Included in the Capital Base

A. Capital elements

Tier 1 (a) Paid-up share capital/common stock

(b) Disclosed reserves

Tier 2 (a) Undisclosed reserves

(b) Asset revaluation reserves

(c) General provisions/general loan-loss reserves (subject to provisions of paragraphs 42 and 43)

(d) Hybrid (debt/equity) capital instruments

(e) Subordinated debt

Tier 3 At the discretion of their national authority, banks may also use a third tier of capital (Tier 3), consisting of short-term subordinated debt as defined in paragraphs 49(xxi) and 49(xxii) of this Framework, for the sole purpose of meeting a proportion of the capital requirements for market risks.

The sum of Tier 1, Tier 2, and Tier 3 elements will be eligible for inclusion in the capital base, subject to the following limits.

B. Limits and restrictions

(i) The total of Tier 2 (supplementary) elements will be limited to a maximum of 100% of the total of Tier 1 elements;

(ii) Subordinated term debt will be limited to a maximum of 50% of Tier 1 elements;

(iii) Tier 3 capital will be limited to 250% of a bank's Tier 1 capital that is required to support market risks.

(iv) Where general provisions/general loan-loss reserves include amounts reflecting lower valuations of asset or latent but unidentified losses present in the balance sheet, the amount of such provisions or reserves will be limited to a maximum of 1.25 percentage points;

(v) Asset revaluation reserves which take the form of latent gains on unrealised securities (see below) will be subject to a discount of 55%.

C. Deductions from the capital base

From Tier 1: Goodwill and increase in equity capital resulting from a securitisation exposure, pursuant to paragraph 562 of this Framework

50% from Tier 1 and 50% from Tier 2 capital:

(i) Investments in unconsolidated banking and financial subsidiary companies.

N.B. The presumption is that this Framework would be applied on a consolidated basis to banking groups.

(ii) Investments in the capital of other banks and financial institutions (at the discretion of national authorities).

(iii) Significant minority investments in other financial entities.

D. Definition of capital elements

(i) **Tier 1**: includes only **permanent shareholders' equity** (issued and fully paid ordinary shares/common stock and perpetual non-cumulative preference shares) and **disclosed reserves** (created or increased by appropriations of retained earnings or other surplus, e.g. share premiums, retained profit, general reserves and legal reserves). Disclosed reserves also include general funds (such as fund for general banking risk in certain EC countries) of the same quality that meet the following criteria:

- Allocations to the funds must be made out of post-tax retained earnings or out of pre-tax earnings adjusted for all potential tax liabilities;
- The funds and movements into or out of them must be disclosed separately in the bank's published accounts;
- The funds must be available to a bank to meet losses for unrestricted and immediate use as soon as they occur;
- Losses cannot be charged directly to the funds but must be taken through the profit and loss account.

In the case of consolidated accounts, this also includes minority interests in the equity of subsidiaries which are less than wholly owned. This basic definition of capital excludes revaluation reserves and cumulative preference shares.

(ii) **Tier 2**

(a) Undisclosed reserves are eligible for inclusion within supplementary elements provided these reserves are accepted by the supervisor. Such reserves consist of that part of the accumulated after-tax surplus of retained profits which banks in some countries may be permitted to maintain as an undisclosed reserve. Apart from the fact that the reserve is not identified in the published balance sheet, it should have the same high quality and character as a disclosed capital reserve; as such, it should not be encumbered by any provision or other known liability but should be freely and immediately available to meet unforeseen future losses. This definition of undisclosed reserves excludes hidden values arising from holdings of securities in the balance sheet at below current market prices (see below).

(b) **Revaluation** reserves arise in two ways. Firstly, in some countries, banks (and other commercial companies) are permitted to revalue fixed assets, normally their own premises, from time to time in line with the change in market values. In some of these countries the amount of such revaluations is determined by law. Revaluations of this kind are reflected on the face of the balance sheet as a revaluation reserve.

Secondly, hidden values of "latent" revaluation reserves may be present as a result of long-term holdings of equity securities valued in the balance sheet at the historic cost of acquisition.

Both types of revaluation reserve may be included in Tier 2 provided that the assets are prudently valued, fully reflecting the possibility of price fluctuation and forced sale. In the case of "latent" revaluation reserves a discount of 55% will be applied to the difference between historic cost book value and market value to reflect the potential volatility of this form of unrealised capital and the notional tax charge on it.

(c) **General provisions/general loan-loss reserves** (for banks using the Standardised Approach for credit risk): provisions or loan-loss reserves held against future, presently unidentified losses are freely available to meet losses which subsequently materialise and therefore qualify for inclusion within supplementary elements. Provisions ascribed to identified deterioration of particular assets or known liabilities, whether individual or grouped, should be excluded. Furthermore, general provisions/general loan-loss reserves eligible for inclusion in Tier 2 will be limited to a maximum of 1.25 percentage points of weighted risk assets

(d) **Hybrid (debt/equity) capital instruments**. This heading includes a range of instruments which combine characteristics of equity capital and of debt. Their precise specifications differ from country to country, but they should meet the following requirements:

- they are *unsecured, subordinated* and *fully paid-up*;
- they are *not redeemable* at the initiative of the holder or without the prior consent of the supervisory authority;
- they are *available to participate in losses* without the bank being obliged to cease trading (unlike conventional subordinated debt);
- although the capital instrument may carry an obligation to pay interest that cannot permanently be reduced or waived (unlike dividends on ordinary shareholders' equity), *it should allow service obligations to be deferred* (as with cumulative preference shares) where the profitability of the bank would not support payment.

Cumulative preference shares, having these characteristics, would be eligible for inclusion in this category. In addition, the following are examples of instruments that may be eligible for inclusion: long-term preferred shares in Canada, titres participatifs and titres subordonnés à durée indéterminée in France, Genusscheine in Germany, perpetual subordinated debt and preference shares in the United Kingdom and mandatory convertible debt instruments in the United States. Debt capital instruments which do not meet these criteria may be eligible for inclusion in item (e).

(e) **Subordinated term debt**: includes conventional unsecured subordinated debt capital instruments with a minimum original fixed term to maturity of over five years and limited life redeemable preference shares. During the last five years to maturity, a cumulative discount (or amortisation) factor of 20% per year will be applied to reflect the diminishing value of these instruments as a continuing source of strength. Unlike instruments included in item (d), these instruments are not normally available to participate in the losses of a bank which continues trading. For this reason these instruments will be limited to a maximum of 50% of Tier 1.

Annex 2

Standardised Approach – Implementing the Mapping Process

1. Because supervisors will be responsible for assigning an eligible ECAI's credit risk assessments to the risk weights available under the standardised approach, they will need to consider a variety of qualitative and quantitative factors to differentiate between the relative degrees of risk expressed by each assessment. Such qualitative factors could include the pool of issuers that each agency covers, the range of ratings that an agency assigns, each rating's meaning, and each agency's definition of default, among others.

2. Quantifiable parameters may help to promote a more consistent mapping of credit risk assessments into the available risk weights under the standardised approach. This Annex summarises the Committee's proposals to help supervisors with mapping exercises. The parameters presented below are intended to provide guidance to supervisors and are not intended to establish new or complement existing eligibility requirements for ECAIs.

Evaluating CDRs: two proposed measures

3. To help ensure that a particular risk weight is appropriate for a particular credit risk assessment, the Committee recommends that supervisors evaluate the cumulative default rate (CDR) associated with all issues assigned the same credit risk rating. Supervisors would evaluate two separate measures of CDRs associated with each risk rating contained in the standardised approach, using in both cases the CDR measured over a three-year period.

- To ensure that supervisors have a sense of the long-run default experience over time, supervisors should evaluate the ten-year average of the three-year CDR when this depth of data is available.[231] For new rating agencies or for those that have compiled less than ten years of default data, supervisors may wish to ask rating agencies what they believe the 10-year average of the three-year CDR would be for each risk rating and hold them accountable for such an evaluation thereafter for the purpose of risk weighting the claims they rate.
- The other measure that supervisors should consider is the most recent three-year CDR associated with each credit risk assessment of an ECAI.

4. Both measurements would be compared to aggregate, historical default rates of credit risk assessments that were compiled by the Committee and that are believed to represent an equivalent level of credit risk.

5. As three-year CDR data is expected to be available from ECAIs, supervisors should be able to compare the default experience of a particular ECAI's assessments with those issued by other rating agencies, in particular major agencies rating a similar population.

[231] In 2002, for example, a supervisor would calculate the average of the three-year CDRs for issuers assigned to each rating grade (the "cohort") for each of the ten years 1990 to1999.

Mapping risk ratings to risk weights using CDRs

6. To help supervisors determine the appropriate risk weights to which an ECAI's risk ratings should be mapped, each of the CDR measures mentioned above could be compared to the following reference and benchmark values of CDRs:

- For each step in an ECAI's rating scale, a ten-year average of the three-year CDR would be compared to a long run "reference" three-year CDR that would represent a sense of the long-run international default experience of risk assessments.
- Likewise, for each step in the ECAI's rating scale, the two most recent three-year CDR would be compared to "benchmarks" for CDRs. This comparison would be intended to determine whether the ECAI's most recent record of assessing credit risk remains within the CDR supervisory benchmarks.

7. Table 1 below illustrates the overall framework for such comparisons.

Table 1

Comparisons of CDR Measures[232]

International Experience (derived from the combined experience of major rating agencies)	Compare to	External Credit Assessment Institution
Set by the Committee as guidance		*Calculated by national supervisors based on the ECAI's own default data*
Long-run "reference" CDR	⟺	Ten-year average of the three-year CDR
CDR Benchmarks	⟺	Two most recent three-year CDR

1. Comparing an ECAI's long-run average three-year CDR to a long-run "reference" CDR

8. For each credit risk category used in the standardised approach of this Framework, the corresponding long-run reference CDR would provide information to supervisors on what its default experience has been internationally. The ten-year average of an eligible ECAI's particular assessment would not be expected to match exactly the long-run reference CDR. The long run CDRs are meant as guidance for supervisors, and not as "targets" that ECAIs would have to meet. The recommended long-run "reference" three-year CDRs for each of the Committee's credit risk categories are presented in Table 2 below, based on the Committee's observations of the default experience reported by major rating agencies internationally.

232 It should be noted that each major rating agency would be subject to these comparisons as well, in which its individual experience would be compared to the aggregate international experience.

Table 2

Proposed long-run "reference" three-year CDRs

S&P Assessment ***(Moody's)***	**AAA-AA** ***(Aaa-Aa)***	**A** ***(A)***	**BBB** ***(Baa)***	**BB** ***(Ba)***	**B** ***(B)***
20-year average of three-year CDR	0.10%	0.25%	1.00%	7.50%	20.00%

2. Comparing an ECAI's most recent three-year CDR to CDR Benchmarks

9. Since an ECAI's own CDRs are not intended to match the reference CDRs exactly, it is important to provide a better sense of what upper bounds of CDRs are acceptable for each assessment, and hence each risk weight, contained in the standardised approach.

10. It is the Committee's general sense that the upper bounds for CDRs should serve as guidance for supervisors and not necessarily as mandatory requirements. Exceeding the upper bound for a CDR would therefore not necessarily require the supervisor to increase the risk weight associated with a particular assessment in all cases if the supervisor is convinced that the higher CDR results from some temporary cause other than weaker credit risk assessment standards.

11. To assist supervisors in interpreting whether a CDR falls within an acceptable range for a risk rating to qualify for a particular risk weight, two benchmarks would be set for each assessment, namely a "monitoring" level benchmark and a "trigger" level benchmark.

(a) "Monitoring" level benchmark

12. Exceeding the "monitoring" level CDR benchmark implies that a rating agency's current default experience for a particular credit risk-assessment grade is markedly higher than international default experience. Although such assessments would generally still be considered eligible for the associated risk weights, supervisors would be expected to consult with the relevant ECAI to understand why the default experience appears to be significantly worse. If supervisors determine that the higher default experience is attributable to weaker standards in assessing credit risk, they would be expected to assign a higher risk category to the ECAI's credit risk assessment.

(b) "Trigger" level

13. Exceeding the "trigger" level benchmark implies that a rating agency's default experience is considerably above the international historical default experience for a particular assessment grade. Thus there is a presumption that the ECAI's standards for assessing credit risk are either too weak or are not applied appropriately. If the observed three-year CDR exceeds the trigger level in two consecutive years, supervisors would be expected to move the risk assessment into a less favourable risk category. However, if supervisors determine that the higher observed CDR is not attributable to weaker

assessment standards, then they may exercise judgement and retain the original risk weight.[233]

14. In all cases where the supervisor decides to leave the risk category unchanged, it may wish to rely on Pillar 2 of this Framework and encourage banks to hold more capital temporarily or to establish higher reserves.

15. When the supervisor has increased the associated risk category, there would be the opportunity for the assessment to again map to the original risk category if the ECAI is able to demonstrate that its three-year CDR falls and remains below the monitoring level for two consecutive years.

(c) Calibrating the benchmark CDRs

16. After reviewing a variety of methodologies, the Committee decided to use Monte Carlo simulations to calibrate both the monitoring and trigger levels for each credit risk assessment category. In particular, the proposed monitoring levels were derived from the 99[th] percentile confidence interval and the trigger level benchmark from the 99.9[th] percentile confidence interval. The simulations relied on publicly available historical default data from major international rating agencies. The levels derived for each risk assessment category are presented in Table 3 below, rounded to the first decimal:

Table 3

Proposed three-year CDR benchmarks

S&P Assessment ***(Moody's)***	**AAA-AA** ***(Aaa-Aa)***	**A** ***(A)***	**BBB** ***(Baa)***	**BB** ***(Ba)***	**B** ***(B)***
Monitoring Level	0.8%	1.0%	2.4%	11.0%	28.6%
Trigger Level	1.2%	1.3%	3.0%	12.4%	35.0%

[233] For example, if supervisors determine that the higher default experience is a temporary phenomenon, perhaps because it reflects a temporary or exogenous shock such as a natural disaster, then the risk weighting proposed in the standardised approach could still apply. Likewise, a breach of the trigger level by several ECAIs simultaneously may indicate a temporary market change or exogenous shock as opposed to a loosening of credit standards. In either scenario, supervisors would be expected to monitor the ECAI's assessments to ensure that the higher default experience is not the result of a loosening of credit risk assessment standards.

Annex 3

Capital Treatment for Failed Trades and Non-DvP Transactions

I. Overarching principles

1. Banks should continue to develop, implement and improve systems for tracking and monitoring the credit risk exposures arising from unsettled and failed transactions as appropriate for producing management information that facilitates action on a timely basis, pursuant to paragraph 88 and 89 of this Framework.

2. Transactions settled through a delivery-versus-payment system (DvP)[234], providing simultaneous exchanges of securities for cash, expose firms to a risk of loss on the difference between the transaction valued at the agreed settlement price and the transaction valued at current market price (i.e. positive current exposure). Transactions where cash is paid without receipt of the corresponding receivable (securities, foreign currencies, gold, or commodities) or, conversely, deliverables were delivered without receipt of the corresponding cash payment (non-DvP, or free-delivery) expose firms to a risk of loss on the full amount of cash paid or deliverables delivered. The current rules set out specific capital charges that address these two kinds of exposures.

3. The following capital treatment is applicable to all transactions on securities, foreign exchange instruments, and commodities that give rise to a risk of delayed settlement or delivery. This includes transactions through recognised clearing houses that are subject to daily mark-to-market and payment of daily variation margins and that involve a mismatched trade. Repurchase and reverse-repurchase agreements as well as securities lending and borrowing that have failed to settle are excluded from this capital treatment[235].

4. In cases of a system wide failure of a settlement or clearing system, a national supervisor may use its discretion to waive capital charges until the situation is rectified.

5. Failure of a counterparty to settle a trade in itself will not be deemed a default for purposes of credit risk under this Framework.

6. In applying a risk weight to failed free-delivery exposures, banks using the IRB approach for credit risk may assign PDs to counterparties for which they have no other banking book exposure on the basis of the counterparty's external rating. Banks using the Advanced IRB approach may use a 45% LGD in lieu of estimating LGDs so long as they apply it to all failed trade exposures. Alternatively, banks using the IRB approach may opt to apply the standardised approach risk weights or a 100% risk weight.

---

[234] For the purpose of this Framework, DvP transactions include payment-versus-payment (PvP) transactions.

[235] All repurchase and reverse-repurchase agreements as well as securities lending and borrowing, including those that have failed to settle, are treated in accordance with Annex 4 or the sections on credit risk mitigation of this Framework.

II. Capital requirements

7. For DvP transactions, if the payments have not yet taken place five business days after the settlement date, firms must calculate a capital charge by multiplying the positive current exposure of the transaction by the appropriate factor, according to the Table 1 below.

Table 1

Number of working days after the agreed settlement date	Corresponding risk multiplier
From 5 to 15	8%
From 16 to 30	50%
From 31 to 45	75%
46 or more	100%

A reasonable transition period may be allowed for firms to upgrade their information system to be able to track the number of days after the agreed settlement date and calculate the corresponding capital charge.

8. For non-DvP transactions (i.e. free deliveries), after the first contractual payment/delivery leg, the bank that has made the payment will treat its exposure as a loan if the second leg has not been received by the end of the business day[236]. This means that a bank under the IRB approach will apply the appropriate IRB formula set out in this Framework, for the exposure to the counterparty, in the same way as it does for all other banking book exposures. Similarly, banks under the standardised approach will use the standardised risk weights set forth in this Framework. However, when exposures are not material, banks may choose to apply a uniform 100% risk-weight to these exposures, in order to avoid the burden of a full credit assessment. If five business days after the second contractual payment/delivery date the second leg has not yet effectively taken place, the bank that has made the first payment leg will deduct from capital the full amount of the value transferred plus replacement cost, if any. This treatment will apply until the second payment/delivery leg is effectively made.

[236] If the dates when two payment legs are made are the same according to the time zones where each payment is made, it is deemed that they are settled on the same day. For example, if a bank in Tokyo transfers Yen on day X (Japan Standard Time) and receives corresponding US Dollar via CHIPS on day X (US Eastern Standard Time), the settlement is deemed to take place on the same value date.

Annex 4

Treatment of Counterparty Credit Risk and Cross-Product Netting

1. This rule identifies permissible methods for estimating the Exposure at Default (EAD) or the exposure amount for instruments with counterparty credit risk (CCR) under this Framework.[237] Banks may seek supervisory approval to make use of an internal modelling method meeting the requirements and specifications identified herein. As alternatives banks may also use the standardised method or the current exposure method.

I. Definitions and general terminology

2. This section defines terms that will be used throughout this text.

A. General terms

- **Counterparty Credit Risk (CCR)** is the risk that the counterparty to a transaction could default before the final settlement of the transaction's cash flows. An economic loss would occur if the transactions or portfolio of transactions with the counterparty has a positive economic value at the time of default. Unlike a firm's exposure to credit risk through a loan, where the exposure to credit risk is unilateral and only the lending bank faces the risk of loss, CCR creates a bilateral risk of loss: the market value of the transaction can be positive or negative to either counterparty to the transaction. The market value is uncertain and can vary over time with the movement of underlying market factors.

B. Transaction types

- **Long Settlement Transactions** are transactions where a counterparty undertakes to deliver a security, a commodity, or a foreign exchange amount against cash, other financial instruments, or commodities, or vice versa, at a settlement or delivery date that is contractually specified as more than the lower of the market standard for this particular instrument and five business days after the date on which the bank enters into the transaction.
- **Securities Financing Transactions (SFTs)** are transactions such as repurchase agreements, reverse repurchase agreements, security lending and borrowing, and margin lending transactions, where the value of the transactions depends on market valuations and the transactions are often subject to margin agreements.
- **Margin Lending Transactions** are transactions in which a bank extends credit in connection with the purchase, sale, carrying or trading of securities. Margin lending transactions do not include other loans that happen to be secured by securities

[237] In the present document, the terms "exposure at default" and "exposure amount" are used together in order to identify measures of exposure under both an IRB and a standardised approach for credit risk.

collateral. Generally, in margin lending transactions, the loan amount is collateralised by securities whose value is greater than the amount of the loan.

C. Netting sets, hedging sets, and related terms

- **Netting Set** is a group of transactions with a single counterparty that are subject to a legally enforceable bilateral netting arrangement and for which netting is recognised for regulatory capital purposes under the provisions of paragraphs 96 (i) to 96 (v) of this Annex, this Framework text on credit risk mitigation techniques, or the Cross-Product Netting Rules set forth in this Annex. Each transaction that is not subject to a legally enforceable bilateral netting arrangement that is recognised for regulatory capital purposes should be interpreted as its own netting set for the purpose of these rules.
- **Risk Position** is a risk number that is assigned to a transaction under the CCR standardised method (set out in this Annex) using a regulatory algorithm.
- **Hedging Set** is a group of risk positions from the transactions within a single netting set for which only their balance is relevant for determining the exposure amount or EAD under the CCR standardised method.
- **Margin Agreement** is a contractual agreement or provisions to an agreement under which one counterparty must supply collateral to a second counterparty when an exposure of that second counterparty to the first counterparty exceeds a specified level.
- **Margin Threshold** is the largest amount of an exposure that remains outstanding until one party has the right to call for collateral.
- **Margin Period of Risk** is the time period from the last exchange of collateral covering a netting set of transactions with a defaulting counterpart until that counterpart is closed out and the resulting market risk is re-hedged.
- **Effective Maturity under the Internal Model Method** for a netting set with maturity greater than one year is the ratio of the sum of expected exposure over the life of the transactions in a netting set discounted at the risk-free rate of return divided by the sum of expected exposure over one year in a netting set discounted at the risk-free rate. This effective maturity may be adjusted to reflect rollover risk by replacing expected exposure with effective expected exposure for forecasting horizons under one year. The formula is given in paragraph 38.
- **Cross-Product Netting** refers to the inclusion of transactions of different product categories within the same netting set pursuant to the Cross-Product Netting Rules set out in this Annex.
- **Current Market Value (CMV)** refers to the net market value of the portfolio of transactions within the netting set with the counterparty. Both positive and negative market values are used in computing CMV.

D. Distributions

- **Distribution of Market Values** is the forecast of the probability distribution of net market values of transactions within a netting set for some future date (the forecasting horizon) given the realised market value of those transactions up to the present time.
- **Distribution of Exposures** is the forecast of the probability distribution of market values that is generated by setting forecast instances of negative net market values

equal to zero (this takes account of the fact that, when the bank owes the counterparty money, the bank does not have an exposure to the counterparty).

- **Risk-Neutral Distribution** is a distribution of market values or exposures at a future time period where the distribution is calculated using market implied values such as implied volatilities.
- **Actual Distribution** is a distribution of market values or exposures at a future time period where the distribution is calculated using historic or realised values such as volatilities calculated using past price or rate changes.

E. Exposure measures and adjustments

- **Current Exposure** is the larger of zero, or the market value of a transaction or portfolio of transactions within a netting set with a counterparty that would be lost upon the default of the counterparty, assuming no recovery on the value of those transactions in bankruptcy. Current exposure is often also called Replacement Cost.
- **Peak Exposure** is a high percentile (typically 95% or 99%) of the distribution of exposures at any particular future date before the maturity date of the longest transaction in the netting set. A peak exposure value is typically generated for many future dates up until the longest maturity date of transactions in the netting set.
- **Expected Exposure** is the mean (average) of the distribution of exposures at any particular future date before the longest-maturity transaction in the netting set matures. An expected exposure value is typically generated for many future dates up until the longest maturity date of transactions in the netting set.
- **Effective Expected Exposure** at a specific date is the maximum expected exposure that occurs at that date or any prior date. Alternatively, it may be defined for a specific date as the greater of the expected exposure at that date, or the effective exposure at the previous date. In effect, the Effective Expected Exposure is the Expected Exposure that is constrained to be non-decreasing over time.
- **Expected Positive Exposure (EPE)** is the weighted average over time of expected exposures where the weights are the proportion that an individual expected exposure represents of the entire time interval. When calculating the minimum capital requirement, the average is taken over the first year or, if all the contracts in the netting set mature before one year, over the time period of the longest-maturity contract in the netting set.
- **Effective Expected Positive Exposure (Effective EPE)** is the weighted average over time of effective expected exposure over the first year, or, if all the contracts in the netting set mature before one year, over the time period of the longest-maturity contract in the netting set where the weights are the proportion that an individual expected exposure represents of the entire time interval.
- **Credit Valuation Adjustment** is an adjustment to the mid-market valuation of the portfolio of trades with a counterparty. This adjustment reflects the market value of the credit risk due to any failure to perform on contractual agreements with a counterparty. This adjustment may reflect the market value of the credit risk of the counterparty or the market value of the credit risk of both the bank and the counterparty.
- **One-Sided Credit Valuation Adjustment** is a credit valuation adjustment that reflects the market value of the credit risk of the counterparty to the firm, but does not reflect the market value of the credit risk of the bank to the counterparty.

F. CCR-related risks

- **Rollover Risk** is the amount by which expected positive exposure is understated when future transactions with a counterpart are expected to be conducted on an ongoing basis, but the additional exposure generated by those future transactions is not included in calculation of expected positive exposure.
- **General Wrong-Way Risk** arises when the probability of default of counterparties is positively correlated with general market risk factors.
- **Specific Wrong-Way Risk** arises when the exposure to a particular counterpart is positively correlated with the probability of default of the counterparty due to the nature of the transactions with the counterparty.

II. Scope of application

3. The methods for computing the exposure amount under the standardised approach for credit risk or EAD under the internal ratings-based (IRB) approach to credit risk described in this Annex are applicable to SFTs and OTC derivatives.

4. Such instruments generally exhibit the following abstract characteristics:

- The transactions generate a current exposure or market value.
- The transactions have an associated random future market value based on market variables.
- The transactions generate an exchange of payments or an exchange of a financial instrument (including commodities) against payment.
- The transactions are undertaken with an identified counterparty against which a unique probability of default can be determined[238].

5. Other common characteristics of the transactions to be covered may include the following:

- Collateral may be used to mitigate risk exposure and is inherent in the nature of some transactions.
- Short-term financing may be a primary objective in that the transactions mostly consist of an exchange of one asset for another (cash or securities) for a relatively short period of time, usually for the business purpose of financing. The two sides of the transactions are not the result of separate decisions but form an indivisible whole to accomplish a defined objective.
- Netting may be used to mitigate the risk.
- Positions are frequently valued (most commonly on a daily basis), according to market variables.
- Remargining may be employed.

[238] Transactions for which the probability of default is defined on a pooled basis are not included in this treatment of CCR.

6. An exposure value of zero for counterparty credit risk can be attributed to derivative contracts or SFTs that are outstanding with a central counterparty (e.g. a clearing house). This does not apply to counterparty credit risk exposures from derivative transactions and SFTs that have been rejected by the central counterparty. Furthermore, an exposure value of zero can be attributed to banks' credit risk exposures to central counterparties that result from the derivative transactions, SFTs or spot transactions that the bank has outstanding with the central counterparty. This exemption extends in particular to credit exposures from clearing deposits and from collateral posted with the central counterparty. A central counterparty is an entity that interposes itself between counterparties to contracts traded within one or more financial markets, becoming the legal counterparty such that it is the buyer to every seller and the seller to every buyer. In order to qualify for the above exemptions, the central counterparty CCR exposures with all participants in its arrangements must be fully collateralized on a daily basis, thereby providing protection for the central counterparty's CCR exposures. Assets held by a central counterparty as a custodian on the bank's behalf would not be subject to a capital requirement for counterparty credit risk exposure.

7. Under all of the three methods identified in this Annex, when a bank purchases credit derivative protection against a banking book exposure, or against a counterparty credit risk exposure, it will determine its capital requirement for the hedged exposure subject to the criteria and general rules for the recognition of credit derivatives, i.e. substitution or double default rules as appropriate. Where these rules apply, the exposure amount or EAD for counterparty credit risk from such instruments is zero.

8. The exposure amount or EAD for counterparty credit risk is zero for sold credit default swaps in the banking book where they are treated in the framework as a guarantee provided by the bank and subject to a credit risk charge for the full notional amount.

9. Under all three methods identified in this Annex, the exposure amount or EAD for a given counterparty is equal to the sum of the exposure amounts or EADs calculated for each netting set with that counterparty.

III. Cross-product netting rules[239]

10. Banks that receive approval to estimate their exposures to CCR using the internal model method may include within a netting set SFTs, or both SFTs and OTC derivatives subject to a legally valid form of bilateral netting that satisfies the following legal and operational criteria for a Cross-Product Netting Arrangement (as defined below). The bank must also have satisfied any prior approval or other procedural requirements that its national supervisor determines to implement for purposes of recognising a Cross-Product Netting Arrangement.

[239] These Cross-Product Netting Rules apply specifically to netting across SFTs, or to netting across both SFTs and OTC derivatives, for purposes of regulatory capital computation under IMM. They do not revise or replace the rules that apply to recognition of netting within the OTC derivatives, repo-style transaction, and margin lending transaction product categories under the 1988 Accord, as amended, or in this Framework. The rules in the 1988 Accord and this Framework continue to apply for purposes of regulatory capital recognition of netting within product categories under IMM or other relevant methodology.

Legal Criteria

11. The bank has executed a written, bilateral netting agreement with the counterparty that creates a single legal obligation, covering all included bilateral master agreements and transactions ("Cross-Product Netting Arrangement"), such that the bank would have either a claim to receive or obligation to pay only the net sum of the positive and negative (i) close-out values of any included individual master agreements and (ii) mark-to-market values of any included individual transactions (the "Cross-Product Net Amount"), in the event a counterparty fails to perform due to any of the following: default, bankruptcy, liquidation or similar circumstances.

12. The bank has written and reasoned legal opinions that conclude with a high degree of certainty that, in the event of a legal challenge, relevant courts or administrative authorities would find the firm's exposure under the Cross-Product Netting Arrangement to be the Cross-Product Net Amount under the laws of all relevant jurisdictions. In reaching this conclusion, legal opinions must address the validity and enforceability of the entire Cross-Product Netting Arrangement under its terms and the impact of the Cross-Product Netting Arrangement on the material provisions of any included bilateral master agreement.

- The laws of "all relevant jurisdictions" are: (i) the law of the jurisdiction in which the counterparty is chartered and, if the foreign branch of a counterparty is involved, then also under the law of the jurisdiction in which the branch is located, (ii) the law that governs the individual transactions, and (iii) the law that governs any contract or agreement necessary to effect the netting.
- A legal opinion must be generally recognised as such by the legal community in the firm's home country or a memorandum of law that addresses all relevant issues in a reasoned manner.

13. The bank has internal procedures to verify that, prior to including a transaction in a netting set, the transaction is covered by legal opinions that meet the above criteria.

14. The bank undertakes to update legal opinions as necessary to ensure continuing enforceability of the Cross-Product Netting Arrangement in light of possible changes in relevant law.

15. The Cross-Product Netting Arrangement does not include a walkaway clause. A walkaway clause is a provision which permits a non-defaulting counterparty to make only limited payments, or no payment at all, to the estate of the defaulter, even if the defaulter is a net creditor.

16. Each included bilateral master agreement and transaction included in the Cross-Product Netting Arrangement satisfies applicable legal requirements for recognition of (i) bilateral netting of derivatives contracts in paragraphs 96(i) to 96(v) of this Annex, or (ii) credit risk mitigation techniques in Part 2, Section II.D of this Framework.

17. The bank maintains all required documentation in its files.

Operational Criteria

18. The supervisory authority is satisfied that the effects of a Cross-Product Netting Arrangement are factored into the firm's measurement of a counterparty's aggregate credit risk exposure and that the bank manages its counterparty credit risk on such basis.

19. Credit risk to each counterparty is aggregated to arrive at a single legal exposure across products covered by the Cross-Product Netting Arrangement. This aggregation must be factored into credit limit and economic capital processes.

IV. Approval to adopt an internal modelling method to estimate EAD

20. A bank (meaning the individual legal entity or a group) that wishes to adopt an internal modelling method to measure exposure or EAD for regulatory capital purposes must seek approval from its supervisor. The internal modelling method is available both for banks that adopt the internal ratings-based approach to credit risk and for banks for which the standardised approach to credit risk applies to all of their credit risk exposures. The bank must meet all of the requirements given in Section V of this Annex and must apply the method to all of its exposures that are subject to counterparty credit risk, except for long settlement transactions.

21. A bank may also choose to adopt an internal modelling method to measure CCR for regulatory capital purposes for its exposures or EAD to only OTC derivatives, to only SFTs, or to both, subject to the appropriate recognition of netting specified above. The bank must apply the method to all relevant exposures within that category, except for those that are immaterial in size and risk. During the initial implementation of the internal models method, a bank may use the standardised method or the current exposure method for a portion of its business. The bank must submit a plan to its supervisor to bring all material exposures for that category of transactions under the internal model method.

22. For all OTC derivative transactions and for all long settlement transactions for which a bank has not received approval from its supervisor to use the internal models method, the bank must use either the standardised method or the current exposure method. Combined use of the current exposure method and the standardised method is permitted on a permanent basis within a group. Combined use of the current exposure method and the standardised method within a legal entity is only permissible for the cases indicated in paragraph 90 of this Annex.

23. Exposures or EAD arising from long settlement transactions can be determined using any of the three methods identified in this document regardless of the methods chosen for treating OTC derivatives and SFTs. In computing capital requirements for long settlement transactions banks that hold permission to use the internal ratings-based approach may opt to apply the risk weights under this Framework's standardised approach for credit risk on a permanent basis and irrespective to the materiality of such positions.

24. After adoption of the internal model method, the bank must comply with the above requirements on a permanent basis. Only under exceptional circumstances or for immaterial exposures can a bank revert to either the current exposure or standardised methods for all or part of its exposure. The bank must demonstrate that reversion to a less sophisticated method does not lead to an arbitrage of the regulatory capital rules.

V. Internal Model Method: measuring exposure and minimum requirements

A. Exposure amount or EAD under the internal model method

25. CCR exposure or EAD is measured at the level of the netting set as defined in Sections I and III of this Annex. A qualifying internal model for measuring counterparty credit exposure must specify the forecasting distribution for changes in the market value of the netting set attributable to changes in market variables, such as interest rates, foreign exchange rates, etc. The model then computes the firm's CCR exposure for the netting set at each future date given the changes in the market variables. For margined counterparties, the model may also capture future collateral movements. Banks may include eligible financial

collateral as defined in paragraphs 146 and 703 of this Framework in their forecasting distributions for changes in the market value of the netting set, if the quantitative, qualitative and data requirements for internal model method are met for the collateral.

26. To the extent that a bank recognises collateral in exposure amount or EAD via current exposure, a bank would not be permitted to recognise the benefits in its estimates of LGD. As a result, the bank would be required to use an LGD of an otherwise similar uncollateralised facility. In other words, the bank would be required to use an LGD that does not include collateral that is already included in EAD.

27. Under the Internal Model Method, the bank need not employ a single model. Although the following text describes an internal model as a simulation model, no particular form of model is required. Analytical models are acceptable so long as they are subject to supervisory review, meet all of the requirements set forth in this section and are applied to all material exposures subject to a CCR-related capital charge as noted above, with the exception of long settlement transactions, which are treated separately, and with the exception of those exposures that are immaterial in size and risk.

28. Expected exposure or peak exposure measures should be calculated based on a distribution of exposures that accounts for the possible non-normality of the distribution of exposures, including the existence of leptokurtosis ("fat tails"), where appropriate.

29. When using an internal model, exposure amount or EAD is calculated as the product of alpha times Effective EPE, as specified below:

$$\text{EAD} = \alpha \times \text{Effective EPE} \qquad (1)$$

30. Effective EPE ("Expected Positive Exposure") is computed by estimating expected exposure (EE_t) as the average exposure at future date t, where the average is taken across possible future values of relevant market risk factors, such as interest rates, foreign exchange rates, etc. The internal model estimates EE at a series of future dates t_1, t_2, t_3…[240] Specifically, "Effective EE" is computed recursively as

$$\text{Effective } EE_{t_k} = \max(\text{Effective } EE_{t_{k-1}}, EE_{t_k}) \qquad (2)$$

where the current date is denoted as t_0 and Effective EE_{t_0} equals current exposure.

31. In this regard, "Effective EPE" is the average Effective EE during the first year of future exposure. If all contracts in the netting set mature before one year, EPE is the average of expected exposure until all contracts in the netting set mature. Effective EPE is computed as a weighted average of Effective EE:

$$\mathit{Effective\ EPE} = \sum_{k=1}^{\min(1\mathit{year},\mathit{maturity})} \mathit{Effective\,EE}_{t_k} \times \Delta t_k \qquad (3)$$

where the weights $\Delta t_k = t_k - t_{k-1}$ allows for the case when future exposure is calculated at dates that are not equally spaced over time.

[240] In theory, the expectations should be taken with respect to the actual probability distribution of future exposure and not the risk-neutral one. Supervisors recognise that practical considerations may make it more feasible to use the risk-neutral one. As a result, supervisors will not mandate which kind of forecasting distribution to employ.

32. Alpha (α) is set equal to 1.4.

33. Supervisors have the discretion to require a higher alpha based on a firm's CCR exposures. Factors that may require a higher alpha include the low granularity of counterparties; particularly high exposures to general wrong-way risk; particularly high correlation of market values across counterparties; and other institution-specific characteristics of CCR exposures.

B. Own estimates for alpha

34. Banks may seek approval from their supervisors to compute internal estimates of alpha subject to a floor of 1.2, where alpha equals the ratio of economic capital from a full simulation of counterparty exposure across counterparties (numerator) and economic capital based on EPE (denominator), assuming they meet certain operating requirements. Eligible banks must meet all the operating requirements for internal estimates of EPE and must demonstrate that their internal estimates of alpha capture in the numerator the material sources of stochastic dependency of distributions of market values of transactions or of portfolios of transactions across counterparties (e.g. the correlation of defaults across counterparties and between market risk and default).

35. In the denominator, EPE must be used as if it were a fixed outstanding loan amount.

36. To this end, banks must ensure that the numerator and denominator of alpha are computed in a consistent fashion with respect to the modelling methodology, parameter specifications and portfolio composition. The approach used must be based on the firm's internal economic capital approach, be well-documented and be subject to independent validation. In addition, banks must review their estimates on at least a quarterly basis, and more frequently when the composition of the portfolio varies over time. Banks must assess the model risk.

37. Where appropriate, volatilities and correlations of market risk factors used in the joint simulation of market and credit risk should be conditioned on the credit risk factor to reflect potential increases in volatility or correlation in an economic downturn. Internal estimates of alpha should take account of the granularity of exposures.

C. Maturity

38. If the original maturity of the longest-dated contract contained in the set is greater than one year, the formula for effective maturity (M) in paragraph 320 of this Framework is replaced with the following:

$$M = \frac{\sum_{k=1}^{t_k \le 1year} Effective\,EE_k \times \Delta t_k \times df_k + \sum_{t_k > 1year}^{maturity} EE_k \times \Delta t_k \times df_k}{\sum_{k=1}^{t_k \le 1year} Effective\,EE_k \times \Delta t_k \times df_k}$$

where df_k is the risk-free discount factor for future time period t_k and the remaining symbols are defined above. Similar to the treatment under corporate exposures, M has a cap of five years.[241]

39. For netting sets in which all contracts have an original maturity of less than one year, the formula for effective maturity (M) in paragraph 320 of this Framework is unchanged and a floor of one year applies, with the exception of short-term exposures as described in paragraphs 321 to 323 of this Framework.

D. Margin agreements

40. If the netting set is subject to a margin agreement and the internal model captures the effects of margining when estimating EE, the model's EE measure may be used directly in equation (2). Such models are noticeably more complicated than models of EPE for unmargined counterparties. As such, they are subject to a higher degree of supervisory scrutiny before they are approved, as discussed below.

41. A bank that can model EPE without margin agreements but cannot achieve the higher level of modelling sophistication to model EPE with margin agreements can use the following method for margined counterparties. The method is a simple and conservative approximation to Effective EPE and sets Effective EPE for a margined counterparty equal to the lesser of:

- The threshold, if positive, under the margin agreement plus an add-on that reflects the potential increase in exposure over the margin period of risk. The add-on is computed as the expected increase in the netting set's exposure beginning from current exposure of zero over the margin period of risk.[242] A supervisory floor of five business days for netting sets consisting only of repo-style transactions subject to daily remargining and daily mark-to-market, and 10 business days for all other netting sets is imposed on the margin period of risk used for this purpose;
- Effective EPE without a margin agreement.

E. Model validation

42. Because counterparty exposures are driven by movements in market variables, the validation of an EPE model is similar to the validation of a Value-at-Risk (VaR) model that is used to measure market risk. Therefore, in principle, the qualitative standards in paragraph 718 (LXXIV) for the use of VaR models should be carried over to EPE models. However, an EPE model has additional elements that require validation:

- Interest rates, foreign exchange rates, equity prices, commodities, and other market risk factors must be forecast over long time horizons for measuring counterparty exposure. The performance of the forecasting model for market risk factors must be

[241] Conceptually, M equals the effective credit duration of the counterparty exposure. A bank that uses an internal model to calculate a one-sided credit valuation adjustment (CVA) can use the effective credit duration estimated by such a model in place of the above formula with prior approval of its supervisor.

[242] In other words, the add-on equals EE at the end of the margin period of risk assuming current exposure of zero. Since no roll-off of transactions would be occurring as part of this EE calculation, there would be no difference between EE and Effective EE.

validated over a long time horizon. In contrast, VaR for market risk is measured over a short time horizon (typically, one to ten days).

- The pricing models used to calculate counterparty exposure for a given scenario of future shocks to market risk factors must be tested as part of the model validation process. These pricing models may be different from those used to calculate VaR over a short horizon. Pricing models for options must account for the nonlinearity of option value with respect to market risk factors.
- An EPE model must capture transaction-specific information in order to aggregate exposures at the level of the netting set. Banks must verify that transactions are assigned to the appropriate netting set within the model.
- An EPE model must also include transaction-specific information in order to capture the effects of margining. It must take into account both the current amount of margin and margin that would be passed between counterparties in the future. Such a model must account for the nature of margin agreements (unilateral or bilateral), the frequency of margin calls, the margin period of risk, the threshold of unmargined exposure the bank is willing to accept, and the minimum transfer amount. Such a model must either model the mark-to-market change in the value of collateral posted or apply this Framework's rules for collateral.

43. Static, historical backtesting on representative counterparty portfolios must be part of the model validation process. At regular intervals as directed by its supervisor, a bank must conduct such backtesting on a number of representative counterparty portfolios (actual or hypothetical). These representative portfolios must be chosen based on their sensitivity to the material risk factors and correlations to which the bank is exposed.

44. Starting at a particular historical date, backtesting of an EPE model would use the internal model to forecast each portfolio's probability distribution of exposure at various time horizons. Using historical data on movements in market risk factors, backtesting then computes the actual exposures that would have occurred on each portfolio at each time horizon assuming no change in the portfolio's composition. These realised exposures would then be compared with the model's forecast distribution at various time horizons. The above must be repeated for several historical dates covering a wide range of market conditions (e.g. rising rates, falling rates, quiet markets, volatile markets). Significant differences between the realised exposures and the model's forecast distribution could indicate a problem with the model or the underlying data that the supervisor would require the bank to correct. Under such circumstances, supervisors may require additional capital. Unlike the backtesting requirement for VaR models prescribed in paragraph 718(Lxxiv) (b) and 718(xcviii), no particular statistical test is specified for backtesting of EPE models.

45. Under the internal model method, a measure that is more conservative than Effective EPE (e.g. a measure based on peak rather than average exposure) for every counterparty may be used in place of alpha times Effective EPE in equation (1) with the prior approval of the supervisor. The degree of relative conservatism will be assessed upon initial supervisory approval and subject to periodic validation.

46. Banks using an EPE model or a VaR model (as described in paragraphs 178 to 181 of this Framework) must meet the above validation requirements.

F. Operational requirements for EPE models

47. In order to be eligible to adopt an internal model for estimating EPE arising from CCR for regulatory capital purposes, a bank must meet the following operational requirements. These include meeting the requirements related to the qualifying standards on

CCR Management, a use test, stress testing, identification of wrong-way risk, and internal controls.

Qualifying standards on CCR Management

48. The bank must satisfy its supervisor that, in addition to meeting the operational requirements identified in paragraphs 49 to 69 below, it adheres to sound practices for CCR management, including those specified in paragraphs 777 (i) to 777 (xiv) of this Framework.

Use test

49. The distribution of exposures generated by the internal model used to calculate effective EPE must be closely integrated into the day-to-day CCR management process of the bank. For example, the bank could use the peak exposure from the distributions for counterparty credit limits or expected positive exposure for its internal allocation of capital. The internal model's output must accordingly play an essential role in the credit approval, counterparty credit risk management, internal capital allocations, and corporate governance of banks that seek approval to apply such models for capital adequacy purposes. Models and estimates designed and implemented exclusively to qualify for the internal models method are not acceptable.

50. A bank must have a credible track record in the use of internal models that generate a distribution of exposures to CCR. Thus, the bank must demonstrate that it has been using an internal model to calculate the distributions of exposures upon which the EPE calculation is based that meets broadly the minimum requirements for at least one year prior to supervisory approval.

51. Banks employing the internal model method must have an independent control unit that is responsible for the design and implementation of the firm's CCR management system, including the initial and on-going validation of the internal model. This unit must control input data integrity and produce and analyse reports on the output of the firm's risk measurement model, including an evaluation of the relationship between measures of risk exposure and credit and trading limits. This unit must be independent from business credit and trading units; it must be adequately staffed; it must report directly to senior management of the firm. The work of this unit should be closely integrated into the day-to-day credit risk management process of the firm. Its output should accordingly be an integral part of the process of planning, monitoring and controlling the firm's credit and overall risk profile.

52. The internal model used to generate the distribution of exposures must be part of a counterparty risk management framework that includes the identification, measurement, management, approval and internal reporting of counterparty risk.[243] This Framework must include the measurement of usage of credit lines (aggregating counterparty exposures with other credit exposures) and economic capital allocation. In addition to EPE (a measure of future exposure), a bank must measure and manage current exposures. Where appropriate, the bank must measure current exposure gross and net of collateral held. The use test is satisfied if a bank uses other counterparty risk measures, such as peak exposure or potential future exposure (PFE), based on the distribution of exposures generated by the same model to compute EPE.

---

[243] This section draws heavily on the Counterparty Risk Management Policy Group's paper, *Improving Counterparty Risk Management Practices* (June 1999); a copy can be found online at http://www.mfainfo.org/washington/derivatives/Improving%20Counterparty%20risk.pdf.

53. A bank is not required to estimate or report EE daily, but to meet the use test it must have the systems capability to estimate EE daily, if necessary, unless it demonstrates to its supervisor that its exposures to CCR warrant some less frequent calculation. It must choose a time profile of forecasting horizons that adequately reflects the time structure of future cash flows and maturity of the contracts. For example, a bank may compute EE on a daily basis for the first ten days, once a week out to one month, once a month out to eighteen months, once a quarter out to five years and beyond five years in a manner that is consistent with the materiality and composition of the exposure.

54. Exposure must be measured out to the life of all contracts in the netting set (not just to the one year horizon), monitored and controlled. The bank must have procedures in place to identify and control the risks for counterparties where exposure rises beyond the one-year horizon. Moreover, the forecasted increase in exposure must be an input into the firm's internal economic capital model.

Stress testing

55. A bank must have in place sound stress testing processes for use in the assessment of capital adequacy. These stress measures must be compared against the measure of EPE and considered by the bank as part of its internal capital adequacy assessment process. Stress testing must also involve identifying possible events or future changes in economic conditions that could have unfavourable effects on a firm's credit exposures and assessment of the firm's ability to withstand such changes. Examples of scenarios that could be used are; (i) economic or industry downturns, (ii) market-place events, or (iii) decreased liquidity conditions.

56. The bank must stress test its counterparty exposures including jointly stressing market and credit risk factors. Stress tests of counterparty risk must consider concentration risk (to a single counterparty or groups of counterparties), correlation risk across market and credit risk (for example, a counterparty for which a large market move would result in a large exposure, a material deterioration in credit quality, or both), and the risk that liquidating the counterparty's positions could move the market. Such stress tests must also consider the impact on the firm's own positions of such market moves and integrate that impact in its assessment of counterparty risk.

Wrong-way risk

57. Banks must be aware of exposures that give rise to a greater degree of general wrong-way risk.

58. A bank is said to be exposed to "specific wrong-way risk" if future exposure to a specific counterparty is expected to be high when the counterparty's probability of default is also high. For example, a company writing put options on its own stock creates wrong-way exposures for the buyer that is specific to the counterparty. A bank must have procedures in place to identify, monitor and control cases of specific wrong way risk, beginning at the inception of a trade and continuing through the life of the trade.

Integrity of Modelling Process

59. Other operational requirements focus on the internal controls needed to ensure the integrity of model inputs; specifically, the requirements address the transaction data, historical market data, frequency of calculation, and valuation models used in measuring EPE.

60. The internal model must reflect transaction terms and specifications in a timely, complete, and conservative fashion. Such terms include, but are not limited to, contract notional amounts, maturity, reference assets, collateral thresholds, margining arrangements,

netting arrangements, etc. The terms and specifications must reside in a secure database that is subject to formal and periodic audit. The process for recognising netting arrangements must require signoff by legal staff to verify the legal enforceability of netting and be input into the database by an independent unit. The transmission of transaction terms and specifications data to the internal model must also be subject to internal audit and formal reconciliation processes must be in place between the internal model and source data systems to verify on an ongoing basis that transaction terms and specifications are being reflected in EPE correctly or at least conservatively.

61. The internal model must employ current market data to compute current exposures. When using historical data to estimate volatility and correlations, at least three years of historical data must be used and must be updated quarterly or more frequently if market conditions warrant. The data should cover a full range of economic conditions, such as a full business cycle. A unit independent from the business unit must validate the price supplied by the business unit. The data must be acquired independently of the lines of business, must be fed into the internal model in a timely and complete fashion, and maintained in a secure database subject to formal and periodic audit. Banks must also have a well-developed data integrity process to scrub the data of erroneous and/or anomalous observations. To the extent that the internal model relies on proxy market data, for example for new products where three years of historical data may not be available, internal policies must identify suitable proxies and the bank must demonstrate empirically that the proxy provides a conservative representation of the underlying risk under adverse market conditions. If the internal model includes the effect of collateral on changes in the market value of the netting set, the bank must have adequate historical data to model the volatility of the collateral

62. The EPE model (and modifications made to it) must be subject to an internal model validation process. The process must be clearly articulated in firms' policies and procedures. The validation process must specify the kind of testing needed to ensure model integrity and identify conditions under which assumptions are violated and may result in an understatement of EPE. The validation process must include a review of the comprehensiveness of the EPE model, for example such as whether the EPE model covers all products that have a material contribution to counterparty risk exposures.

63. The use of an internal model to estimate EPE, and hence the exposure amount or EAD, of positions subject to a CCR capital charge will be conditional upon the explicit approval of the firm's supervisory authority. Home and host country supervisory authorities of banks that carry out material trading activities in multiple jurisdictions will work co-operatively to ensure an efficient approval process.

64. In this Framework and in prior documents, the Committee has issued guidance regarding the use of internal models to estimate certain parameters of risk and determine minimum capital charges against those risks. Supervisors will require that banks seeking to make use of internal models to estimate EPE meet similar requirements regarding, for example, the integrity of the risk management system, the skills of staff that will rely on such measures in operational areas and in control functions, the accuracy of models, and the rigour of internal controls over relevant internal processes. As an example, banks seeking to make use of an internal model to estimate EPE must demonstrate that they meet the Committee's general criteria for banks seeking to make use of internal models to assess market risk exposures, but in the context of assessing counterparty credit risk.[244]

[244] See Part 2, Section VI D 1 (paragraphs 718 (LXX) to 718 (LXXIII)).

65. Pillar 2 of this Framework provides general background and specific guidance to cover counterparty credit risks that may not be fully covered by the Pillar 1 process.

66. No particular form of model is required to qualify to make use of an internal model. Although this text describes an internal model as a simulation model, other forms of models, including analytic models, are acceptable subject to supervisory approval and review. Banks that seek recognition for the use of an internal model that is not based on simulations must demonstrate to their supervisors that the model meets all operational requirements.

67. For a bank that qualifies to net transactions, the bank must have internal procedures to verify that, prior to including a transaction in a netting set, the transaction is covered by a legally enforceable netting contract that meets the applicable requirements of paragraphs 96(I) to 96(v) of this Annex, this Framework text on credit risk mitigation techniques, or the Cross-Product Netting Rules set forth in this Annex.

68. For a bank that makes use of collateral to mitigate its CCR, the bank must have internal procedures to verify that, prior to recognising the effect of collateral in its calculations, the collateral meets the appropriate legal certainty standards as set out in Part 2, Section II.D of this Framework.

VI. Standardised Method

69. Banks that do not have approval to apply the internal models method for the relevant OTC transactions may use the standardised method. The standardised method can be used only for OTC derivatives; SFTs are subject to the treatments set out under the Internal Model Method of this Annex or under the Part 2, Section II.D, of this Framework. The exposure amount (under the standardised approach for credit risk) or EAD is to be calculated separately for each netting set. It is determined as follows:

$$\text{exposure amount or EAD} = \beta \cdot \max\left(CMV - CMC; \sum_j \left| \sum_i RPT_{ij} - \sum_l RPC_{lj} \right| \times CCF_j \right)$$

where:

CMV = current market value of the portfolio of transactions within the netting set with a counterparty gross of collateral, i.e. $CMV = \sum_i CMV_i$, where CMV_i is the current market value of transaction i.

CMC = current market value of the collateral assigned to the netting set, i.e. $CMC = \sum_l CMC_l$, where CMC_l is the current market value of collateral l.

i = index designating transaction.

l = index designating collateral.

j = index designating supervisory hedging sets. These hedging sets correspond to risk factors for which risk positions of opposite sign can be offset to yield a net risk position on which the exposure measure is then based.

RPT_{ij} = Risk position from *transaction* i with respect to hedging set j[245].

RPC_{lj} = Risk position from collateral l with respect to hedging set j.

CCF_j = Supervisory credit conversion factor with respect to the hedging set j[246].

β = Supervisory scaling parameter.

Collateral received from a counterparty has a positive sign; collateral posted to a counterparty has a negative sign.

Collateral that is recognised for the standardised approach is confined to the collateral that is eligible under paragraphs 146 and 703 of this Framework for credit risk mitigation.

70. When an OTC derivative transaction with linear risk profile (e.g. a forward, a future or a swap agreement) stipulates the exchange of a financial instrument (e.g. a bond, an equity, or a commodity) for a payment, the payment part is referred to as the payment leg. Transactions that stipulate the exchange of payment against payment (e.g. an interest rate swap or a foreign exchange forward) consist of two payment legs. The payment legs consist of the contractually agreed gross payments, including the notional amount of the transaction. Banks may disregard the interest rate risk from payment legs with a remaining maturity of less than one year from the following calculations. Banks may treat transactions that consist of two payment legs that are denominated in the same currency (e.g. interest rate swaps) as a single aggregate transaction. The treatment for payment legs applies to the aggregate transaction.

71. Transactions with linear risk profiles that have equity (including equity indices), gold, other precious metals or other commodities as the underlying financial instruments are mapped to a risk position in the respective equity (or equity index) or commodity (including gold and the other precious metals) hedging set. The payment leg of these transactions is mapped to an interest rate risk position within the appropriate interest rate hedging set. If the payment leg is denominated in a foreign currency, the transaction is also mapped to a foreign exchange risk position in the respective currency.

72. Transactions with linear risk profiles that have a debt instrument (e.g. a bond or a loan) as the underlying instrument are mapped to an interest rate risk positions with one risk position for the debt instrument and another risk position for the payment leg. Transactions with linear risk profiles that stipulate the exchange of payment against payment (including foreign exchange forwards) are mapped to an interest rate risk position for each of the payment legs. If the underlying debt instrument is denominated in a foreign currency, the debt instrument is mapped to a foreign exchange risk position in the respective currency. If a

---

[245] E.g. a short-term FX forward with one leg denominated in the firm's domestic currency will be mapped into three risk positions: 1. an FX risk position, 2. a foreign currency interest rate risk position, 3. a domestic currency risk position.

[246] Calibration has been made assuming at the money forwards or swaps and given a forecasting horizon of one year.

payment leg is denominated in a foreign currency, the payment leg is also mapped to a foreign exchange risk position in this currency.[247] The exposure amount or EAD assigned to a foreign exchange basis swap transactions is zero.

73. For all but debt instruments, the size of a risk position from a transaction with linear risk profile is the effective notional value (market price multiplied by quantity) of the underlying financial instruments (including commodities) converted to the firm's domestic currency.

74. For debt instruments and the payment legs of all transactions, the size of the risk position is the effective notional value of the outstanding gross payments (including the notional amount) converted to the firm's domestic currency, multiplied by the modified duration of the debt instrument or payment leg, respectively.

75. The size of a risk position from a credit default swap is the notional value of the reference debt instrument multiplied by the remaining maturity of the credit default swap.

76. The size of a risk position from an OTC derivative with non-linear risk profile (including options and swaptions) is equal to the delta equivalent effective notional value of the financial instrument that underlies the transaction, except in the case of an underlying debt instrument.

77. For OTC derivative with non-linear risk profiles (including options and swaptions), for which the underlying is a debt instrument or a payment leg, the size of the risk position is equal to the delta equivalent effective notional value of the financial instrument or payment leg multiplied by the modified duration of the debt instrument or payment leg.

78. Banks may use the following formulas to determine the size and sign of a risk position:

a. for all but debt instruments:

effective notional value, or delta equivalent notional value =

$$p_{ref} \frac{\partial V}{\partial p}$$

where

p_{ref}	price of the underlying instrument, expressed in the reference currency
v	value of the financial instrument (in the case of an option: option price; in the case of a transaction with a linear risk profile: value of the underlying instrument itself)
p	price of the underlying instrument, expressed in the same currency as v

b. for debt instruments and the payment legs of all transactions:

[247] E.g. a short-term FX forward with one leg denominated in the firm's domestic currency will be mapped into three risk positions: 1. an FX risk position, 2. a foreign currency interest rate risk position, 3. a domestic currency risk position.

effective notional value multiplied by the modified duration, or

delta equivalent in notional value multiplied by the modified duration

$$\frac{\partial V}{\partial r}$$

where

v	value of the financial instrument (in the case of an option: option price; in the case of a transaction with a linear risk profile: value of the underlying instrument itself or of the payment leg, respectively)
r	interest level

If v is denominated in a currency other than the reference currency, the derivative must be converted into the reference currency by multiplication with the relevant exchange rate.

79. The risk positions are to be grouped into hedging sets. For each hedging set, the absolute value amount of the sum of the resulting risk positions is computed. This sum is termed the "net risk position" and is represented as

$$\left| \sum_i RPT_{ij} - \sum_l RPC_{lj} \right|$$

in the formulas in paragraph 70 of this Annex.

80. Interest rate positions arising from debt instruments of low specific risk are to be mapped into one of six hedging sets for each represented currency. A debt instrument is classified as being of low specific risk when it is subject to a 1.6 percent or lower capital charge according to paragraphs 710 to 711(ii). Interest rate positions arising from the payment legs are to be assigned to the same hedging sets as interest rate risk positions from debt instruments of low specific risk. Interest rate positions arising from money deposits received from the counterparty as collateral are also to be assigned to the same hedging sets as interest rate risk positions from debt instruments of low specific risk. The six hedging sets per currency are defined by a combination of two criteria:

(i) The nature of the referenced interest rate — either a sovereign (government) rate or some other rate.

(ii) The remaining maturity or rate-adjustment frequency — less than one year, between one and five years, or longer than five years.

Table 1

Hedging Sets for Interest Rate Risk Positions Per Currency

Remaining maturity or rate-adjustment frequency	Sovereign-referenced interest rates	Non-sovereign-referenced interest rates
One year or less	X	X
Over one year to five years	X	X
Over five years	X	X

81. For underlying debt instruments (e.g. floating rate notes) or payment legs (e.g. floating rate legs of interest swaps) for which the interest rate is linked to a reference interest rate that represents a general market interest level (e.g. government bond yield, money market rate, swap rate), the rate-adjustment frequency is the length of the time interval up to the next re-adjustment of the reference interest rate. Otherwise, the remaining maturity is the remaining life of the underlying debt instrument, or, in the case of a payment leg, the remaining life of the transaction.

82. There is one hedging set for each issuer of a reference debt instrument that underlies a credit default swap.

83. There is one hedging set for each issuer of a debt instrument of high specific risk, i.e. debt instruments to which a capital charge of more than 1.60 percent applies under the standardised measurement method for interest rate risk in paragraph 710. The same applies to money deposits that are posted with a counterparty as collateral when that counterparty does not have debt obligations of low specific risk outstanding. When a payment leg emulates a debt instrument of high specific risk (e.g. in the case of a total return swap with one leg that emulates a bond), there is also one hedging set for each issuer of the reference debt instrument. Banks may assign risk positions that arise from debt instruments of a certain issuer or from reference debt instruments of the same issuer that are emulated by payment legs or that underlie a credit default swap to the same hedging set.

84. Underlying financial instruments other than debt instruments (equities, precious metals, commodities, other instruments), are assigned to the same respective hedging sets only if they are identical or similar instruments. The similarity of instruments is established as follows:

- For equities, similar instruments are those of the same issuer. An equity index is treated as a separate issuer.
- For precious metals, similar instruments are those of the same metal. A precious metal index is treated as a separate precious metal.
- For commodities, similar instruments are those of the same commodity. A commodity index is treated as a separate commodity.
- For electric power, delivery rights and obligations that refer to the same peak or off-peak load time interval within any 24 hour interval are similar instruments.

85. The credit conversion factor that is applied to a net risk position from a hedging set depends on the supervisory hedging set category as given in paragraphs 86 to 88 of this Annex.

86. The credit conversion factors for underlying financial instruments other than debt instruments and for foreign exchange rates are given in Table 2.

Table 2

Exchange Rates	Gold	Equity	Precious Metals (except gold)	Electric Power	Other Commodities (excluding precious metals)
2.5%	5.0%	7.0%	8.5%	4%	10.0%

87. The credit conversion factor for risk positions from debt instruments are as follows:

- 0.6 percent for risk positions from a debt instrument or reference debt instrument of high specific risk.
- 0.3 percent for risk position from a reference debt instrument that underlies a credit default swap and that is of low specific risk.
- 0.2 percent otherwise.

88. Underlying instruments of OTC derivatives that are not in any of the categories above are assigned to separate individual hedging sets for each category of underlying instrument. A credit conversion factor of 10 percent is applied to the notional equivalent amount.

89. There may be transactions with a non-linear risk profile for which the bank cannot determine the delta with a model that the supervisor has approved for the purposes for determining the minimum capital requirements for market risk (instrument models approved for the purposes of the standardised approach for market risk, or instrument models approved as part of the firm's admission to the internal modelling approach for market risk). In the case of payment legs and transactions with debt instruments as underlying, there may be transactions for which the bank cannot determine the modified duration with such a model. For these transactions, the supervisor will determine the size of the risk positions and the applicable credit conversion factors conservatively. Alternatively, supervisors may require the use of the current exposure method. Netting will not be recognised: in other words, the exposure amount or EAD is to be determined as if there were a netting set that comprises just the individual transaction.

90. The supervisory scaling parameter β (beta) is set at 1.4.

VII. Current Exposure Method

91. Banks that do not have approval to apply the internal models method may use the current exposure method as identified in paragraphs 186, 187 and 317 of this Framework. The current exposure method is to be applied to OTC derivatives only; SFTs are subject to the treatments set out under the Internal Model Method of this Annex or under the Part 2, Section II.D, of this Framework.

92. (Deleted)

92(i) Under the Current Exposure Method, banks must calculate the current replacement cost by marking contracts to market, thus capturing the current exposure without any need for estimation, and then adding a factor (the "add-on") to reflect the potential future exposure over the remaining life of the contract. It has been agreed that, in order to calculate the credit equivalent amount of these instruments under this current exposure method, a bank would sum:

- The total replacement cost (obtained by "marking to market") of all its contracts with positive value; and
- An amount for potential future credit exposure calculated on the basis of the total notional principal amount of its book, split by residual maturity as follows:

	Interest Rates	**FX and Gold**	**Equities**	**Precious Metals Except Gold**	**Other Commodities**
One year or less	0.0%	1.0%	6.0%	7.0%	10.0%
Over one year to five years	0.5%	5.0%	8.0%	7.0%	12.0%
Over five years	1.5%	7.5%	10.0%	8.0%	15.0%

Notes:

1. For contracts with multiple exchanges of principal, the factors are to be multiplied by the number of remaining payments in the contract.
2. For contracts that are structured to settle outstanding exposure following specified payment dates and where the terms are reset such that the market value of the contract is zero on these specified dates, the residual maturity would be set equal to the time until the next reset date. In the case of interest rate contracts with remaining maturities of more than one year that meet the above criteria, the add-on factor is subject to a floor of 0.5%.
3. Forwards, swaps, purchased options and similar derivative contracts not covered by any of the columns of this matrix are to be treated as "other commodities".
4. No potential future credit exposure would be calculated for single currency floating/floating interest rate swaps; the credit exposure on these contracts would be evaluated solely on the basis of their mark-to-market value.

92(ii). Supervisors will take care to ensure that the add-ons are based on effective rather than apparent notional amounts. In the event that the stated notional amount is leveraged or enhanced by the structure of the transaction, banks must use the effective notional amount when determining potential future exposure.

93. Banks can obtain capital relief for collateral as defined in paragraphs 146 and 703 of this Framework. The methodology for the recognition of eligible collateral follows that of the applicable approach for credit risk.

94. The counterparty credit risk exposure amount or EAD for single name credit derivative transactions in the trading book will be calculated using the potential future exposure add-on factors set out in paragraph 707 of this Framework.

95. To determine capital requirements for hedged banking book exposures, the treatment for credit derivatives in this Framework applies to qualifying credit derivative instruments.

96. Where a credit derivative is an n^{th}-to-default transaction (such as a first-to-default transaction), the treatment specified in paragraph 708 of this Framework applies.

Bilateral netting

96(i). Careful consideration has been given to the issue of **bilateral netting**, i.e. weighting the net rather than the gross claims with the same counterparties arising out of the full range of forwards, swaps, options and similar derivative contracts.[248] The Committee is concerned that if a liquidator of a failed counterparty has (or may have) the right to unbundle netted contracts, demanding performance on those contracts favourable to the failed counterparty and defaulting on unfavourable contracts, there is no reduction in counterparty risk.

96(ii). Accordingly, it has been agreed for capital adequacy purposes that:

(a) Banks may net transactions subject to novation under which any obligation between a bank and its counterparty to deliver a given currency on a given value date is automatically amalgamated with all other obligations for the same currency and value date, legally substituting one single amount for the previous gross obligations.

(b) Banks may also net transactions subject to any legally valid form of bilateral netting not covered in (a), including other forms of novation.

(c) In both cases (a) and (b), a bank will need to satisfy its national supervisor that it has:[249]

  (i) A netting contract or agreement with the counterparty which creates a single legal obligation, covering all included transactions, such that the bank would have either a claim to receive or obligation to pay only the net sum of the positive and negative mark-to-market values of included individual transactions in the event a counterparty fails to perform due to any of the following: default, bankruptcy, liquidation or similar circumstances;

  (ii) Written and reasoned legal opinions that, in the event of a legal challenge, the relevant courts and administrative authorities would find the bank's exposure to be such a net amount under:

[248] Payments netting, which is designed to reduce the operational costs of daily settlements, will not be recognised in the capital framework since the counterparty's gross obligations are not in any way affected.

[249] In cases where an agreement as described in 96(ii) (a) has been recognised prior to July 1994, the supervisor will determine whether any additional steps are necessary to satisfy itself that the agreement meets the requirements set out below.

- The law of the jurisdiction in which the counterparty is chartered and, if the foreign branch of a counterparty is involved, then also under the law of the jurisdiction in which the branch is located;
- The law that governs the individual transactions; and
- The law that governs any contract or agreement necessary to effect the netting.

The national supervisor, after consultation when necessary with other relevant supervisors, must be satisfied that the netting is enforceable under the laws of each of the relevant jurisdictions;[250]

(iii) Procedures in place to ensure that the legal characteristics of netting arrangements are kept under review in the light of possible changes in relevant law.

96(iii). Contracts containing walkaway clauses will not be eligible for netting for the purpose of calculating capital requirements pursuant to this Framework. A walkaway clause is a provision which permits a non-defaulting counterparty to make only limited payments, or no payment at all, to the estate of a defaulter, even if the defaulter is a net creditor.

96(iv). Credit exposure on bilaterally netted forward transactions will be calculated as the sum of the net mark-to-market replacement cost, if positive, plus an add-on based on the notional underlying principal. The add-on for netted transactions (A_{Net}) will equal the weighted average of the gross add-on (A_{Gross})[251] and the gross add-on adjusted by the ratio of net current replacement cost to gross current replacement cost (NGR). This is expressed through the following formula:

$$A_{Net}=0.4*A_{Gross}+0.6*NGR*A_{Gross}$$

where :

NGR=level of net replacement cost/level of gross replaceent cost for transactions subject to legally enforceable netting agreements[252]

96(v). The scale of the gross add-ons to apply in this formula will be the same as those for non-netted transactions as set out in paragraphs 91 to 96 of this Annex. The Committee will

[250] Thus, if any of these supervisors is dissatisfied about enforceability under its laws, the netting contract or agreement will not meet this condition and neither counterparty could obtain supervisory benefit.

[251] A_{Gross} equals the sum of individual add-on amounts (calculated by multiplying the notional principal amount by the appropriate add-on factors set out in paragraph 92(i) of this Annex) of all transactions subject to legally enforceable netting agreements with one counterparty.

[252] National authorities may permit a choice of calculating the NGR on a counterparty by counterparty or on an aggregate basis for all transactions subject to legally enforceable netting agreements. If supervisors permit a choice of methods, the method chosen by an institution is to be used consistently. Under the aggregate approach, net negative current exposures to individual counterparties cannot be used to offset net positive current exposures to others, i.e. for each counterparty the net current exposure used in calculating the NGR is the maximum of the net replacement cost or zero. Note that under the aggregate approach, the NGR is to be applied individually to each legally enforceable netting agreement so that the credit equivalent amount will be assigned to the appropriate counterparty risk weight category.

continue to review the scale of add-ons to make sure they are appropriate. For purposes of calculating potential future credit exposure to a netting counterparty for forward foreign exchange contracts and other similar contracts in which notional principal is equivalent to cash flows, notional principal is defined as the net receipts falling due on each value date in each currency. The reason for this is that offsetting contracts in the same currency maturing on the same date will have lower potential future exposure as well as lower current exposure.

Risk weighting

96(vi). Once the bank has calculated the credit equivalent amounts they are to be **weighted** according to the category of counterparty in the same way as in the main framework, including concessionary weighting in respect of exposures backed by eligible guarantees and collateral. The Committee will keep a close eye on the credit quality of participants in these markets and reserves the right to raise the weights if average credit quality deteriorates or if loss experience increases.

Annex 5

Illustrative IRB Risk Weights

1. The following tables provide illustrative risk weights calculated for four asset classes types under the internal ratings-based (IRB) approach to credit risk. Each set of risk weights for unexpected loss (UL) was produced using the appropriate risk-weight function of the risk-weight functions set out in Part 2, Section III. The inputs used to calculate the illustrative risk weights include measures of the PD, LGD, and an assumed effective maturity (M) of 2.5 years.

2. A firm-size adjustment applies to exposures made to small- and medium-sized entity (SME) borrowers (defined as corporate exposures where the reported sales for the consolidated group of which the firm is a part is less than €50 million). Accordingly, the firm size adjustment was made in determining the second set of risk weights provided in column two given that the turnover of the firm receiving the exposure is assumed to be €5 million.

Illustrative IRB Risk Weights for UL

Asset Class:	Corporate Exposures		Residential Mortgages		Other Retail Exposures		Qualifying Revolving Retail Exposures	
LGD:	45%	45%	45%	25%	45%	85%	45%	85%
Maturity: 2.5 years								
Turnover (millions of €)	50	5						
PD:								
0.03%	14.44%	11.30%	4.15%	2.30%	4.45%	8.41%	0.98%	1.85%
0.05%	19.65%	15.39%	6.23%	3.46%	6.63%	12.52%	1.51%	2.86%
0.10%	29.65%	23.30%	10.69%	5.94%	11.16%	21.08%	2.71%	5.12%
0.25%	49.47%	39.01%	21.30%	11.83%	21.15%	39.96%	5.76%	10.88%
0.40%	62.72%	49.49%	29.94%	16.64%	28.42%	53.69%	8.41%	15.88%
0.50%	69.61%	54.91%	35.08%	19.49%	32.36%	61.13%	10.04%	18.97%
0.75%	82.78%	65.14%	46.46%	25.81%	40.10%	75.74%	13.80%	26.06%
1.00%	92.32%	72.40%	56.40%	31.33%	45.77%	86.46%	17.22%	32.53%
1.30%	100.95%	78.77%	67.00%	37.22%	50.80%	95.95%	21.02%	39.70%
1.50%	105.59%	82.11%	73.45%	40.80%	53.37%	100.81%	23.40%	44.19%
2.00%	114.86%	88.55%	87.94%	48.85%	57.99%	109.53%	28.92%	54.63%
2.50%	122.16%	93.43%	100.64%	55.91%	60.90%	115.03%	33.98%	64.18%
3.00%	128.44%	97.58%	111.99%	62.22%	62.79%	118.61%	38.66%	73.03%

6.00%	159.61%	119.48%	162.52%	90.29%	67.73%	127.94%	61.61%	116.37%
10.00%	193.09%	146.51%	204.41%	113.56%	75.54%	142.69%	83.89%	158.47%
15.00%	221.54%	171.91%	235.72%	130.96%	88.60%	167.36%	103.89%	196.23%
20.00%	238.23%	188.42%	253.12%	140.62%	100.28%	189.41%	117.99%	222.86%

Annex 6

Supervisory Slotting Criteria for Specialised Lending

Table 1 — Supervisory Rating Grades for Project Finance Exposures

	Strong	Good	Satisfactory	Weak
Financial strength				
Market conditions	Few competing suppliers or substantial and durable advantage in location, cost, or technology. Demand is strong and growing	Few competing suppliers or better than average location, cost, or technology but this situation may not last. Demand is strong and stable	Project has no advantage in location, cost, or technology. Demand is adequate and stable	Project has worse than average location, cost, or technology. Demand is weak and declining
Financial ratios (e.g. *debt service coverage ratio (DSCR), loan life coverage ratio (LLCR), project life coverage ratio (PLCR), and debt-to-equity ratio*)	Strong financial ratios considering the level of project risk; very robust economic assumptions	Strong to acceptable financial ratios considering the level of project risk; robust project economic assumptions	Standard financial ratios considering the level of project risk	Aggressive financial ratios considering the level of project risk
Stress analysis	The project can meet its financial obligations under sustained, severely stressed economic or sectoral conditions	The project can meet its financial obligations under normal stressed economic or sectoral conditions. The project is only likely to default under severe economic conditions	The project is vulnerable to stresses that are not uncommon through an economic cycle, and may default in a normal downturn	The project is likely to default unless conditions improve soon

	Strong	Good	Satisfactory	Weak
Financial structure				
Duration of the credit compared to the duration of the project	Useful life of the project significantly exceeds tenor of the loan	Useful life of the project exceeds tenor of the loan	Useful life of the project exceeds tenor of the loan	Useful life of the project may not exceed tenor of the loan
Amortisation schedule	Amortising debt	Amortising debt	Amortising debt repayments with limited bullet payment	Bullet repayment or amortising debt repayments with high bullet repayment
Political and legal environment				
Political risk, including transfer risk, considering project type and mitigants	Very low exposure; strong mitigation instruments, if needed	Low exposure; satisfactory mitigation instruments, if needed	Moderate exposure; fair mitigation instruments	High exposure; no or weak mitigation instruments
Force majeure risk (war, civil unrest, etc),	Low exposure	Acceptable exposure	Standard protection	Significant risks, not fully mitigated
Government support and project's importance for the country over the long term	Project of strategic importance for the country (preferably export-oriented). Strong support from Government	Project considered important for the country. Good level of support from Government	Project may not be strategic but brings unquestionable benefits for the country. Support from Government may not be explicit	Project not key to the country. No or weak support from Government
Stability of legal and regulatory environment (risk of change in law)	Favourable and stable regulatory environment over the long term	Favourable and stable regulatory environment over the medium term	Regulatory changes can be predicted with a fair level of certainty	Current or future regulatory issues may affect the project
Acquisition of all necessary supports and approvals for such relief from local content laws	Strong	Satisfactory	Fair	Weak

	Strong	Good	Satisfactory	Weak
Enforceability of contracts, collateral and security	Contracts, collateral and security are enforceable	Contracts, collateral and security are enforceable	Contracts, collateral and security are considered enforceable even if certain non-key issues may exist	There are unresolved key issues in respect if actual enforcement of contracts, collateral and security
Transaction characteristics				
Design and technology risk	Fully proven technology and design	Fully proven technology and design	Proven technology and design — start-up issues are mitigated by a strong completion package	Unproven technology and design; technology issues exist and/or complex design
Construction risk				
Permitting and siting	All permits have been obtained	Some permits are still outstanding but their receipt is considered very likely	Some permits are still outstanding but the permitting process is well defined and they are considered routine	Key permits still need to be obtained and are not considered routine. Significant conditions may be attached
Type of construction contract	Fixed-price date-certain turnkey construction EPC (engineering and procurement contract)	Fixed-price date-certain turnkey construction EPC	Fixed-price date-certain turnkey construction contract with one or several contractors	No or partial fixed-price turnkey contract and/or interfacing issues with multiple contractors
Completion guarantees	Substantial liquidated damages supported by financial substance and/or strong completion guarantee from sponsors with excellent financial standing	Significant liquidated damages supported by financial substance and/or completion guarantee from sponsors with good financial standing	Adequate liquidated damages supported by financial substance and/or completion guarantee from sponsors with good financial standing	Inadequate liquidated damages or not supported by financial substance or weak completion guarantees

	Strong	Good	Satisfactory	Weak
Track record and financial strength of contractor in constructing similar projects.	Strong	Good	Satisfactory	Weak
Operating risk				
Scope and nature of operations and maintenance (O & M) contracts	Strong long-term O&M contract, preferably with contractual performance incentives, and/or O&M reserve accounts	Long-term O&M contract, and/or O&M reserve accounts	Limited O&M contract or O&M reserve account	No O&M contract: risk of high operational cost overruns beyond mitigants
Operator's expertise, track record, and financial strength	Very strong, or committed technical assistance of the sponsors	Strong	Acceptable	Limited/weak, or local operator dependent on local authorities
Off-take risk				
(a) If there is a take-or-pay or fixed-price off-take contract:	Excellent creditworthiness of off-taker; strong termination clauses; tenor of contract comfortably exceeds the maturity of the debt	Good creditworthiness of off-taker; strong termination clauses; tenor of contract exceeds the maturity of the debt	Acceptable financial standing of off-taker; normal termination clauses; tenor of contract generally matches the maturity of the debt	Weak off-taker; weak termination clauses; tenor of contract does not exceed the maturity of the debt
(b) If there is no take-or-pay or fixed-price off-take contract:	Project produces essential services or a commodity sold widely on a world market; output can readily be absorbed at projected prices even at lower than historic market growth rates	Project produces essential services or a commodity sold widely on a regional market that will absorb it at projected prices at historical growth rates	Commodity is sold on a limited market that may absorb it only at lower than projected prices	Project output is demanded by only one or a few buyers or is not generally sold on an organised market

	Strong	Good	Satisfactory	Weak
Supply risk				
Price, volume and transportation risk of feed-stocks; supplier's track record and financial strength	Long-term supply contract with supplier of excellent financial standing	Long-term supply contract with supplier of good financial standing	Long-term supply contract with supplier of good financial standing — a degree of price risk may remain	Short-term supply contract or long-term supply contract with financially weak supplier — a degree of price risk definitely remains
Reserve risks (e.g. natural resource development)	Independently audited, proven and developed reserves well in excess of requirements over lifetime of the project	Independently audited, proven and developed reserves in excess of requirements over lifetime of the project	Proven reserves can supply the project adequately through the maturity of the debt	Project relies to some extent on potential and undeveloped reserves
Strength of Sponsor				
Sponsor's track record, financial strength, and country/sector experience	Strong sponsor with excellent track record and high financial standing	Good sponsor with satisfactory track record and good financial standing	Adequate sponsor with adequate track record and good financial standing	Weak sponsor with no or questionable track record and/or financial weaknesses
Sponsor support, as evidenced by equity, ownership clause and incentive to inject additional cash if necessary	Strong. Project is highly strategic for the sponsor (core business — long-term strategy)	Good. Project is strategic for the sponsor (core business — long-term strategy)	Acceptable. Project is considered important for the sponsor (core business)	Limited. Project is not key to sponsor's long-term strategy or core business
Security Package				
Assignment of contracts and accounts	Fully comprehensive	Comprehensive	Acceptable	Weak

	Strong	Good	Satisfactory	Weak
Pledge of assets, taking into account quality, value and liquidity of assets	First perfected security interest in all project assets, contracts, permits and accounts necessary to run the project	Perfected security interest in all project assets, contracts, permits and accounts necessary to run the project	Acceptable security interest in all project assets, contracts, permits and accounts necessary to run the project	Little security or collateral for lenders; weak negative pledge clause
Lender's control over cash flow (e.g. cash sweeps, independent escrow accounts)	Strong	Satisfactory	Fair	Weak
Strength of the covenant package (mandatory prepayments, payment deferrals, payment cascade, dividend restrictions…)	Covenant package is strong for this type of project Project may issue no additional debt	Covenant package is satisfactory for this type of project Project may issue extremely limited additional debt	Covenant package is fair for this type of project Project may issue limited additional debt	Covenant package is Insufficient for this type of project Project may issue unlimited additional debt
Reserve funds (debt service, O&M, renewal and replacement, unforeseen events, etc)	Longer than average coverage period, all reserve funds fully funded in cash or letters of credit from highly rated bank	Average coverage period, all reserve funds fully funded	Average coverage period, all reserve funds fully funded	Shorter than average coverage period, reserve funds funded from operating cash flows

Table 2 — Supervisory Rating Grades for Income-Producing Real Estate Exposures and High-Volatility Commercial Real Estate Exposures

	Strong	Good	Satisfactory	Weak
Financial strength				
Market conditions	The supply and demand for the project's type and location are currently in equilibrium. The number of competitive properties coming to market is equal or lower than forecasted demand	The supply and demand for the project's type and location are currently in equilibrium. The number of competitive properties coming to market is roughly equal to forecasted demand	Market conditions are roughly in equilibrium. Competitive properties are coming on the market and others are in the planning stages. The project's design and capabilities may not be state of the art compared to new projects	Market conditions are weak. It is uncertain when conditions will improve and return to equilibrium. The project is losing tenants at lease expiration. New lease terms are less favourable compared to those expiring
Financial ratios and advance rate	The property's debt service coverage ratio (DSCR) is considered strong (DSCR is not relevant for the construction phase) and its loan to value ratio (LTV) is considered low given its property type. Where a secondary market exists, the transaction is underwritten to market standards	The DSCR (not relevant for development real estate) and LTV are satisfactory. Where a secondary market exists, the transaction is underwritten to market standards	The property's DSCR has deteriorated and its value has fallen, increasing its LTV	The property's DSCR has deteriorated significantly and its LTV is well above underwriting standards for new loans

	Strong	Good	Satisfactory	Weak
Stress analysis	The property's resources, contingencies and liability structure allow it to meet its financial obligations during a period of severe financial stress (e.g. interest rates, economic growth)	The property can meet its financial obligations under a sustained period of financial stress (e.g. interest rates, economic growth). The property is likely to default only under severe economic conditions	During an economic downturn, the property would suffer a decline in revenue that would limit its ability to fund capital expenditures and significantly increase the risk of default	The property's financial condition is strained and is likely to default unless conditions improve in the near term
Cash-flow predictability				
(a) For complete and stabilised property.	The property's leases are long-term with creditworthy tenants and their maturity dates are scattered. The property has a track record of tenant retention upon lease expiration. Its vacancy rate is low. Expenses (maintenance, insurance, security, and property taxes) are predictable	Most of the property's leases are long-term, with tenants that range in creditworthiness. The property experiences a normal level of tenant turnover upon lease expiration. Its vacancy rate is low. Expenses are predictable	Most of the property's leases are medium rather than long-term with tenants that range in creditworthiness. The property experiences a moderate level of tenant turnover upon lease expiration. Its vacancy rate is moderate. Expenses are relatively predictable but vary in relation to revenue	The property's leases are of various terms with tenants that range in creditworthiness. The property experiences a very high level of tenant turnover upon lease expiration. Its vacancy rate is high. Significant expenses are incurred preparing space for new tenants
(b) For complete but not stabilised property	Leasing activity meets or exceeds projections. The project should achieve stabilisation in the near future	Leasing activity meets or exceeds projections. The project should achieve stabilisation in the near future	Most leasing activity is within projections; however, stabilisation will not occur for some time	Market rents do not meet expectations. Despite achieving target occupancy rate, cash flow coverage is tight due to disappointing revenue

	Strong	Good	Satisfactory	Weak
(c) For construction phase	The property is entirely pre-leased through the tenor of the loan or pre-sold to an investment grade tenant or buyer, or the bank has a binding commitment for take-out financing from an investment grade lender	The property is entirely pre-leased or pre-sold to a creditworthy tenant or buyer, or the bank has a binding commitment for permanent financing from a creditworthy lender	Leasing activity is within projections but the building may not be pre-leased and there may not exist a take-out financing. The bank may be the permanent lender	The property is deteriorating due to cost overruns, market deterioration, tenant cancellations or other factors. There may be a dispute with the party providing the permanent financing
Asset characteristics				
Location	Property is located in highly desirable location that is convenient to services that tenants desire	Property is located in desirable location that is convenient to services that tenants desire	The property location lacks a competitive advantage	The property's location, configuration, design and maintenance have contributed to the property's difficulties
Design and condition	Property is favoured due to its design, configuration, and maintenance, and is highly competitive with new properties	Property is appropriate in terms of its design, configuration and maintenance. The property's design and capabilities are competitive with new properties	Property is adequate in terms of its configuration, design and maintenance	Weaknesses exist in the property's configuration, design or maintenance
Property is under construction	Construction budget is conservative and technical hazards are limited. Contractors are highly qualified	Construction budget is conservative and technical hazards are limited. Contractors are highly qualified	Construction budget is adequate and contractors are ordinarily qualified	Project is over budget or unrealistic given its technical hazards. Contractors may be under qualified

	Strong	Good	Satisfactory	Weak
Strength of Sponsor/Developer				
Financial capacity and willingness to support the property.	The sponsor/developer made a substantial cash contribution to the construction or purchase of the property. The sponsor/developer has substantial resources and limited direct and contingent liabilities. The sponsor/developer's properties are diversified geographically and by property type	The sponsor/developer made a material cash contribution to the construction or purchase of the property. The sponsor/developer's financial condition allows it to support the property in the event of a cash flow shortfall. The sponsor/developer's properties are located in several geographic regions	The sponsor/developer's contribution may be immaterial or non-cash. The sponsor/developer is average to below average in financial resources	The sponsor/developer lacks capacity or willingness to support the property
Reputation and track record with similar properties.	Experienced management and high sponsors' quality. Strong reputation and lengthy and successful record with similar properties	Appropriate management and sponsors' quality. The sponsor or management has a successful record with similar properties	Moderate management and sponsors' quality. Management or sponsor track record does not raise serious concerns	Ineffective management and substandard sponsors' quality. Management and sponsor difficulties have contributed to difficulties in managing properties in the past
Relationships with relevant real estate actors	Strong relationships with leading actors such as leasing agents	Proven relationships with leading actors such as leasing agents	Adequate relationships with leasing agents and other parties providing important real estate services	Poor relationships with leasing agents and/or other parties providing important real estate services

	Strong	Good	Satisfactory	Weak
Security Package				
Nature of lien	Perfected first lien[253]	Perfected first lien[253]	Perfected first lien[253]	Ability of lender to foreclose is constrained
Assignment of rents (for projects leased to long-term tenants)	The lender has obtained an assignment. They maintain current tenant information that would facilitate providing notice to remit rents directly to the lender, such as a current rent roll and copies of the project's leases	The lender has obtained an assignment. They maintain current tenant information that would facilitate providing notice to the tenants to remit rents directly to the lender, such as current rent roll and copies of the project's leases	The lender has obtained an assignment. They maintain current tenant information that would facilitate providing notice to the tenants to remit rents directly to the lender, such as current rent roll and copies of the project's leases	The lender has not obtained an assignment of the leases or has not maintained the information necessary to readily provide notice to the building's tenants
Quality of the insurance coverage	Appropriate	Appropriate	Appropriate	Substandard

[253] Lenders in some markets extensively use loan structures that include junior liens. Junior liens may be indicative of this level of risk if the total LTV inclusive of all senior positions does not exceed a typical first loan LTV.

Table 3 — Supervisory Rating Grades for Object Finance Exposures

	Strong	**Good**	**Satisfactory**	**Weak**
Financial strength				
Market conditions	Demand is strong and growing, strong entry barriers, low sensitivity to changes in technology and economic outlook	Demand is strong and stable. Some entry barriers, some sensitivity to changes in technology and economic outlook	Demand is adequate and stable, limited entry barriers, significant sensitivity to changes in technology and economic outlook	Demand is weak and declining, vulnerable to changes in technology and economic outlook, highly uncertain environment
Financial ratios (debt service coverage ratio and loan-to-value ratio)	Strong financial ratios considering the type of asset. Very robust economic assumptions	Strong / acceptable financial ratios considering the type of asset. Robust project economic assumptions	Standard financial ratios for the asset type	Aggressive financial ratios considering the type of asset
Stress analysis	Stable long-term revenues, capable of withstanding severely stressed conditions through an economic cycle	Satisfactory short-term revenues. Loan can withstand some financial adversity. Default is only likely under severe economic conditions	Uncertain short-term revenues. Cash flows are vulnerable to stresses that are not uncommon through an economic cycle. The loan may default in a normal downturn	Revenues subject to strong uncertainties; even in normal economic conditions the asset may default, unless conditions improve
Market liquidity	Market is structured on a worldwide basis; assets are highly liquid	Market is worldwide or regional; assets are relatively liquid	Market is regional with limited prospects in the short term, implying lower liquidity	Local market and/or poor visibility. Low or no liquidity, particularly on niche markets
Political and legal environment				
Political risk, including transfer risk	Very low; strong mitigation instruments, if needed	Low; satisfactory mitigation instruments, if needed	Moderate; fair mitigation instruments	High; no or weak mitigation instruments

	Strong	Good	Satisfactory	Weak
Legal and regulatory risks	Jurisdiction is favourable to repossession and enforcement of contracts	Jurisdiction is favourable to repossession and enforcement of contracts	Jurisdiction is generally favourable to repossession and enforcement of contracts, even if repossession might be long and/or difficult	Poor or unstable legal and regulatory environment. Jurisdiction may make repossession and enforcement of contracts lengthy or impossible
Transaction characteristics				
Financing term compared to the economic life of the asset	Full payout profile/minimum balloon. No grace period	Balloon more significant, but still at satisfactory levels	Important balloon with potentially grace periods	Repayment in fine or high balloon
Operating risk				
Permits / licensing	All permits have been obtained; asset meets current and foreseeable safety regulations	All permits obtained or in the process of being obtained; asset meets current and foreseeable safety regulations	Most permits obtained or in process of being obtained, outstanding ones considered routine, asset meets current safety regulations	Problems in obtaining all required permits, part of the planned configuration and/or planned operations might need to be revised
Scope and nature of O & M contracts	Strong long-term O&M contract, preferably with contractual performance incentives, and/or O&M reserve accounts (if needed)	Long-term O&M contract, and/or O&M reserve accounts (if needed)	Limited O&M contract or O&M reserve account (if needed)	No O&M contract: risk of high operational cost overruns beyond mitigants
Operator's financial strength, track record in managing the asset type and capability to re-market asset when it comes off-lease	Excellent track record and strong re-marketing capability	Satisfactory track record and re-marketing capability	Weak or short track record and uncertain re-marketing capability	No or unknown track record and inability to re-market the asset

	Strong	Good	Satisfactory	Weak
Asset characteristics				
Configuration, size, design and maintenance (i.e. age, size for a plane) compared to other assets on the same market	Strong advantage in design and maintenance. Configuration is standard such that the object meets a liquid market	Above average design and maintenance. Standard configuration, maybe with very limited exceptions — such that the object meets a liquid market	Average design and maintenance. Configuration is somewhat specific, and thus might cause a narrower market for the object	Below average design and maintenance. Asset is near the end of its economic life. Configuration is very specific; the market for the object is very narrow
Resale value	Current resale value is well above debt value	Resale value is moderately above debt value	Resale value is slightly above debt value	Resale value is below debt value
Sensitivity of the asset value and liquidity to economic cycles	Asset value and liquidity are relatively insensitive to economic cycles	Asset value and liquidity are sensitive to economic cycles	Asset value and liquidity are quite sensitive to economic cycles	Asset value and liquidity are highly sensitive to economic cycles
Strength of sponsor				
Operator's financial strength, track record in managing the asset type and capability to re-market asset when it comes off-lease	Excellent track record and strong re-marketing capability	Satisfactory track record and re-marketing capability	Weak or short track record and uncertain re-marketing capability	No or unknown track record and inability to re-market the asset
Sponsors' track record and financial strength	Sponsors with excellent track record and high financial standing	Sponsors with good track record and good financial standing	Sponsors with adequate track record and good financial standing	Sponsors with no or questionable track record and/or financial weaknesses

	Strong	Good	Satisfactory	Weak
Security Package				
Asset control	Legal documentation provides the lender effective control (e.g. a first perfected security interest, or a leasing structure including such security) on the asset, or on the company owning it	Legal documentation provides the lender effective control (e.g. a perfected security interest, or a leasing structure including such security) on the asset, or on the company owning it	Legal documentation provides the lender effective control (e.g. a perfected security interest, or a leasing structure including such security) on the asset, or on the company owning it	The contract provides little security to the lender and leaves room to some risk of losing control on the asset
Rights and means at the lender's disposal to monitor the location and condition of the asset	The lender is able to monitor the location and condition of the asset, at any time and place (regular reports, possibility to lead inspections)	The lender is able to monitor the location and condition of the asset, almost at any time and place	The lender is able to monitor the location and condition of the asset, almost at any time and place	The lender is able to monitor the location and condition of the asset are limited
Insurance against damages	Strong insurance coverage including collateral damages with top quality insurance companies	Satisfactory insurance coverage (not including collateral damages) with good quality insurance companies	Fair insurance coverage (not including collateral damages) with acceptable quality insurance companies	Weak insurance coverage (not including collateral damages) or with weak quality insurance companies

Table 4 — Supervisory Rating Grades for Commodities Finance Exposures

	Strong	Good	Satisfactory	Weak
Financial strength				
Degree of over-collateralisation of trade	Strong	Good	Satisfactory	Weak
Political and legal environment				
Country risk	No country risk	Limited exposure to country risk (in particular, offshore location of reserves in an emerging country)	Exposure to country risk (in particular, offshore location of reserves in an emerging country)	Strong exposure to country risk (in particular, inland reserves in an emerging country)
Mitigation of country risks	Very strong mitigation: Strong offshore mechanisms Strategic commodity 1st class buyer	Strong mitigation: Offshore mechanisms Strategic commodity Strong buyer	Acceptable mitigation: Offshore mechanisms Less strategic commodity Acceptable buyer	Only partial mitigation: No offshore mechanisms Non-strategic commodity Weak buyer
Asset characteristics				
Liquidity and susceptibility to damage	Commodity is quoted and can be hedged through futures or OTC instruments. Commodity is not susceptible to damage	Commodity is quoted and can be hedged through OTC instruments. Commodity is not susceptible to damage	Commodity is not quoted but is liquid. There is uncertainty about the possibility of hedging. Commodity is not susceptible to damage	Commodity is not quoted. Liquidity is limited given the size and depth of the market. No appropriate hedging instruments. Commodity is susceptible to damage

	Strong	Good	Satisfactory	Weak
Strength of sponsor				
Financial strength of trader	Very strong, relative to trading philosophy and risks	Strong	Adequate	Weak
Track record, including ability to manage the logistic process	Extensive experience with the type of transaction in question. Strong record of operating success and cost efficiency	Sufficient experience with the type of transaction in question. Above average record of operating success and cost efficiency	Limited experience with the type of transaction in question. Average record of operating success and cost efficiency	Limited or uncertain track record in general. Volatile costs and profits
Trading controls and hedging policies	Strong standards for counterparty selection, hedging, and monitoring	Adequate standards for counterparty selection, hedging, and monitoring	Past deals have experienced no or minor problems	Trader has experienced significant losses on past deals
Quality of financial disclosure	Excellent	Good	Satisfactory	Financial disclosure contains some uncertainties or is insufficient
Security package				
Asset control	First perfected security interest provides the lender legal control of the assets at any time if needed	First perfected security interest provides the lender legal control of the assets at any time if needed	At some point in the process, there is a rupture in the control of the assets by the lender. The rupture is mitigated by knowledge of the trade process or a third party undertaking as the case may be	Contract leaves room for some risk of losing control over the assets. Recovery could be jeopardised

	Strong	Good	Satisfactory	Weak
Insurance against damages	Strong insurance coverage including collateral damages with top quality insurance companies	Satisfactory insurance coverage (not including collateral damages) with good quality insurance companies	Fair insurance coverage (not including collateral damages) with acceptable quality insurance companies	Weak insurance coverage (not including collateral damages) or with weak quality insurance companies

Annex 7

Illustrative Examples: Calculating the Effect of Credit Risk Mitigation under Supervisory Formula

Some examples are provided below for determining how collateral and guarantees are to be recognised under the SF.

Illustrative Example Involving Collateral ─ proportional cover

Assume an originating bank purchases a €100 securitisation exposure with a credit enhancement level in excess of K_{IRB} for which an external or inferred rating is not available. Additionally, assume that the SF capital charge on the securitisation exposure is €1.6 (when multiplied by 12.5 results in risk weighted assets of €20). Further assume that the originating bank has received €80 of collateral in the form of cash that is denominated in the same currency as the securitisation exposure. The capital requirement for the position is determined by multiplying the SF capital requirement by the ratio of adjusted exposure amount and the original exposure amount, as illustrated below.

Step 1: Adjusted Exposure Amount (E*) = max {0, [E x (1 + He) – C x (1 – Hc – Hfx)]}

E* = max {0, [100 x (1 + 0) – 80 x (1 – 0 – 0)]} = €20

where (based on the information provided above):

E* = the exposure value after risk mitigation (€20)

E = current value of the exposure (€100)

He = haircut appropriate to the exposure (This haircut is not relevant because the originating bank is not lending the securitisation exposure in exchange for collateral).

C = the current value of the collateral received (€80)

Hc = haircut appropriate to the collateral (0)

Hfx = haircut appropriate for mismatch between the collateral and exposure (0)

Step 2: Capital requirement = (E* / E) x SF capital requirement

where (based on the information provide above):

Capital requirement = €20 / €100 x €1.6 = €0.32.

Illustrative Example Involving a Guarantee ─ proportional cover

All of the assumptions provided in the illustrative example involving collateral apply except for the form of credit risk mitigant. Assume that the bank has received an eligible, unsecured guarantee in the amount of €80 from a bank. Therefore, a haircut for currency mismatch will not apply. The capital requirement is determined as follows.

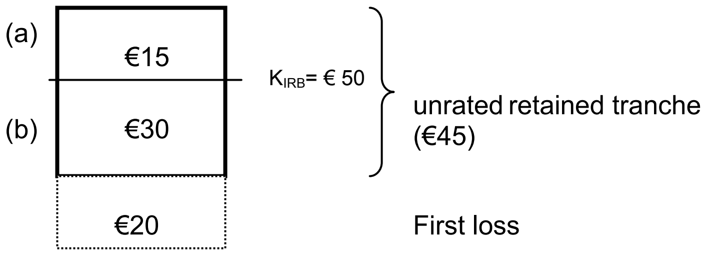
- The protected portion of the securitisation exposure (€80) is to receive the risk weight of the protection provider. The risk weight for the protection provider is equivalent to that for an unsecured loan to the guarantor bank, as determined under the IRB approach. Assume that this risk weight is 10%. Then, the capital charge on the protected portion would be: €80 x 10% x 0.08 = €0.64.
- The capital charge for the unprotected portion (€20) is derived by multiplying the capital charge on the securitisation exposure by the share of the unprotected portion to the exposure amount. The share of the unprotected portion is: €20 / €100 = 20%. Thus, the capital requirement will be: €1.6 x 20% = €0.32.

The total capital requirement for the protected and unprotected portions is:

€0.64 (protected portion) + €0.32 (unprotected portion) = €0.96 .

Illustrative example ─ the case of credit risk mitigants covering the most senior parts

Assume an originating bank that securitises a pool of loans of €1000. The K_{IRB} of this underlying pool is 5% (capital charge of €50). There is a first loss position of €20. The originator retains only the second most junior tranche: an unrated tranche of €45. We can summarise the situation as follows:



1. Capital charge without collateral or guarantees

According to this example, the capital charge for the unrated retained tranche that is straddling the K_{IRB} line is the sum of the capital requirements for tranches (a) and (b) in the graph above:

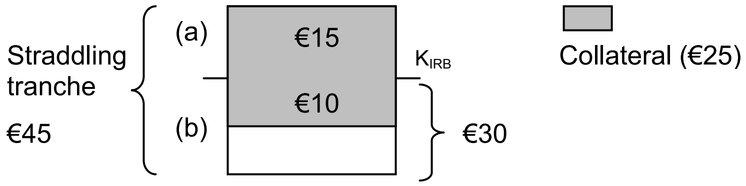
(a) Assume the SF risk weight for this subtranche is 820%. Thus, risk-weighted assets are €15 x 820% = €123. Capital charge is €123 x 8%= €9.84

(b) The subtranche below K_{IRB} must be deducted. Risk-weighted assets: €30 x 1250% = €375. Capital charge of €375 x 8% = €30

Total capital charge for the unrated straddling tranche = €9.84 + €30 = €39.84

2. Capital charge with collateral

Assume now that the originating bank has received €25 of collateral in the form of cash that is denominated in the same currency as the securitisation exposure. Because the tranche is straddling the K_{IRB} level, we must assume that the collateral is covering the most senior subtranche above K_{IRB} ((a) subtranche covered by €15 of collateral) and, only if there is some collateral left, the coverage must be applied to the subtranche below K_{IRB} beginning with the most senior portion (e.g. tranche (b) covered by €10 of collateral). Thus, we have:



The capital requirement for the position is determined by multiplying the SF capital requirement by the ratio of adjusted exposure amount and the original exposure amount, as illustrated below. We must apply this for the two subtranches.

(a) The first subtranche has an initial exposure of €15 and collateral of €15, so in this case it is completely covered. In other words:

Step 1: Adjusted Exposure Amount

E* = max {0, [E x (1 + He) – C x (1 – Hc – Hfx)]} = max {0, [15 – 15]} = €0

where:

E* = the exposure value after risk mitigation (€0)

E = current value of the exposure (€15)

C = the current value of the collateral received (€15)

He = haircut appropriate to the exposure (not relevant here, thus 0)

Hc and Hfx = haircut appropriate to the collateral and that for the mismatch between the collateral and exposure (to simplify, 0)

Step 2: Capital requirement = (E* / E) x SF capital requirement

Capital requirement = 0 x €9.84 = €0

(b) The second subtranche has an initial exposure of €30 and collateral of €10, which is the amount left after covering the subtranche above K_{IRB}. Thus, these €10 must be allocated to the most senior portion of the €30 subtranche.

Step1: Adjusted Exposure Amount

E* = max {0, [30 x (1 + 0) – 10 x (1 – 0 – 0)]} = €20

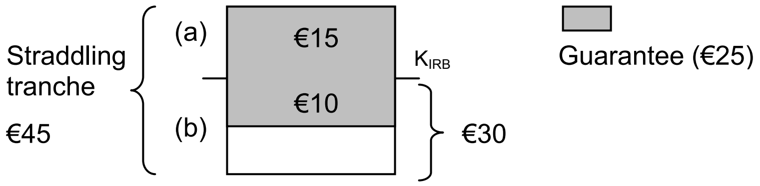
Step 2: Capital requirement = (E* / E) x SF capital requirement

Capital requirement = €20 / €30 x €30 = €20

Finally, the total capital charge for the unrated straddling tranche = €0 + €20 = €20

3. Guarantee

Assume now that instead of collateral, the bank has received an eligible, unsecured guarantee in the amount of €25 from a bank. Therefore the haircut for currency mismatch will not apply. The situation can be summarised as:



The capital requirement for the two subtranches is determined as follows:

(a) The first subtranche has an initial exposure of €15 and a guarantee of €15, so in this case it is completely covered. The €15 will receive the risk weight of the protection provider. The risk weight for the protection provider is equivalent to that for an unsecured loan to the guarantor bank, as determined under the IRB approach. Assume that this risk weight is 20%.

capital charge on the protected portion is €15 x 20% x 8% = €0.24

(b) The second subtranche has an initial exposure of €30 and guarantee of €10 which must be applied to the most senior portion of this subtranche. Accordingly, the protected part is €10 and the unprotected part is €20.

- Again, the protected portion of the securitisation exposure is to receive the risk weight of the guarantor bank.

  capital charge on the protected portion is €10 x 20% x 8% = €0.16

  The capital charge for the unprotected portion (for an unrated position below K_{IRB}) is €20 x 1250% x 8% = €20

Total capital charge for the unrated straddling tranche = €0.24 (protected portion, above K_{IRB}) + €0.16 (protected portion, below K_{IRB}) + €20 (unprotected portion, below K_{IRB}) = €20.4

Annex 8

Mapping of Business Lines

Mapping of Business Lines

Level 1	Level 2	Activity Groups
Corporate Finance	Corporate Finance	Mergers and acquisitions, underwriting, privatisations, securitisation, research, debt (government, high yield), equity, syndications, IPO, secondary private placements
	Municipal/Government Finance	
	Merchant Banking	
	Advisory Services	
Trading & Sales	Sales	Fixed income, equity, foreign exchanges, commodities, credit, funding, own position securities, lending and repos, brokerage, debt, prime brokerage
	Market Making	
	Proprietary Positions	
	Treasury	
Retail Banking	Retail Banking	Retail lending and deposits, banking services, trust and estates
	Private Banking	Private lending and deposits, banking services, trust and estates, investment advice
	Card Services	Merchant/commercial/corporate cards, private labels and retail
Commercial Banking	Commercial Banking	Project finance, real estate, export finance, trade finance, factoring, leasing, lending, guarantees, bills of exchange
Payment and Settlement[254]	External Clients	Payments and collections, funds transfer, clearing and settlement
Agency Services	Custody	Escrow, depository receipts, securities lending (customers) corporate actions
	Corporate Agency	Issuer and paying agents
	Corporate Trust	
Asset Management	Discretionary Fund Management	Pooled, segregated, retail, institutional, closed, open, private equity
	Non-Discretionary Fund Management	Pooled, segregated, retail, institutional, closed, open
Retail Brokerage	Retail Brokerage	Execution and full service

[254] Payment and settlement losses related to a bank's own activities would be incorporated in the loss experience of the affected business line.

Principles for business line mapping[255]

(a) All activities must be mapped into the eight level 1 business lines in a mutually exclusive and jointly exhaustive manner.

(b) Any banking or non-banking activity which cannot be readily mapped into the business line framework, but which represents an ancillary function to an activity included in the framework, must be allocated to the business line it supports. If more than one business line is supported through the ancillary activity, an objective mapping criteria must be used.

(c) When mapping gross income, if an activity cannot be mapped into a particular business line then the business line yielding the highest charge must be used. The same business line equally applies to any associated ancillary activity.

(d) Banks may use internal pricing methods to allocate gross income between business lines provided that total gross income for the bank (as would be recorded under the Basic Indicator Approach) still equals the sum of gross income for the eight business lines.

(e) The mapping of activities into business lines for operational risk capital purposes must be consistent with the definitions of business lines used for regulatory capital calculations in other risk categories, i.e. credit and market risk. Any deviations from this principle must be clearly motivated and documented.

(f) The mapping process used must be clearly documented. In particular, written business line definitions must be clear and detailed enough to allow third parties to replicate the business line mapping. Documentation must, among other things, clearly motivate any exceptions or overrides and be kept on record.

(g) Processes must be in place to define the mapping of any new activities or products.

---

[255] **Supplementary business line mapping guidance**

There are a variety of valid approaches that banks can use to map their activities to the eight business lines, provided the approach used meets the business line mapping principles. Nevertheless, the Committee is aware that some banks would welcome further guidance. The following is therefore an example of one possible approach that could be used by a bank to map its gross income:

Gross income for retail banking consists of net interest income on loans and advances to retail customers and SMEs treated as retail, plus fees related to traditional retail activities, net income from swaps and derivatives held to hedge the retail banking book, and income on purchased retail receivables. To calculate net interest income for retail banking, a bank takes the interest earned on its loans and advances to retail customers less the weighted average cost of funding of the loans (from whatever source — retail or other deposits).

Similarly, gross income for commercial banking consists of the net interest income on loans and advances to corporate (plus SMEs treated as corporate), interbank and sovereign customers and income on purchased corporate receivables, plus fees related to traditional commercial banking activities including commitments, guarantees, bills of exchange, net income (e.g. from coupons and dividends) on securities held in the banking book, and profits/losses on swaps and derivatives held to hedge the commercial banking book. Again, the calculation of net interest income is based on interest earned on loans and advances to corporate, interbank and sovereign customers less the weighted average cost of funding for these loans (from whatever source).

For trading and sales, gross income consists of profits/losses on instruments held for trading purposes (i.e. in the mark-to-market book), net of funding cost, plus fees from wholesale broking.

For the other five business lines, gross income consists primarily of the net fees/commissions earned in each of these businesses. Payment and settlement consists of fees to cover provision of payment/settlement facilities for wholesale counterparties. Asset management is management of assets on behalf of others.

(h) Senior management is responsible for the mapping policy (which is subject to the approval by the board of directors).

(i) The mapping process to business lines must be subject to independent review.

Annex 9

Detailed Loss Event Type Classification

Event-Type Category (Level 1)	Definition	Categories (Level 2)	Activity Examples (Level 3)
Internal fraud	Losses due to acts of a type intended to defraud, misappropriate property or circumvent regulations, the law or company policy, excluding diversity/ discrimination events, which involves at least one internal party	Unauthorised Activity	Transactions not reported (intentional) Transaction type unauthorised (w/monetary loss) Mismarking of position (intentional)
		Theft and Fraud	Fraud / credit fraud / worthless deposits Theft / extortion / embezzlement / robbery Misappropriation of assets Malicious destruction of assets Forgery Check kiting Smuggling Account take-over / impersonation / etc. Tax non-compliance / evasion (wilful) Bribes / kickbacks Insider trading (not on firm's account)
External fraud	Losses due to acts of a type intended to defraud, misappropriate property or circumvent the law, by a third party	Theft and Fraud	Theft/Robbery Forgery Check kiting
		Systems Security	Hacking damage Theft of information (w/monetary loss)
Employment Practices and Workplace Safety	Losses arising from acts inconsistent with employment, health or safety laws or agreements, from payment of personal injury claims, or from diversity / discrimination events	Employee Relations	Compensation, benefit, termination issues Organised labour activity
		Safe Environment	General liability (slip and fall, etc.) Employee health & safety rules events Workers compensation
		Diversity & Discrimination	All discrimination types

Event-Type Category (Level 1)	Definition	Categories (Level 2)	Activity Examples (Level 3)
Clients, Products & Business Practices	Losses arising from an unintentional or negligent failure to meet a professional obligation to specific clients (including fiduciary and suitability requirements), or from the nature or design of a product.	Suitability, Disclosure & Fiduciary	Fiduciary breaches / guideline violations Suitability / disclosure issues (KYC, etc.) Retail customer disclosure violations Breach of privacy Aggressive sales Account churning Misuse of confidential information Lender liability
		Improper Business or Market Practices	Antitrust Improper trade / market practices Market manipulation Insider trading (on firm's account) Unlicensed activity Money laundering
		Product Flaws	Product defects (unauthorised, etc.) Model errors
		Selection, Sponsorship & Exposure	Failure to investigate client per guidelines Exceeding client exposure limits
		Advisory Activities	Disputes over performance of advisory activities
Damage to Physical Assets	Losses arising from loss or damage to physical assets from natural disaster or other events.	Disasters and other events	Natural disaster losses Human losses from external sources (terrorism, vandalism)
Business disruption and system failures	Losses arising from disruption of business or system failures	Systems	Hardware Software Telecommunications Utility outage / disruptions

Event-Type Category (Level 1)	Definition	Categories (Level 2)	Activity Examples (Level 3)
Execution, Delivery & Process Management	Losses from failed transaction processing or process management, from relations with trade counterparties and vendors	Transaction Capture, Execution & Maintenance	Miscommunication Data entry, maintenance or loading error Missed deadline or responsibility Model / system misoperation Accounting error / entity attribution error Other task misperformance Delivery failure Collateral management failure Reference Data Maintenance
		Monitoring and Reporting	Failed mandatory reporting obligation Inaccurate external report (loss incurred)
		Customer Intake and Documentation	Client permissions / disclaimers missing Legal documents missing / incomplete
		Customer / Client Account Management	Unapproved access given to accounts Incorrect client records (loss incurred) Negligent loss or damage of client assets
		Trade Counterparties	Non-client counterparty misperformance Misc. non-client counterparty disputes
		Vendors & Suppliers	Outsourcing Vendor disputes

Annex 10

Overview of Methodologies for the Capital Treatment of Transactions Secured by Financial Collateral under the Standardised and IRB Approaches

1. The rules set forth in the standardised approach — Credit Risk Mitigation (CRM), for collateralised transactions generally determine the treatment under both the standardised and the foundation internal ratings-based (IRB) approaches for claims in the banking book that are secured by financial collateral of sufficient quality. Banks using the advanced IRB approach will typically take financial collateral on banking book exposures into account by using their own internal estimates to adjust the exposure's loss given default (LGD). One exception for a bank using the advanced IRB approach pertains to the recognition of repo-style transactions subject to a master netting agreement, as discussed below.

2. Collateralised exposures that take the form of repo-style transactions (i.e. repo/reverse repos and securities lending/borrowing) are subject to special considerations. Such transactions that are held in the trading book are subject to a counterparty risk capital charge as described below. Further, all banks, including those using the advanced IRB approach, must follow the methodology in the CRM section, which is outlined below, for repo-style transactions booked in either the banking book or trading book that are subject to master netting agreements if they wish to recognise the effects of netting for capital purposes.

Standardised and Foundation IRB Approaches

3. Banks under the standardised approach may use either the simple approach or the comprehensive approach for determining the appropriate risk weight for a transaction secured by eligible financial collateral. Under the simple approach, the risk weight of the collateral substitutes for that of the counterparty. Apart from a few types of very low risk transactions, the risk weight floor is 20%. Under the foundation IRB approach, banks may only use the comprehensive approach.

4. Under the comprehensive approach, eligible financial collateral reduces the amount of the exposure to the counterparty. The amount of the collateral is decreased and, where appropriate, the amount of the exposure is increased through the use of haircuts, to account for potential changes in the market prices of securities and foreign exchange rates over the holding period. This results in an adjusted exposure amount, E*. Banks may either use supervisory haircuts set by the Committee or, subject to qualifying criteria, rely on their "own" estimates of haircuts. Where the supervisory holding period for calculating the haircut amounts differs from the holding period set down in the rules for that type of collateralised transaction, the haircuts are to be scaled up or down as appropriate. Once E* is calculated, the standardised bank will assign that amount a risk weight appropriate to the counterparty. For transactions secured by financial collateral other than repos subject to a master netting agreement, foundation IRB banks are to use E* to adjust the LGD on the exposure.

Special Considerations for Repo-Style Transactions

5. Repo-style transactions booked in the trading book, will, like OTC derivatives held in the trading book, be subject to a counterparty credit risk charge. In calculating this charge, a bank under the standardised approach must use the comprehensive approach to collateral; the simple approach will not be available.

6. The capital treatment for repo-style transactions that are not subject to master netting agreements is the same as that for other collateralised transactions. However, for banks using the comprehensive approach, national supervisors have the discretion to determine that a haircut of zero may be used where the transaction is with a core market participant and meets certain other criteria (so-called carve-out treatment). Where repo-style transactions are subject to a master netting agreement whether they are held in the banking book or trading book, a bank may choose not to recognise the netting effects in calculating capital. In that case, each transaction will be subject to a capital charge as if there were no master netting agreement.

7. If a bank wishes to recognise the effects of master netting agreements on repo-style transactions for capital purposes, it must apply the treatment the CRM section sets forth in that regard on a counterparty-by-counterparty basis. This treatment would apply to all repo-style transactions subject to master netting agreements, regardless of whether the bank is under the standardised, foundation IRB, or advanced IRB approach and regardless of whether the transactions are held in the banking or trading book. Under this treatment, the bank would calculate E* as the sum of the net current exposure on the contract plus an add-on for potential changes in security prices and foreign exchange rates. The add-on may be determined through the supervisory haircuts or, for those banks that meet the qualifying criteria, own estimate haircuts or an internal VaR model. The carve-out treatment for haircuts on repo-style transactions may not be used where an internal VaR model is applied.

8. The calculated E* is in effect an unsecured loan equivalent amount that would be used for the exposure amount under the standardised approach and the exposure at default (EAD) value under both the foundation and advanced IRB approaches. E* is used for EAD under the IRB approaches, thus would be treated in the same manner as the credit equivalent amount (calculated as the sum of replacement cost plus an add-on for potential future exposure) for OTC derivatives subject to master netting agreements.

Annex 10a

Supervisory Framework for the Use of "Backtesting" in Conjunction with the Internal Models Approach to Market Risk Capital Requirements

I. Introduction

1. This Annex presents the framework developed by the Committee for incorporating backtesting into the internal models approach to market risk capital requirements. It represents an elaboration of paragraph 718(LXXVI) (j) of this Framework.

2. Many banks that have adopted an internal model-based approach to market risk measurement routinely compare daily profits and losses with model-generated risk measures to gauge the quality and accuracy of their risk measurement systems. This process, known as "backtesting", has been found useful by many institutions as they have developed and introduced their risk measurement models.

3. As a technique for evaluating the quality of a firm's risk measurement model, backtesting continues to evolve. New approaches to backtesting are still being developed and discussed within the broader risk management community. At present, different banks perform different types of backtesting comparisons, and the standards of interpretation also differ somewhat across banks. Active efforts to improve and refine the methods currently in use are underway, with the goal of distinguishing more sharply between accurate and inaccurate risk models.

4. The essence of all backtesting efforts is the comparison of actual trading results with model-generated risk measures. If this comparison is close enough, the backtest raises no issues regarding the quality of the risk measurement model. In some cases, however, the comparison uncovers sufficient differences that problems almost certainly must exist, either with the model or with the assumptions of the backtest. In between these two cases is a grey area where the test results are, on their own, inconclusive.

5. The Committee believes that backtesting offers the best opportunity for incorporating suitable incentives into the internal models approach in a manner that is consistent and that will cover a variety of circumstances. Indeed, many of the public comments on the April 1995 internal models proposal stressed the need to maintain strong incentives for the continual improvement of banks' internal risk measurement models. In considering how to incorporate backtesting more closely into the internal models approach to market risk capital requirements, the Committee has sought to reflect both the fact that the industry has not yet settled on a single backtesting methodology and concerns over the imperfect nature of the signal generated by backtesting.

6. The Committee believes that the framework outlined in this document strikes an appropriate balance between recognition of the potential limitations of backtesting and the need to put in place appropriate incentives. At the same time, the Committee recognises that the techniques for risk measurement and backtesting are still evolving, and the Committee is committed to incorporating important new developments in these areas into its framework.

7. The remainder of this document describes the backtesting framework that is to accompany the internal models capital requirement. The aim of this framework is the

promotion of more rigorous approaches to backtesting and the supervisory interpretation of backtesting results. The next section deals with the nature of the backtests themselves, while the section that follows concerns the supervisory interpretation of the results and sets out the agreed standards of the Committee in this regard.

II. Description of the backtesting framework

8. The backtesting framework developed by the Committee is based on that adopted by many of the banks that use internal market risk measurement models. These backtesting programs typically consist of a periodic comparison of the bank's daily value-at-risk measures with the subsequent daily profit or loss ("trading outcome"). The value-at-risk measures are intended to be larger than all but a certain fraction of the trading outcomes, where that fraction is determined by the confidence level of the value-at-risk measure. Comparing the risk measures with the trading outcomes simply means that the bank counts the number of times that the risk measures were larger than the trading outcome. The fraction actually covered can then be compared with the intended level of coverage to gauge the performance of the bank's risk model. In some cases, this last step is relatively informal, although there are a number of statistical tests that may also be applied.

9. The supervisory framework for backtesting in this document involves all of the steps identified in the previous paragraph, and attempts to set out as consistent an interpretation of each step as is feasible without imposing unnecessary burdens. Under the value-at-risk framework, the risk measure is an estimate of the amount that could be lost on a set of positions due to general market movements over a given holding period, measured using a specified confidence level.

10. The backtests to be applied compare whether the observed percentage of outcomes covered by the risk measure is consistent with a *99% level of confidence*. That is, they attempt to determine if a bank's 99th percentile risk measures truly cover 99% of the firm's trading outcomes. While it can be argued that the extreme-value nature of the 99th percentile makes it more difficult to estimate reliably than other, lower percentiles, the Committee has concluded that it is important to align the test with the confidence level specified in the Amendment to the Capital Accord.

11. An additional consideration in specifying the appropriate risk measures and trading outcomes for backtesting arises because the value-at-risk approach to risk measurement is generally based on the sensitivity of a static portfolio to instantaneous price shocks. That is, end-of-day trading positions are input into the risk measurement model, which assesses the possible change in the value of this static portfolio due to price and rate movements over the assumed holding period.

12. While this is straightforward in theory, in practice it complicates the issue of backtesting. For instance, it is often argued that value-at-risk measures cannot be compared against actual trading outcomes, since the actual outcomes will inevitably be "contaminated" by changes in portfolio composition during the holding period. According to this view, the inclusion of fee income together with trading gains and losses resulting from changes in the composition of the portfolio should not be included in the definition of the trading outcome because they do not relate to the risk inherent in the static portfolio that was assumed in constructing the value-at-risk measure.

13. This argument is persuasive with regard to the use of value-at-risk measures based on price shocks calibrated to longer holding periods. That is, comparing the ten-day, 99th percentile risk measures from the internal models capital requirement with actual ten-day

trading outcomes would probably not be a meaningful exercise. In particular, in any given ten day period, significant changes in portfolio composition relative to the initial positions are common at major trading institutions. For this reason, *the backtesting framework described here involves the use of risk measures calibrated to a one-day holding period*. Other than the restrictions mentioned in this paper, the test would be based on how banks model risk internally.

14. Given the use of one-day risk measures, it is appropriate to employ one-day trading outcomes as the benchmark to use in the backtesting program. The same concerns about "contamination" of the trading outcomes discussed above continue to be relevant, however, even for one-day trading outcomes. That is, there is a concern that the overall one-day trading outcome is not a suitable point of comparison, because it reflects the effects of intra-day trading, possibly including fee income that is booked in connection with the sale of new products.

15. On the one hand, intra-day trading will tend to increase the volatility of trading outcomes, and may result in cases where the overall trading outcome exceeds the risk measure. This event clearly does not imply a problem with the methods used to calculate the risk measure; rather, it is simply outside the scope of what the value-at-risk method is intended to capture. On the other hand, including fee income may similarly distort the backtest, but in the other direction, since fee income often has annuity-like characteristics.

16. Since this fee income is not typically included in the calculation of the risk measure, problems with the risk measurement model could be masked by including fee income in the definition of the trading outcome used for backtesting purposes.

17. Some have argued that the actual trading outcomes experienced by the bank are the most important and relevant figures for risk management purposes, and that the risk measures should be benchmarked against this reality, even if the assumptions behind their calculations are limited in this regard. Others have also argued that the issue of fee income can be addressed sufficiently, albeit crudely, by simply removing the mean of the trading outcomes from their time series before performing the backtests. A more sophisticated approach would involve a detailed attribution of income by source, including fees, spreads, market movements, and intra-day trading results.

18. To the extent that the backtesting program is viewed purely as a statistical test of the integrity of the calculation of the value-at-risk measure, it is clearly most appropriate to employ a definition of daily trading outcome that allows for an "uncontaminated" test. To meet this standard, banks should develop the capability to perform backtests based on the hypothetical changes in portfolio value that would occur were end-of-day positions to remain unchanged.

19. Backtesting using actual daily profits and losses is also a useful exercise since it can uncover cases where the risk measures are not accurately capturing trading volatility in spite of being calculated with integrity.

20. For these reasons, *the Committee urges banks to develop the capability to perform backtests using both hypothetical and actual trading outcomes*. Although national supervisors may differ in the emphasis that they wish to place on these different approaches to backtesting, it is clear that each approach has value. In combination, the two approaches are likely to provide a strong understanding of the relation between calculated risk measures and trading outcomes.

21. The next step in specifying the backtesting program concerns the nature of the backtest itself, and the frequency with which it is to be performed. The framework adopted by

the Committee, which is also the most straightforward procedure for comparing the risk measures with the trading outcomes, is simply to calculate the number of times that the trading outcomes are not covered by the risk measures ("exceptions"). For example, over 200 trading days, a 99% daily risk measure should cover, on average, 198 of the 200 trading outcomes, leaving two exceptions.

22. With regard to the frequency of the backtest, the desire to base the backtest on as many observations as possible must be balanced against the desire to perform the test on a regular basis. The backtesting framework to be applied entails a *formal testing and accounting of exceptions on a quarterly basis using the most recent twelve months of data*.

23. The implementation of the backtesting program should formally begin on the date that the internal models capital requirement becomes effective, that is, by year-end 1997 at the latest. This implies that *the first formal accounting of exceptions under the backtesting program would occur by year-end 1998*. This of course does not preclude national supervisors from requesting backtesting results prior to that date, and in particular does not preclude their usage, at national discretion, as part of the internal model approval process.

24. Using the most recent twelve months of data yields approximately 250 daily observations for the purposes of backtesting. *The national supervisor will use the number of exceptions (out of 250) generated by the bank's model as the basis for a supervisory response.* In many cases, there will be no response. In other cases, the supervisor may initiate a dialogue with the bank to determine if there is a problem with a bank's model. In the most serious cases, the supervisor may impose an increase in a bank's capital requirement or disallow use of the model.

25. The appeal of using the number of exceptions as the primary reference point in the backtesting process is the simplicity and straightforwardness of this approach. From a statistical point of view, using the number of exceptions as the basis for appraising a bank's model requires relatively few strong assumptions. In particular, the primary assumption is that each day's test (exception/no exception) is independent of the outcome of any of the others.

26. The Committee of course recognises that tests of this type are limited in their power to distinguish an accurate model from an inaccurate model. To a statistician, this means that it is not possible to calibrate the test so that it correctly signals all the problematic models without giving false signals of trouble at many others. This limitation has been a prominent consideration in the design of the framework presented here, and should also be prominent among the considerations of national supervisors in interpreting the results of a bank's backtesting program. However, the Committee does not view this limitation as a decisive objection to the use of backtesting. Rather, conditioning supervisory standards on a clear framework, though limited and imperfect, is seen as preferable to a purely judgmental standard or one with no incentive features whatsoever.

III. Supervisory framework for the interpretation of backtesting results

A. Description of three-zone approach

27. It is with the statistical limitations of backtesting in mind that the Committee is introducing a framework for the supervisory interpretation of backtesting results that encompasses a range of possible responses, depending on the strength of the signal generated from the backtest. These responses are classified into three zones, distinguished

by colours into a hierarchy of responses. The green zone corresponds to backtesting results that do not themselves suggest a problem with the quality or accuracy of a bank's model. The yellow zone encompasses results that do raise questions in this regard, but where such a conclusion is not definitive. The red zone indicates a backtesting result that almost certainly indicates a problem with a bank's risk model.

28. The Committee has agreed to standards regarding the definitions of these zones in respect of the number of exceptions generated in the backtesting program, and these are set forth below. To place these definitions in proper perspective, however, it is useful to examine the probabilities of obtaining various numbers of exceptions under different assumptions about the accuracy of a bank's risk measurement model.

B. Statistical considerations in defining the zones

29. Three zones have been delineated and their boundaries chosen in order to balance two types of statistical error: (1) the possibility that an accurate risk model would be classified as inaccurate on the basis of its backtesting result, and (2) the possibility that an inaccurate model would not be classified that way based on its backtesting result.

30. Table 1 reports the probabilities of obtaining a particular number of exceptions from a sample of 250 independent observations under several assumptions about the actual percentage of outcomes that the model captures (that is, these are binomial probabilities). For example, the left-hand portion of Table 1 reports probabilities associated with an accurate model (that is, a true coverage level of 99%). Under these assumptions, the column labelled "exact" reports that exactly five exceptions can be expected in 6.7% of the samples.

31. The right-hand portion of Table 1 reports probabilities associated with several possible inaccurate models, namely models whose true levels of coverage are 98%, 97%, 96%, and 95%, respectively. Thus, the column labelled "exact" under an assumed coverage level of 97% shows that five exceptions would then be expected in 10.9% of the samples.

32. Table 1 also reports several important error probabilities. For the assumption that the model covers 99% of outcomes (the desired level of coverage), the table reports the probability that selecting a given number of exceptions as a threshold for rejecting the accuracy of the model will result in an erroneous rejection of an accurate model ("type 1" error). For example, if the threshold is set as low as one exception, then accurate models will be rejected fully 91.9% of the time, because they will escape rejection only in the 8.1% of cases where they generate zero exceptions. As the threshold number of exceptions is increased, the probability of making this type of error declines.

33. Under the assumptions that the model's true level of coverage is not 99%, Table 1 reports the probability that selecting a given number of exceptions as a threshold for rejecting the accuracy of the model will result in an erroneous acceptance of a model with the assumed (inaccurate) level of coverage ("type 2" error). For example, if the model's actual level of coverage is 97%, and the threshold for rejection is set at seven or more exceptions, the table indicates that this model would be erroneously accepted 37.5% of the time.

34. In interpreting the information in Table 1, it is also important to understand that although the alternative models appear close to the desired standard in probability terms (97% is close to 99%), the difference between these models in terms of the size of the risk measures generated can be substantial. That is, a bank's risk measure could be substantially less than that of an accurate model and still cover 97% of the trading outcomes. For example, in the case of normally distributed trading outcomes, the 97th percentile corresponds to 1.88 standard deviations, while the 99th percentile corresponds to 2.33

standard deviations, an increase of nearly 25%. Thus, the supervisory desire to distinguish between models providing 99% coverage, and those providing say, 97% coverage, is a very real one.

C. Definition of the green, yellow, and red zones

35. The results in Table 1 also demonstrate some of the statistical limitations of backtesting. In particular, there is no threshold number of exceptions that yields both a low probability of erroneously rejecting an accurate model and a low probability of erroneously accepting all of the relevant inaccurate models. It is for this reason that the Committee has rejected an approach that contains only a single threshold.

36. Given these limitations, the Committee has classified outcomes into three categories. In the first category, the test results are consistent with an accurate model, and the possibility of erroneously accepting an inaccurate model is low (green zone). At the other extreme, the test results are extremely unlikely to have resulted from an accurate model, and the probability of erroneously rejecting an accurate model on this basis is remote (red zone). In between these two cases, however, is a zone where the backtesting results could be consistent with either accurate or inaccurate models, and the supervisor should encourage a bank to present additional information about its model before taking action (yellow zone).

37. Table 2 sets out the Committee’s agreed boundaries for these zones and the presumptive supervisory response for each backtesting outcome, based on a sample of 250 observations. For other sample sizes, the boundaries should be deduced by calculating the binomial probabilities associated with true coverage of 99%, as in Table 1. The yellow zone begins at the point such that the probability of obtaining that number or fewer exceptions equals or exceeds 95%. Table 2 reports these cumulative probabilities for each number of exceptions. For 250 observations, it can be seen that five or fewer exceptions will be obtained 95.88% of the time when the true level of coverage is 99%. Thus, the yellow zone begins at five exceptions.

38. Similarly, the beginning of the red zone is defined as the point such that the probability of obtaining that number or fewer exceptions equals or exceeds 99.99%. Table 2 shows that for a sample of 250 observations and a true coverage level of 99%, this occurs with ten exceptions.

D. The green zone

39. The green zone needs little explanation. Since a model that truly provides 99% coverage would be quite likely to produce as many as four exceptions in a sample of 250 outcomes, there is little reason for concern raised by backtesting results that fall in this range. This is reinforced by the results in Table 1, which indicate that accepting outcomes in this range leads to only a small chance of erroneously accepting an inaccurate model.

E. The yellow zone

40. The range from five to nine exceptions constitutes the yellow zone. Outcomes in this range are plausible for both accurate and inaccurate models, although Table 1 suggests that they are generally more likely for inaccurate models than for accurate models. Moreover, the results in Table 1 indicate that the presumption that the model is inaccurate should grow as the number of exceptions increases in the range from five to nine.

41. The Committee has agreed that, within the yellow zone, the number of exceptions should generally guide the size of potential supervisory increases in a firm's capital requirement. Table 2 sets out the Committee's agreed guidelines for increases in the multiplication factor applicable to the internal models capital requirement, resulting from backtesting results in the yellow zone.

42. These guidelines help in maintaining the appropriate structure of incentives applicable to the internal models approach. In particular, the potential supervisory penalty increases with the number of exceptions. The results in Table 1 generally support the notion that nine exceptions is a more troubling result than five exceptions, and these steps are meant to reflect that.

43. These particular values reflect the general idea that the increase in the multiplication factor should be sufficient to return the model to a 99th percentile standard. For example, five exceptions in a sample of 250 implies only 98% coverage. Thus, the increase in the multiplication factor should be sufficient to transform a model with 98% coverage into one with 99% coverage. Needless to say, precise calculations of this sort require additional statistical assumptions that are not likely to hold in all cases. For example, if the distribution of trading outcomes is assumed to be normal, then the ratio of the 99th percentile to the 98th percentile is approximately 1.14, and the increase needed in the multiplication factor is therefore approximately 0.40 for a scaling factor of 3. If the actual distribution is not normal, but instead has "fat tails", then larger increases may be required to reach the 99th percentile standard. The concern about fat tails was also an important factor in the choice of the specific increments set out in Table 2.

44. It is important to stress, however, that these increases are not meant to be purely automatic. The results in Table 1 indicate that results in the yellow zone do not always imply an inaccurate model, and the Committee has no interest in penalising banks solely for bad luck. *Nevertheless, to keep the incentives aligned properly, backtesting results in the yellow zone should generally be presumed to imply an increase in the multiplication factor unless the bank can demonstrate that such an increase is not warranted.*

45. In other words, the burden of proof in these situations should not be on the supervisor to prove that a problem exists, but rather should be on the bank to prove that their model is fundamentally sound. In such a situation, there are many different types of additional information that might be relevant to an assessment of the bank's model.

46. For example, it would then be particularly valuable to see the results of backtests covering disaggregated subsets of the bank's overall trading activities. Many banks that engage in regular backtesting programs break up their overall trading portfolio into trading units organised around risk factors or product categories. Disaggregating in this fashion could allow the tracking of a problem that surfaced at the aggregate level back to its source at the level of a specific trading unit or risk model.

47. Banks should also document all of the exceptions generated from their ongoing backtesting program, including an explanation for the exception. This documentation is important to determining an appropriate supervisory response to a backtesting result in the yellow zone. Banks may also implement backtesting for confidence intervals other than the 99th percentile, or may perform other statistical tests not considered here. Naturally, this information could also prove very helpful in assessing their model.

48. In practice, there are several possible explanations for a backtesting exception, some of which go to the basic integrity of the model, some of which suggest an under-specified or low-quality model, and some of which suggest either bad luck or poor intra-day

trading results. Classifying the exceptions generated by a bank's model into these categories can be a very useful exercise.

Basic integrity of the model

(1) The bank's systems simply are not capturing the risk of the positions themselves (e.g. the positions of an overseas office are being reported incorrectly).

(2) Model volatilities and/or correlations were calculated incorrectly (e.g. the computer is dividing by 250 when it should be dividing by 225).

Model's accuracy could be improved

(3) The risk measurement model is not assessing the risk of some instruments with sufficient precision (e.g. too few maturity buckets or an omitted spread).

Bad luck or markets moved in fashion unanticipated by the model

(4) Random chance (a very low probability event).

(5) Markets moved by more than the model predicted was likely (i.e. volatility was significantly higher than expected).

(6) Markets did not move together as expected (i.e. correlations were significantly different than what was assumed by the model).

Intra-day trading

(7) There was a large (and money-losing) change in the bank's positions or some other income event between the end of the first day (when the risk estimate was calculated) and the end of the second day (when trading results were tabulated).

49. In general, problems relating to the basic integrity of the risk measurement model are potentially the most serious. If there are exceptions attributed to this category for a particular trading unit, the plus should apply. In addition, the model may be in need of substantial review and/or adjustment, and the supervisor would be expected to take appropriate action to ensure that this occurs.

50. The second category of problem (lack of model precision) is one that can be expected to occur at least part of the time with most risk measurement models. No model can hope to achieve infinite precision, and thus all models involve some amount of approximation. If, however, a particular bank's model appears more prone to this type of problem than others, the supervisor should impose the plus factor and also consider what other incentives are needed to spur improvements.

51. The third category of problems (markets moved in a fashion unanticipated by the model) should also be expected to occur at least some of the time with value-at-risk models. In particular, even an accurate model is not expected to cover 100% of trading outcomes. Some exceptions are surely the random 1% that the model can be expected not to cover. In other cases, the behaviour of the markets may shift so that previous estimates of volatility and correlation are less appropriate. No value-at-risk model will be immune from this type of problem; it is inherent in the reliance on past market behaviour as a means of gauging the risk of future market movements.

52. Finally, depending on the definition of trading outcomes employed for the purpose of backtesting, exceptions could also be generated by intra-day trading results or an unusual event in trading income other than from positioning. Although exceptions for these reasons would not necessarily suggest a problem with the bank's value-at-risk model, they could still be cause for supervisory concern and the imposition of the plus should be considered.

53. The extent to which a trading outcome exceeds the risk measure is another relevant piece of information. All else equal, exceptions generated by trading outcomes far in excess of the risk measure are a matter of greater concern than are outcomes only slightly larger than the risk measure.

54. In deciding whether or not to apply increases in a bank's capital requirement, it is envisioned that the supervisor could weigh these factors as well as others, including an appraisal of the bank's compliance with applicable qualitative standards of risk management. Based on the additional information provided by the bank, the supervisor will decide on the appropriate course of action.

55. In general, the imposition of a higher capital requirement for outcomes in the yellow zone is an appropriate response when the supervisor believes the reason for being in the yellow zone is a correctable problem in a bank's model. This can be contrasted with the case of an unexpected bout of high market volatility, which nearly all models may fail to predict. While these episodes may be stressful, they do not necessarily indicate that a bank's risk model is in need of redesign. Finally, in the case of severe problems with the basic integrity of the model, the supervisor should consider whether to disallow the use of the model for capital purposes altogether.

F. The red zone

56. Finally, in contrast to the yellow zone where the supervisor may exercise judgement in interpreting the backtesting results, outcomes in the red zone (ten or more exceptions) should generally lead to an automatic presumption that a problem exists with a bank's model. This is because it is extremely unlikely that an accurate model would independently generate ten or more exceptions from a sample of 250 trading outcomes.

57. In general, therefore, if a bank's model falls into the red zone, the supervisor should automatically increase the multiplication factor applicable to a firm's model by one (from three to four). Needless to say, the supervisor should also begin investigating the reasons why the bank's model produced such a large number of misses, and should require the bank to begin work on improving its model immediately.

58. Although ten exceptions is a very high number for 250 observations, there will on very rare occasions be a valid reason why an accurate model will produce so many exceptions. In particular, when financial markets are subjected to a major regime shift, many volatilities and correlations can be expected to shift as well, perhaps substantially. Unless a bank is prepared to update its volatility and correlation estimates instantaneously, such a regime shift could generate a number of exceptions in a short period of time. In essence, however, these exceptions would all be occurring for the same reason, and therefore the appropriate supervisory reaction might not be the same as if there were ten exceptions, but each from a separate incident. For example, one possible supervisory response in this instance would be to simply require the bank's model to take account of the regime shift as quickly as it can while maintaining the integrity of its procedures for updating the model.

59. It should be stressed, however, that the Committee believes that this exception should be allowed only under the most extraordinary circumstances, and that it is committed

to an automatic and non-discretionary increase in a bank's capital requirement for backtesting results that fall into the red zone.

IV. Conclusion

60. The above framework is intended to set out a consistent approach for incorporating backtesting into the internal models approach to market risk capital requirements. The goals of this effort have been to build appropriate and necessary incentives into a framework that relies heavily on the efforts of banks themselves to calculate the risks they face, to do so in a way that respects the inherent limitations of the available tools, and to keep the burdens and costs of the imposed procedures to a minimum.

61. The Basel Committee believes that the framework described above strikes the right balance in this regard. Perhaps more importantly, however, the Committee believes that this approach represents the first, and therefore critical, step toward a tighter integration of supervisory guidelines with verifiable measures of bank performance.

Table 1

Model is accurate		
Exceptions (our of 250)	Coverage = 99% exact	type 1
0	8.1 %	100.0 %

10	1.8 %	97.0 %	8.6 %	77.9 %	12.8 %	45.5 %	9.6 %	19.5 %
11	0.8 %	98.7 %	5.8 %	86.6 %	11.6 %	58.3 %	11.1 %	29.1 %
12	0.3 %	99.5 %	3.6 %	92.4 %	9.6 %	69.9 %	11.6 %	40.2 %
13	0.1 %	99.8 %	2.0 %	96.0 %	7.3 %	79.5 %	11.2 %	51.8 %
14	0.0 %	99.9 %	1.1 %	98.0 %	5.2 %	86.9 %	10.0 %	62.9 %
15	0.0 %	100.0 %	0.5 %	99.1 %	3.4 %	92.1 %	8.2 %	72.9 %

Notes: The table reports both exact probabilities of obtaining a certain number of exceptions from a sample of 250 independent observations under several assumptions about the true level of coverage, as well as type 1 or type 2 error probabilities derived from these exact probabilities.

The left-hand portion of the table pertains to the case where the model is accurate and its true level of coverage is 99%. Thus, the probability of any given observation being an exception is 1% (100% - 99% = 1%). The column labelled "exact" reports the probability of obtaining exactly the number of exceptions shown under this assumption in a sample of 250 independent observations. The column labelled "type 1" reports the probability that using a given number of exceptions as the cut-off for rejecting a model will imply erroneous rejection of an accurate model using a sample of 250 independent observations. For example, if the cut-off level is set at five or more exceptions, the type 1 column reports the probability of falsely rejecting an accurate model with 250 independent observations is 10.8%.

The right-hand portion of the table pertains to models that are inaccurate. In particular, the table concentrates of four specific inaccurate models, namely models whose true levels of coverage are 98%, 97%, 96% and 95% respectively. For each inaccurate model, the "exact" column reports the probability of obtaining exactly the number of exceptions shown under this assumption in a sample of 250 independent observations. The columns labelled "type 2" report the probability that using a given number of exceptions as the cut-off for rejecting a model will imply erroneous acceptance of an inaccurate model with the assumed level of coverage using a sample of 250 independent observations. For example, if the cut-off level is set at five or more exceptions, the type 2 column for an assumed coverage level of 97% reports the probability of falsely accepting a model with only 97% coverage with 250 independent observations is 12.8%.

Table 2

Zone	Number of exceptions	Increase in scaling factor	Cumulative probability
Green Zone	0	0.00	8.11%
	1	0.00	28.58%
	2	0.00	54.32%
	3	0.00	75.81%
	4	0.00	89.22%
Yellow Zone	5	0.40	95.88%
	6	0.50	98.63%
	7	0.65	99.60%
	8	0.75	99.89%
	9	0.85	99.97%
Red Zone	10 or more	1.00	99.99%

Notes: The table defines the green, yellow and red zones that supervisors will use to assess backtesting results in conjunction with the internal models approach to market risk capital requirements. The boundaries shown in the table are based on a sample of 250 observations. For other sample sizes, the yellow zone begins at the point where the cumulative probability equals or exceeds 95%, and the red zone begins at the point where the cumulative probability equals or exceeds 99.99%.

The cumulative probability is simply the probability of obtaining a given number or fewer exceptions in a sample of 250 observations when the true coverage level is 99%. For example, the cumulative probability shown for four exceptions is the probability of obtaining between zero and four exceptions.

Note that these cumulative probabilities and the type 1 error probabilities reported in Table 1 do not sum to one because the cumulative probability for a given number of exceptions includes the possibility of obtaining exactly that number of exceptions, as does the type 1 error probability. Thus, the sum of these two probabilities exceeds one by the amount of the probability of obtaining exactly that number of exceptions.

Annex 11

The Simplified Standardised Approach[256]

I. Credit risk ─ general rules for risk weights

1. Exposures should be risk weighted net of specific provisions.

A. Claims on sovereigns and central banks

2. Claims on sovereigns and their central banks will be risk-weighted on the basis of the consensus country risk scores of export credit agencies (ECA) participating in the "Arrangement on Officially Supported Export Credits". These scores are available on the OECD's website.[257] The methodology establishes eight risk score categories associated with minimum export insurance premiums. As detailed below, each ECA risk score will correspond to a specific risk weight category.

ECA risk scores	0-1	2	3	4 to 6	7
Risk weights	0%	20%	50%	100%	150%

3. At national discretion, a lower risk weight may be applied to banks' exposures to their sovereign (or central bank) of incorporation denominated in domestic currency and funded[258] in that currency.[259] Where this discretion is exercised, other national supervisory authorities may also permit their banks to apply the same risk weight to domestic currency exposures to this sovereign (or central bank) funded in that currency.

B. Claims on other official entities

4. Claims on the Bank for International Settlements, the International Monetary Fund, the European Central Bank and the European Community will receive a 0% risk weight.

5. The following Multilateral Development Banks (MDBs) will be eligible for a 0% risk weight:

- the World Bank Group, comprised of the International Bank for Reconstruction and Development (IBRD) and the International Finance Corporation (IFC),
- the Asian Development Bank (ADB),

[256] This approach should not be seen as another approach for determining regulatory capital. Rather, it collects in one place the simplest options for calculating risk-weighted assets.

[257] The consensus country risk classification is available on the OECD's website (http://www.oecd.org) in the Export Credit Arrangement web-page of the Trade Directorate.

[258] This is to say that the bank should also have liabilities denominated in the domestic currency.

[259] This lower risk weight may be extended to the risk weighting of collateral and guarantees.

- the African Development Bank (AfDB),
- the European Bank for Reconstruction and Development (EBRD),
- the Inter-American Development Bank (IADB),
- the European Investment Bank (EIB),
- the European Investment Fund (EIF),
- the Nordic Investment Bank (NIB),
- the Caribbean Development Bank (CDB),
- the Islamic Development Bank (IDB), and
- the Council of Europe Development Bank (CEDB).

6. The standard risk weight for claims on other MDBs will be 100%.

7. Claims on domestic public sector entitles (PSEs) will be risk-weighted according to the risk weight framework for claims on banks of that country. Subject to national discretion, claims on a domestic PSE may also be treated as claims on the sovereign in whose jurisdiction the PSEs are established.[260] Where this discretion is exercised, other national supervisors may allow their banks to risk weight claims on such PSEs in the same manner.

C. Claims on banks and securities firms

8. Banks will be assigned a risk weight based on the weighting of claims on the country in which they are incorporated (see paragraph 2). The treatment is summarised in the table below:

ECA risk scores for sovereigns	0-1	2	3	4 to 6	7
Risk weights	20%	50%	100%	100%	150%

[260] The following examples outline how PSEs might be categorised when focusing upon the existence of revenue raising powers. However, there may be other ways of determining the different treatments applicable to different types of PSEs, for instance by focusing on the extent of guarantees provided by the central government:

- **Regional governments and local authorities** could qualify for the same treatment as claims on their sovereign or central government if these governments and local authorities have specific revenue-raising powers and have specific institutional arrangements the effect of which is to reduce their risks of default.
- **Administrative bodies responsible to central governments, regional governments or to local authorities and other non-commercial undertakings** owned by the governments or local authorities may not warrant the same treatment as claims on their sovereign if the entities do not have revenue raising powers or other arrangements as described above. If strict lending rules apply to these entities and a declaration of bankruptcy is not possible because of their special public status, it may be appropriate to treat these claims in the same manner as claims on banks.
- **Commercial undertakings** owned by central governments, regional governments or by local authorities might be treated as normal commercial enterprises. However, if these entities function as a corporate in competitive markets even though the state, a regional authority or a local authority is the major shareholder of these entities, supervisors should decide to consider them as corporates and therefore attach to them the applicable risk weights.

9. When the national supervisor has chosen to apply the preferential treatment for claims on the sovereign as described in paragraph 3, it can also assign a risk weight that is one category less favourable than that assigned to claims on the sovereign, subject to a floor of 20%, to claims on banks of an original maturity of 3 months or less denominated and funded in the domestic currency.

10. Claims on securities firms may be treated as claims on banks provided such firms are subject to supervisory and regulatory arrangements comparable to those under this Framework (including, in particular, risk-based capital requirements).[261] Otherwise such claims would follow the rules for claims on corporates.

D. Claims on corporates

11. The standard risk weight for claims on corporates, including claims on insurance companies, will be 100%.

E. Claims included in the regulatory retail portfolios

12. Claims that qualify under the criteria listed in paragraph 13 may be considered as retail claims for regulatory capital purposes and included in a regulatory retail portfolio. Exposures included in such a portfolio may be risk-weighted at 75%, except as provided in paragraph 18 for past due loans.

13. To be included in the regulatory retail portfolio, claims must meet the following four criteria:

- Orientation criterion ─ The exposure is to an individual person or persons or to a small business;
- Product criterion ─ The exposure takes the form of any of the following: revolving credits and lines of credit (including credit cards and overdrafts), personal term loans and leases (e.g. instalment loans, auto loans and leases, student and educational loans, personal finance) and small business facilities and commitments. Securities (such as bonds and equities), whether listed or not, are specifically excluded from this category. Mortgage loans are excluded to the extent that they qualify for treatment as claims secured by residential property (see paragraph 15).
- Granularity criterion ─ The supervisor must be satisfied that the regulatory retail portfolio is sufficiently diversified to a degree that reduces the risks in the portfolio, warranting the 75% risk weight. One way of achieving this may be to set a numerical limit that no aggregate exposure to one counterpart[262] can exceed 0.2% of the overall regulatory retail portfolio.

[261] That is, capital requirements that are comparable to those applied to banks in this Framework. Implicit in the meaning of the word "comparable" is that the securities firm (but not necessarily its parent) is subject to consolidated regulation and supervision with respect to any downstream affiliates.

[262] Aggregated exposure means gross amount (i.e. not taking any credit risk mitigation into account) of all forms of debt exposures (e.g. loans or commitments) that individually satisfy the three other criteria. In addition, "on one counterpart" means one or several entities that may be considered as a single beneficiary (e.g. in the case of a small business that is affiliated to another small business, the limit would apply to the bank's aggregated exposure on both businesses).

- Low value of individual exposures. The maximum aggregated retail exposure to one counterpart cannot exceed an absolute threshold of €1 million.

14. National supervisory authorities should evaluate whether the risk weights in paragraph 12 are considered to be too low based on the default experience for these types of exposures in their jurisdictions. Supervisors, therefore, may require banks to increase these risk weights as appropriate.

F. Claims secured by residential property

15. Lending fully secured by mortgages on residential property that is or will be occupied by the borrower, or that is rented, will be risk-weighted at 35%. In applying the 35% weight, the supervisory authorities should satisfy themselves, according to their national arrangements for the provision of housing finance, that this concessionary weight is applied restrictively for residential purposes and in accordance with strict prudential criteria, such as the existence of substantial margin of additional security over the amount of the loan based on strict valuation rules. Supervisors should increase the standard risk weight where they judge the criteria are not met.

16. National supervisory authorities should evaluate whether the risk weights in paragraph 15 are considered to be too low based on the default experience for these types of exposures in their jurisdictions. Supervisors, therefore, may require banks to increase these risk weights as appropriate.

G. Claims secured by commercial real estate

17. Mortgages on commercial real estate will be risk-weighted at 100%.

H. Treatment of past due loans

18. The unsecured portion of any loan (other than a qualifying residential mortgage loan) that is past due for more than 90 days, net of specific provisions (including partial write-offs), will be risk-weighted as follows:[263]

- 150% risk weight when provisions are less than 20% of the outstanding amount of the loan;
- 100% risk weight when specific provisions are no less than 20% of the outstanding amount of the loan; and
- 100% risk weight when specific provisions are no less than 50% of the outstanding amount of the loan, but with supervisory discretion to reduce the risk weight to 50%.

19. For the purpose of defining the secured portion of the past due loan, eligible collateral and guarantees will be the same as for credit risk mitigation purposes (see Section II).[264] Past due retail loans are to be excluded from the overall regulatory retail

[263] Subject to national discretion, supervisors may permit banks to treat non-past due loans extended to counterparties subject to a 150% risk weight in the same way as past due loans described in paragraphs 18 to 20.

[264] There will be a transitional period of three years during which a wider range of collateral may be recognised, subject to national discretion.

portfolio when assessing the granularity criterion specified in paragraph 13, for risk-weighting purposes.

20. In addition to the circumstances described in paragraph 18, where a past due loan is fully secured by those forms of collateral that are not recognised in paragraph 50, a 100% risk weight may apply when specific provisions reach 15% of the outstanding amount of the loan. These forms of collateral are not recognised elsewhere in the simplified standardised approach. Supervisors should set strict operational criteria to ensure the quality of collateral.

21. In the case of qualifying residential mortgage loans, when such loans are past due for more than 90 days they will be risk-weighted at 100%, net of specific provisions. If such loans are past due but specific provisions are no less than 20% of their outstanding amount, the risk weight applicable to the remainder of the loan can be reduced to 50% at national discretion.

I. Higher-risk categories

22. National supervisors may decide to apply a 150% or higher risk weight reflecting the higher risks associated with some other assets, such as venture capital and private equity investments.

J. Other assets

23. The treatment of securitisation exposures is presented separately in Section III. The standard risk weight for all other assets will be 100%.[265] Investments in equity or regulatory capital instruments issued by banks or securities firms will be risk-weighted at 100%, unless deducted from the capital base according to Part 1 of the present Framework.

K. Off-balance sheet items

24. Off-balance sheet items under the simplified standardised approach will be converted into credit exposure equivalents through the use of credit conversion factors (CCF). Counterparty risk weights for OTC derivative transactions will not be subject to any specific ceiling.

25. Commitments with an original maturity up to one year and commitments with an original maturity over one year will receive a CCF of 20% and 50%, respectively. However, any commitments that are unconditionally cancellable at any time by the bank without prior notice, or that effectively provide for automatic cancellation due to deterioration in a borrower's creditworthiness, will receive a 0% credit conversion factor.[266]

25(i). Direct credit substitutes, e.g. general guarantees of indebtedness (including standby letters of credit serving as financial guarantees for loans and securities) and acceptances (including endorsements with the character of acceptances) will receive a CCF of 100%.

[265] However, at national discretion, gold bullion held in own vaults or on an allocated basis to the extent backed by bullion liabilities can be treated as cash and therefore risk-weighted at 0%. In addition, cash items in the process of collection can be risk-weighted at 20%.

[266] In certain countries, retail commitments are considered unconditionally cancellable if the terms permit the bank to cancel them to the full extent allowable under consumer protection and related legislation.

25(ii). Sale and repurchase agreements and asset sales with recourse,[267] where the credit risk remains with the bank will receive a CCF of 100%.

26. A CCF of 100% will be applied to the lending of banks' securities or the posting of securities as collateral by banks, including instances where these arise out of repo-style transactions (i.e. repurchase/reverse repurchase and securities lending/securities borrowing transactions). See Section II for the calculation of risk-weighted assets where the credit converted exposure is secured by eligible collateral.

26(i). Forward asset purchases, forward forward deposits and partly-paid shares and securities[268], which represent commitments with certain drawdown will receive a CCF of 100%.

26(ii). Certain transaction-related contingent items (e.g. performance bonds, bid bonds, warranties and standby letters of credit related to particular transactions) will receive a CCF of 50%.

26(iii). Note issuance facilities (NIFs) and revolving underwriting facilities (RUFs) will receive a CCF of 50%.

27. For short-term self-liquidating trade letters of credit arising from the movement of goods (e.g. documentary credits collateralised by the underlying shipment), a 20% credit conversion factor will be applied to both issuing and confirming banks.

28. Where there is an undertaking to provide a commitment on an off-balance sheet items, banks are to apply the lower of the two applicable CCFs.

29. The credit equivalent amount of transactions that expose banks to counterparty credit risk must be calculated under the rules specified in Section VII of Annex 4 of this Framework.

30. Banks must closely monitor securities, commodities, and foreign exchange transactions that have failed, starting the first day they fail. A capital charge to failed transactions must be calculated in accordance with Annex 3 of this Framework.

31. With regard to unsettled securities, commodities, and foreign exchange transactions, the Committee is of the opinion that banks are exposed to counterparty credit risk from trade date, irrespective of the booking or the accounting of the transaction. Therefore, banks are encouraged to develop, implement and improve systems for tracking and monitoring the credit risk exposure arising from unsettled transactions as appropriate for producing management information that facilitates action on a timely basis. Furthermore, when such transactions are not processed through a delivery-versus-payment (DvP) or payment-versus-payment (PvP) mechanism, banks must calculate a capital charge as set forth in Annex 3 of this Framework.

---

[267] These items are to be weighted according to the type of asset and not according to the type of counterparty with whom the transaction has been entered into.

[268] These items are to be weighted according to the type of asset and not according to the type of counterparty with whom the transaction has been entered into.

II. Credit risk mitigation

A. Overarching issues

1. Introduction

32. Banks use a number of techniques to mitigate the credit risks to which they are exposed. Exposure may be collateralised in whole or in part with cash or securities, or a loan exposure may be guaranteed by a third party.

33. Where these various techniques meet the operational requirements below credit risk mitigation (CRM) may be recognised.

2. General remarks

34. The framework set out in this section is applicable to the banking book exposures under the simplified standardised approach.

35. No transaction in which CRM techniques are used should receive a higher capital requirement than an otherwise identical transaction where such techniques are not used.

36. The effects of CRM will not be double counted. Therefore, no additional supervisory recognition of CRM for regulatory capital purposes will be granted on claims for which an issue-specific rating is used that already reflects that CRM. Principal-only ratings will also not be allowed within the framework of CRM.

37. Although banks use CRM techniques to reduce their credit risk, these techniques give rise to risks (residual risks) which may render the overall risk reduction less effective. Where these risks are not adequately controlled, supervisors may impose additional capital charges or take other supervisory actions as detailed in Pillar 2.

38. While the use of CRM techniques reduces or transfers credit risk, it simultaneously may increase other risks to the bank, such as legal, operational, liquidity and market risks. Therefore, it is imperative that banks employ robust procedures and processes to control these risks, including strategy; consideration of the underlying credit; valuation; policies and procedures; systems; control of roll-off risks; and management of concentration risk arising from the bank's use of CRM techniques and its interaction with the bank's overall credit risk profile.

39. The Pillar 3 requirements must also be observed for banks to obtain capital relief in respect of any CRM techniques.

3. Legal certainty

40. In order for banks to obtain capital relief, all documentation used in collateralised transactions and for documenting guarantees must be binding on all parties and legally enforceable in all relevant jurisdictions. Banks must have conducted sufficient legal review to verify this and have a well founded legal basis to reach this conclusion, and undertake such further review as necessary to ensure continuing enforceability.

4. Proportional cover

41. Where the amount collateralised or guaranteed (or against which credit protection is held) is less than the amount of the exposure, and the secured and unsecured portions are of equal seniority, i.e. the bank and the guarantor share losses on a pro-rata basis, capital

relief will be afforded on a proportional basis, i.e. the protected portion of the exposure will receive the treatment applicable to the collateral or counterparty, with the remainder treated as unsecured.

B. Collateralised transactions

42. A collateralised transaction is one in which:

- banks have a credit exposure or potential credit exposure; and
- that credit exposure or potential credit exposure is hedged in whole or in part by collateral posted by the counterparty[269] or by a third party on behalf of the counterparty.

43. Under the simplified standardised approach, only the simple approach from the standardised approach will apply, which, similar to the 1988 Accord, substitutes the risk weighting of the collateral for the risk weighting of the counterparty for the collateralised portion of the exposure (generally subject to a 20% floor). Partial collateralisation is recognised. Mismatches in the maturity or currency of the underlying exposure and the collateral will not be allowed.

1. Minimum conditions

44. In addition to the general requirements for legal certainty set out in paragraph 40, the following operational requirements must be met.

45. The collateral must be pledged for at least the life of the exposure and it must be marked to market and revalued with a minimum frequency of six months.

46. In order for collateral to provide protection, the credit quality of the counterparty and the value of the collateral must not have a material positive correlation. For example, securities issued by the counterparty ─ or by any related group entity ─ would provide little protection and so would be ineligible.

47. The bank must have clear and robust procedures for the timely liquidation of collateral.

48. Where the collateral is held by a custodian, banks must take reasonable steps to ensure that the custodian segregates the collateral from its own assets.

49. Where a bank, acting as agent, arranges a repo-style transaction (i.e. repurchase/reverse repurchase and securities lending/borrowing transactions) between a customer and a third party and provides a guarantee to the customer that the third party will perform on its obligations, then the risk to the bank is the same as if the bank had entered into the transaction as principal. In such circumstances, banks will be required to calculate capital requirements as if they were themselves the principal.

[269] In this section "counterparty" is used to denote a party to whom a bank has an on- or off-balance sheet credit exposure or a potential credit exposure. That exposure may, for example, take the form of a loan of cash or securities (where the counterparty would traditionally be called the borrower), of securities posted as collateral, of a commitment or of exposure under an OTC derivative contract.

2. Eligible collateral

50. The following collateral instruments are eligible for recognition:

- Cash (as well as certificates of deposit or comparable instruments issued by the lending bank) on deposit with the bank which is incurring the counterparty exposure,[270, 271]
- Gold,
- Debt securities issued by sovereigns rated category 4 or above, [272] and
- Debt securities issued by PSE that are treated as sovereigns by the national supervisor and that are rated category 4 or above.[272]

3. Risk weights

51. Those portions of claims collateralised by the market value of recognised collateral receive the risk weight applicable to the collateral instrument. The risk weight on the collateralised portion will be subject to a floor of 20%. The remainder of the claim should be assigned to the risk weight appropriate to the counterparty. A capital requirement will be applied to banks on either side of the collateralised transaction: for example, both repos and reverse repos will be subject to capital requirements.

52. The 20% floor for the risk weight on a collateralised transaction will not be applied and a 0% risk weight can be provided where the exposure and the collateral are denominated in the same currency, and either:

- the collateral is cash on deposit; or
- the collateral is in the form of sovereign/PSE securities eligible for a 0% risk weight, and its market value has been discounted by 20%.

C. Guaranteed transactions

53. Where guarantees meet and supervisors are satisfied that banks fulfil the minimum operational conditions set out below, they may allow banks to take account of such credit protection in calculating capital requirements.

1. Minimum conditions

54. A guarantee (counter-guarantee) must represent a direct claim on the protection provider and must be explicitly referenced to specific exposures or a pool of exposures, so that the extent of the cover is clearly defined and incontrovertible. Other than non-payment by a protection purchaser of money due in respect of the credit protection contract it must be irrevocable; there must be no clause in the contract that would increase the effective cost of

---

[270] Cash funded credit linked notes issued by the bank against exposures in the banking book which fulfil the criteria for credit derivatives will be treated as cash collateralised transactions.

[271] When cash on deposit, certificates of deposit or comparable instruments issued by the lending bank are held as collateral at a third-party bank in a non-custodial arrangement, if they are openly pledged/assigned to the lending bank and if the pledge/assignment is unconditional and irrevocable, the exposure amount covered by the collateral (after any necessary haircuts for currency risk) will receive the risk weight of the third-party bank.

[272] The rating category refers to the ECA country risk score as described in paragraph 2.

cover as a result of deteriorating credit quality in the hedged exposure. It must also be unconditional; there should be no clause in the protection contract outside the control of the bank that could prevent the protection provider from being obliged to pay out in a timely manner in the event that the original counterparty fails to make the payment(s) due.

55. In addition to the legal certainty requirements in paragraph 40 above, the following conditions must be satisfied:

(a) On the qualifying default or non-payment of the counterparty, the bank may in a timely manner pursue the guarantor for any monies outstanding under the documentation governing the transaction. The guarantor may make one lump sum payment of all monies under such documentation to the bank, or the guarantor may assume the future payment obligations of the counterparty covered by the guarantee. The bank must have the right to receive any such payments from the guarantor without first having to take legal actions in order to pursue the counterparty for payment.

(b) The guarantee is an explicitly documented obligation assumed by the guarantor.

(c) Except as noted in the following sentence, the guarantee covers all types of payments the underlying obligor is expected to make under the documentation governing the transaction, for example notional amount, margin payments, etc. Where a guarantee covers payment of principal only, interests and other uncovered payments should be treated as an unsecured amount

2. Eligible guarantors (counter-guarantors)

56. Credit protection given by the following entities will be recognised: sovereign entities,[273] PSEs and other entities with a risk weight of 20% or better and a lower risk weight than the counterparty.

3. Risk weights

57. The protected portion is assigned the risk weight of the protection provider. The uncovered portion of the exposure is assigned the risk weight of the underlying counterparty.

58. As specified in paragraph 3, a lower risk weight may be applied at national discretion to a bank's exposure to the sovereign (or central bank) where the bank is incorporated and where the exposure is denominated in domestic currency and funded in that currency. National authorities may extend this treatment to portions of claims guaranteed by the sovereign (or central bank), where the guarantee is denominated in the domestic currency and the exposure is funded in that currency.

59. Materiality thresholds on payments below which no payment will be made in the event of loss are equivalent to retained first loss positions and must be deducted in full from the capital of the bank purchasing the credit protection.

---

[273] This includes the Bank for International Settlements, the International Monetary Fund, the European Central Bank and the European Community.

D. Other items related to the treatment of CRM techniques

Treatment of pools of CRM techniques

60. In the case where a bank has multiple CRM covering a single exposure (e.g. a bank has both collateral and guarantee partially covering an exposure), the bank will be required to subdivide the exposure into portions covered by each type of CRM tool (e.g. portion covered by collateral, portion covered by guarantee) and the risk-weighted assets of each portion must be calculated separately. When credit protection provided by a single protection provider has differing maturities, they must be subdivided into separate protection as well.

III. Credit risk — Securitisation framework

A. Scope of transactions covered under the securitisation framework

61. A traditional securitisation is a structure where the cash flow from an underlying pool of exposures is used to service at least two different stratified risk positions or tranches reflecting different degrees of credit risk. Payments to the investors depend upon the performance of the specified underlying exposures, as opposed to being derived from an obligation of the entity originating those exposures. The stratified/tranched structures that characterise securitisations differ from ordinary senior/subordinated debt instruments in that junior securitisation tranches can absorb losses without interrupting contractual payments to more senior tranches, whereas subordination in a senior/subordinated debt structure is a matter of priority of rights to the proceeds of a liquidation.

62. Banks' exposures to securitisation are referred to as "securitisation exposures".

B. Permissible role of banks

63. A bank operating under the simplified standardised approach can only assume the role of an investing bank in a traditional securitisation. An investing bank is an institution, other than the originator or the servicer that assumes the economic risk of a securitisation exposure.

64. A bank is considered to be an originator if it originates directly or indirectly credit exposures included in the securitisation. A servicer bank is one that manages the underlying credit exposures of a securitisation on a day-to-day basis in terms of collection of principal and interest, which is then forwarded to investors in securitisation exposures. A bank under the simplified standardised approach should not offer credit enhancement, liquidity facilities or other financial support to a securitisation.

C. Treatment of Securitisation Exposures

65. Banks using the simplified standardised approach to credit risk for the type of underlying exposure(s) securitised are permitted to use a simplified version of the standardised approach under the securitisation framework.

66. The standard risk weight for securitisation exposures for an investing bank will be 100%. For first loss positions acquired, deduction from capital will be required. The deduction will be taken 50% from Tier 1 and 50% from Tier 2 capital.

IV. Operational risk

67. The simplified standardised approach for operational risk is the Basic Indicator Approach under which banks must hold capital equal to a fixed percentage (15%) of average annual gross income, where positive, over the previous three years.

68. Gross income is defined as net interest income plus net non-interest income.[274] It is intended that this measure should: (i) be gross of any provisions (e.g. for unpaid interest); (ii) be gross of operating expenses, including fees paid to outsourcing service providers;[275] (iii) exclude realised profits/losses from the sale of securities in the banking book;[276] and (iv) exclude extraordinary or irregular items as well as income derived from insurance.

69. Banks using this approach are encouraged to comply with the Committee's guidance on *Sound Practices for the Management and Supervision of Operational Risk* (February 2003).

---

[274] As defined by national supervisors and/or national accounting standards.

[275] In contrast to fees paid for services that are outsourced, fees received by banks that provide outsourcing services shall be included in the definition of gross income.

[276] Realised profit/losses from securities classified as "held to maturity" and "available for sale", which typically constitute items of the banking book (e.g. under certain accounting standards), are also excluded from the definition of gross income.

Basel III: Finalising post-crisis reforms

December 2017

BANK FOR INTERNATIONAL SETTLEMENTS

This publication is available on the BIS website (www.bis.org).

ISBN 978-92-9259-022-2 (online)

Contents

Introduction

1. This document sets out the Basel Committee's finalisation of the Basel III framework. It complements the initial phase of Basel III reforms previously finalised by the Committee. The Basel III framework is a central element of the Basel Committee's response to the global financial crisis. It addresses a number of shortcomings with the pre-crisis regulatory framework and provides a regulatory foundation for a resilient banking system that supports the real economy.

2. A key objective of the revisions in this document is to reduce excessive variability of risk-weighted assets (RWAs). At the peak of the global financial crises, a wide range of stakeholders – including academics, analysts and market participants – lost faith in banks' reported risk-weighted capital ratios. The Committee's own empirical analyses highlighted a worrying degree of variability in the calculation of RWAs by banks.

3. A prudent and credible calculation of RWAs is an integral element of the risk-weighted capital framework. Banks' reported risk-weighted capital ratios should be sufficiently transparent and comparable to permit stakeholders to assess their risk profile. The Committee's strategic review of the regulatory framework highlighted a number of fault lines with the existing architecture, particularly the extent to which it adequately balances simplicity, comparability and risk sensitivity.

4. The revisions to the regulatory framework set out in this document will help restore credibility in the calculation of RWAs by: (i) enhancing the robustness and risk sensitivity of the standardised approaches for credit risk and operational risk, which will facilitate the comparability of banks' capital ratios; (ii) constraining the use of internally-modelled approaches; and (iii) complementing the risk-weighted capital ratio with a finalised leverage ratio and a revised and robust capital floor. An accompanying document summarises the main features of these revisions.[1]

5. In finalising these reforms, the Committee was guided by three overarching principles. First, the Committee is firmly committed to its mandate of strengthening the regulation, supervision and practices of banks worldwide, with the purpose of enhancing financial stability. A banking system that is resilient will be able to support the real economy and contribute positively to sustainable economic growth over the medium term.

6. Second, the Committee actively seeks the views of stakeholders when developing standards. For these reforms, the Committee conducted an extensive consultation process with a wide range of stakeholders. The Committee thanks all stakeholders for their constructive contributions during this process.

7. Third, the Committee conducted a comprehensive and rigorous assessment of the impact of these revisions on the banking system and the wider macro economy. As a result of this assessment, the Committee focused on not significantly increasing overall capital requirements.[2] This is reflected in the design, calibration and transitional arrangements discussed below. The Committee will continue to monitor and evaluate the effectiveness of these reforms in reducing excessive RWA variability.

8. While the revised framework will continue to permit the use of internally-modelled approaches for certain risk categories (subject to supervisory approval), a jurisdiction which does not implement some or all of the internal-modelled approaches but instead only implements the standardised approaches is compliant with the Basel framework. More generally, jurisdictions may elect to implement more

[1] The summary of the main features of the Basel III reforms is available at www.bis.org/bcbs/publ/d424_hlsummary.pdf.

[2] The quantitative impact study is available at www.bis.org/bcbs/publ/d426.htm.

conservative requirements and/or accelerated transitional arrangements, as the Basel framework constitutes minimum standards only.

Implementation dates and transitional arrangements

9. The Committee is introducing transitional arrangements to implement the new standards to ensure an orderly and timely implementation by jurisdictions and adjustment by banks. The main implementation dates are provided in the table below.

Revision	Implementation date
Revisions to standardised approach for credit risk	• 1 January 2022
Revisions to IRB framework	• 1 January 2022[3]
Revisions to CVA framework	• 1 January 2022
Revisions to operational risk framework	• 1 January 2022
Leverage ratio	• Existing exposure definition: 1 January 2018[4] • Revised exposure definition: 1 January 2022[5] • G-SIB buffer: 1 January 2022
Output floor	• 1 January 2022: 50% • 1 January 2023: 55% • 1 January 2024: 60% • 1 January 2025: 65% • 1 January 2026: 70% • 1 January 2027: 72.5%

[3] On implementation of the revisions to the risk-weighted framework outlined in this standard and the revised output floor, the 1.06 scaling factor that applies to the RWA amounts for credit risk under the IRB approach will no longer apply. More specifically, the references to the scaling factor in paragraphs 14 and 44 of the Basel II framework (June 2006), and paragraphs 49, 88, 90 and 91 of the revised securitisation framework (July 2016) will no longer apply.

[4] Based on the January 2014 definition of the leverage ratio exposure measure. Jurisdictions are free to apply the revised definition of the exposure measure at an earlier date than 1 January 2022.

[5] Based on the revised leverage ratio exposure measure set out in this document.

Standardised approach for credit risk

Introduction

1. The Committee permits banks to choose between two broad methodologies for calculating their risk-based capital requirements for credit risk. The first, the standardised approach, assigns standardised risk weights to exposures as described in paragraphs 4 to 97. To determine the risk weights in the standardised approach for certain exposure classes, in jurisdictions that allow the use of external ratings for regulatory purposes, banks may, as a starting point, use assessments by external credit assessment institutions that are recognised as eligible for capital purposes by national supervisors, in accordance with paragraphs 98 to 116. Under the standardised approach, exposures should be risk-weighted net of specific provisions (including partial write-offs).

2. The second risk-weighted capital treatment for measuring credit risk, the internal ratings-based (IRB) approach, allows banks to use their internal rating systems for credit risk, subject to the explicit approval of the bank's supervisor.

3. Securitisation exposures are addressed in the securitisation standard.[1] Credit equivalent amounts of OTC derivatives, exchange traded derivatives and long-settlement transactions that expose a bank to counterparty credit risk[2] are to be calculated under the counterparty credit risk standards.[3] Equity investments in funds and exposures to central counterparties must be treated according to their own specific frameworks.[4]

[1] The securitisation standard is available at www.bis.org/bcbs/publ/d374.pdf.

[2] Counterparty credit risk is defined as the risk that the counterparty to a transaction could default before the final settlement of the transaction's cash flows. An economic loss would occur if the transactions or portfolio of transactions with the counterparty has a positive economic value at the time of default. Unlike a firm's exposure to credit risk through a loan, where the exposure to credit risk is unilateral and only the lending bank faces the risk of loss, counterparty credit risk creates a bilateral risk of loss: the market value of the transaction can be positive or negative to either counterparty to the transaction. The market value is uncertain and can vary over time with the movement of underlying market factors.

[3] The counterparty credit risk standards are set out in Annex 4 of the Basel II framework (June 2006), amended to reflect the changes set out in: (i) *Basel III: A global regulatory framework for more resilient banks and banking systems (June 2011)*, available at www.bis.org/publ/bcbs189.pdf; (ii) *The standardised approach for measuring counterparty credit risk exposures (April 2014),* available at www.bis.org/publ/bcbs279.pdf; and (iii) *Capital requirements for bank exposures to central counterparties (April 2014)*, available at www.bis.org/publ/bcbs282.pdf.

[4] Standards on capital requirements for banks' equity investments in funds are available at www.bis.org/publ/bcbs266.pdf; and for capital requirements for bank exposures to central counterparties are set out in Section XI of the counterparty credit risk standards.

A. Individual exposures

Due diligence requirements

4. Consistent with the Committee's guidance on the assessment of credit risk[5] and paragraphs 733 to 735 of the Basel II framework (June 2006), banks must perform due diligence to ensure that they have an adequate understanding, at origination and thereafter on a regular basis (at least annually), of the risk profile and characteristics of their counterparties. In cases where ratings are used, due diligence is necessary to assess the risk of the exposure for risk management purposes and whether the risk weight applied is appropriate and prudent.[6] The sophistication of the due diligence should be appropriate to the size and complexity of banks' activities. Banks must take reasonable and adequate steps to assess the operating and financial performance levels and trends through internal credit analysis and/or other analytics outsourced to a third party, as appropriate for each counterparty. Banks must be able to access information about their counterparties on a regular basis to complete due diligence analyses.

5. For exposures to entities belonging to consolidated groups, due diligence should, to the extent possible, be performed at the solo entity level to which there is a credit exposure. In evaluating the repayment capacity of the solo entity, banks are expected to take into account the support of the group and the potential for it to be adversely impacted by problems in the group.

6. Banks should have in place effective internal policies, processes, systems and controls to ensure that the appropriate risk weights are assigned to counterparties. Banks must be able to demonstrate to their supervisors that their due diligence analyses are appropriate. As part of their supervisory review, supervisors should ensure that banks have appropriately performed their due diligence analyses, and should take supervisory measures where these have not been done.

1. Exposures to sovereigns

(Treatment unchanged from the Basel II framework (June 2006))

7. Exposures to sovereigns and their central banks will be risk-weighted as follows:

Risk weight table for sovereigns and central banks — Table 1

External rating	AAA to AA–	A+ to A–	BBB+ to BBB–	BB+ to B–	Below B–	Unrated
Risk weight	0%	20%	50%	100%	150%	100%

5 Basel Committee on Banking Supervision, *Guidance on credit risk and accounting for expected credit losses*, December 2015, available at www.bis.org/bcbs/publ/d350.pdf.

6 The due diligence requirements do not apply to the exposures set out in paragraphs 7 to 12.

8. At national discretion, a lower risk weight may be applied to banks' exposures to their sovereign (or central bank) of incorporation denominated in domestic currency and funded[7] in that currency.[8] Where this discretion is exercised, other national supervisors may also permit their banks to apply the same risk weight to domestic currency exposures to this sovereign (or central bank) funded in that currency.

9. For the purpose of risk-weighting exposures to sovereigns, supervisors may recognise the country risk scores assigned by Export Credit Agencies (ECAs). To qualify, an ECA must publish its risk scores and subscribe to the OECD-agreed methodology. Banks may choose to use the risk scores published by individual ECAs that are recognised by their supervisor, or the consensus risk scores of ECAs participating in the "Arrangement on Officially Supported Export Credits".[9] The OECD-agreed methodology establishes eight risk score categories associated with minimum export insurance premiums. These ECA risk scores will correspond to risk weight categories as detailed below.

Risk weight table for sovereigns and central banks

Table 2

ECA risk scores	0 to 1	2	3	4 to 6	7
Risk weight	0%	20%	50%	100%	150%

10. Exposures to the Bank for International Settlements, the International Monetary Fund, the European Central Bank, the European Union, the European Stability Mechanism (ESM) and the European Financial Stability Facility (EFSF) may receive a 0% risk weight.

2. Exposures to non-central government public sector entities (PSEs)

(Treatment unchanged from the Basel II framework (June 2006), only minor editorial changes have been made to remove reference to current options for banks.)

11. Exposures to domestic PSEs will be risk-weighted at national discretion, according to either of the following two options.

Risk weight table for PSEs

Option 1: Based on external rating of sovereign

Table 3

External rating of the sovereign	AAA to AA–	A+ to A–	BBB+ to BBB–	BB+ to B–	Below B–	Unrated
Risk weight under Option 1	20%	50%	100%	100%	150%	100%

[7] This is to say that the bank would also have corresponding liabilities denominated in the domestic currency.

[8] This lower risk weight may be extended to the risk-weighting of collateral and guarantees under the CRM framework.

[9] The consensus country risk classification is available on the OECD's website (www.oecd.org) in the Export Credit Arrangement webpage of the Trade Directorate.

Risk weight table for PSEs

Option 2: Based on external rating of PSE — Table 4

External rating of the PSE	AAA to AA–	A+ to A–	BBB+ to BBB–	BB+ to B–	Below B–	Unrated
Risk weight under Option 2	20%	50%	50%	100%	150%	50%

12. Subject to national discretion, exposures to certain domestic PSEs[10] may also be treated as exposures to the sovereigns in whose jurisdictions the PSEs are established. Where this discretion is exercised, other national supervisors may allow their banks to risk-weight exposures to such PSEs in the same manner.

3. Exposures to multilateral development banks (MDBs)

13. For the purposes of calculating capital requirements, a Multilateral Development Bank (MDB) is an institution, created by a group of countries that provides financing and professional advice for economic and social development projects. MDBs have large sovereign memberships and may include both developed countries and/or developing countries. Each MDB has its own independent legal and operational status, but with a similar mandate and a considerable number of joint owners.

14. A 0% risk weight will be applied to exposures to MDBs that fulfil to the Committee's satisfaction the eligibility criteria provided below.[11] The Committee will continue to evaluate eligibility on a case-by-case basis. The eligibility criteria for MDBs risk-weighted at 0% are:

(i) very high-quality long-term issuer ratings, ie a majority of an MDB's external ratings must be AAA;[12]

[10] The following examples outline how PSEs might be categorised when focusing on one specific feature, namely revenue-raising powers. However, there may be other ways of determining the different treatments applicable to different types of PSEs, for instance by focusing on the extent of guarantees provided by the central government:

- Regional governments and local authorities could qualify for the same treatment as claims on their sovereign or central government if these governments and local authorities have specific revenue-raising powers and have specific institutional arrangements the effect of which is to reduce their risk of default.
- Administrative bodies responsible to central governments, regional governments or to local authorities and other non-commercial undertakings owned by the governments or local authorities may not warrant the same treatment as claims on their sovereign if the entities do not have revenue-raising powers or other arrangements as described above. If strict lending rules apply to these entities and a declaration of bankruptcy is not possible because of their special public status, it may be appropriate to treat these claims according to Option 1 or 2 for PSEs.
- Commercial undertakings owned by central governments, regional governments or by local authorities may be treated as normal commercial enterprises. However, if these entities function as a corporate in competitive markets even though the state, a regional authority or a local authority is the major shareholder of these entities, supervisors should decide to consider them as corporates and therefore attach to them the applicable risk weights.

[11] MDBs currently eligible for a 0% risk weight are: the World Bank Group comprising the International Bank for Reconstruction and Development (IBRD), the International Finance Corporation (IFC), the Multilateral Investment Guarantee Agency (MIGA) and the International Development Association (IDA), the Asian Development Bank (ADB), the African Development Bank (AfDB), the European Bank for Reconstruction and Development (EBRD), the Inter-American Development Bank (IADB), the European Investment Bank (EIB), the European Investment Fund (EIF), the Nordic Investment Bank (NIB), the Caribbean Development Bank (CDB), the Islamic Development Bank (IDB), the Council of Europe Development Bank (CEDB), the International Finance Facility for Immunization (IFFIm), and the Asian Infrastructure Investment Bank (AIIB).

[12] MDBs that request to be added to the list of MDBs eligible for a 0% risk weight must comply with the AAA rating criterion at the time of the application. Once included in the list of eligible MDBs, the rating may be downgraded, but in no case lower than AA–. Otherwise, exposures to such MDBs will be subject to the treatment set out in paragraph 15.

(ii) either the shareholder structure comprises a significant proportion of sovereigns with long-term issuer external ratings of AA– or better, or the majority of the MDB's fund-raising is in the form of paid-in equity/capital and there is little or no leverage;

(iii) strong shareholder support demonstrated by the amount of paid-in capital contributed by the shareholders; the amount of further capital the MDBs have the right to call, if required, to repay their liabilities; and continued capital contributions and new pledges from sovereign shareholders;

(iv) adequate level of capital and liquidity (a case-by-case approach is necessary in order to assess whether each MDB's capital and liquidity are adequate); and,

(v) strict statutory lending requirements and conservative financial policies, which would include among other conditions a structured approval process, internal creditworthiness and risk concentration limits (per country, sector, and individual exposure and credit category), large exposures approval by the board or a committee of the board, fixed repayment schedules, effective monitoring of use of proceeds, status review process, and rigorous assessment of risk and provisioning to loan loss reserve.

15. For exposures to all other MDBs, banks incorporated in jurisdictions that allow the use of external ratings for regulatory purposes will assign to their MDB exposures the corresponding "base" risk weights determined by the external ratings according to Table 5. Banks incorporated in jurisdictions that do not allow external ratings for regulatory purposes will risk-weight such exposures at 50%.

Risk weight table for MDB exposures — Table 5

External rating of counterparty	AAA to AA–	A+ to A–	BBB+ to BBB–	BB+ to B–	Below B–	Unrated
"Base" risk weight	20%	30%	50%	100%	150%	50%

4. Exposures to banks

16. For the purposes of calculating capital requirements, a bank exposure is defined as a claim (including loans and senior debt instruments, unless considered as subordinated debt for the purposes of paragraph 53) on any financial institution that is licensed to take deposits from the public and is subject to appropriate prudential standards and level of supervision.[13] The treatment associated with subordinated bank debt and equities is addressed in paragraphs 49 to 53.

Risk weight determination

17. Bank exposures will be risk-weighted based on the following hierarchy:[14]

[13] For internationally active banks, appropriate prudential standards (eg capital and liquidity requirements) and level of supervision should be in accordance with the Basel framework. For domestic banks, appropriate prudential standards are determined by the national supervisors but should include at least a minimum regulatory capital requirement.

[14] With the exception of exposures giving rise to Common Equity Tier 1, Additional Tier 1 and Tier 2 items, national supervisors may allow banks belonging to the same institutional protection scheme (such as mutual, cooperatives or savings institutions)

(a) External Credit Risk Assessment Approach (ECRA): This approach is for banks incorporated in jurisdictions that allow the use of external ratings for regulatory purposes. It applies to all their exposures to banks that are rated. Banks will apply paragraphs 98 to 116 to determine which rating can be used and for which exposures.

(b) Standardised Credit Risk Assessment Approach (SCRA): This approach is for all exposures of banks incorporated in jurisdictions that do not allow the use of external ratings for regulatory purposes. For exposures to banks that are unrated, this approach also applies to banks incorporated in jurisdictions that allow the use of external ratings for regulatory purposes.

(a) External Credit Risk Assessment Approach (ECRA)

18. Banks incorporated in jurisdictions that allow the use of external ratings for regulatory purposes will assign to their rated bank exposures[15] the corresponding "base" risk weights determined by the external ratings according to Table 6. Such ratings must not incorporate assumptions of implicit government support, unless the rating refers to a public bank owned by its government.[16] Banks incorporated in jurisdictions that allow the use of external ratings for regulatory purposes must only apply SCRA for their unrated bank exposures, in accordance with paragraph 21.

Risk weight table for bank exposures

External Credit Risk Assessment Approach — Table 6

External rating of counterparty	AAA to AA–	A+ to A–	BBB+ to BBB–	BB+ to B–	Below B–
"Base" risk weight	20%	30%	50%	100%	150%
Risk weight for short-term exposures	20%	20%	20%	50%	150%

19. Exposures to banks with an original maturity of three months or less, as well as exposures to banks that arise from the movement of goods across national borders with an original maturity of six months or less[17] can be assigned a risk weight that correspond to the risk weights for short term exposures in Table 6.

in their jurisdictions to apply a lower risk weight than that indicated by the ECRA and SCRA to their intra-group or in-network exposures provided that both counterparties to the exposures are members of the same effective institutional protection scheme that is a contractual or statutory arrangement set up to protect those institutions and seeks to ensure their liquidity and solvency to avoid bankruptcy.

15 An exposure is rated from the perspective of a bank if the exposure is rated by a recognised "eligible credit assessment institution" (ECAI) which has been nominated by the bank (ie the bank has informed its supervisor of its intention to use the ratings of such ECAI for regulatory purposes in a consistent manner (paragraphs 103). In other words, if an external rating exists but the credit rating agency is not a recognised ECAI by the national supervisor, or the rating has been issued by an ECAI which has not been nominated by the bank, the exposure would be considered as being unrated from the perspective of the bank.

16 Implicit government support refers to the notion that the government would act to prevent bank creditors from incurring losses in the event of a bank default or bank distress. National supervisors may continue to allow banks to use external ratings which incorporate assumptions of implicit government support for up to a period of five years, from the date of implementation of this standard, when assigning the "base" risk weights in Table 6 to their bank exposures.

17 This may include on-balance sheet exposures such as loans and off-balance sheet exposures such as self-liquidating trade-related contingent items.

20. Banks must perform due diligence to ensure that the external ratings appropriately and conservatively reflect the creditworthiness of the bank counterparties. If the due diligence analysis reflects higher risk characteristics than that implied by the external rating bucket of the exposure (ie AAA to AA–; A+ to A– etc), the bank must assign a risk weight at least one bucket higher than the "base" risk weight determined by the external rating. Due diligence analysis must never result in the application of a lower risk weight than that determined by the external rating.

(b) Standardised Credit Risk Assessment Approach (SCRA)

21. Banks incorporated in jurisdictions that do not allow the use of external ratings for regulatory purposes will apply the SCRA to all their bank exposures. The SCRA also applies to unrated bank exposures for banks incorporated in jurisdictions that allow the use of external ratings for regulatory purposes. The SCRA requires bank to classify bank exposures into one of three risk-weight buckets (ie Grades A, B and C) and assign the corresponding risk weights in Table 7. For the purposes of the SCRA only, "published minimum regulatory requirements" in paragraphs 22 to 29 excludes liquidity standards.

Risk weight table for bank exposures

Standardised Credit Risk Assessment Approach Table 7

Credit risk assessment of counterparty	Grade A	Grade B	Grade C
"Base" risk weight	40%[18]	75%	150%
Risk weight for short-term exposures	20%	50%	150%

Grade A

22. Grade A refers to exposures to banks, where the counterparty bank has adequate capacity to meet their financial commitments (including repayments of principal and interest) in a timely manner, for the projected life of the assets or exposures and irrespective of the economic cycles and business conditions.

23. A counterparty bank classified into Grade A must meet or exceed the published minimum regulatory requirements and buffers established by its national supervisor as implemented in the jurisdiction where it is incorporated, except for bank-specific minimum regulatory requirements or buffers that may be imposed through supervisory actions (eg via Pillar 2) and not made public. If such minimum regulatory requirements and buffers (other than bank-specific minimum requirements or buffers) are not publicly disclosed or otherwise made available by the counterparty bank then the counterparty bank must be assessed as Grade B or lower.

24. If as part of its due diligence, a bank assesses that a counterparty bank does not meet the definition of Grade A in paragraphs 22 and 23, exposures to the counterparty bank must be classified as Grade B or Grade C.

Grade B

25. Grade B refers to exposures to banks, where the counterparty bank is subject to substantial credit risk, such as repayment capacities that are dependent on stable or favourable economic or business conditions.

26. A counterparty bank classified into Grade B must meet or exceed the published minimum regulatory requirements (excluding buffers) established by its national supervisor as implemented in the

[18] Under the Standardised Credit Risk Assessment Approach, exposures to banks without an external credit rating may receive a risk weight of 30%, provided that the counterparty bank has a CET1 ratio which meets or exceeds 14% and a Tier 1 leverage ratio which meets or exceeds 5%. The counterparty bank must also satisfy all the requirements for Grade A classification.

jurisdiction where it is incorporated, except for bank-specific minimum regulatory requirements that may be imposed through supervisory actions (eg via Pillar 2) and not made public. If such minimum regulatory requirements are not publicly disclosed or otherwise made available by the counterparty bank then the counterparty bank must be assessed as Grade C.

27. Banks will classify all exposures that do not meet the requirements outlined in paragraphs 22 and 23 into Grade B, unless the exposure falls within Grade C under paragraphs 28 and 29.

Grade C

28. Grade C refers to higher credit risk exposures to banks, where the counterparty bank has material default risks and limited margins of safety. For these counterparties, adverse business, financial, or economic conditions are very likely to lead, or have led, to an inability to meet their financial commitments.

29. At a minimum, if any of the following triggers is breached, a bank must classify the exposure into Grade C:

- The counterparty bank does not meet the criteria for being classifed as Grade B with respect to its published minimum regulatory requirements, as set out in paragraphs 25 and 26; or
- Where audited financial statements are required, the external auditor has issued an adverse audit opinion or has expressed substantial doubt about the counterparty bank's ability to continue as a going concern in its financial statements or audited reports within the previous 12 months.

Even if these triggers are not breached, a bank may assess that the counterparty bank meets the definition in paragraph 28. In that case, the exposure to such counterparty bank must be classified into Grade C.

30. Exposures to banks with an original maturity of three months or less, as well as exposures to banks that arise from the movement of goods across national borders with an original maturity of six months or less,[19] can be assigned a risk weight that correspond to the risk weights for short term exposures in Table 7.

31. To reflect transfer and convertibility risk under the SCRA, a risk-weight floor based on the risk weight applicable to exposures to the sovereign of the country where the bank counterparty is incorporated will be applied to the risk weight assigned to bank exposures. The sovereign floor applies when the exposure is not in the local currency of the jurisdiction of incorporation of the debtor bank and for a borrowing booked in a branch of the debtor bank in a foreign jurisdiction, when the exposure is not in the local currency of the jurisdiction in which the branch operates. The sovereign floor will not apply to short-term (ie with a maturity below one year) self-liquidating, trade-related contingent items that arise from the movement of goods.[20]

5. Exposures to covered bonds

32. Covered bonds are bonds issued by a bank or mortgage institution that are subject by law to special public supervision designed to protect bond holders. Proceeds deriving from the issue of these bonds must be invested in conformity with the law in assets which, during the whole period of the validity of the bonds, are capable of covering claims attached to the bonds and which, in the event of the failure of the issuer, would be used on a priority basis for the reimbursement of the principal and payment of the accrued interest.

[19] This may include on-balance sheet exposures such as loans and off-balance sheet exposures such as self-liquidating trade-related contingent items.

[20] Basel Committee on Banking Supervision, *Treatment of trade finance under the Basel capital framework*, October 2011, available at http://www.bis.org/publ/bcbs205.pdf.

Eligible assets

33. In order to be eligible for the risk weights set out in paragraph 35, the underlying assets (the cover pool) of covered bonds as defined in paragraph 32 shall meet the requirements set out in paragraph 34 and shall include any of the following:

- claims on, or guaranteed by, sovereigns, their central banks, public sector entities or multilateral development banks;
- claims secured by residential real estate that meet the criteria set out in paragraph 60 and with a loan-to-value ratio of 80% or lower;
- claims secured by commercial real estate that meets the criteria set out in paragraph 60 and with a loan-to-value ratio of 60% or lower; or
- claims on, or guaranteed by banks that qualify for a 30% or lower risk weight. However, such assets cannot exceed 15% of covered bond issuances.

The nominal value of the pool of assets assigned to the covered bond instrument(s) by its issuer should exceed its nominal outstanding value by at least 10%. The value of the pool of assets for this purpose does not need to be that required by the legislative framework. However, if the legislative framework does not stipulate a requirement of at least 10%, the issuing bank needs to publicly disclose on a regular basis that their cover pool meets the 10% requirement in practice. In addition to the primary assets listed in this paragraph, additional collateral may include substitution assets (cash or short term liquid and secure assets held in substitution of the primary assets to top up the cover pool for management purposes) and derivatives entered into for the purposes of hedging the risks arising in the covered bond program.

The conditions set out in this paragraph must be satisfied at the inception of the covered bond and throughout its remaining maturity.

Disclosure requirements

34. Exposures in the form of covered bonds are eligible for the treatment set out in paragraph 35, provided that the bank investing in the covered bonds can demonstrate to its national supervisors that:

(a) it receives portfolio information at least on: (i) the value of the cover pool and outstanding covered bonds; (ii) the geographical distribution and type of cover assets, loan size, interest rate and currency risks; (iii) the maturity structure of cover assets and covered bonds; and (iv) the percentage of loans more than 90 days past due;

(b) the issuer makes the information referred to in point (a) available to the bank at least semi-annually.

35. Covered bonds that meet the criteria set out in the paragraphs 33 and 34 shall be risk-weighted based on the issue-specific rating or the issuer's risk weight according to the rules outlined in paragraphs 98 to 116. For covered bonds with issue-specific ratings,[21] the risk weight shall be determined according to Table 8. For unrated covered bonds, the risk weight would be inferred from the issuer's ECRA or SCRA risk weight according to Table 9.

[21] An exposure is rated from the perspective of a bank if the exposure is rated by a recognised "eligible credit assessment institution" (ECAI) which has been nominated by the bank (ie the bank has informed its supervisor of its intention to use the ratings of such ECAI for regulatory purposes in a consistent manner (see paragraphs 103). In other words, if an external rating exists but the credit rating agency is not a recognised ECAI by the national supervisor, or the rating has been issued by an ECAI which has not been nominated by the bank, the exposure would be considered as being unrated from the perspective of the bank.

Risk weight table for rated covered bond exposures					Table 8
Issue-specific rating of the covered bond	AAA to AA–	A+ to A–	BBB+ to BBB–	BB+ to B–	Below B–
"Base" risk weight	10%	20%	20%	50%	100%

Risk weight table for unrated covered bond exposures							Table 9
Risk weight of the issuing bank	20%	30%	40%	50%	75%	100%	150%
"Base" risk weight	10%	15%	20%	25%	35%	50%	100%

36. Banks must perform due diligence to ensure that the external ratings appropriately and conservatively reflect the creditworthiness of the covered bond and the issuing bank. If the due diligence analysis reflects higher risk characteristics than that implied by the external rating bucket of the exposure (ie AAA to AA–; A+ to A– etc), the bank must assign a risk weight at least one bucket higher than the "base" risk weight determined by the external rating. Due diligence analysis must never result in the application of a lower risk weight than that determined by the external rating.

6. Exposures to securities firms and other financial institutions

37. Exposures to securities firms and other financial institutions will be treated as exposures to banks provided that these firms are subject to prudential standards and a level of supervision equivalent to those applied to banks (including capital and liquidity requirements). National supervisors should determine whether the regulatory and supervisory framework governing securities firms and other financial institutions in their own jurisdictions is equivalent to that which is applied to banks in their own jurisdictions. Where the regulatory and supervisory framework governing securities firms and other financial institutions is determined to be equivalent to that applied to banks in a jurisdiction, other national supervisors may allow their banks to risk weight such exposures to securities firms and other financial institutions as exposures to banks. Exposures to all other securities firms and financial institutions will be treated as exposures to corporates.

7. Exposures to corporates

38. For the purposes of calculating capital requirements, exposures to corporates include exposures (loans, bonds, receivables, etc) to incorporated entities, associations, partnerships, proprietorships, trusts, funds and other entities with similar characteristics, except those which qualify for one of the other exposure classes. The treatment associated with subordinated debt and equities of these counterparties is addressed in paragraphs 49 to 53. The corporate exposure class includes exposures to insurance companies and other financial corporates that do not meet the definitions of exposures to banks, or securities firms and other financial institutions, as determined in paragraphs 16 and 37 respectively. The corporate exposure class does not include exposures to individuals. The corporate exposure class differentiates between the following subcategories:

(i) General corporate exposures;

(ii) Specialised lending exposures, as defined in paragraph 44.

7.1 General corporate exposures

Risk weight determination

39. For corporate exposures of banks incorporated in jurisdictions that allow the use of external ratings for regulatory purposes, banks will assign "base" risk weights according to Table 10.[22] Banks must perform due diligence to ensure that the external ratings appropriately and conservatively reflect the creditworthiness of the counterparties. Banks which have assigned risk weights to their rated bank exposures based on paragraph 18 must assign risk weights for all their corporate exposures according to Table 10. If the due diligence analysis reflects higher risk characteristics than that implied by the external rating bucket of the exposure (ie AAA to AA–; A+ to A– etc), the bank must assign a risk weight at least one bucket higher than the "base" risk weight determined by the external rating. Due diligence analysis must never result in the application of a lower risk weight than that determined by the external rating.

40. Unrated corporate exposures of banks incorporated in jurisdictions that allow the use of external ratings for regulatory purposes will receive a 100% risk weight, with the exception of unrated exposures to corporate small and medium entities (SMEs), as described in paragraph 43.

Risk weight table for corporate exposures

Jurisdictions that use external ratings for regulatory purposes — Table 10

External rating of counterparty	AAA to AA–	A+ to A–	BBB+ to BBB–	BB+ to BB–	Below BB–	Unrated
"Base" risk weight	20%	50%	75%	100%	150%	100%

41. For corporate exposures of banks incorporated in jurisdictions that do not allow the use of external ratings for regulatory purposes, banks will assign a 100% risk weight to all corporate exposures, with the exception of:

- exposures to corporates identified as "investment grade" in paragraph 42; and
- exposures to corporate SMEs in paragraph 43.

Banks must apply the treatment set out in this paragraph to their corporate exposures if they have assigned risk weights to their rated bank exposures based on paragraph 21.

42. Banks in jurisdictions that do not allow the use of external ratings for regulatory purposes may assign a 65% risk weight to exposures to "investment grade" corporates. An "investment grade" corporate is a corporate entity that has adequate capacity to meet its financial commitments in a timely manner and its ability to do so is assessed to be robust against adverse changes in the economic cycle and business conditions. When making this determination, the bank should assess the corporate entity against the investment grade definition taking into account the complexity of its business model, performance against industry and peers, and risks posed by the entity's operating environment. Moreover, the corporate entity (or its parent company) must have securities outstanding on a recognised securities exchange.

43. For unrated exposures to corporate SMEs (defined as corporate exposures where the reported annual sales for the consolidated group of which the corporate counterparty is a part is less than or equal to €50 million for the most recent financial year), an 85% risk weight will be applied. Exposures to SMEs that meet the criteria in paragraph 55 will be treated as regulatory retail SME exposures and risk weighted at 75%.

[22] An exposure is rated from the perspective of a bank if the exposure is rated by a recognised "eligible credit assessment institution" (ECAI) which has been nominated by the bank (ie the bank has informed its supervisor of its intention to use the ratings of such ECAI for regulatory purposes in a consistent manner (paragraphs 103). In other words, if an external rating exists but the credit rating agency is not a recognised ECAI by the national supervisor, or the rating has been issued by an ECAI which has not been nominated by the bank, the exposure would be considered as being unrated from the perspective of the bank.

7.2 Specialised lending

44. A corporate exposure will be treated as a specialised lending exposure if such lending possesses some or all of the following characteristics, either in legal form or economic substance:

- The exposure is not related to real estate and is within the definitions of object finance, project finance or commodities finance under paragraph 45. If the activity is related to real estate, the treatment would be determined in accordance with paragraphs 59 to 75;
- The exposure is typically to an entity (often a special purpose vehicle (SPV)) that was created specifically to finance and/or operate physical assets;
- The borrowing entity has few or no other material assets or activities, and therefore little or no independent capacity to repay the obligation, apart from the income that it receives from the asset(s) being financed. The primary source of repayment of the obligation is the income generated by the asset(s), rather than the independent capacity of the borrowing entity; and
- The terms of the obligation give the lender a substantial degree of control over the asset(s) and the income that it generates.

45. Exposures described in paragraph 44 will be classified in one of the following three subcategories of specialised lending:

(i) Project finance refers to the method of funding in which the lender looks primarily to the revenues generated by a single project, both as the source of repayment and as security for the loan. This type of financing is usually for large, complex and expensive installations such as power plants, chemical processing plants, mines, transportation infrastructure, environment, media, and telecoms. Project finance may take the form of financing the construction of a new capital installation, or refinancing of an existing installation, with or without improvements.

(ii) Object finance refers to the method of funding the acquisition of equipment (eg ships, aircraft, satellites, railcars, and fleets) where the repayment of the loan is dependent on the cash flows generated by the specific assets that have been financed and pledged or assigned to the lender.

(iii) Commodities finance refers to short-term lending to finance reserves, inventories, or receivables of exchange-traded commodities (eg crude oil, metals, or crops), where the loan will be repaid from the proceeds of the sale of the commodity and the borrower has no independent capacity to repay the loan.

46. Banks incorporated in jurisdictions that allow the use of external ratings for regulatory purposes will assign to their specialised lending exposures the risk weights determined by the *issue-specific* external ratings, if these are available, according to Table 10. Issuer ratings must not be used (ie paragraph 107 does not apply in the case of specialised lending exposures).

47. For specialised lending exposures for which an issue-specific external rating is not available, and for all specialised lending exposures of banks incorporated in jurisdictions that do not allow the use of external ratings for regulatory purposes, the following risk weights will apply:

- Object and commodities finance exposures will be risk-weighted at 100%;
- Project finance exposures will be risk-weighted at 130% during the pre-operational phase and 100% during the operational phase. Project finance exposures in the operational phase which are deemed to be high quality, as described in paragraph 48, will be risk weighted at 80%. For this purpose, operational phase is defined as the phase in which the entity that was specifically created to finance the project has (i) a positive net cash flow that is sufficient to cover any remaining contractual obligation, and (ii) declining long term debt.

48. A high quality project finance exposure refers to an exposure to a project finance entity that is able to meet its financial commitments in a timely manner and its ability to do so is assessed to be robust

against adverse changes in the economic cycle and business conditions. The following conditions must also be met:

- The project finance entity is restricted from acting to the detriment of the creditors (eg by not being able to issue additional debt without the consent of existing creditors);
- The project finance entity has sufficient reserve funds or other financial arrangements to cover the contingency funding and working capital requirements of the project;
- The revenues are availability-based[23] or subject to a rate-of-return regulation or take-or-pay contract;
- The project finance entity's revenue depends on one main counterparty and this main counterparty shall be a central government, PSE or a corporate entity with a risk weight of 80% or lower;
- The contractual provisions governing the exposure to the project finance entity provide for a high degree of protection for creditors in case of a default of the project finance entity;
- The main counterparty or other counterparties which similarly comply with the eligibility criteria for the main counterparty will protect the creditors from the losses resulting from a termination of the project;
- All assets and contracts necessary to operate the project have been pledged to the creditors to the extent permitted by applicable law; and
- Creditors may assume control of the project finance entity in case of its default.

8. Subordinated debt, equity and other capital instruments

49. The treatment described in paragraphs 50 to 53 applies to subordinated debt, equity and other regulatory capital instruments issued by either corporates or banks, provided that such instruments are not deducted from regulatory capital or risk-weighted at 250% according to paragraphs 87 to 90 of the Basel III framework (June 2011). Equity exposures are defined on the basis of the economic substance of the instrument. They include both direct and indirect ownership interests,[24] whether voting or non-voting, in the assets and income of a commercial enterprise or of a financial institution that is not consolidated or deducted. An instrument is considered to be an equity exposure if it meets all of the following requirements:

- It is irredeemable in the sense that the return of invested funds can be achieved only by the sale of the investment or sale of the rights to the investment or by the liquidation of the issuer;
- It does not embody an obligation on the part of the issuer; and
- It conveys a residual claim on the assets or income of the issuer.

Additionally any of the following instruments must be categorised as an equity exposure:

[23] Availability-based revenues mean that once construction is completed, the project finance entity is entitled to payments from its contractual counterparties (eg the government), as long as contract conditions are fulfilled. Availability payments are sized to cover operating and maintenance costs, debt service costs and equity returns as the project finance entity operates the project. Availability payments are not subject to swings in demand, such as traffic levels, and are adjusted typically only for lack of performance or lack of availability of the asset to the public.

[24] Indirect equity interests include holdings of derivative instruments tied to equity interests, and holdings in corporations, partnerships, limited liability companies or other types of enterprises that issue ownership interests and are engaged principally in the business of investing in equity instruments.

- An instrument with the same structure as those permitted as Tier 1 capital for banking organisations.
- An instrument that embodies an obligation on the part of the issuer and meets any of the following conditions:
  1) The issuer may defer indefinitely the settlement of the obligation;
  2) The obligation requires (or permits at the issuer's discretion) settlement by issuance of a fixed number of the issuer's equity shares;
  3) The obligation requires (or permits at the issuer's discretion) settlement by issuance of a variable number of the issuer's equity shares and (ceteris paribus) any change in the value of the obligation is attributable to, comparable to, and in the same direction as, the change in the value of a fixed number of the issuer's equity shares;[25] or,
  4) The holder has the option to require that the obligation be settled in equity shares, unless either (i) in the case of a traded instrument, the supervisor is content that the bank has demonstrated that the instrument trades more like the debt of the issuer than like its equity, or (ii) in the case of non-traded instruments, the supervisor is content that the bank has demonstrated that the instrument should be treated as a debt position. In cases (i) and (ii), the bank may decompose the risks for regulatory purposes, with the consent of the supervisor.

Debt obligations and other securities, partnerships, derivatives or other vehicles structured with the intent of conveying the economic substance of equity ownership are considered an equity holding.[26] This includes liabilities from which the return is linked to that of equities.[27] Conversely, equity investments that are structured with the intent of conveying the economic substance of debt holdings or securitisation exposures would not be considered an equity holding.[28]

[25] For certain obligations that require or permit settlement by issuance of a variable number of the issuer's equity shares, the change in the monetary value of the obligation is equal to the change in the fair value of a fixed number of equity shares multiplied by a specified factor. Those obligations meet the conditions of item 3 if both the factor and the referenced number of shares are fixed. For example, an issuer may be required to settle an obligation by issuing shares with a value equal to three times the appreciation in the fair value of 1,000 equity shares. That obligation is considered to be the same as an obligation that requires settlement by issuance of shares equal to the appreciation in the fair value of 3,000 equity shares.

[26] Equities that are recorded as a loan but arise from a debt/equity swap made as part of the orderly realisation or restructuring of the debt are included in the definition of equity holdings. However, these instruments may not attract a lower capital charge than would apply if the holdings remained in the debt portfolio.

[27] Supervisors may decide not to require that such liabilities be included where they are directly hedged by an equity holding, such that the net position does not involve material risk.

[28] The national supervisor has the discretion to re-characterise debt holdings as equites for regulatory purposes and to otherwise ensure the proper treatment of holdings under Pillar 2.

50. Banks will assign a risk weight of 400% to speculative unlisted equity exposures described in paragraph 51 and a risk weight of 250% to all other equity holdings, with the exception of those equity holdings referred to in paragraph 52.[29]

51. Speculative unlisted equity exposures are defined as equity investments in unlisted companies that are invested for short-term resale purposes or are considered venture capital or similar investments which are subject to price volatility and are acquired in anticipation of significant future capital gains.[30]

52. National supervisors may allow banks to assign a risk weight of 100% to equity holdings made pursuant to national legislated programmes that provide significant subsidies for the investment to the bank and involve government oversight and restrictions on the equity investments. Such treatment can only be accorded to equity holdings up to an aggregate of 10% of the bank's combined Tier 1 and Tier 2 capital. Example of restrictions are limitations on the size and types of businesses in which the bank is investing, allowable amounts of ownership interests, geographical location and other pertinent factors that limit the potential risk of the investment to the bank.

53. Banks will assign a risk weight of 150% to subordinated debt and capital instruments other than equities. Any liabilities that meet the definition of "other TLAC liabilities" in paragraphs 66b and 66c of the amended version of Basel III set out in the TLAC holdings standard (October 2016) and that are not deducted from regulatory capital are considered to be subordinated debt for the purposes of this paragraph.

9. Retail exposures

54. Retail exposures are exposures to an individual person or persons, or to regulatory retail SMEs.[31] Retail exposures secured by real estate will be treated according to paragraphs 59 to 75. All other retail exposures will be treated as outlined in paragraphs 55 to 58.

55. Retail exposures that meet all of the criteria listed below will be classified as "regulatory retail" exposures and risk-weighted at 75%. Defaulted retail exposures are to be excluded from the overall regulatory retail portfolio when assessing the granularity criterion.

- Product criterion: the exposure takes the form of any of the following: revolving credits and lines of credit (including credit cards, charge cards and overdrafts), personal term loans and leases (eg instalment loans, auto loans and leases, student and educational loans, personal finance) and

[29] The risk weight treatment described in paragraph 50, excluding equity holdings referred to in paragraph 52, will be subject to a five-year linear phase-in arrangement from the date of implementation of this standard. For speculative unlisted equity exposures, the applicable risk weight will start at 100% and increase by 60 percentage points at the end of each year until the end of Year 5. For all other equity holdings, the applicable risk weight will start at 100% and increase by 30 percentage points at the end of each year until the end of Year 5.

[30] For example, investments in unlisted equities of corporate clients with which the bank has or intends to establish a long-term business relationship and debt-equity swaps for corporate restructuring purposes would be excluded.

[31] Regulatory retail SMEs are SMEs, defined in accordance to paragraph 43, that meet the requirements set out in paragraph 55. In some jurisdictions (eg emerging economies), national supervisors might deem it appropriate to define SMEs in a more conservative manner (ie with a lower level of sales).

small business facilities and commitments. Mortgage loans, derivatives and other securities (such as bonds and equities), whether listed or not, are specifically excluded from this category.

- Low value of individual exposures: the maximum aggregated exposure to one counterparty cannot exceed an absolute threshold of €1 million.
- Granularity criterion: no aggregated exposure to one counterparty[32] can exceed 0.2%[33] of the overall regulatory retail portfolio, unless national supervisors have determined another method to ensure satisfactory diversification of the regulatory retail portfolio.

56. "Regulatory retail" exposures which meet the criteria in paragraph 55 that arise from obligors who qualify as transactors will be risk-weighted at 45%. Transactors are obligors in relation to facilities such as credit cards and charge cards where the balance has been repaid in full at each scheduled repayment date for the previous 12 months. Obligors in relation to overdraft facilities would also be considered as transactors if there has been no drawdowns over the previous 12 months.

57. "Other retail": exposures to an individual person or persons that do not meet all of the criteria in paragraph 55 will be risk-weighted at 100%.

58. Exposures to SMEs that do not meet all of the criteria in paragraph 55 will be treated as corporate SMEs exposures under paragraph 43, unless secured by real estate.

10. Real estate exposure class

59. The risk weights in Tables 11, 12, 13 and 14 and the approaches set out in paragraphs 65 and 71 will apply to jurisdictions where structural factors result in sustainably low credit losses associated with the exposures to the real estate market. National supervisors should evaluate whether the risk weights in the corresponding risk weight tables are too low for these types of exposures in their jurisdictions based on default experience and other factors such as market price stability. Supervisors may require banks in their jurisdictions to increase these risk weights as appropriate.

60. To apply the risk-weights in Tables 11, 12, 13 and 14 and the approaches set out in paragraphs 65 and 71, the loan must meet the following requirements:

- Finished property: the property securing the exposure must be fully completed. This requirement does not apply to forest and agricultural land. Subject to national discretion, supervisors may apply the risk-weight treatment described in paragraphs 64 and 65 for loans to individuals that are secured by residential property under construction or land upon which residential property would be constructed, provided that: (i) the property is a one-to-four family residential housing unit that will be the primary residence of the borrower and the lending to the individual is not, in

[32] Aggregated exposure means gross amount (ie not taking any credit risk mitigation into account) of all forms of retail exposures, excluding residential real estate exposures. In case of off-balance sheet claims, the gross amount would be calculated after applying credit conversion factors. In addition, "to one counterparty" means one or several entities that may be considered as a single beneficiary (eg in the case of a small business that is affiliated to another small business, the limit would apply to the bank's aggregated exposure on both businesses).

[33] To avoid circular calculations, the granularity criterion will be verified only once. The calculation must be done on the portfolio of retail exposures that meet the product and orientation criteria as well as the low value of the exposure.

effect, indirectly financing land acquisition, development and construction exposures described in paragraph 74; or (ii) where the sovereign or PSEs involved have the legal powers and ability to ensure that the property under construction will be finished.

- Legal enforceability: any claim on the property taken must be legally enforceable in all relevant jurisdictions. The collateral agreement and the legal process underpinning it must be such that they provide for the bank to realise the value of the property within a reasonable time frame.
- Claims over the property: the loan is a claim over the property where the lender bank holds a first lien over the property, or a single bank holds the first lien and any sequentially lower ranking lien(s) (ie there is no intermediate lien from another bank) over the same property. However, in jurisdictions where junior liens provide the holder with a claim for collateral that is legally enforceable and constitute an effective credit risk mitigant, junior liens held by a different bank than the one holding the senior lien may also be recognised.[34] In order to meet the above requirements, the national frameworks governing liens should ensure the following: (i) each bank holding a lien on a property can initiate the sale of the property independently from other entities holding a lien on the property; and (ii) where the sale of the property is not carried out by means of a public auction, entities holding a senior lien take reasonable steps to obtain a fair market value or the best price that may be obtained in the circumstances when exercising any power of sale on their own (ie it is not possible for the entity holding the senior lien to sell the property on its own at a discounted value in detriment of the junior lien).[35]
- Ability of the borrower to repay: the borrower must meet the requirements set according to paragraph 61.
- Prudent value of property: the property must be valued according to the criteria in paragraph 62 for determining the value in the loan to value (LTV) ratio. Moreover, the value of the property must not depend materially on the performance of the borrower.

[34] Likewise, this would apply to junior liens held by the same bank that holds the senior lien in case there is an intermediate lien from another bank (ie the senior and junior liens held by the bank are not in sequential ranking order).

[35] In certain jurisdictions, the majority of bank loans to individuals for the purchase of residential property are not provided as mortgages in legal form. Instead, they are typically provided as loans that are guaranteed by a highly rated monoline guarantor that is required to repay the bank in full if the borrower defaults, and where the bank has legal right to take a mortgage on the property in the event that the guarantor fails. These loans may be treated as residential real estate exposures (rather than guaranteed loans) if the following additional conditions are met:

(i) the borrower shall be contractually committed not to grant any mortgage lien without the consent of the bank that granted the loan;

(ii) the guarantor shall be either a bank or a financial institution subject to capital requirements comparable to those applied to banks or an insurance undertaking;

(iii) the guarantor shall establish a fully-funded mutual guarantee fund or equivalent protection for insurance undertakings to absorb credit risk losses, whose calibration shall be periodically reviewed by its supervisors and subject to periodic stress testing; and

(iv) the bank shall be contractually and legally allowed to take a mortgage on the property in the event that the guarantor fails.

- Required documentation: all the information required at loan origination and for monitoring purposes must be properly documented, including information on the ability of the borrower to repay and on the valuation of the property.

61. National supervisors should ensure that banks put in place underwriting policies with respect to the granting of mortgage loans that include the assessment of the ability of the borrower to repay. Underwriting policies must define a metric(s) (such as the loan's debt service coverage ratio) and specify its (their) corresponding relevant level(s) to conduct such assessment.[36] Underwriting policies must also be appropriate when the repayment of the mortgage loan depends materially on the cash flows generated by the property, including relevant metrics (such as an occupancy rate of the property). National supervisors may provide guidance on appropriate definitions and levels for these metrics in their jurisdictions.

62. The LTV ratio is the amount of the loan divided by the value of the property. The value of the property will be maintained at the value measured at origination unless national supervisors elect to require banks to revise the property value downward.[37] The value must be adjusted if an extraordinary, idiosyncratic event occurs resulting in a permanent reduction of the property value. Modifications made to the property that unequivocally increase its value could also be considered in the LTV. When calculating the LTV ratio, the loan amount will be reduced as the loan amortises.

The LTV ratio must be prudently calculated in accordance with the following requirements:

- Amount of the loan: includes the outstanding loan amount and any undrawn committed amount of the mortgage loan.[38] The loan amount must be calculated gross of any provisions and other risk mitigants, except for pledged deposits accounts with the lending bank that meet all requirements for on-balance sheet netting and have been unconditionally and irrevocably pledged for the sole purposes of redemption of the mortgage loan.[39]

[36] Metrics and levels for measuring the ability to repay should mirror the FSB *Principles for sound residential mortgage underwriting practices (April 2012)*.

[37] If the value has been adjusted downwards, a subsequent upwards adjustment can be made but not to a higher value than the value at origination.

[38] If a bank grants different loans secured by the same property and they are sequential in ranking order (ie there is no intermediate lien from another bank), the different loans should be considered as a single exposure for risk-weighting purposes, and the amount of the loans should be added to calculate the LTV ratio.

[39] In jurisdictions where junior liens held by a different bank than that holding the senior lien are recognised (in accordance with paragraph 60), the loan amount of the junior liens must include all other loans secured with liens of equal or higher ranking than the bank's lien securing the loan for purposes of defining the LTV bucket and risk weight for the junior lien. If there is insufficient information for ascertaining the ranking of the other liens, the bank should assume that these liens rank pari passu with the junior lien held by the bank. This treatment does not apply to exposures that are risk weighted according to paragraphs 65 and 71, where the junior lien would be taken into account in the calculation of the value of the property. The bank will first determine the "base" risk weight based on Tables 11, 12, 13 or 14 as applicable and adjust the "base" risk weight by a multiplier of 1.25, for application to the loan amount of the junior lien. If the "base" risk weight corresponds to the lowest LTV bucket, the multiplier will not be applied. The resulting risk weight of multiplying the "base" risk weight by 1.25 will be capped at the risk weight applied to the exposure when the requirements in paragraph 60 are not met.

- Value of the property: the valuation must be appraised independently[40] using prudently conservative valuation criteria. To ensure that the value of the property is appraised in a prudently conservative manner, the valuation must exclude expectations on price increases and must be adjusted to take into account the potential for the current market price to be significantly above the value that would be sustainable over the life of the loan. National supervisors should provide guidance setting out prudent valuation criteria where such guidance does not already exist under national law. If a market value can be determined, the valuation should not be higher than the market value.[41]

A guarantee or financial collateral may be recognised as a credit risk mitigant in relation to exposures secured by real estate if it qualifies as eligible collateral under the credit risk mitigation framework. This may include mortgage insurance[42] if it meets the operational requirements of the credit risk mitigation framework for a guarantee. Banks may recognise these risk mitigants in calculating the exposure amount; however, the LTV bucket and risk weight to be applied to the exposure amount must be determined before the application of the appropriate credit risk mitigation technique.

10.1 Exposures secured by residential real estate

63. A residential real estate exposure is an exposure secured by an immovable property that has the nature of a dwelling and satisfies all applicable laws and regulations enabling the property to be occupied for housing purposes (ie residential property).[43]

64. Where the requirements in paragraph 60 are met and provided that paragraphs 67, 74 and 75 are not applicable, the risk weight to be assigned to the total exposure amount will be determined based on the exposure's LTV ratio in Table 11.

Risk weight table for residential real estate exposures

(Repayment is not materially dependent on cash flows generated by property) Table 11

	LTV ≤ 50%	50% < LTV ≤ 60%	60% < LTV ≤ 80%	80% < LTV ≤ 90%	90% < LTV ≤ 100%	LTV > 100%
Risk weight	20%	25%	30%	40%	50%	70%

65. As an alternative to the approach in paragraph 64, where the requirements in paragraph 60 are met and provided that paragraphs 67, 74 and 75 are not applicable, jurisdictions may apply a risk weight of 20% to the part of the exposure up to 55% of the property value and the risk weight of the counterparty as prescribed in footnote 45 to the residual exposure.[44] Where there are liens on the property that are not held by the bank, the treatment is as follows:

- Case 1: the bank holds the junior lien and there are senior liens not held by the bank. When the value of all liens exceeds 55% of the property value, the amount of the bank's lien that is eligible for the 20% risk weight should be calculated as the maximum of: (i) 55% of the property value minus the amount of the senior liens; and (ii) zero. For example, for a loan of €70,000 to an

40 The valuation must be done independently from the bank's mortgage acquisition, loan processing and loan decision process.

41 In the case where the mortgage loan is financing the purchase of the property, the value of the property for LTV purposes will not be higher than the effective purchase price.

42 A bank's use of mortgage insurance should mirror the *FSB Principles for sound residential mortgage underwriting* (April 2012).

43 For residential property under construction described in paragraph 60, this means there should be an expectation that the property will satisfy all applicable laws and regulations enabling the property to be occupied for housing purposes

44 For example, for a loan of €70,000 to an individual secured on a property valued at €100,000, the bank will apply a risk weight of 20% to €55,000 of the exposure and, according to footnote 45, a risk weight of 75% to the residual exposure of €15,000. This gives total risk weighted assets for the exposure of €22,250 =(0.20 * €55,000) + (0.75 * €15,000).

individual secured on a property valued at €100,000, where there is also a senior ranking lien of €10,000 held by another institution, the bank will apply a risk weight of 20% to €45,000 (=max(€55,000 - €10,000, 0)) of the exposure and, according to footnote 45, a risk weight of 75% to the residual exposure of €25,000. When the value of all liens does not exceed 55% of the property value, a risk weight of 20% will be applied to the bank's exposure.

- Case 2: there are liens not held by the bank that rank pari passu with the bank's lien and there are no other senior or junior liens. When the value of all liens exceeds 55% of the property value, the part of the bank's exposure that is eligible for the 20% risk weight should be calculated as the product of: (i) 55% of the property value; and (ii) the bank's exposure divided by the sum of all pari passu liens. For example, for a loan of €70,000 to an individual secured on a property valued at €100,000, where there is also a pari passu ranking lien of €10,000 held by another institution, the bank will apply a risk weight of 20% to €48,125 (=€55,000 * €70,000/€80,000) of the exposure and, according to footnote 45, a risk weight of 75% to the residual exposure of €21,875. When the value of all liens does not exceed 55% of the property value, a risk weight of 20% will be applied to the bank's exposure.

66. For exposures where any of the requirements in paragraph 60 are not met and paragraphs 67, 74 and 75 are not applicable, the risk weight applicable will be the risk weight of the counterparty.[45]

67. When the prospects for servicing the loan materially depend[46] on the cash flows generated by the property securing the loan rather than on the underlying capacity of the borrower to service the debt from other sources, and provided that paragraphs 74 and 75 are not applicable, the exposure will be risk-weighted as follows:

- if the requirements in paragraph 60 are met, according to the LTV ratio as set out in Table 12 below; and
- if any of the requirements of paragraph 60 are not met, at 150%.

The primary source of these cash flows would generally be lease or rental payments, or the sale of the residential property. The distinguishing characteristic of these exposures compared to other residential real estate exposures is that both the servicing of the loan and the prospects for recovery in the event of default depend materially on the cash flows generated by the property securing the exposure.

Risk weight table for residential real estate exposures

(Repayment is materially dependent on cash flows generated by property) Table 12

	LTV ≤ 50%	50% < LTV ≤ 60%	60% < LTV ≤ 80%	80% < LTV ≤ 90%	90% < LTV ≤ 100%	LTV > 100%
Risk weight	30%	35%	45%	60%	75%	105%

68. The following types of exposures are excluded from the treatment described in paragraph 67 and instead, subject to the treatment described in paragraphs 64 to 66:

- An exposure secured by a property that is the borrower's primary residence;

45 For exposures to individuals the risk weight applied will be 75%. For exposures to SMEs, the risk weight applied will be 85%. For exposures to other counterparties, the risk weight applied is the risk weight that would be assigned to an unsecured exposure to that counterparty.

46 It is expected that the material dependence condition would predominantly apply to loans to corporates, SMEs or SPVs, but is not restricted to those borrower types. As an example, a loan may be considered materially dependent if more than 50% of the income from the borrower used in the bank's assessment of its ability to service the loan is from cash flows generated by the residential property. National supervisors may provide further guidance setting out criteria on how material dependence should be assessed for specific exposure types.

- An exposure secured by an income-producing residential housing unit, to an individual who has mortgaged less than a certain number of properties or housing units, as specified by national supervisors;
- An exposure secured by residential real estate property to associations or cooperatives of individuals that are regulated under national law and exist with the only purpose of granting its members the use of a primary residence in the property securing the loans; and
- An exposure secured by residential real estate property to public housing companies and not-for-profit associations regulated under national law that exist to serve social purposes and to offer tenants long-term housing.

10.2 Exposures secured by commercial real estate

69. A commercial real estate exposure is an exposure secured by any immovable property that is not a residential real estate as defined in paragraph 63.

70. Where the requirements in paragraph 60 are met and provided that paragraphs 73, 74 and 75 are not applicable, the risk weight to be assigned to the total exposure amount will be determined based on the exposure's LTV ratio in Table 13. For the purpose of paragraphs 70 to 72, "risk weight of the counterparty" refers to 75% for exposures to individuals, 85% for exposures to SMEs and for exposures to other counterparties, the risk weight applied is the risk weight that would be assigned to an unsecured exposure to that counterparty.

Risk weight table for commercial real estate exposures

(Repayment is not materially dependent on cash flows generated by property) Table 13

	LTV ≤ 60%	LTV > 60%
Risk weight	Min (60%, RW of counterparty)	RW of counterparty

71. As an alternative to the approach in paragraph 70, where the requirements in paragraph 60 are met and provided that paragraphs 73, 74 and 75 are not applicable, jurisdictions may apply a risk weight of 60% or the risk weight of the counterparty, whichever is lower, to the part of the exposure up to 55% of the property value[47], and the risk weight of the counterparty to the residual exposure.

72. Where any of the requirements in paragraph 60 are not met and paragraphs 73, 74 and 75 are not applicable, the risk weight applied will be the risk weight of the counterparty.

73. When the prospects for servicing the loan materially depend[48] on the cash flows generated by the property securing the loan rather than on the underlying capacity of the borrower to service the debt

[47] Where there are liens on the property that are not held by the bank, the part of the exposure up to 55% of the property value should be reduced by the amount of the senior liens not held by the bank and by a pro-rata percentage of any liens pari passu with the bank's lien but not held by the bank. See paragraph 65 for examples of how this methodology applies in the case of residential retail exposures.

[48] It is expected that the material dependence condition would predominantly apply to loans to corporates, SMEs or SPVs, but is not restricted to those borrower types. As an example: a loan may be considered materially dependent if more than 50% of the income from the borrower used in the bank's assessment of its ability to service the loan is from cash flows generated by the

from other sources,[49] and provided that paragraphs 74 and 75 is not applicable, the exposure will be risk-weighted as follows:[50]

- if the requirements in paragraph 60 are met, according to the LTV ratio as set out in the risk-weight Table 14 below; and
- if any of the requirements of paragraph 60 are not met, at 150%.

The primary source of these cash flows would generally be lease or rental payments, or the sale, of the commercial property. The distinguishing characteristic of these exposures compared to other commercial real estate exposures is that both the servicing of the loan and the recovery in the event of default depend materially on the cash flows generated by the property securing the exposure.

Risk weight table for commercial real estate exposures

(Repayment is materially dependent on cash flows generated by property) Table 14

	LTV ≤ 60%	60% < LTV ≤ 80%	LTV > 80%
Risk weight	70%	90%	110%

10.3 Land acquisition, development and construction exposures

74. Land acquisition, development and construction (ADC) exposures[51] refers to loans to companies or SPVs financing any of the land acquisition for development and construction purposes, or development and construction of any residential or commercial property. ADC exposures will be risk-weighted at 150%, unless they meet the criteria in paragraph 75.

75. ADC exposures to residential real estate may be risk weighted at 100%, provided that the following criteria are met:

- prudential underwriting standards meet the requirements in paragraph 60 where applicable;
- pre-sale or pre-lease contracts amount to a signficant portion of total contracts or substantial equity at risk.[52] Pre-sale or pre-lease contracts must be legally binding written contracts and the purchaser/renter must have made a substantial cash deposit which is subject to forfeiture if the contract is terminated. Equity at risk should be determined as an appropriate amount of borrower-contributed equity to the real estate's appraised as-completed value.

commercial property. National supervisors may provide further guidance setting out criteria on how material dependence should be assessed for specific exposure types.

49 For such exposures, national supervisors may allow banks to apply the treatment described in paragraphs 70 to 71 subject to the following conditions: (i) the losses stemming from commercial real estate lending up to 60% of LTV must not exceed 0.3% of the outstanding loans in any given year and (ii) overall losses stemming from commercial real estate lending must not exceed 0.5% of the outstanding loans in any given year. If either of these tests are not satisfied in a given year, the eligibility of the exemption will cease and the exposures where the prospect for servicing the loan materially depend on cash flows generated by the property securing the loan rather than the underlying capacity of the borrower to service the debt from other sources will again be risk weighted according to paragraph 73 until both tests are satisfied again in the future. Jurisdictions applying such treatment must publicly disclose whether these conditions are met.

50 National supervisors may require that the risk weight treatment described in paragraph 73 be applied to exposures where the servicing of the loan materially depends on the cash flows generated by a portfolio of properties owned by the borrower.

51 ADC exposures do not include the acquisition of forest or agricultural land, where there is no planning consent or intention to apply for planning consent.

52 National supervisors will give further guidance on the appropriate levels of pre-sale or pre-lease contracts and/or equity at risk to be applied in their jurisdictions.

11. Risk weight multiplier to certain exposures with currency mismatch

76. For unhedged retail and residential real estate exposures to individuals where the lending currency differs from the currency of the borrower's source of income, banks will apply a 1.5 times multiplier to the applicable risk weight according to paragraphs 54 to 58 and 63 to 68, subject to a maximum risk weight of 150%.

77. For the purposes of paragraph 76, an unhedged exposure refers to an exposure to a borrower that has no natural or financial hedge against the foreign exchange risk resulting from the currency mismatch between the currency of the borrower's income and the currency of the loan. A natural hedge exists where the borrower, in its normal operating procedures, receives foreign currency income that matches the currency of a given loan (eg remittances, rental incomes, salaries). A financial hedge generally includes a legal contract with a financial institution (eg forward contract). For the purposes of application of the multiplier, only these natural or financial hedges are considered sufficient where they cover at least 90% of the loan instalment, regardless of the number of hedges.

12. Off-balance sheet items

78. Off-balance sheet items will be converted into credit exposure equivalents through the use of credit conversion factors (CCF). In the case of commitments, the committed but undrawn amount of the exposure would be multiplied by the CCF. For these purposes, commitment means any contractual arrangement that has been offered by the bank and accepted by the client to extend credit, purchase assets or issue credit substitutes.[53] It includes any such arrangement that can be unconditionally cancelled by the bank at any time without prior notice to the obligor. It also includes any such arrangement that can be cancelled by the bank if the obligor fails to meet conditions set out in the facility documentation, including conditions that must be met by the obligor prior to any initial or subsequent drawdown under the arrangement. Counterparty risk weightings for OTC derivative transactions will not be subject to any specific ceiling.

79. A 100% CCF will be applied to the following items:

- Direct credit substitutes, eg general guarantees of indebtedness (including standby letters of credit serving as financial guarantees for loans and securities) and acceptances (including endorsements with the character of acceptances).

[53] At national discretion, a jurisdiction may exempt certain arrangements from the definition of commitments provided that the following conditions are met: (i) the bank receives no fees or commissions to establish or maintain the arrangements; (ii) the client is required to apply to the bank for the initial and each subsequent drawdown; (iii) the bank has full authority, regardless of the fulfilment by the client of the conditions set out in the facility documentation, over the execution of each drawdown; and (iv) the bank's decision on the execution of each drawdown is only made after assessing the creditworthiness of the client immediately prior to drawdown. Exempted arrangements that meet the above criteria are limited to certain arrangements for corporates and SMEs, where counterparties are closely monitored on an ongoing basis.

- Sale and repurchase agreements and asset sales with recourse[54] where the credit risk remains with the bank.
- The lending of banks' securities or the posting of securities as collateral by banks, including instances where these arise out of repo-style transactions (ie repurchase/reverse repurchase and securities lending/securities borrowing transactions). The risk-weighting treatment for counterparty credit risk must be applied in addition to the credit risk charge on the securities or posted collateral, where the credit risk of the securities lent or posted as collateral remains with the bank. This paragraph does not apply to posted collateral related to derivative transactions that is treated in accordance with the counterparty credit risk standards.
- Forward asset purchases, forward forward deposits and partly paid shares and securities,[55] which represent commitments with certain drawdown.
- Off-balance sheet items that are credit substitutes not explicitly included in any other category.

80. A 50% CCF will be applied to note issuance facilities (NIFs) and revolving underwriting facilities (RUFs) regardless of the maturity of the underlying facility.

81. A 50% CCF will be applied to certain transaction-related contingent items (eg performance bonds, bid bonds, warranties and standby letters of credit related to particular transactions).

82. A 40% CCF will be applied to commitments, regardless of the maturity of the underlying facility, unless they qualify for a lower CCF.

83. A 20% CCF will be applied to both the issuing and confirming banks of short-term[56] self-liquidating trade letters of credit arising from the movement of goods (eg documentary credits collateralised by the underlying shipment).

84. A 10% CCF will be applied to commitments that are unconditionally cancellable at any time by the bank without prior notice, or that effectively provide for automatic cancellation due to deterioration in a borrower's creditworthiness. National supervisors should evaluate various factors in the jurisdiction, which may constrain banks' ability to cancel the commitment in practice, and consider applying a higher CCF to certain commitments as appropriate.

85. Where there is an undertaking to provide a commitment on an off-balance sheet item, banks are to apply the lower of the two applicable CCFs.[57]

86. The credit equivalent amount of SFTs that expose a bank to counterparty credit risk is to be calculated under the comprehensive approach in paragraphs 155 to 178. The credit equivalent amount of OTC derivatives that expose a bank to counterparty credit risk is to be calculated under the rules for counterparty credit risk in paragraph 189. As an alternative for both SFTs and OTC derivatives, banks may use the Internal Model Method as set out the counterparty credit risk standards for calculating the credit equivalent amount, subject to supervisory approval.

[54] These items are to be weighted according to the type of asset and not according to the type of counterparty with whom the transaction has been entered into.

[55] These items are to be weighted according to the type of asset and not according to the type of counterparty with whom the transaction has been entered into.

[56] That is, with a maturity below one year. For further details see Basel Committee on Banking Supervision, *Treatment of trade finance under the Basel capital framework*, October 2011, www.bis.org/publ/bcbs205.pdf.

[57] For example, if a bank has a commitment to open short-term self-liquidating trade letters of credit arising from the movement of goods, a 20% CCF will be applied (instead of a 40% CCF); and if a bank has an unconditionally cancellable commitment described in paragraph 84 to issue direct credit substitutes, a 10% CCF will be applied (instead of a 100% CCF).

87. Banks must closely monitor securities, commodities and foreign exchange transactions that have failed, starting from the first day they fail. A capital charge on failed transactions must be calculated in accordance with Annex 3 of the Basel II framework (June 2006).

88. Banks are exposed to the risk associated with unsettled securities, commodities, and foreign exchange transactions from trade date. Irrespective of the booking or the accounting of the transaction, unsettled transactions must be taken into account for regulatory capital requirements purposes. Where they do not appear on the balance sheet (ie settlement date accounting), the unsettled exposure amount will receive a 100% CCF. Banks are encouraged to develop, implement and improve systems for tracking and monitoring the credit risk exposure arising from unsettled transactions as appropriate so that they can produce management information that facilitates timely action. Furthermore, when such transactions are not processed through a delivery-versus-payment (DvP) or payment-versus-payment (PvP) mechanism, banks must calculate a capital charge as set forth in Annex 3 of the Basel II framework (June 2006).

89. A bank providing credit protection through a first-to-default or second-to-default credit derivative is subject to capital requirements on such instruments. For first-to-default credit derivatives, the risk weights of the assets included in the basket must be aggregated up to a maximum of 1250% and multiplied by the nominal amount of the protection provided by the credit derivative to obtain the risk-weighted asset amount. For second-to-default credit derivatives, the treatment is similar; however, in aggregating the risk weights, the asset with the lowest risk-weighted amount can be excluded from the calculation. This treatment applies respectively for n^{th}-to-default credit derivatives, for which the n-1 assets with the lowest risk-weighted amounts can be excluded from the calculation.

13. Defaulted exposures

90. For risk-weighting purposes under the standardised approach, a defaulted exposure is defined as one that is past due for more than 90 days, or is an exposure to a defaulted borrower. A defaulted borrower is a borrower in respect of whom any of the following events have occurred:

- Any material credit obligation that is past due for more than 90 days. Overdrafts will be considered as being past due once the customer has breached an advised limit or been advised of a limit smaller than current outstandings;
- Any material credit obligation is on non-accrued status (eg the lending bank no longer recognises accrued interest as income or, if recognised, makes an equivalent amount of provisions);
- A write-off or account-specific provision is made as a result of a significant perceived decline in credit quality subsequent to the bank taking on any credit exposure to the borrower;
- Any credit obligation is sold at a material credit-related economic loss;
- A distressed restructuring of any credit obligation (ie a restructuring that may result in a diminished financial obligation caused by the material forgiveness, or postponement, of principal, interest or (where relevant) fees) is agreed by the bank;
- The borrower's bankruptcy or a similar order in respect of any of the borrower's credit obligations to the banking group has been filed;
- The borrower has sought or has been placed in bankruptcy or similar protection where this would avoid or delay repayment of any of the credit obligations to the banking group; or
- Any other situation where the bank considers that the borrower is unlikely to pay its credit obligations in full without recourse by the bank to actions such as realising security.

91. For retail exposures, the definition of default can be applied at the level of a particular credit obligation, rather than at the level of the borrower. As such, default by a borrower on one obligation does not require a bank to treat all other obligations to the banking group as defaulted.

92. With the exception of residential real estate exposures treated under paragraph 93, the unsecured or unguaranteed portion of a defaulted exposure shall be risk-weighted net of specific provisions and partial write-offs as follows:

- 150% risk weight when specific provisions are less than 20% of the outstanding amount of the loan; and
- 100% risk weight when specific provisions are equal or greater than 20% of the outstanding amount of the loan.[58]

93. Defaulted residential real estate exposures where repayments do not materially depend on cash flows generated by the property securing the loan shall be risk-weighted net of specific provisions and partial write-offs at 100%. Guarantees or financial collateral which are eligible according to the credit risk mitigation framework might be taken into account in the calculation of the exposure in accordance with paragraph 62.

94. For the purpose of defining the secured or guaranteed portion of the defaulted exposure, eligible collateral and guarantees will be the same as for credit risk mitigation purposes (see Section D).

14. Other assets

95. The standard risk weight for all other assets will be 100%, with the exception of exposures mentioned in paragraphs 96 and 97.

96. A 0% risk weight will apply to (i) cash owned and held at the bank or in transit; and (ii) gold bullion held at the bank or held in another bank on an allocated basis, to the extent the gold bullion assets are backed by gold bullion liabilities.

97. A 20% risk weight will apply to cash items in the process of collection.

B. Recognition of external ratings by national supervisors

1. The recognition process

98. In jurisdictions that allow the use of external ratings for regulatory purposes, only credit assessments from credit rating agencies recognised as external credit assessment institutions (ECAIs) will be allowed. National supervisors are responsible for determining on a continuous basis whether an ECAI meets the criteria listed in paragraph 99 and recognition should only be provided in respect of ECAI ratings for types of claim where all criteria and conditions are met. National supervisors should also take into account the criteria and conditions provided in the IOSCO *Code of Conduct Fundamentals for Credit Rating Agencies*[59] when determining ECAI eligibility. The supervisory process for recognising ECAIs should be made public to avoid unnecessary barriers to entry.

[58] National supervisors have discretion to reduce the risk weight to 50% when specific provisions are no less than 50% of the outstanding amount of the loan.

[59] Available at www.iosco.org/library/pubdocs/pdf/IOSCOPD482.pdf.

2. Eligibility criteria

99. An ECAI must satisfy each of the following eight criteria.

- ***Objectivity***: The methodology for assigning external ratings must be rigorous, systematic, and subject to some form of validation based on historical experience. Moreover, external ratings must be subject to ongoing review and responsive to changes in financial condition. Before being recognised by supervisors, a rating methodology for each market segment, including rigorous backtesting, must have been established for at least one year and preferably three years.
- ***Independence***: An ECAI should be independent and should not be subject to political or economic pressures that may influence the rating. In particular, an ECAI should not delay or refrain from taking a rating action based on its potential effect (economic, political or otherwise). The rating process should be as free as possible from any constraints that could arise in situations where the composition of the board of directors or the shareholder structure of the CRA may be seen as creating a conflict of interest. Furthermore, an ECAI should separate operationally, legally and, if practicable, physically its rating business from other businesses and analysts.
- ***International access/transparency***: The individual ratings, the key elements underlining the assessments and whether the issuer participated in the rating process should be publicly available on a non-selective basis, unless they are private ratings, which should be at least available to both domestic and foreign insitutions with legitimate interest and on equivalent terms. In addition, the ECAI's general procedures, methodologies and assumptions for arriving at ratings should be publicly available.
- ***Disclosure***: An ECAI should disclose the following information: its code of conduct; the general nature of its compensation arrangements with assessed entities; any conflict of interest,[60] the ECAI's compensation arrangements,[61] its assessment methodologies, including the definition of default, the time horizon, and the meaning of each rating; the actual default rates experienced in each assessment category; and the transitions of the ratings, eg the likelihood of AA ratings becoming A over time. A rating should be disclosed as soon as practicably possible after issuance.

[60] At a minimum, the following situations and their influence on the ECAI's credit rating methodologies or credit rating actions shall be disclosed:

- The ECAI is being paid to issue a credit rating by the rated entity or by the obligor, originator, underwriter, or arranger of the rated obligation;
- The ECAI is being paid by subscribers with a financial interest that could be affected by a credit rating action of the ECAI;
- The ECAI is being paid by rated entities, obligors, originators, underwriters, arrangers, or subscribers for services other than issuing credit ratings or providing access to the ECAI's credit ratings;
- The ECAI is providing a preliminary indication or similar indication of credit quality to an entity, obligor, originator, underwriter, or arranger prior to being hired to determine the final credit rating for the entity, obligor, originator, underwriter, or arranger; and
- The ECAI has a direct or indirect ownership interest in a rated entity or obligor, or a rated entity or obligor has a direct or indirect ownership interest in the ECAI.

[61] An ECAI should disclose the general nature of its compensation arrangements with rated entities, obligors, lead underwriters, or arrangers.

When the ECAI receives from a rated entity, obligor, originator, lead underwriter, or arranger compensation unrelated to its credit rating services, the ECAI should disclose such unrelated compensation as a percentage of total annual compensation received from such rated entity, obligor, lead underwriter, or arranger in the relevant credit rating report or elsewhere, as appropriate.

An ECAI should disclose in the relevant credit rating report or elsewhere, as appropriate, if it receives 10% or more of its annual revenue from a single client (eg a rated entity, obligor, originator, lead underwriter, arranger, or subscriber, or any of their affiliates).

When disclosing a rating, the information should be provided in plain language, indicating the nature and limitation of credit ratings and the risk of unduly relying on them to make investments.

- ***Resources***: An ECAI should have sufficient resources to carry out high-quality credit assessments. These resources should allow for substantial ongoing contact with senior and operational levels within the entities assessed in order to add value to the credit assessments. In particular, ECAIs should assign analysts with appropriate knowledge and experience to assess the creditworthiness of the type of entity or obligation being rated. Such assessments should be based on methodologies combining qualitative and quantitative approaches.
- ***Credibility***: To some extent, credibility is derived from the criteria above. In addition, the reliance on an ECAI's external ratings by independent parties (investors, insurers, trading partners) is evidence of the credibility of the ratings of an ECAI. The credibility of an ECAI is also underpinned by the existence of internal procedures to prevent the misuse of confidential information. In order to be eligible for recognition, an ECAI does not have to assess firms in more than one country.
- ***No abuse of unsolicited ratings***: ECAIs must not use unsolicited ratings to put pressure on entities to obtain solicited ratings. Supervisors should consider whether to continue recognising such ECAIs as eligible for capital adequacy purposes, if such behaviour is identified.
- ***Cooperation with the supervisor:*** ECAIs should notify the supervisor of significant changes to methodologies and provide access to external ratings and other relevant data in order to support intial and continued determination of eligibility.

C. Implementation considerations in jurisdictions that allow use of external ratings for regulatory purposes

1. The mapping process

100. Supervisors will be responsible for assigning eligible ECAIs' ratings to the risk weights available under the standardised risk weighting framework, ie deciding which rating categories correspond to which risk weights. The mapping process should be objective and should result in a risk weight assignment consistent with that of the level of credit risk reflected in the tables above. It should cover the full spectrum of risk weights.

101. When conducting such a mapping process, factors that supervisors should assess include, among others, the size and scope of the pool of issuers that each ECAI covers, the range and meaning of the ratings that it assigns, and the definition of default used by the ECAI.

102. In order to promote a more consistent mapping of ratings into the available risk weights and help supervisors in conducting such a process, Annex 2 of the Basel II framework (June 2006) provides guidance as to how such a mapping process may be conducted.

103. Banks must use the chosen ECAIs and their ratings consistently for all types of claim where they have been recognised by their supervisor as an eligible ECAI, for both risk-weighting and risk management purposes. Banks will not be allowed to "cherry-pick" the ratings provided by different ECAIs and to arbitrarily change the use of ECAIs.

2. Multiple external ratings

104. If there is only one rating by an ECAI chosen by a bank for a particular claim, that rating should be used to determine the risk weight of the exposure.

105. If there are two ratings by ECAIs chosen by a bank that map into different risk weights, the higher risk weight will be applied.

106. If there are three or more ratings with different risk weights, the two ratings that correspond to the lowest risk weights should be referred to. If these give rise to the same risk weight, that risk weight should be applied. If different, the higher risk weight should be applied.

3. Determination of whether an exposure is rated: Issue-specific and issuer ratings

107. Where a bank invests in a particular issue that has an issue-specific rating, the risk weight of the exposure will be based on this rating. Where the bank's exposure is not an investment in a specific rated issue, the following general principles apply.

- In circumstances where the borrower has a specific rating for an issued debt – but the bank's exposure is not an investment in this particular debt – a high-quality credit rating (one which maps into a risk weight lower than that which applies to an unrated claim) on that specific debt may only be applied to the bank's unrated exposure if this claim ranks in all respects *pari passu* or senior to the claim with a rating. If not, the external rating cannot be used and the unassessed claim will receive the risk weight for unrated exposures.
- In circumstances where the borrower has an issuer rating, this rating typically applies to senior unsecured claims on that issuer. Consequently, only senior claims on that issuer will benefit from a high-quality issuer rating. Other unassessed exposures of a highly rated issuer will be treated as unrated. If either the issuer or a single issue has a low-quality rating (mapping into a risk weight equal to or higher than that which applies to unrated exposures), an unassessed exposure to the same counterparty that ranks *pari passu* or is subordinated to either the senior unsecured issuer rating or the exposure with a low-quality rating will be assigned the same risk weight as is applicable to the low-quality assessment.
- In circumstances where the issuer has a specific high-quality rating (one which maps into a lower risk weight) that only applies to a limited class of liabilities (such as a deposit assessment or a counterparty risk assessment), this may only be used in respect of exposures that fall within that class.

108. Whether the bank intends to rely on an issuer- or an issue-specific rating, the rating must take into account and reflect the entire amount of credit risk exposure the bank has with regard to all payments owed to it.[62]

[62] For example, if a bank is owed both principal and interest, the assessment must fully take into account and reflect the credit risk associated with repayment of both principal and interest.

109. In order to avoid any double-counting of credit enhancement factors, no supervisory recognition of credit risk mitigation techniques will be taken into account if the credit enhancement is already reflected in the issue specific rating (see paragraph 121).

4. Domestic currency and foreign currency ratings

110. Where exposures are risk-weighted based on the rating of an equivalent exposure to that borrower, the general rule is that foreign currency ratings would be used for exposures in foreign currency. Domestic currency ratings, if separate, would only be used to risk-weight exposures denominated in the domestic currency.[63]

5. Short-term/long-term ratings

111. For risk-weighting purposes, short-term ratings are deemed to be issue-specific. They can only be used to derive risk weights for exposures arising from the rated facility. They cannot be generalised to other short-term exposures, except under the conditions of paragraph 113. In no event can a short-term rating be used to support a risk weight for an unrated long-term exposure. Short-term ratings may only be used for short-term exposures against banks and corporates. The table below provides a framework for banks' exposures to specific short-term facilities, such as a particular issuance of commercial paper:

Risk weight table for specific short-term ratings

Table 15

External rating	A-1/P-1[64]	A-2/P-2	A-3/P-3	Others[65]
Risk weight	20%	50%	100%	150%

112. If a short-term rated facility attracts a 50% risk-weight, unrated short-term exposures cannot attract a risk weight lower than 100%. If an issuer has a short-term facility with an external rating that warrants a risk weight of 150%, all unrated exposures, whether long-term or short-term, should also receive a 150% risk weight, unless the bank uses recognised credit risk mitigation techniques for such exposures.

113. In cases where short-term ratings are available, the following interaction with the general preferential treatment for short-term exposures to banks as described in paragraph 19 will apply:

- The general preferential treatment for short-term exposures applies to all exposures to banks of up to three months original maturity when there is no specific short-term claim assessment.
- When there is a short-term rating and such a rating maps into a risk weight that is more favourable (ie lower) or identical to that derived from the general preferential treatment, the short-term rating should be used for the specific exposure only. Other short-term exposures would benefit from the general preferential treatment.

[63] However, when an exposure arises through a bank's participation in a loan that has been extended, or has been guaranteed against convertibility and transfer risk, by certain MDBs, its convertibility and transfer risk can be considered by national supervisors to be effectively mitigated. To qualify, MDBs must have preferred creditor status recognised in the market and be included in footnote 11 (in paragraph 14). In such cases, for risk-weighting purposes, the borrower's domestic currency rating may be used instead of its foreign currency rating. In the case of a guarantee against convertibility and transfer risk, the local currency rating can be used only for the portion that has been guaranteed. The portion of the loan not benefiting from such a guarantee will be risk-weighted based on the foreign currency rating.

[64] The notations follow the methodology used by Standard & Poor's and by Moody's Investors Service. The A-1 rating of Standard & Poor's includes both A-1+ and A-1–.

[65] This category includes all non-prime and B or C ratings.

- When a specific short-term rating for a short term exposure to a bank maps into a less favourable (higher) risk weight, the general short-term preferential treatment for interbank exposures cannot be used. All unrated short-term exposures should receive the same risk weighting as that implied by the specific short-term rating.

114. When a short-term rating is to be used, the institution making the assessment needs to meet all of the eligibility criteria for recognising ECAIs, as described in paragraph 99, in terms of its short-term ratings.

6. Level of application of the rating

115. External ratings for one entity within a corporate group cannot be used to risk-weight other entities within the same group.

7. Use of unsolicited ratings

116. As a general rule, banks should use solicited ratings from eligible ECAIs. National supervisors may allow banks to use *unsolicited* ratings in the same way as solicited ratings if they are satisfied that the credit assessments of unsolicited ratings are not inferior in quality to the general quality of solicited ratings.

D. Credit risk mitigation techniques for exposures risk-weighted under the standardised approach

1. Overarching issues

(i) Introduction

117. Banks use a number of techniques to mitigate the credit risks to which they are exposed. For example, exposures may be collateralised by first-priority claims, in whole or in part with cash or securities, a loan exposure may be guaranteed by a third party, or a bank may buy a credit derivative to offset various forms of credit risk. Additionally banks may agree to net loans owed to them against deposits from the same counterparty.[66]

118. The framework set out in this section is applicable to banking book exposures that are risk-weighted under the standardised approach.

(ii) General requirements

119. No transaction in which CRM techniques are used shall receive a higher capital requirement than an otherwise identical transaction where such techniques are not used.

120. The Pillar 3 requirements must be fulfilled for banks to obtain capital relief in respect of any CRM techniques.

121. The effects of CRM must not be double-counted. Therefore, no additional supervisory recognition of CRM for regulatory capital purposes will be granted on exposures for which the risk weight already

[66] In this section, "counterparty" is used to denote a party to whom a bank has an on- or off-balance sheet credit exposure. That exposure may, for example, take the form of a loan of cash or securities (where the counterparty would traditionally be called the borrower), of securities posted as collateral, of a commitment or of exposure under an OTC derivatives contract.

reflects that CRM. Consistent with paragraph 108, principal-only ratings will also not be allowed within the CRM framework.

122. While the use of CRM techniques reduces or transfers credit risk, it may simultaneously increase other risks (ie residual risks). Residual risks include legal, operational, liquidity and market risks. Therefore, banks must employ robust procedures and processes to control these risks, including strategy; consideration of the underlying credit; valuation; policies and procedures; systems; control of roll-off risks; and management of concentration risk arising from the bank's use of CRM techniques and its interaction with the bank's overall credit risk profile. Where these risks are not adequately controlled, supervisors may impose additional capital charges or take other supervisory actions as outlined in Pillar 2.

123. In order for CRM techniques to provide protection, the credit quality of the counterparty must not have a material positive correlation with the employed CRM technique or with the resulting residual risks (as defined in paragraph 122). For example, securities issued by the counterparty (or by any counterparty-related entity) provide little protection as collateral and are thus ineligible.

124. In the case where a bank has multiple CRM techniques covering a single exposure (eg a bank has both collateral and a guarantee partially covering an exposure), the bank must subdivide the exposure into portions covered by each type of CRM technique (eg portion covered by collateral, portion covered by guarantee) and the risk-weighted assets of each portion must be calculated separately. When credit protection provided by a single protection provider has differing maturities, they must be subdivided into separate protection as well.

(iii) Legal requirements

125. In order for banks to obtain capital relief for any use of CRM techniques, all documentation used in collateralised transactions, on-balance sheet netting agreements, guarantees and credit derivatives must be binding on all parties and legally enforceable in all relevant jurisdictions. Banks must have conducted sufficient legal review to verify this and have a well-founded legal basis to reach this conclusion, and undertake such further review as necessary to ensure continuing enforceability.

(iv) General treatment of maturity mismatches

126. For the purposes of calculating risk-weighted assets, a maturity mismatch occurs when the residual maturity of a credit protection arrangement (eg hedge) is less than that of the underlying exposure.

127. In the case of financial collateral, maturity mismatches are not allowed under the simple approach (see paragraph 147).

128. Under the other approaches, when there is a maturity mismatch the credit protection arrangement may only be recognised if the original maturity of the arrangement is greater than or equal to one year, and its residual maturity is greater than or equal to three months. In such cases, credit risk mitigation may be partially recognised as detailed below in paragraph 129.

129. When there is a maturity mismatch with recognised credit risk mitigants, the following adjustment applies

$$P_a = P \cdot \frac{t - 0.25}{T - 0.25}$$

where:

- P_a = value of the credit protection adjusted for maturity mismatch
- P = credit protection amount (eg collateral amount, guarantee amount) adjusted for any haircuts
- t = min {T, residual maturity of the credit protection arrangement expressed in years}

- T =min {five years, residual maturity of the exposure expressed in years}

130. The maturity of the underlying exposure and the maturity of the hedge must both be defined conservatively. The effective maturity of the underlying must be gauged as the longest possible remaining time before the counterparty is scheduled to fulfil its obligation, taking into account any applicable grace period. For the hedge, (embedded) options that may reduce the term of the hedge must be taken into account so that the shortest possible effective maturity is used. For example: where, in the case of a credit derivative, the protection seller has a call option, the maturity is the first call date. Likewise, if the protection buyer owns the call option and has a strong incentive to call the transaction at the first call date, for example because of a step-up in cost from this date on, the effective maturity is the remaining time to the first call date.

(v) Currency mismatches

131. Currency mismatches are allowed under all approaches. Under the simple approach there is no specific treatment for currency mismatches, given that a minimum risk weight of 20% (floor) is generally applied. Under the comprehensive approach and in case of guarantees and credit derivatives, a specific adjustment for currency mismatches is prescribed in paragraphs 165 and 204, respectively.

2. Overview of credit risk mitigation techniques[67]

(i) Collateralised transactions

132. A collateralised transaction is one in which:

- banks have a credit exposure or a potential credit exposure; and
- that credit exposure or potential credit exposure is hedged in whole or in part by collateral posted by a counterparty or by a third party on behalf of the counterparty.

Where banks take eligible financial collateral, they may reduce their regulatory capital requirements through the application of CRM techniques.[68]

133. Banks may opt for either:

(i) The simple approach, which replaces the risk weight of the counterparty with the risk weight of the collateral for the collateralised portion of the exposure (generally subject to a 20% floor); or

(ii) The comprehensive approach, which allows a more precise offset of collateral against exposures, by effectively reducing the exposure amount by a volatility-adjusted value ascribed to the collateral.

Detailed operational requirements for both approaches are given in paragraphs 146 to 178. Banks may operate under either, but not both, approaches in the banking book.

134. For collateralised OTC transactions, exchange traded derivatives and long settlement transactions, banks may use the standardised approach for counterparty credit risk (SA-CCR) or the Internal Model Method to calculate the exposure amount, in accordance with paragraph 189.

[67] See Annex 10 of Basel II (June 2006) for an overview of methodologies for the capital treatment of transactions secured by financial collateral under the standardised and IRB approaches.

[68] Alternatively, banks with appropriate supervisory approval may instead use the Internal Model Method to determine the exposure amount, taking into account collateral.

(ii) On-balance sheet netting

135. Where banks have legally enforceable netting arrangements for loans and deposits that meet the conditions in paragraph 190 they may calculate capital requirements on the basis of net credit exposures as set out in that paragraph.

(iii) Guarantees and credit derivatives

136. Where guarantees or credit derivatives fulfil the minimum operational conditions set out in paragraphs 191 to 193, banks may take account of the credit protection offered by such credit risk mitigation techniques in calculating capital requirements.

137. A range of guarantors and protection providers are recognised and a substitution approach applies for capital requirement calculations. Only guarantees issued by or protection provided by entities with a lower risk weight than the counterparty lead to reduced capital charges for the guaranteed exposure, since the protected portion of the counterparty exposure is assigned the risk weight of the guarantor or protection provider, whereas the uncovered portion retains the risk weight of the underlying counterparty.

138. Detailed conditions and operational requirements for guarantees and credit derivatives are given in paragraphs 191 to 205.

3. Collateralised transactions

(i) General requirements

139. Before capital relief is granted in respect of any form of collateral, the standards set out below in paragraphs 140 to 145 must be met, irrespective of whether the simple or the comprehensive approach is used. Banks that lend securities or post collateral must calculate capital requirements for both of the following: (i) the credit risk or market risk of the securities, if this remains with the bank; and (ii) the counterparty credit risk arising from the risk that the borrower of the securities may default.

140. The legal mechanism by which collateral is pledged or transferred must ensure that the bank has the right to liquidate or take legal possession of it, in a timely manner, in the event of the default, insolvency or bankruptcy (or one or more otherwise-defined credit events set out in the transaction documentation) of the counterparty (and, where applicable, of the custodian holding the collateral). Additionally, banks must take all steps necessary to fulfil those requirements under the law applicable to the bank's interest in the collateral for obtaining and maintaining an enforceable security interest, eg by registering it with a registrar, or for exercising a right to net or set off in relation to the title transfer of the collateral.

141. Banks must have clear and robust procedures for the timely liquidation of collateral to ensure that any legal conditions required for declaring the default of the counterparty and liquidating the collateral are observed, and that collateral can be liquidated promptly.

142. Banks must ensure that sufficient resources are devoted to the orderly operation of margin agreements with OTC derivative and securities-financing counterparties, as measured by the timeliness and accuracy of its outgoing margin calls and response time to incoming margin calls. Banks must have collateral risk management policies in place to control, monitor and report:

- the risk to which margin agreements expose them (such as the volatility and liquidity of the securities exchanged as collateral);
- the concentration risk to particular types of collateral;
- the reuse of collateral (both cash and non-cash) including the potential liquidity shortfalls resulting from the reuse of collateral received from counterparties; and

- the surrender of rights on collateral posted to counterparties.

143. Where the collateral is held by a custodian, banks must take reasonable steps to ensure that the custodian segregates the collateral from its own assets.

144. A capital requirement must be applied on both sides of a transaction. For example, both repos and reverse repos will be subject to capital requirements. Likewise, both sides of a securities lending and borrowing transaction will be subject to explicit capital charges, as will the posting of securities in connection with derivatives exposures or with any other borrowing transaction.

145. Where a bank, acting as an agent, arranges a repo-style transaction (ie repurchase/reverse repurchase and securities lending/borrowing transactions) between a customer and a third party and provides a guarantee to the customer that the third party will perform on its obligations, then the risk to the bank is the same as if the bank had entered into the transaction as a principal. In such circumstances, a bank must calculate capital requirements as if it were itself the principal.

(ii) The simple approach

General requirements for the simple approach

146. Under the simple approach, the risk weight of the counterparty is replaced by the risk weight of the collateral instrument collateralising or partially collateralising the exposure.

147. For collateral to be recognised in the simple approach, it must be pledged for at least the life of the exposure and it must be marked to market and revalued with a minimum frequency of six months. Those portions of exposures collateralised by the market value of recognised collateral receive the risk weight applicable to the collateral instrument. The risk weight on the collateralised portion is subject to a floor of 20% except under the conditions specified in paragraphs 150 to 154. The remainder of the exposure must be assigned the risk weight appropriate to the counterparty. Maturity mismatches are not allowed under the simple approach (see paragraphs 126 and 127).

Eligible financial collateral under the simple approach

148. The following collateral instruments are eligible for recognition in the simple approach:

(a) Cash (as well as certificates of deposit or comparable instruments issued by the lending bank) on deposit with the bank that is incurring the counterparty exposure.[69, 70]

(b) Gold.

(c) In jurisdictions that allow the use of external ratings for regulatory purposes:

  (i) Debt securities rated by a recognised ECAI where these are either:

    – at least BB– when issued by sovereigns or PSEs that are treated as sovereigns by the national supervisor; or

    – at least BBB– when issued by other entities (including banks and other prudentially regulated financial institutions); or

    – at least A-3/P-3 for short-term debt instruments.

[69] Cash-funded credit-linked notes issued by the bank against exposures in the banking book that fulfil the criteria for credit derivatives are treated as cash-collateralised transactions.

[70] When cash on deposit, certificates of deposit or comparable instruments issued by the lending bank are held as collateral at a third-party bank in a non-custodial arrangement, if they are openly pledged/assigned to the lending bank and if the pledge/assignment is unconditional and irrevocable, the exposure amount covered by the collateral (after any necessary haircuts for currency risk) receives the risk weight of the third-party bank.

(ii) Debt securities not rated by a recognised ECAI where these are:

– issued by a bank; and

– listed on a recognised exchange; and

– classified as senior debt; and

– all rated issues of the same seniority by the issuing bank are rated at least BBB– or A-3/P-3 by a recognised ECAI; and

– the bank holding the securities as collateral has no information to suggest that the issue justifies a rating below BBB– or A-3/P-3 (as applicable); and

– the supervisor is sufficiently confident that the market liquidity of the security is adequate.

(d) In jurisdictions that do not allow the use of external ratings for regulatory purposes, the following securities will be eligible provided that the supervisor is sufficiently confident that the market liquidity of the security is adequate:

(i) Debt securities issued by sovereigns or PSEs that are treated as sovereigns by the national supervisor;

(ii) Debt securities issued by banks assigned to Grade A under the SCRA;

(iii) Other debt securities issued by "investment grade" entities as defined in paragraph 197, and

(iv) Securitisation exposures with a risk weight of less than 100%.

(e) Equities (including convertible bonds) that are included in a main index.

(f) Undertakings for Collective Investments in Transferable Securities (UCITS) and mutual funds where:

- a price for the units is publicly quoted daily; and
- the UCITS/mutual fund is limited to investing in the instruments listed in this paragraph.[71]

149. Resecuritisations as defined in the securitisation framework are not eligible financial collateral.

Exemptions under the simple approach to the risk-weight floor

150. Repo-style transactions that fulfil all of the following conditions are exempted from the risk-weight floor under the simple approach:

(a) Both the exposure and the collateral are cash or a sovereign security or PSE security qualifying for a 0% risk weight under the standardised approach;

(b) Both the exposure and the collateral are denominated in the same currency;

(c) Either the transaction is overnight or both the exposure and the collateral are marked to market daily and are subject to daily remargining;

(d) Following a counterparty's failure to remargin, the time that is required between the last mark-to-market before the failure to remargin and the liquidation of the collateral is considered to be no more than four business days;

(e) The transaction is settled across a settlement system proven for that type of transaction;

[71] However, the use or potential use by a UCITS/mutual fund of derivative instruments solely to hedge investments listed in this paragraph and paragraph 159 shall not prevent units in that UCITS/mutual fund from being eligible financial collateral.

(f) The documentation covering the agreement is standard market documentation for repo-style transactions in the securities concerned;

(g) The transaction is governed by documentation specifying that if the counterparty fails to satisfy an obligation to deliver cash or securities or to deliver margin or otherwise defaults, then the transaction is immediately terminable; and

(h) Upon any default event, regardless of whether the counterparty is insolvent or bankrupt, the bank has the unfettered, legally enforceable right to immediately seize and liquidate the collateral for its benefit.

151. *Core market participants* may include, at the discretion of the national supervisor, the following entities:

(a) Sovereigns, central banks and PSEs;

(b) Banks and securities firms;

(c) Other financial companies (including insurance companies) eligible for a 20% risk weight in the standardised approach;

(d) Regulated mutual funds that are subject to capital or leverage requirements;

(e) Regulated pension funds; and

(f) Qualifying central counterparties (QCCPs).

152. Repo transactions that fulfil the requirement in paragraph 150 receive a 10% risk weight, as an exemption to the risk weight floor described in paragraph 147. If the counterparty to the transaction is a core market participant, banks may apply a risk weight of 0% to the transaction.

153. OTC derivative transactions subject to daily mark-to-market, collateralised by cash and where there is no currency mismatch may receive a 0% risk weight. Such transactions collateralised by sovereign or PSE securities qualifying for a 0% risk weight in the standardised approach may receive a 10% risk weight.

154. The 20% floor for the risk weight on a collateralised transaction does not apply and a 0% risk weight may be applied where the exposure and the collateral are denominated in the same currency, and either:

- the collateral is cash on deposit as defined in paragraph 148(a); or
- the collateral is in the form of sovereign/PSE securities eligible for a 0% risk weight, and its market value has been discounted by 20%.

(iii) The comprehensive approach

(a) General requirements for the comprehensive approach

155. In the comprehensive approach, when taking collateral, banks must calculate their adjusted exposure to a counterparty in order to take account of the risk mitigating effect of that collateral. Banks must use the applicable supervisory haircuts to adjust both the amount of the exposure to the counterparty and the value of any collateral received in support of that counterparty to take account of possible future fluctuations in the value of either,[72] as occasioned by market movements. Unless either side of the transaction is cash or a zero haircut is applied, the volatility-adjusted exposure amount is higher than the nominal exposure and the volatility-adjusted collateral value is lower than the nominal collateral value.

[72] Exposure amounts may vary where, for example, securities are being lent.

156. The size of the individual haircuts depends on the type of instrument, type of transaction, residual maturity and the frequency of marking to market and remargining as provided in paragraphs 163 and 164. Haircuts must be scaled up using the square root of time formula depending on the frequency of remargining or marking to market. This formula is included in paragraph 172.

157. Additionally, where the exposure and collateral are held in different currencies, banks must apply an additional haircut to the volatility-adjusted collateral amount in accordance with paragraphs 165 and 204 to take account of possible future fluctuations in exchange rates.

158. The effect of master netting agreements covering repo-style transactions can be recognised for the calculation of capital requirements subject to the conditions and requirements in paragraphs 175 to 178.

(b) Eligible financial collateral under the comprehensive approach

159. The following collateral instruments are eligible for recognition in the comprehensive approach:

(a) All of the instruments listed in paragraph 148;

(b) Equities and convertible bonds that are not included in a main index but which are listed on a recognised security exchange;

(c) UCITS/mutual funds which include the instruments in point (b).

(c) Calculation of capital requirement for transactions secured by financial collateral

160. For a collateralised transaction, the exposure amount after risk mitigation is calculated as follows:

$$E^{*} = max\left\{0, E \cdot \left(1 + H_{e}\right) - C \cdot \left(1 - H_{c} - H_{fx}\right)\right\}$$

where:

E^* = the exposure value after risk mitigation

E = current value of the exposure

H_e = haircut appropriate to the exposure

C = the current value of the collateral received

H_c = haircut appropriate to the collateral

H_{fx} = haircut appropriate for currency mismatch between the collateral and exposure

161. In the case of maturity mismatches, the value of the collateral received (collateral amount) must be adjusted in accordance with paragraphs 126 to 130.

162. The exposure amount after risk mitigation (E^*) must be multiplied by the risk weight of the counterparty to obtain the risk-weighted asset amount for the collateralised transaction.

163. In jurisdictions that allow the use of external ratings for regulatory purposes, the following supervisory haircuts (assuming daily mark-to-market, daily remargining and a 10-business day holding period), expressed as percentages, must be used to determine the haircuts appropriate to the collateral (Hc) and to the exposure (He):

Supervisory haircuts for comprehensive approach

Jurisdictions that allow the use of external ratings for regulatory purposes — Table 14

Issue rating for debt securities	Residual maturity	Sovereigns[73]	Other issuers[74]	Securitisation exposures[75]
AAA to AA–/A-1	≤ 1 year	0.5	1	2
	>1 year, ≤ 3 years	2	3	8
	>3 years, ≤ 5 years		4	
	>5 years, ≤ 10 years	4	6	16
	> 10 years		12	
A+ to BBB–/ A-2/A-3/P-3 and unrated bank securities per para. 148(c)(ii)	≤ 1 year	1	2	4
	>1 year, ≤ 3 years	3	4	12
	>3 years, ≤ 5 years		6	
	>5 years, ≤ 10 years	6	12	24
	> 10 years		20	
BB+ to BB–	All	15	Not eligible	Not eligible
Main index equities (including convertible bonds) and gold		20		
Other equities and convertible bonds listed on a recognised exchange		30		
UCITS/mutual funds		Highest haircut applicable to any security in which the fund can invest, unless the bank can apply the look-through approach (LTA) for equity investments in funds, in which case the bank may use a weighted average of haircuts applicable to instruments held by the fund.		
Cash in the same currency[76]		0		

164. In jurisdictions that do not allow the use of external ratings for regulatory purposes, the following supervisory haircuts (assuming daily mark-to-market, daily remargining and a 10-business day holding period), expressed as percentages, must be used to determine the haircuts appropriate to the collateral (Hc) and to the exposure (He):

73 Includes: PSEs that are treated as sovereigns by the national supervisor, as well as multilateral development banks receiving a 0% risk weight.

74 Includes PSEs that are not treated as sovereigns by the national supervisor.

75 Those exposures that meet the definition set forth in the securitisation framework.

76 Eligible cash collateral specified in paragraph 148(a).

Supervisory haircuts for comprehensive approach

Jurisdictions that do not allow the use of external ratings for regulatory purposes — Table 15

	Residual maturity	Issuer's risk weight (only for securities issued by sovereigns[77])			Other investment-grade securities, consistent with paragraphs 148(d)(iii)[78]	
		0%	20% or 50%	100%	Non-securitisation exposures	Senior securitisation exposures with risk weight < 100%
Debt securities	≤ 1 year	0.5	1	15	2	4
	>1 year, ≤ 3 years	2	3	15	4	12
	>3 years, ≤ 5 years				6	
	>5 years, ≤ 10 years	4	6	15	12	24
	> 10 years				20	
Main index equities (including convertible bonds) and gold	20					
Other equities and convertible bonds listed on a recognised exchange	30					
UCITS/mutual funds	Highest haircut applicable to any security in which the fund can invest, unless the bank can apply the look-through approach (LTA) for equity investments in funds, in which case the bank may use a weighted average of haircuts applicable to instruments held by the fund.					
Cash in the same currency[79]	0					
Other exposure types	30					

165. The haircut for currency risk (Hfx) where exposure and collateral are denominated in different currencies is 8% (also based on a 10-business day holding period and daily mark-to-market).

166. For SFTs and secured lending transactions, a haircut adjustment may need to be applied in accordance with paragraphs 169 to 172.

167. For SFTs in which the bank lends, or posts as collateral, non-eligible instruments, the haircut to be applied on the exposure must be 30%. For transactions in which the bank borrows non-eligible instruments, credit risk mitigation may not be applied.

168. Where the collateral is a basket of assets, the haircut on the basket must be $H = \sum_i a_i H_i$, where a_i is the weight of the asset (as measured by units of currency) in the basket and H_i the haircut applicable to that asset.

(d) Adjustment for different holding periods and non-daily mark-to-market or remargining

169. For some transactions, depending on the nature and frequency of the revaluation and remargining provisions, different holding periods and thus different haircuts must be applied. The framework for collateral haircuts distinguishes between repo-style transactions (ie repo/reverse repos and

77 Includes: PSEs that are treated as sovereigns by the national supervisor, as well as multilateral development banks receiving a 0% risk weight.

78 Includes PSEs that are not treated as sovereigns by the national supervisor.

79 Eligible cash collateral specified in paragraph 148(a).

securities lending/borrowing), "other capital markets-driven transactions" (ie OTC derivatives transactions and margin lending) and secured lending. In capital-market-driven transactions and repo-style transactions, the documentation contains remargining clauses; in secured lending transactions, it generally does not.

170. The minimum holding period for various products is summarised in the following table:

Adjustment to supervisory haircuts

For different holding periods and non-daily mark-to-market or remargining Table 16

Transaction type	Minimum holding period	Condition
Repo-style transaction	five business days	daily remargining
Other capital market transactions	10 business days	daily remargining
Secured lending	20 business days	daily revaluation

171. Where a bank has a transaction or netting set that meets the criteria outlined in paragraphs 41(i) or 41(ii) of the counterparty credit risk standards, the minimum holding period must be the margin period of risk that would apply under those paragraphs.

172. When the frequency of remargining or revaluation is longer than the minimum, the minimum haircut numbers must be scaled up depending on the actual number of business days between remargining or revaluation. The 10-business day haircuts provided in paragraphs 163 and 164 are the default haircuts and these haircuts must be scaled up or down using the formula below:

$$H = H_{10}\sqrt{\frac{N_R + (T_M - 1)}{10}}$$

where:

H = haircut

H_{10} = 10-business day haircut for instrument

N_R = actual number of business days between remargining for capital market transactions or revaluation for secured transactions

T_M = minimum holding period for the type of transaction.

(e) Exemptions under the comprehensive approach for qualifying repo-style transactions involving core market participants

173. For repo-style transactions with core market participants as defined in paragraph 151 and that satisfy the conditions in paragraph 150 supervisors may apply a haircut of zero.

174. Where, under the comprehensive approach, a supervisor applies a specific carve-out to repo-style transactions in securities issued by its domestic government, other supervisors may choose to allow banks incorporated in their jurisdiction to adopt the same approach to the same transactions.

(f) Treatment under the comprehensive approach of SFTs covered by master netting agreements

175. The effects of bilateral netting agreements covering repo-style transactions may be recognised on a counterparty-by-counterparty basis if the agreements are legally enforceable in each relevant jurisdiction upon the occurrence of an event of default and regardless of whether the counterparty is insolvent or bankrupt. In addition, netting agreements must:

(a) provide the non-defaulting party the right to terminate and close out in a timely manner all transactions under the agreement upon an event of default, including in the event of insolvency or bankruptcy of the counterparty;

(b) provide for the netting of gains and losses on transactions (including the value of any collateral) terminated and closed out under it so that a single net amount is owed by one party to the other;

(c) allow for the prompt liquidation or set-off of collateral upon the event of default; and

(d) be, together with the rights arising from the provisions required in (a) to (c) above, legally enforceable in each relevant jurisdiction upon the occurrence of an event of default and regardless of the counterparty's insolvency or bankruptcy.

176. Netting across positions in the banking and trading book may only be recognised when the netted transactions fulfil the following conditions:

- All transactions are marked to market daily;[80] and
- The collateral instruments used in the transactions are recognised as eligible financial collateral in the banking book.

177. The formula in paragraph 178 will be used to calculate the counterparty credit risk capital requirements for transactions with netting agreements. This formula includes the current exposure, an amount for systematic exposure of the securities based on the net exposure, an amount for the idiosyncratic exposure of the securities based on the gross exposure, and an amount for currency mismatch. All other rules regarding the calculation of haircuts under the comprehensive approach stated in paragraphs 155 to 174 equivalently apply for banks using bilateral netting agreements for repo-style transactions.

178. Banks using standard supervisory haircuts for repo-style transactions conducted under a master netting agreement must use the following formula to calculate their exposure amount:

$$E^* = max\left\{0; \sum_i E_i - \sum_i C_j + 0.4 \cdot net\,exposure + 0.6 \cdot \frac{gross\,exposure}{\sqrt{N}} + \sum_{fx}\left(E_{fx} \cdot H_{fx}\right)\right\}$$

where:

E^* = exposure value of the netting set after risk mitigation

E_i = current value of all cash and securities lent, sold with an agreement to repurchase or otherwise posted to the counterparty under the netting agreement

C_j = current value of all cash and securities borrowed, purchased with an agreement to resell or otherwise held by the bank under the netting agreement

$$net\,exposure = \left|\sum_s E_s H_s\right|$$

$$gross\,exposure = \sum_s E_s \left|H_s\right|$$

E_s = The net current value of each security issuance under the netting set (always a positive value)

H_s = haircut appropriate to E_s as described in tables of paragraphs 163 or 164, as applicable,

[80] The holding period for the haircuts depends, as in other repo-style transactions, on the frequency of margining.

– H_s has a positive sign if the security is lent, sold with an agreement to repurchased, or transacted in manner similar to either securities lending or a repurchase agreement

– H_s has a negative sign if the security is borrowed, purchased with an agreement to resell, or transacted in a manner similar to either a securities borrowing or reverse repurchase agreement

N is the number of security issues contained in the netting set (except that issuances where the value E_s is less than one tenth of the value of the largest E_s in the netting set are not included the count)

E_{fx} = absolute value of the net position in each currency *fx* different from the settlement currency

H_{fx} = haircut appropriate for currency mismatch of currency *fx*.

(iv) Minimum haircut floors for SFTs

179. Paragraphs 180 to 188 specify the treatment of certain non-centrally cleared SFTs with certain counterparties. The requirements are not applicable to banks in jurisdictions that are prohibited from conducting such transactions below the minimum haircut floors specified in paragraph 184 below.

180. The haircut floors found in paragraph 184 below apply to the following transactions:

- Non-centrally cleared SFTs in which the financing (ie the lending of cash) against collateral other than government securities is provided to counterparties who are not supervised by a regulator that imposes prudential requirements consistent with international norms.
- Collateral upgrade transactions with these same counterparties. A collateral upgrade transaction is when a bank lends a security to its counterparty and the counterparty pledges a lower quality security as collateral, thus allowing the counterparty to exchange a lower quality security for a higher quality security. For these transactions, the floors must be calculated according to the formula set out in paragraph 187.

181. SFTs with central banks are not subject to the haircut floors.

182. Cash-collateralised securities lending transactions are exempted from the haircut floors where:

- Securities are lent (to the bank) at long maturities and the lender of securities reinvests or employs the cash at the same or shorter maturity, therefore not giving rise to material maturity or liquidity mismatch.
- Securities are lent (to the bank) at call or at short maturities, giving rise to liquidity risk, only if the lender of the securities reinvests the cash collateral into a reinvestment fund or account subject to regulations or regulatory guidance meeting the minimum standards for reinvestment of cash collateral by securities lenders set out in Section 3.1 of the *Policy Framework for Addressing Shadow Banking Risks in Securities Lending and Repos*.[81] For this purpose, banks may rely on representations by securities lenders that their reinvestment of cash collateral meets the minimum standards.

183. Banks that lend securities are exempted from the haircut floors on collateral upgrade transactions if they are unable to re-use, or provide representations that they do not and will not reuse, the securities received as collateral against the securities lent.

[81] Financial Stability Board, *Strengthening oversight and regulation of shadow banking, Policy framework for addressing shadow banking risks in securities lending and repos*, 29 August 2013, www.fsb.org/wp-content/uploads/r_130829b.pdf.

184. These are the haircut floors for SFTs referred to above (herein referred to as "in-scope SFTs"), expressed as percentages:

Residual maturity of collateral	Haircut level	
	Corporate and other issuers	Securitised products
≤ 1 year debt securities, and floating rate notes (FRNs)	0.5%	1%
> 1 year, ≤ 5 years debt securities	1.5%	4%
> 5 years, ≤ 10 years debt securities	3%	6%
> 10 years debt securities	4%	7%
Main index equities	6%	
Other assets within the scope of the framework	10%	

185. In-scope SFTs which do not meet the haircut floors must be treated as unsecured loans to the counterparties.

186. To determine whether the treatment in paragraph 185 applies to an in-scope SFT (or a netting set of SFTs in the case of portfolio-level haircuts), we must compare the collateral haircut H (real or calculated as per the rules below) and a haircut floor f (from paragraph 184 above or calculated as per the below rules).

187. For a single in-scope SFT not included in a netting set, the values of H and f are computed as:

- For a single cash-lent-for-collateral SFT, H and f are known since H is simply defined by the amount of collateral received and f is given in paragraph 184. For the purposes of this calculation, collateral that is called by either counterparty can be treated collateral received from the moment that it is called (ie the treatment is independent of the settlement period).

  For example, consider an in-scope SFT where 100 cash is lent against 101 of a corporate debt security with a 12-year maturity, H is 1% [(101-100)/100] and f is 4% (per paragraph 184). Therefore, the SFT in question would be subject to the treatment in paragraph 185.

- For a single collateral-for-collateral SFT, lending collateral A and receiving collateral B, the H is still be defined by the amount of collateral received but the effective floor of the transaction must integrate the floor of the two types of collateral and can be computed as:

$$f = \left[\left(\frac{1}{1+f_A} \right) \Big/ \left(\frac{1}{1+f_B} \right) \right] - 1 = \frac{1+f_B}{1+f_A} - 1$$

  which will be compared to the effective haircut of the transaction, ie $\frac{C_B}{C_A} - 1$.

  For example, consider an in-scope SFT where 102 of a corporate debt security with a 10-year maturity is exchanged against 104 of equity, the effective haircut H of the transaction is 104/102 – 1 = 1.96% which has to be compared with the effective floor f of 1.06/1.03 – 1 =2.91%. Therefore, the SFT in question would be subject to the treatment in paragraph 185.

188. For a netting of SFTs an effective "portfolio" floor of the transaction must be computed as:

$$f_{Portfolio} = \left[\left(\frac{\sum_s E_s}{\sum_s E_s \times (1+f_s)} \right) \Big/ \left(\frac{\sum_t C_t}{\sum_t C_t \times (1+f_t)} \right) \right] - 1$$

where E_s is the net position in each security (or cash) s that is net lent, C_t the net position that is net borrowed, and f_s and f_t are the haircut floors for the securities that are net lent and net borrowed respectively. This calculation is therefore the weighted average floor of the portfolio. Then the portfolio does not breach the floor where:

$$\frac{\sum C_t - \sum E_s}{\sum E_s} \geq f_{Portfolio}$$

If the portfolio haircut does breach the floor, then the netting set of SFTs is subject to the treatment in paragraph 185. This treatment should be applied to all trades for which the security received appears in the table in paragraph 184 and for which, within the netting set, the bank is also a net receiver in that security. For the purposes of this calculation, collateral that is called by either counterparty can be treated collateral received from the moment that it is called (ie the treatment is independent of the settlement period).

The following portfolio of trades gives an example of how this methodology works (it shows a portfolio that does not breach the floor).

Actual trades	Cash	Sovereign debt	Collateral A	Collateral B
Floor (f_s)	*0%*	*0%*	*6%*	*10%*
Portfolio of trades	50	100	-400	250
E_s	50	100	0	250
C_t	0	0	400	0

$f_{Portfolio}$	-0.0024
$\frac{\sum C_t - \sum E_s}{\sum E_s}$	0

(v) Collateralised OTC derivatives transactions

189. Under the standardised approach for counterparty credit risk (SA-CCR), the calculation of the counterparty credit risk charge for an individual contact will be as follows:

$$Exposure\ amount = alpha \cdot (RC + PFE)$$

where:

Alpha = 1.4,

RC = the replacement cost calculated according to paragraphs 130 to 145 of the counterparty credit risk standards, and

PFE = the amount for potential future exposure calculated according to paragraphs 146 to 187 of the counterparty credit risk standards.

As an alternative to the SA-CCR for the calculation of the counterparty credit risk charge, banks may also use the Internal Model Method as set out in the counterparty credit risk standards, subject to supervisory approval.

4. On-balance sheet netting

190. Where a bank:

(a) has a well founded legal basis for concluding that the netting or offsetting agreement is enforceable in each relevant jurisdiction regardless of whether the counterparty is insolvent or bankrupt;

(b) is able at any time to determine those assets and liabilities with the same counterparty that are subject to the netting agreement;

(c) monitors and controls its roll-off risks; and

(d) monitors and controls the relevant exposures on a net basis,

it may use the net exposure of loans and deposits as the basis for its capital adequacy calculation in accordance with the formula in paragraph 160. Assets (loans) are treated as exposure and liabilities (deposits) as collateral. The haircuts are zero except when a currency mismatch exists. A 10-business day holding period applies when daily mark-to-market is conducted. For on-balance sheet netting, the requirements in paragraphs 163 and 172 and 126 to 130 must be applied.

5. Guarantees and credit derivatives

(i) Operational requirements for guarantees and credit derivatives

191. If conditions set below are met, banks can substitute the risk weight of the counterparty with the risk weight of the guarantor.

192. A guarantee (counter-guarantee) or credit derivative must satisfy the following requirements:

(a) it represents a direct claim on the protection provider;

(b) it is explicitly referenced to specific exposures or a pool of exposures, so that the extent of the cover is clearly defined and incontrovertible;

(c) other than non-payment by a protection purchaser of money due in respect of the credit protection contract it is irrevocable; there is no clause in the contract that would allow the protection provider unilaterally to cancel the credit cover or that would increase the effective cost of cover as a result of deteriorating credit quality in the hedged exposure;[82]

(d) it must be unconditional; there should be no clause in the protection contract outside the direct control of the bank that could prevent the protection provider from being obliged to pay out in a timely manner in the event that the underlying counterparty fails to make the payment(s) due.

193. In the case of maturity mismatches, the amount of credit protection that is provided must be adjusted in accordance with paragraphs 126 to 130.

(ii) Specific operational requirements for guarantees

194. In addition to the legal certainty requirements in paragraph 125, in order for a guarantee to be recognised, the following requirements must be satisfied:

(a) On the qualifying default/non-payment of the counterparty, the bank may in a timely manner pursue the guarantor for any monies outstanding under the documentation governing the transaction. The guarantor may make one lump sum payment of all monies under such documentation to the bank, or the guarantor may assume the future payment obligations of the counterparty covered by the guarantee. The bank must have the right to receive any such payments from the guarantor without first having to take legal action in order to pursue the counterparty for payment.

[82] There must be no possibility for the protection provider to change the maturity agreed *ex post*.

(b) The guarantee is an explicitly documented obligation assumed by the guarantor.

(c) Except as noted in the following sentence, the guarantee covers all types of payments the underlying counterparty is expected to make under the documentation governing the transaction, for example notional amount, margin payments, etc. Where a guarantee covers payment of principal only, interests and other uncovered payments must be treated as an unsecured amount in accordance with the rules for proportional cover described in paragraph 202.

(iii) Specific operational requirements for credit derivatives

195. In addition to the legal certainty requirements in paragraph 125, in order for a credit derivative contract to be recognised, the following requirements must be satisfied:

(a) The credit events specified by the contracting parties must at a minimum cover:

- failure to pay the amounts due under terms of the underlying obligation that are in effect at the time of such failure (with a grace period that is closely in line with the grace period in the underlying obligation);
- bankruptcy, insolvency or inability of the obligor to pay its debts, or its failure or admission in writing of its inability generally to pay its debts as they become due, and analogous events; and
- restructuring[83] of the underlying obligation involving forgiveness or postponement of principal, interest or fees that results in a credit loss event (ie write-off, specific provision or other similar debit to the profit and loss account).

(b) If the credit derivative covers obligations that do not include the underlying obligation, section (g) below governs whether the asset mismatch is permissible.

(c) The credit derivative shall not terminate prior to expiration of any grace period required for a default on the underlying obligation to occur as a result of a failure to pay. In the case of a maturity mismatch, the provisions of paragraphs 126 to 130 must be applied.

(d) Credit derivatives allowing for cash settlement are recognised for capital purposes insofar as a robust valuation process is in place in order to estimate loss reliably. There must be a clearly specified period for obtaining post-credit-event valuations of the underlying obligation. If the reference obligation specified in the credit derivative for purposes of cash settlement is different from the underlying obligation, section (g) below governs whether the asset mismatch is permissible.

(e) If the protection purchaser's right/ability to transfer the underlying obligation to the protection provider is required for settlement, the terms of the underlying obligation must provide that any required consent to such transfer may not be unreasonably withheld.

(f) The identity of the parties responsible for determining whether a credit event has occurred must be clearly defined. This determination must not be the sole responsibility of the protection seller. The protection buyer must have the right/ability to inform the protection provider of the occurrence of a credit event.

[83] When hedging corporate exposures, this particular credit event is not required to be specified provided that (i) A 100% vote is needed to amend maturity, principal, coupon, currency or seniority status of the underlying corporate exposure; (ii) The legal domicile in which the corporate exposure is governed has a well-established bankruptcy code that allows for a company to reorganise/restructure and provides for an orderly settlement of creditor claims. If these conditions are not met, then the treatment in paragraph 196 may be eligible.

(g) A mismatch between the underlying obligation and the reference obligation under the credit derivative (ie the obligation used for purposes of determining cash settlement value or the deliverable obligation) is permissible if (1) the reference obligation ranks pari passu with or is junior to the underlying obligation, and (2) the underlying obligation and reference obligation share the same obligor (ie the same legal entity) and legally enforceable cross-default or cross-acceleration clauses are in place.

(h) A mismatch between the underlying obligation and the obligation used for purposes of determining whether a credit event has occurred is permissible if (1) the latter obligation ranks pari passu with or is junior to the underlying obligation, and (2) the underlying obligation and reference obligation share the same obligor (ie the same legal entity) and legally enforceable cross-default or cross-acceleration clauses are in place.

196. When the restructuring of the underlying obligation is not covered by the credit derivative, but the other requirements in paragraph 195 are met, partial recognition of the credit derivative will be allowed. If the amount of the credit derivative is less than or equal to the amount of the underlying obligation, 60% of the amount of the hedge can be recognised as covered. If the amount of the credit derivative is larger than that of the underlying obligation, then the amount of eligible hedge is capped at 60% of the amount of the underlying obligation.

(iv) Range of eligible guarantors (counter-guarantors)/protection providers and credit derivatives

197. Credit protection given by the following entities can be recognised when they have a lower risk weight than the counterparty:

- Sovereign entities,[84] PSEs, MDBs, banks, securities firms and other prudentially regulated financial institutions with a lower risk weight than the counterparty;[85]
- In jurisdictions that allow the use of external ratings for regulatory purposes:
  - other entities that are externally rated except when credit protection is provided to a securitisation exposure. This would include credit protection provided by a parent, subsidiary and affiliate companies when they have a lower risk weight than the obligor;
  - when credit protection is provided to a securitisation exposure, other entities that currently are externally rated BBB– or better and that were externally rated A– or better at the time the credit protection was provided. This would include credit protection provided by parent, subsidiary and affiliate companies when they have a lower risk weight than the obligor.
- In jurisdictions that do not allow the use of external ratings for regulatory purposes:
  - Other entities, defined as "investment grade" meaning they have adequate capacity to meet their financial commitments (including repayments of principal and interest) in a timely manner, irrespective of the economic cycle and business conditions.

[84] This includes the Bank for International Settlements, the International Monetary Fund, the European Central Bank, the European Union, the European Stability Mechanism (ESM) and the European Financial Stability Facility (EFSF), as well as MDBs eligible for a 0% risk weight as defined in paragraph 14 and referred to in footnote 11.

[85] A prudentially regulated financial institution is defined as: a legal entity supervised by a regulator that imposes prudential requirements consistent with international norms or a legal entity (parent company or subsidiary) included in a consolidated group where any substantial legal entity in the consolidated group is supervised by a regulator that imposes prudential requirements consistent with international norms. These include, but are not limited to, prudentially regulated insurance companies, broker/dealers, thrifts and futures commission merchants, and qualifying central counterparties as defined in Basel Committee on Banking Supervision, *Regulatory capital requirements framework for bank exposures to central counterparties*, July 2012, www.bis.org/publ/bcbs227.pdf.

When making this determination, the bank should assess the entity against the investment grade definition taking into account the complexity of its business model, performance against industry and peers, and risks posed by the entity's operating environment.

Moreover, the following conditions will have to be met:

- o For corporate entities (or the entity's parent company), they must have securities outstanding on a recognised securities exchange;
- o The creditworthiness of these "investment grade entities" is not positively correlated with the credit risk of the exposures for which they provided guarantees.

– Parent, subsidiary and affiliate companies of the obligor where their creditworthiness is not positively correlated with the credit risk of the exposures for which they provided guarantees. For an intra-group company to be recognised as eligible guarantor, the credit risk of the whole group should be taken into account.

198. Only credit default swaps and total return swaps that provide credit protection equivalent to guarantees are eligible for recognition.[86] The following exception applies: where a bank buys credit protection through a total return swap and records the net payments received on the swap as net income, but does not record offsetting deterioration in the value of the asset that is protected (either through reductions in fair value or by an addition to reserves), the credit protection will not be recognised.

199. First-to-default and all other nth-to-default credit derivatives (ie by which a bank obtains credit protection for a basket of reference names and where the first- or nth–to-default among the reference names triggers the credit protection and terminates the contract) are not eligible as a credit risk mitigation technique and therefore cannot provide any regulatory capital relief. In transactions in which a bank provided credit protection through such instruments, it shall apply the treatment described in paragraph 89.

(v) Risk-weight treatment of transactions in which eligible credit protection is provided

General risk-weight treatment

200. The protected portion is assigned the risk weight of the protection provider. The uncovered portion of the exposure is assigned the risk weight of the underlying counterparty.

201. Materiality thresholds on payments below which the protection provider is exempt from payment in the event of loss are equivalent to retained first-loss positions. The portion of the exposure that is below a materiality threshold must be assigned a risk weight of 1250% by the bank purchasing the credit protection.

Proportional cover

202. Where losses are shared pari passu on a pro rata basis between the bank and the guarantor, capital relief is afforded on a proportional basis, ie the protected portion of the exposure receives the treatment applicable to eligible guarantees/credit derivatives, with the remainder treated as unsecured.

Tranched cover

203. Where the bank transfers a portion of the risk of an exposure in one or more tranches to a protection seller or sellers and retains some level of the risk of the loan, and the risk transferred and the risk retained are of different seniority, banks may obtain credit protection for either the senior tranches

[86] Cash-funded credit-linked notes issued by the bank against exposures in the banking book that fulfil all minimum requirements for credit derivatives are treated as cash-collateralised transactions. However, in this case the limitations regarding the protection provider as set out in paragraph 197 do not apply.

(eg the second-loss portion) or the junior tranche (eg the first-loss portion). In this case the rules as set out in the securitisation standard apply.

(vi) Currency mismatches

204. Where the credit protection is denominated in a currency different from that in which the exposure is denominated – ie there is a currency mismatch – the amount of the exposure deemed to be protected must be reduced by the application of a haircut H_{FX}, ie

$$G_A = G \cdot \left(1 - H_{FX}\right)$$

where:

G = nominal amount of the credit protection

H_{FX} = haircut appropriate for currency mismatch between the credit protection and underlying obligation.

The currency mismatch haircut for a 10-business day holding period (assuming daily marking to market) is 8%. This haircut must be scaled up using the square root of time formula, depending on the frequency of revaluation of the credit protection as described in paragraph 172.

(vii) Sovereign guarantees and counter-guarantees

205. As specified in paragraph 8, a lower risk weight may be applied at national discretion to a bank's exposures to the sovereign (or central bank) where the bank is incorporated and where the exposure is denominated in domestic currency and funded in that currency. National supervisors may extend this treatment to portions of exposures guaranteed by the sovereign (or central bank), where the guarantee is denominated in the domestic currency and the exposure is funded in that currency. An exposure may be covered by a guarantee that is indirectly counter-guaranteed by a sovereign. Such an exposure may be treated as covered by a sovereign guarantee provided that:

(a) the sovereign counter-guarantee covers all credit risk elements of the exposure;

(b) both the original guarantee and the counter-guarantee meet all operational requirements for guarantees, except that the counter-guarantee need not be direct and explicit to the original exposure; and

(c) the supervisor is satisfied that the cover is robust and that no historical evidence suggests that the coverage of the counter-guarantee is less than effectively equivalent to that of a direct sovereign guarantee.

Internal ratings-based approach for credit risk

A. Overview

1. This section describes the IRB approach for credit risk. Subject to certain minimum conditions and disclosure requirements, banks that have received supervisory approval to use the IRB approach may rely on their own internal estimates of risk components in determining the capital requirement for a given exposure. The risk components include measures of the probability of default (PD), loss given default (LGD), the exposure at default (EAD), and effective maturity (M). In some cases, banks may be required to use a supervisory value as opposed to an internal estimate for one or more of the risk components.

2. The IRB approach is based on measures of unexpected losses (UL) and expected losses (EL). The risk-weight functions produce capital requirements for the UL portion. Expected losses are treated separately, as outlined in paragraph 43 of the Basel II framework (June 2006)[1] and Section G below.

3. In this section, the asset classes are defined first. Adoption of the IRB approach across asset classes is also discussed early in this section. The risk components, each of which is defined later in this section, serve as inputs to the risk-weight functions that have been developed for separate asset classes. For example, there is a risk-weight function for corporate exposures and another one for qualifying revolving retail exposures. The treatment of each asset class begins with a presentation of the relevant risk-weight function(s) followed by the risk components and other relevant factors, such as the treatment of credit risk mitigants. The legal certainty standards for recognising CRM as set out in paragraphs 117 to 205 of the standardised approach apply for both the foundation and advanced IRB approaches. The minimum requirements that banks must satisfy to use the IRB approach are presented at the end of this section starting at Section H, paragraph 154.

B. Mechanics of the IRB approach

4. In Section 1 that follows, the asset classes (eg corporate exposures and retail exposures) eligible for the IRB approach are defined. Section 2 provides a description of the risk components to be used by banks by asset class. Section 3 discusses a bank's adoption of the IRB approach at the asset class level and the related roll-out requirements. In cases where an IRB treatment is not specified, the risk weight for those other exposures is 100%, except when a 0% risk weight applies under the standardised approach, and the resulting risk-weighted assets are assumed to represent UL only.

1. Categorisation of exposures

5. Under the IRB approach, banks must categorise banking-book exposures into broad classes of assets with different underlying risk characteristics, subject to the definitions set out below. The classes of assets are (a) corporate, (b) sovereign, (c) bank, (d) retail, and (e) equity. Within the corporate asset class, five sub-classes of specialised lending are separately identified. Within the retail asset class, three sub-classes are separately identified. Within the corporate and retail asset classes, a distinct treatment for purchased receivables may also apply provided certain conditions are met. For the equity asset class the IRB approach is not permitted, as outlined further below.

[1] References to the Basel II framework (June 2006) are to the comprehensive version available at: www.bis.org/publ/bcbs128.pdf.

6. The classification of exposures in this way is broadly consistent with established bank practice. However, some banks may use different definitions in their internal risk management and measurement systems. While it is not the intention of the Committee to require banks to change the way in which they manage their business and risks, banks are required to apply the appropriate treatment to each exposure for the purposes of deriving their minimum capital requirement. Banks must demonstrate to supervisors that their methodology for assigning exposures to different classes is appropriate and consistent over time.

7. For the treatment of securitisation exposures, see the Committee's *Revisions to the securitisation framework*.[2]

(i) Definition of corporate exposures

8. In general, a corporate exposure is defined as a debt obligation of a corporation, partnership, or proprietorship. Banks are permitted to distinguish separately exposures to small- and medium-sized entities (SME), as defined in paragraph 54.

9. In addition to general corporates, within the corporate asset class, five sub-classes of specialised lending (SL) are identified. Such lending possesses all the following characteristics, either in legal form or economic substance:

- The exposure is typically to an entity (often a special purpose entity (SPE)) which was created specifically to finance and/or operate physical assets;
- The borrowing entity has little or no other material assets or activities, and therefore little or no independent capacity to repay the obligation, apart from the income that it receives from the asset(s) being financed;
- The terms of the obligation give the lender a substantial degree of control over the asset(s) and the income that it generates; and
- As a result of the preceding factors, the primary source of repayment of the obligation is the income generated by the asset(s), rather than the independent capacity of a broader commercial enterprise.

10. The five sub-classes of specialised lending (SL) are project finance, object finance, commodities finance, income-producing real estate, and high-volatility commercial real estate. Each of these sub-classes is defined below.

Project finance

11. Project finance (PF) is a method of funding in which the lender looks primarily to the revenues generated by a single project, both as the source of repayment and as security for the exposure. This type of financing is usually for large, complex and expensive installations that might include, for example, power plants, chemical processing plants, mines, transportation infrastructure, environment, and telecommunications infrastructure. Project finance may take the form of financing of the construction of a new capital installation, or refinancing of an existing installation, with or without improvements.

12. In such transactions, the lender is usually paid solely or almost exclusively out of the money generated by the contracts for the facility's output, such as the electricity sold by a power plant. The borrower is usually an SPE that is not permitted to perform any function other than developing, owning, and operating the installation. The consequence is that repayment depends primarily on the project's cash flow and on the collateral value of the project's assets. In contrast, if repayment of the exposure depends

[2] Basel Committee on Banking Supervision, *Revisions to the securitisation framework*, 11 December 2014 (revised July 2016), www.bis.org/bcbs/publ/d374.pdf.

primarily on a well-established, diversified, credit-worthy, contractually obligated end user for repayment, it is considered a secured exposure to that end-user.

Object finance

13. Object finance (OF) refers to a method of funding the acquisition of physical assets (eg ships, aircraft, satellites, railcars, and fleets) where the repayment of the exposure is dependent on the cash flows generated by the specific assets that have been financed and pledged or assigned to the lender. A primary source of these cash flows might be rental or lease contracts with one or several third parties. In contrast, if the exposure is to a borrower whose financial condition and debt-servicing capacity enables it to repay the debt without undue reliance on the specifically pledged assets, the exposure should be treated as a collateralised corporate exposure.

Commodities finance

14. Commodities finance (CF) refers to structured short-term lending to finance reserves, inventories, or receivables of exchange-traded commodities (eg crude oil, metals, or crops), where the exposure will be repaid from the proceeds of the sale of the commodity and the borrower has no independent capacity to repay the exposure. This is the case when the borrower has no other activities and no other material assets on its balance sheet. The structured nature of the financing is designed to compensate for the weak credit quality of the borrower. The exposure's rating reflects its self-liquidating nature and the lender's skill in structuring the transaction rather than the credit quality of the borrower.

15. The Committee believes that such lending can be distinguished from exposures financing the reserves, inventories, or receivables of other more diversified corporate borrowers. Banks are able to rate the credit quality of the latter type of borrowers based on their broader ongoing operations. In such cases, the value of the commodity serves as a risk mitigant rather than as the primary source of repayment.

Income-producing real estate

16. Income-producing real estate (IPRE) refers to a method of providing funding to real estate (such as, office buildings to let, retail space, multifamily residential buildings, industrial or warehouse space, and hotels) where the prospects for repayment and recovery on the exposure depend primarily on the cash flows generated by the asset. The primary source of these cash flows would generally be lease or rental payments or the sale of the asset. The borrower may be, but is not required to be, an SPE, an operating company focused on real estate construction or holdings, or an operating company with sources of revenue other than real estate. The distinguishing characteristic of IPRE versus other corporate exposures that are collateralised by real estate is the strong positive correlation between the prospects for repayment of the exposure and the prospects for recovery in the event of default, with both depending primarily on the cash flows generated by a property.

High-volatility commercial real estate

17. High-volatility commercial real estate (HVCRE) lending is the financing of commercial real estate that exhibits higher loss rate volatility (ie higher asset correlation) compared to other types of SL. HVCRE includes:

- Commercial real estate exposures secured by properties of types that are categorised by the national supervisor as sharing higher volatilities in portfolio default rates;
- Loans financing any of the land acquisition, development and construction (ADC) phases for properties of those types in such jurisdictions; and
- Loans financing ADC of any other properties where the source of repayment at origination of the exposure is either the future uncertain sale of the property or cash flows whose source of repayment is substantially uncertain (eg the property has not yet been leased to the occupancy

rate prevailing in that geographic market for that type of commercial real estate), unless the borrower has substantial equity at risk. Commercial ADC loans exempted from treatment as HVCRE loans on the basis of certainty of repayment of borrower equity are, however, ineligible for the additional reductions for SL exposures described in paragraph 58.

18. Where supervisors categorise certain types of commercial real estate exposures as HVCRE in their jurisdictions, they are required to make public such determinations. Other supervisors need to ensure that such treatment is then applied equally to banks under their supervision when making such HVCRE loans in that jurisdiction.

(ii) Definition of sovereign exposures

19. This asset class covers all exposures to counterparties treated as sovereigns under the standardised approach. This includes sovereigns (and their central banks), certain PSEs identified as sovereigns in the standardised approach, MDBs that meet the criteria for a 0% risk weight and referred to in footnote 11 of the standardised approach, and the entities referred to in paragraph 10 of the standardised approach. The treatment of sovereign exposures is unchanged from the Basel II framework (June 2006).

(iii) Definition of bank exposures

20. This asset class covers exposures to banks as defined in paragraph 16 of the standardised approach for credit risk and those securities firms and other financial institutions set out in paragraph 37 of the standardised approach for credit risk that are treated as exposures to banks. Bank exposures also include claims on all domestic PSEs that are not treated as exposures to sovereigns under the standardised approach, and MDBs that do not meet the criteria for a 0% risk weight under the standardised approach (ie MDBs that are not listed in footnote 11 of the standardised approach).

(iv) Definition of retail exposures

21. An exposure is categorised as a retail exposure if it meets all of the following criteria:

Nature of borrower or low value of individual exposures

- Exposures to individuals – such as revolving credits and lines of credit (eg credit cards, overdrafts, and retail facilities secured by financial instruments) as well as personal term loans and leases (eg instalment loans, auto loans and leases, student and educational loans, personal finance, and other exposures with similar characteristics) – are generally eligible for retail treatment regardless of exposure size, although supervisors may wish to establish exposure thresholds to distinguish between retail and corporate exposures.
- Residential mortgage loans[3] (including first and subsequent liens, term loans and revolving home equity lines of credit) are eligible for retail treatment regardless of exposure size so long as the credit is:
  - (i) an exposure to an individual;[4] or
  - (ii) an exposure to associations or cooperatives of individuals that are regulated under national law and exist with the only purpose of granting its members the use of a primary residence in the property securing the loan.

[3] Loans that meet the conditions set out in footnote 35 of paragraph 60 of the standardised approach for credit risk are also eligible to be included in the IRB retail residential mortgage sub-class.

[4] At national discretion, supervisors may exclude from the retail residential mortgage sub-asset class loans to individuals that have mortgaged more than a specified number of properties or housing units, and treat such loans as corporate exposures.

- Loans extended to small businesses and managed as retail exposures are eligible for retail treatment provided the total exposure of the banking group to a small business borrower (on a consolidated basis where applicable) is less than €1 million. Small business loans extended through or guaranteed by an individual are subject to the same exposure threshold.
- It is expected that supervisors provide flexibility in the practical application of such thresholds such that banks are not forced to develop extensive new information systems simply for the purpose of ensuring perfect compliance. It is, however, important for supervisors to ensure that such flexibility (and the implied acceptance of exposure amounts in excess of the thresholds that are not treated as violations) is not being abused.

Large number of exposures

22. The exposure must be one of a large pool of exposures, which are managed by the bank on a pooled basis.

- Small business exposures below €1 million may be treated as retail exposures if the bank treats such exposures in its internal risk management systems consistently over time and in the same manner as other retail exposures. This requires that such an exposure be originated in a similar manner to other retail exposures. Furthermore, it must not be managed individually in a way comparable to corporate exposures, but rather as part of a portfolio segment or pool of exposures with similar risk characteristics for purposes of risk assessment and quantification. However, this does not preclude retail exposures from being treated individually at some stages of the risk management process. The fact that an exposure is rated individually does not by itself deny the eligibility as a retail exposure.

23. Within the retail asset class category, banks are required to identify separately three sub-classes of exposures: (a) residential mortgage loans, as defined above, (b) qualifying revolving retail exposures, as defined in the following paragraph, and (c) all other retail exposures.

(v) Definition of qualifying revolving retail exposures

24. All of the following criteria must be satisfied for a sub-portfolio to be treated as a qualifying revolving retail exposure (QRRE). These criteria must be applied at a sub-portfolio level consistent with the bank's segmentation of its retail activities generally. Segmentation at the national or country level (or below) should be the general rule.

(a) The exposures are revolving, unsecured, and uncommitted (both contractually and in practice). In this context, revolving exposures are defined as those where customers' outstanding balances are permitted to fluctuate based on their decisions to borrow and repay, up to a limit established by the bank.

(b) The exposures are to individuals.

(c) The maximum exposure to a single individual in the sub-portfolio is €100,000 or less.

(d) Because the asset correlation assumptions for the QRRE risk-weight function are markedly below those for the other retail risk-weight function at low PD values, banks must demonstrate that the use of the QRRE risk-weight function is constrained to portfolios that have exhibited low volatility of loss rates, relative to their average level of loss rates, especially within the low PD bands. Supervisors will review the relative volatility of loss rates across the QRRE subportfolios, as well as the aggregate QRRE portfolio, and intend to share information on the typical characteristics of QRRE loss rates across jurisdictions.

(e) Data on loss rates for the sub-portfolio must be retained in order to allow analysis of the volatility of loss rates.

(f) The supervisor must concur that treatment as a qualifying revolving retail exposure is consistent with the underlying risk characteristics of the sub-portfolio.

25. The QRRE sub-class is split into exposures to transactors and revolvers. A QRRE transactor is an exposure to an obligor that meets the definition set out in paragraph 56 of the standardised approach. That is, the exposure is to an obligor in relation to a facility such as credit card or charge card where the balance has been repaid in full at each scheduled repayment date for the previous 12 months, or the exposure is in relation to an overdraft facility if there have been no drawdowns over the previous 12 months. All exposures that are not QRRE transactors are QRRE revolvers.

(vi) Definition of equity exposures

26. This asset class covers exposures to equities as defined in paragraph 49 of the standardised approach for credit risk.

(vii) Definition of eligible purchased receivables

27. Eligible purchased receivables are divided into retail and corporate receivables as defined below.

Retail receivables

28. Purchased retail receivables, provided the purchasing bank complies with the IRB rules for retail exposures, are eligible for the top-down approach as permitted within the existing standards for retail exposures. The bank must also apply the minimum operational requirements as set forth in Sections F and H.

Corporate receivables

29. In general, for purchased corporate receivables, banks are expected to assess the default risk of individual obligors as specified in Section C.1 (starting with paragraph 52) consistent with the treatment of other corporate exposures. However, the top-down approach may be used, provided that the purchasing bank's programme for corporate receivables complies with both the criteria for eligible receivables and the minimum operational requirements of this approach. The use of the top-down purchased receivables treatment is limited to situations where it would be an undue burden on a bank to be subjected to the minimum requirements for the IRB approach to corporate exposures that would otherwise apply. Primarily, it is intended for receivables that are purchased for inclusion in asset-backed securitisation structures, but banks may also use this approach, with the approval of national supervisors, for appropriate on-balance sheet exposures that share the same features.

30. Supervisors may deny the use of the top-down approach for purchased corporate receivables depending on the bank's compliance with minimum requirements. In particular, to be eligible for the proposed 'top-down' treatment, purchased corporate receivables must satisfy the following conditions:

- The receivables are purchased from unrelated, third party sellers, and as such the bank has not originated the receivables either directly or indirectly.

- The receivables must be generated on an arm's-length basis between the seller and the obligor. (As such, intercompany accounts receivable and receivables subject to contra-accounts between firms that buy and sell to each other are ineligible.[5])
- The purchasing bank has a claim on all proceeds from the pool of receivables or a pro-rata interest in the proceeds.[6]
- National supervisors must also establish concentration limits above which capital charges must be calculated using the minimum requirements for the bottom-up approach for corporate exposures. Such concentration limits may refer to one or a combination of the following measures: the size of one individual exposure relative to the total pool, the size of the pool of receivables as a percentage of regulatory capital, or the maximum size of an individual exposure in the pool.

31. The existence of full or partial recourse to the seller does not automatically disqualify a bank from adopting this top-down approach, as long as the cash flows from the purchased corporate receivables are the primary protection against default risk as determined by the rules in paragraphs 132 to 135 for purchased receivables and the bank meets the eligibility criteria and operational requirements.

2. Foundation and advanced approaches

32. For each of the asset classes covered under the IRB framework, there are three key elements:

- Risk components: estimates of risk parameters provided by banks, some of which are supervisory estimates.
- Risk-weight functions: the means by which risk components are transformed into risk-weighted assets and therefore capital requirements.
- Minimum requirements: the minimum standards that must be met in order for a bank to use the IRB approach for a given asset class.

33. For many of the asset classes, the Committee has made available two broad approaches: a foundation and an advanced approach. Under the foundation approach (F-IRB approach), as a general rule, banks provide their own estimates of PD and rely on supervisory estimates for other risk components. Under the advanced approach (A-IRB approach), banks provide more of their own estimates of PD, LGD and EAD, and their own calculation of M, subject to meeting minimum standards. For both the foundation and advanced approaches, banks must always use the risk-weight functions provided in this Framework for the purpose of deriving capital requirements. The full suite of approaches is described below.

34. For exposures to equities, defined in paragraph 26 above, the IRB approaches are not permitted (see paragraph 42). In addition, the A-IRB approach cannot be used for the following:

(i) Exposures to general corporates belonging to a group with total consolidated annual revenues greater than €500m.

(ii) Exposures in the bank asset class (paragraph 20), and other securities firms and financial institutions (including insurance companies and any other financial institutions in the corporate asset class).

In making the assessment above for the revenue threshold, the amounts must be as reported in the audited financial statements of the corporates or, for corporates that are part of consolidated groups,

5 Contra-accounts involve a customer buying from and selling to the same firm. The risk is that debts may be settled through payments in kind rather than cash. Invoices between the companies may be offset against each other instead of being paid. This practice can defeat a security interest when challenged in court.

6 Claims on tranches of the proceeds (first loss position, second loss position, etc) would fall under the securitisation treatment.

their consolidated groups (according to the accounting standard applicable to the ultimate parent of the consolidated group). The figures must be based on the average amounts calculated over the prior three years, or on the latest amounts updated every three years by the bank.

(i) Corporate and bank exposures

35. Under the foundation approach, banks must provide their own estimates of PD associated with each of their borrower grades, but must use supervisory estimates for the other relevant risk components. The other risk components are LGD, EAD and M.[7]

36. Under the advanced approach, banks must calculate the effective maturity (M)[8] and provide their own estimates of PD, LGD and EAD.

37. There is an exception to this general rule for the five sub-classes of assets identified as SL.

The SL categories: PF, OF, CF, IPRE and HVCRE

38. Banks that do not meet the requirements for the estimation of PD under the corporate foundation approach for their SL exposures are required to map their internal risk grades to five supervisory categories, each of which is associated with a specific risk weight. This version is termed the 'supervisory slotting criteria approach'.

39. Banks that meet the requirements for the estimation of PD are able to use the foundation approach to corporate exposures to derive risk weights for all classes of SL exposures except HVCRE. At national discretion, banks meeting the requirements for HVCRE exposure are able to use a foundation approach that is similar in all respects to the corporate approach, with the exception of a separate risk-weight function as described in paragraph 64.

40. Banks that meet the requirements for the estimation of PD, LGD and EAD are able to use the advanced approach to corporate exposures to derive risk weights for all classes of SL exposures except HVCRE. At national discretion, banks meeting these requirements for HVCRE exposure are able to use an advanced approach that is similar in all respects to the corporate approach, with the exception of a separate risk-weight function as described in paragraph 64.

(ii) Retail exposures

41. For retail exposures, banks must provide their own estimates of PD, LGD and EAD. There is no foundation approach for this asset class.

(iii) Equity exposures

42. All equity exposures are subject to the standardised approach set out in paragraph 50[9] of the standardised approach for credit risk, with the exception of equity investments in funds that are subject to the requirements set out in the standard published by the Basel Committee in December 2013.[10]

[7] As noted in paragraph 107, some supervisors may require banks using the foundation approach to calculate M using the definition provided in paragraphs 109 to 114.

[8] At the discretion of the national supervisor, certain domestic exposures may be exempt from the calculation of M (see paragraph 108).

[9] The prohibition on the use of the IRB approach for equity exposures will be subject to a five-year linear phase-in arrangement from the date of implementation of this standard. During the phase-in period, the risk weight for equity exposures will be the greater of: (i) the risk weight as calculated under the IRB approach; and (ii) the risk weight set for the linear phase-in arrangement under the standardised approach for credit risk (see paragraph 50 footnote 29 of the standardised approach). Alternatively, supervisory authorities may require banks to apply the fully phased-in standardised approach treatment from the date of implementation of this standard.

[10] Final standards on capital requirements for banks' equity investments in funds are available at www.bis.org/publ/bcbs266.pdf.

(iv) Eligible purchased receivables

43. The treatment potentially straddles two asset classes. For eligible corporate receivables, both a foundation and advanced approach are available subject to certain operational requirements being met. As noted in paragraph 29, for corporate purchased receivables banks are in general expected to assess the default risk of individual obligors. The bank may use the A-IRB treatment for purchased corporate receivables (paragraphs 134 and 135) only for exposures to individual corporate obligors that are eligible for the A-IRB approach according to paragraph 34. Otherwise, the F-IRB treatment for purchased corporate receivables should be used. For eligible retail receivables, as with the retail asset class, only the A-IRB approach is available.

3. Adoption of the IRB approach for asset classes

44. Once a bank adopts an IRB approach for part of its holdings within an asset class, it is expected to extend it across all holdings within that asset class. In this context, the relevant assets classes are as follows:

- Banks
- Corporates (excluding specialised lending and purchased receivables)
- Specialised lending
- Corporate purchased receivables
- Qualifying revolving retail exposures
- Retail residential mortgages
- Other retail (excluding purchased receivables)
- Retail purchased receivables

The Committee recognises however, that, for many banks, it may not be practicable for various reasons to implement the IRB approach for an entire asset class across all business units at the same time. Furthermore, once on IRB, data limitations may mean that banks can meet the standards for the use of own estimates of LGD and EAD for some but not all of their exposures within an asset classes at the same time (for example, exposures that are in the same asset class, but are in different business units).

45. As such, supervisors may allow banks to adopt a phased rollout of the IRB approach across an asset class. The phased rollout includes: (i) adoption of IRB across the asset class within the same business unit; (ii) adoption of IRB for the asset class across business units in the same banking group; and (iii) move from the foundation approach to the advanced approach for certain risk components where use of the advanced approach is permitted. However, when a bank adopts an IRB approach for an asset class within a particular business unit, it must apply the IRB approach to all exposures within that asset class in that unit.

46. If a bank intends to adopt an IRB approach to an asset class, it must produce an implementation plan, specifying to what extent and when it intends to roll out the IRB approaches within the asset class and business units. The plan should be realistic, and must be agreed with the supervisor. It should be driven by the practicality and feasibility of moving to the more advanced approaches, and not motivated by a desire to adopt a Pillar 1 approach that minimises its capital charge. During the roll-out period, supervisors will ensure that no capital relief is granted for intra-group transactions which are designed to reduce a banking group's aggregate capital charge by transferring credit risk among entities on the standardised approach, foundation and advanced IRB approaches. This includes, but is not limited to, asset sales or cross guarantees.

47. Some exposures that are immaterial in terms of size and perceived risk profile within their asset class may be exempt from the requirements in the previous two paragraphs, subject to supervisory approval. Capital requirements for such operations will be determined according to the standardised approach, with the national supervisor determining whether a bank should hold more capital under Pillar 2 for such positions.

48. Banks adopting an IRB approach for an asset class are expected to continue to employ an IRB approach for that asset class. A voluntary return to the standardised or foundation approach is permitted only in extraordinary circumstances, such as divestiture of a large fraction of the bank's credit-related business in that asset class, and must be approved by the supervisor.

49. Given the data limitations associated with SL exposures, a bank may remain on the supervisory slotting criteria approach for one or more of the PF, OF, CF, IPRE or HVCRE sub-classes, and move to the foundation or advanced approach for the other sub-classes. However, a bank should not move to the advanced approach for the HVCRE sub-class without also doing so for material IPRE exposures at the same time.

50. Irrespective of the materiality, exposures to CCPs arising from OTC derivatives, exchange traded derivatives transactions and SFTs must be treated according to the dedicated treatment laid down in Section XI of the counterparty credit risk standards.

C. Rules for corporate and bank exposures

51. Section C presents the method of calculating the unexpected loss (UL) capital requirements for corporate and bank exposures. As discussed in Section C.1, a single risk-weight function is provided for determining the capital requirement for corporate and bank exposures. Supervisory risk weights are provided for each of the specialised lending sub-classes of corporates, and a separate risk-weight function is also provided for HVCRE. Section C.2 discusses the risk components. The method of calculating expected losses, and for determining the difference between that measure and provisions is described in Section G.

1. Risk-weighted assets for corporate and bank exposures

(i) Formula for derivation of risk-weighted assets for corporate and bank exposures

52. The derivation of risk-weighted assets is dependent on estimates of the PD, LGD, EAD and, in some cases, effective maturity (M), for a given exposure.

53. Throughout this section, PD and LGD are measured as decimals, and EAD is measured as currency (eg euros), except where explicitly noted otherwise. For exposures not in default, the formula for calculating risk-weighted assets is:[11, 12]

[11] In denotes the natural logarithm.

[12] N(x) denotes the cumulative distribution function for a standard normal random variable (ie the probability that a normal random variable with mean zero and variance of one is less than or equal to x). G(z) denotes the inverse cumulative distribution

Correlation (R) = $0.12 \cdot \frac{\left(1-e^{-50 \cdot PD}\right)}{\left(1-e^{-50}\right)} + 0.24 \cdot \left(1 - \frac{\left(1-e^{-50 \cdot PD}\right)}{\left(1-e^{-50}\right)}\right)$

Maturity adjustment (b) = $\left[0.11852 - 0.05478 \cdot \ln\left(PD\right)\right]^2$

Capital requirement[13,14](K) = $\left[LGD \cdot N\left[\frac{G\left(PD\right)}{\sqrt{\left(1-R\right)}} + \sqrt{\frac{R}{1-R}} \cdot G\left(0.999\right)\right] - PD \cdot LGD\right] \cdot \frac{\left(1+\left(M-2.5\right) \cdot b\right)}{\left(1-1.5 \cdot b\right)}$

Risk-weighted assets (RWA) = $K \cdot 12.5 \cdot EAD$

The capital requirement (K) for a defaulted exposure is equal to the greater of zero and the difference between its LGD (described in paragraph 235) and the bank's best estimate of expected loss (described in paragraph 238). The risk-weighted asset amount for the defaulted exposure is the product of K, 12.5, and the EAD.

A multiplier of 1.25 is applied to the correlation parameter of all exposures to financial institutions meeting the following criteria:

- Regulated financial institutions whose total assets are greater than or equal to US $100 billion. The most recent audited financial statement of the parent company and consolidated subsidiaries must be used in order to determine asset size. For the purpose of this paragraph, a regulated financial institution is defined as a parent and its subsidiaries where any substantial legal entity in the consolidated group is supervised by a regulator that imposes prudential requirements consistent with international norms. These include, but are not limited to, prudentially regulated Insurance Companies, Broker/Dealers, Banks, Thrifts and Futures Commission Merchants;
- Unregulated financial institutions, regardless of size. Unregulated financial institutions are, for the purposes of this paragraph, legal entities whose main business includes: the management of financial assets, lending, factoring, leasing, provision of credit enhancements, securitisation, investments, financial custody, central counterparty services, proprietary trading and other financial services activities identified by supervisors.
- Correlation (R_FI) = $1.25 \cdot \left[0.12 \cdot \frac{\left(1-e^{-50 \cdot PD}\right)}{\left(1-e^{-50}\right)} + 0.24 \cdot \left(1 - \frac{\left(1-e^{-50 \cdot PD}\right)}{\left(1-e^{-50}\right)}\right)\right]$

Illustrative risk weights are shown in Annex 5 of the Basel II framework (June 2006).

function for a standard normal random variable (ie the value of x such that N(x) = z). The normal cumulative distribution function and the inverse of the normal cumulative distribution function are, for example, available in Excel as the functions NORMSDIST and NORMSINV.

13 If this calculation results in a negative capital charge for any individual sovereign exposure, banks should apply a zero capital charge for that exposure.

14 The following terms are used to refer to specific parts of the capital requirements formula:

- Full maturity adjustment = $\frac{\left(1+\left(M-2.5\right) \cdot b\right)}{\left(1-1.5 \cdot b\right)}$
- Explicit maturity adjustment = $\left(1+\left(M-2.5\right) \cdot b\right)$
- M is the effective maturity, calculated according to paragraphs 107 to 114

(ii) Firm-size adjustment for small- and medium-sized entities (SME)

54. Under the IRB approach for corporate credits, banks will be permitted to separately distinguish exposures to SME borrowers (defined as corporate exposures where the reported sales for the consolidated group of which the firm is a part is less than €50 million) from those to large firms. A firm-size adjustment (ie 0.04 x (1 – (S – 5) / 45)) is made to the corporate risk weight formula for exposures to SME borrowers. S is expressed as total annual sales in millions of euros with values of S falling in the range of equal to or less than €50 million or greater than or equal to €5 million. Reported sales of less than €5 million will be treated as if they were equivalent to €5 million for the purposes of the firm-size adjustment for SME borrowers.

$$\text{Correlation (R)} = 0.12 \cdot \frac{\left(1-e^{-50 \cdot PD}\right)}{\left(1-e^{-50}\right)} + 0.24 \cdot \left(1 - \frac{\left(1-e^{-50 \cdot PD}\right)}{\left(1-e^{-50}\right)}\right) - 0.04 \cdot \left(1 - \frac{\left(S-5\right)}{45}\right)$$

55. Subject to national discretion, supervisors may allow banks, as a failsafe, to substitute total assets of the consolidated group for total sales in calculating the SME threshold and the firm-size adjustment. However, total assets should be used only when total sales are not a meaningful indicator of firm size.

(iii) Risk weights for specialised lending

Risk weights for PF, OF, CF and IPRE

56. Banks that do not meet the requirements for the estimation of PD under the corporate IRB approach will be required to map their internal grades to five supervisory categories, each of which is associated with a specific risk weight. The slotting criteria on which this mapping must be based are provided in Annex 6 of the Basel II framework (June 2006). The risk weights for unexpected losses associated with each supervisory category are:

Supervisory categories and UL risk weights for other SL exposures

Strong	Good	Satisfactory	Weak	Default
70%	90%	115%	250%	0%

57. Although banks are expected to map their internal ratings to the supervisory categories for specialised lending using the slotting criteria provided in Annex 6 of the Basel II framework (June 2006), each supervisory category broadly corresponds to a range of external credit assessments as outlined below.

Strong	Good	Satisfactory	Weak	Default
BBB- or better	BB+ or BB	BB- or B+	B to C-	Not applicable

58. At national discretion, supervisors may allow banks to assign preferential risk weights of 50% to “strong” exposures, and 70% to “good” exposures, provided they have a remaining maturity of less than 2.5 years or the supervisor determines that banks’ underwriting and other risk characteristics are substantially stronger than specified in the slotting criteria for the relevant supervisory risk category.

59. Banks that meet the requirements for the estimation of PD will be able to use the F-IRB approach for the corporate asset class to derive risk weights for SL sub-classes.

60. Banks that meet the requirements for the estimation of PD and LGD and EAD (where relevant) will be able to use the A-IRB approach for the corporate asset class to derive risk weights for SL sub-classes.

Risk weights for HVCRE

61. Banks that do not meet the requirements for estimation of PD, or whose supervisor has chosen not to implement the foundation or advanced approaches to HVCRE, must map their internal grades to five supervisory categories, each of which is associated with a specific risk weight. The slotting criteria on which this mapping must be based are the same as those for IPRE, as provided in Annex 6 of the Basel II framework (June 2006). The risk weights associated with each supervisory category are:

Supervisory categories and UL risk weights for high-volatility commercial real estate

Strong	Good	Satisfactory	Weak	Default
95%	120%	140%	250%	0%

62. As indicated in paragraph 57, each supervisory category broadly corresponds to a range of external credit assessments.

63. At national discretion, supervisors may allow banks to assign preferential risk weights of 70% to "strong" exposures, and 95% to "good" exposures, provided they have a remaining maturity of less than 2.5 years or the supervisor determines that banks' underwriting and other risk characteristics are substantially stronger than specified in the slotting criteria for the relevant supervisory risk category.

64. Banks that meet the requirements for the estimation of PD and whose supervisor has chosen to implement a foundation or advanced approach to HVCRE exposures will use the same formula for the derivation of risk weights that is used for other SL exposures, except that they will apply the following asset correlation formula:

$$\text{Correlation (R)} = 0.12 \cdot \frac{\left(1-e^{-50 \cdot PD}\right)}{\left(1-e^{-50}\right)} + 0.30 \cdot \left(1 - \frac{\left(1-e^{-50 \cdot PD}\right)}{\left(1-e^{-50}\right)}\right)$$

65. Banks that do not meet the requirements for estimation of LGD and EAD for HVCRE exposures must use the supervisory parameters for LGD and EAD for corporate exposures.

2. Risk components

66. This section, paragraphs 67 to 115, sets out the calculation of the risk components for corporate and bank exposures. In the case of an exposure that is guaranteed by a sovereign, the floors that apply to the risk components do not apply to that part of the exposure covered by the sovereign guarantee (ie any part of the exposure that is not covered by the guarantee is subject to the relevant floors).

(i) Probability of default (PD)

67. For corporate and bank exposures, the PD is the one-year PD associated with the internal borrower grade to which that exposure is assigned. The PD of borrowers assigned to a default grade(s), consistent with the reference definition of default, is 100%. The minimum requirements for the derivation of the PD estimates associated with each internal borrower grade are outlined in paragraphs 229 to 231.

68. The PD for each exposure that is used as input into the risk weight formula and the calculation of expected loss must not be less than 0.05%.

(ii) Loss given default (LGD)

69. A bank must provide an estimate of the LGD for each corporate and bank exposure. There are two approaches for deriving this estimate: a foundation approach and an advanced approach. As noted in paragraph 34, the advanced approach is not permitted for exposures to certain entities.

LGD under the foundation approach

Treatment of unsecured claims and non-recognised collateral

70. Under the foundation approach, senior claims on banks, securities firms and other financial institutions (including insurance companies and any financial institutions in the corporate asset class) that are not secured by recognised collateral will be assigned a 45% LGD. Senior claims on other corporates that are not secured by recognised collateral will be assigned a 40% LGD.

71. All subordinated claims on corporates and banks will be assigned a 75% LGD. A subordinated loan is a facility that is expressly subordinated to another facility. At national discretion, supervisors may choose to employ a wider definition of subordination. This might include economic subordination, such as cases where the facility is unsecured and the bulk of the borrower's assets are used to secure other exposures.

Collateral under the foundation approach

72. In addition to the eligible financial collateral recognised in the standardised approach, under the foundation IRB approach some other forms of collateral, known as eligible IRB collateral, are also recognised. These include receivables, specified commercial and residential real estate (CRE/RRE), and other physical collateral, where they meet the minimum requirements set out in paragraphs 283 to 299. For eligible financial collateral, the requirements are identical to the operational standards as set out in the credit risk mitigation section of the standardised approach.

Methodology for recognition of eligible collateral under the foundation approach

73. The simple approach to collateral presented in the standardised approach is not available to banks applying the IRB approach.

74. The LGD applicable to a collateralised transaction (LGD*) must be calculated as the exposure weighted average of the LGD applicable to the unsecured part of an exposure (LGD_U) and the LGD applicable to the collateralised part of an exposure (LGD_S). Specifically:

$$LGD^* = LGD_U \cdot \frac{E_U}{E \cdot (1+H_E)} + LGD_S \cdot \frac{E_S}{E \cdot (1+H_E)}$$

where:

- E is the current value of the exposure (ie cash lent or securities lent or posted). In the case of securities lent or posted the exposure value has to be increased by applying the appropriate haircuts (H_E) according to the comprehensive approach for financial collateral.
- E_S is the current value of the collateral received after the application of the haircut applicable for the type of collateral (H_c) and for any currency mismatches between the exposure and the collateral, as specified in paragraphs 75 to 76. E_S is capped at the value of $E \cdot (1+H_E)$.
- $E_U = E \cdot (1+H_E) - E_S$. The terms E_U and E_S are only used to calculate LGD*. Banks must continue to calculate EAD without taking into account the presence of any collateral, unless otherwise specified.
- LGD_U = the LGD applicable for an unsecured exposure, as set out in paragraph 70 to 71.
- LGD_S = the LGD applicable to exposures secured by the type of collateral used in the transaction, as specified in paragraph 75.

75. The following table specifies the LGD_S and haircuts applicable in the formula set out in paragraph 74:

Type of collateral	LGD_S	Haircut
Eligible financial collateral	0%	As determined by the haircuts that apply in the comprehensive formula of the standardised approach for credit risk (paragraph 163 for jurisdictions that allow the use of ratings for regulatory purposes and paragraph 164 for jurisdictions that do not). The haircuts have to be adjusted for different holding periods and non-daily remargining or revaluation according to paragraphs 169 to 172 of the standardised approach.
Eligible receivables	20%	40%
Eligible residential real estate / commercial real estate	20%	40%
Other eligible physical collateral	25%	40%
Ineligible collateral	N/A	100%

76. When eligible collateral is denominated in a different currency to that of the exposure, the haircut for currency risk is the same haircut that applies in the comprehensive approach (paragraph 165 of the standardised approach).

77. Banks that lend securities or post collateral must calculate capital requirements for both of the following: (i) the credit risk or market risk of the securities, if this remains with the bank; and (ii) the counterparty credit risk arising from the risk that the borrower of the securities may default. For repo-style transactions, banks may recognise a reduction in the counterparty credit risk requirement arising from the effect of a master netting agreement providing that it satisfies the criteria set out in paragraphs 175 and 176 of the standardised approach. The bank must calculate E*, which is the exposure to be used for the counterparty credit risk charge taking account of the risk mitigation of collateral received, using the formula set out in paragraph 178 of the standardised approach. In calculating RWA and EL amounts for the counterparty credit risk arising from the set of transactions covered by the master netting agreement, E* must be used as the EAD of the counterparty and the LGD of the counterparty must be determined using the LGD specified for unsecured exposures, as set out in paragraphs 70 and 71.

Use of models to calculate EAD for counterparty credit risk

78. As an alternative to the use of standard haircuts for the calculation of the counterparty credit risk charge for SFTs set out in paragraph 77, banks may be permitted to use a VaR models approach to reflect price volatility of the exposures and the financial collateral. This approach can take into account the correlation effects between security positions. This approach applies to single SFTs and SFTs covered by netting agreements on a counterparty-by-counterparty basis, both under the condition that the collateral is revalued on a daily basis. This holds for the underlying securities being different and unrelated to securitisations. The master netting agreement must satisfy the criteria set out in paragraph 175 and 176 of the standardised approach. The VaR models approach is available to banks that have received supervisory recognition for an internal market risk model according to paragraph 177 of "Minimum capital requirements for market risk". Banks which have not received market risk model recognition can separately apply for supervisory recognition to use their internal VaR models for the calculation of potential price volatility for SFTs, provided the model meets the requirements of paragraph 177. Although the market risk standards have changed from a 99% VaR to a 97.5% expected shortfall, the VaR models approach to SFTs retains the use of a 99% VaR to calculate the counterparty credit risk for SFTs. The VaR model needs to capture risk sufficient to pass the backtesting and profit and loss attribution tests of paragraph 183 of "Minimum capital requirements for market risk". The default risk charge of paragraph 186 is not required in the VaR model for SFTs.

79. The quantitative and qualitative criteria for recognition of internal market risk models for SFTs are in principle the same as in paragraphs 180 and 181 of "Minimum capital requirements for market risk". The minimum liquidity horizon or the holding period for SFTs is 5-business days for margined repo-style

transactions, rather than the 10-business days in paragraph 181 (k). For other transactions eligible for the VaR models approach, the 10-business day holding period will be retained. The minimum holding period should be adjusted upwards for market instruments where such a holding period would be inappropriate given the liquidity of the instrument concerned.

80. The calculation of the exposure E* for banks using their internal model to calculate their counterparty credit risk charge will be the following:

$$E^* = \max \{0, [(\Sigma E - \Sigma C) + \text{VaR output from internal model}]\}$$

In calculating capital requirements banks will use the previous business day's VaR number.

81. Subject to supervisory approval, instead of using the VaR approach, banks may also calculate an effective expected positive exposure for repo-style and other similar SFTs, in accordance with the Internal Model Method set out in the counterparty credit risk standards.

Carve out from the comprehensive approach

82. As in the standardised approach, for transactions where the conditions in paragraph 150 are met, and in addition, the counterparty is a core market participant as specified in paragraph 151, supervisors may choose not to apply the haircuts specified under the comprehensive approach, but instead to apply a zero H. A netting set that contains any transaction that does not meet the requirements in paragraph 150 of the standardised approach is not eligible for this treatment.

Methodology for the treatment of pools of collateral

83. In the case where a bank has obtained multiple types of collateral it may apply the formula set out in paragraph 74 sequentially for each individual type of collateral. In doing so, after each step of recognising one individual type of collateral, the remaining value of the unsecured exposure (E_U) will be reduced by the adjusted value of the collateral (E_S) recognised in that step. In line with paragraph 74, the total of E_S across all collateral types is capped at the value of $E \cdot (1 + H_E)$. This results in the following formula:

$$LGD^* = LGD_U \cdot \frac{E_U}{E \cdot (1 + H_E)} + \sum_i LGD_{Si} \cdot \frac{E_{Si}}{E \cdot (1 + H_E)}$$

where for each collateral type i:

- LGD_{Si} is the LGD applicable to that form of collateral (as specified in paragraph 75); and
- E_{Si} is the current value of the collateral received after the application of the haircut applicable for the type of collateral (Hc) (as specified in paragraph 75).

LGD under the advanced approach

84. Subject to certain additional minimum requirements specified below (and the conditions set out in paragraph 34), supervisors may permit banks to use their own internal estimates of LGD for corporate exposures. LGD must be measured as the loss given default as a percentage of the EAD. Banks eligible for the IRB approach that are unable to meet these additional minimum requirements must utilise the foundation LGD treatment described above.

85. The LGD for each exposure that is used as input into the risk weight formula and the calculation of expected loss must not be less than the parameter floors indicated in the table below:

LGD parameter floors

	LGD	
	Unsecured	Secured
Corporate	25%	Varying by collateral type: • 0% financial • 10% receivables • 10% commercial or residential real estate • 15% other physical

86. The LGD floors for secured exposures in the table above apply when the exposure is fully secured (ie the value of collateral after the application of haircuts exceeds the value of the exposure). The LGD floor for a partially secured exposure is calculated as a weighted average of the unsecured LGD floor for the unsecured portion and the secured LGD floor for the secured portion. That is, the following formula should be used to determine the LGD floor:

$$Floor = LGD_{U\,floor} \cdot \frac{E_U}{E \cdot (1 + H_E)} + LGD_{S\,floor} \cdot \frac{E_S}{E \cdot (1 + H_E)}$$

where:

- $LGD_{U\ floor}$ and $LGD_{S\ floor}$ are the floor values for fully unsecured and fully secured exposures respectively, as specified in the table in paragraph 85.
- The other terms are defined as set out in paragraph 74 and 75.

87. In cases where a bank has met the conditions to use their own internal estimates of LGD for a pool of unsecured exposures, and takes collateral against one of these exposures, it may not be able to model the effects of the collateral (ie it may not have enough data to model the effect of the collateral on recoveries). In such cases, the bank is permitted to apply the formula set out in paragraph 74 or 83, with the exception that the LGD_U term would be the bank's own internal estimate of the unsecured LGD. To adopt this treatment the collateral must be eligible under the F-IRB and the bank's estimate of LGD_U must not take account of any effects of collateral recoveries.

88. The minimum requirements for the derivation of LGD estimates are outlined in paragraphs 235 to 240.

Treatment of certain repo-style transactions

89. Banks that want to recognise the effects of master netting agreements on repo-style transactions for capital purposes must apply the methodology outlined in paragraph 77 for determining E* for use as the EAD in the calculation of counterparty credit risk. For banks using the advanced approach, own LGD estimates would be permitted for the unsecured equivalent amount (E*) used to calculate counterparty credit risk. In both cases banks, in addition to counterparty credit risk, must also calculate the capital requirements relating to any credit or market risk to which they remain exposed arising from the underlying securities in the master netting agreement.

Treatment of guarantees and credit derivatives

90. There are two approaches for recognition of CRM in the form of guarantees and credit derivatives in the IRB approach: a foundation approach for banks using supervisory values of LGD, and an advanced approach for those banks using their own internal estimates of LGD.

91. Under either approach, CRM in the form of guarantees and credit derivatives must not reflect the effect of double default (see paragraph 254). As such, to the extent that the CRM is recognised by the

bank, the adjusted risk weight will not be less than that of a comparable direct exposure to the protection provider. Consistent with the standardised approach, banks may choose not to recognise credit protection if doing so would result in a higher capital requirement.

Recognition under the foundation approach

92. For banks using the foundation approach for LGD, the approach to guarantees and credit derivatives closely follows the treatment under the standardised approach as specified in paragraphs 191 to 205 of the standardised approach. The range of eligible guarantors is the same as under the standardised approach except that companies that are internally rated may also be recognised under the foundation approach. To receive recognition, the requirements outlined in paragraphs 191 to 196 of the standardised approach must be met.

93. Eligible guarantees from eligible guarantors will be recognised as follows:

- For the covered portion of the exposure, a risk weight is derived by taking:
  - the risk-weight function appropriate to the type of guarantor, and
  - the PD appropriate to the guarantor's borrower grade.
- The bank may replace the LGD of the underlying transaction with the LGD applicable to the guarantee taking into account seniority and any collateralisation of a guaranteed commitment. For example, when a bank has a subordinated claim on the borrower but the guarantee represents a senior claim on the guarantor this may be reflected by using an LGD applicable for senior exposures (see paragraph 70) instead of an LGD applicable for subordinated exposures.
- In case the bank applies the standardised approach to direct exposures to the guarantor it may only recognise the guarantee by applying the standardised approach to the covered portion of the exposure.

94. The uncovered portion of the exposure is assigned the risk weight associated with the underlying obligor.

95. Where partial coverage exists, or where there is a currency mismatch between the underlying obligation and the credit protection, it is necessary to split the exposure into a covered and an uncovered amount. The treatment in the foundation approach follows that outlined in paragraphs 202 to 204 of the standardised approach, and depends upon whether the cover is proportional or tranched.

Recognition under the advanced approach

96. Banks using the advanced approach for estimating LGDs may reflect the risk-mitigating effect of guarantees and credit derivatives through either adjusting PD or LGD estimates. Whether adjustments are done through PD or LGD, they must be done in a consistent manner for a given guarantee or credit derivative type. In doing so, banks must not include the effect of double default in such adjustments. Thus, the adjusted risk weight must not be less than that of a comparable direct exposure to the protection provider. In case the bank applies the standardised approach to direct exposures to the guarantor it may only recognise the guarantee by applying the standardised approach to the covered portion of the exposure. In case the bank applies the foundation IRB approach to direct exposures to the guarantor it may only recognise the guarantee by determining the risk weight for the comparable direct exposure to the guarantor according to the foundation IRB approach.

97. A bank relying on own-estimates of LGD has the option to adopt the treatment outlined above for banks under the foundation IRB approach (paragraphs 92 to 95), or to make an adjustment to its LGD estimate of the exposure to reflect the presence of the guarantee or credit derivative. Under this option, there are no limits to the range of eligible guarantors although the set of minimum requirements provided in paragraphs 256 and 257 concerning the type of guarantee must be satisfied. For credit derivatives, the

requirements of paragraphs 262 and 263 must be satisfied.[15] For exposures for which a bank has permission to use its own estimates of LGD, the bank may recognise the risk mitigating effects of first-to-default credit derivatives, but may not recognise the risk mitigating effects of second-to-default or more generally nth-to-default credit derivatives.

(iii) Exposure at default (EAD)

98. The following sections apply to both on and off-balance sheet positions. All exposures are measured gross of specific provisions or partial write-offs. The EAD on drawn amounts should not be less than the sum of: (i) the amount by which a bank's regulatory capital would be reduced if the exposure were written-off fully; and (ii) any specific provisions and partial write-offs. When the difference between the instrument's EAD and the sum of (i) and (ii) is positive, this amount is termed a discount. The calculation of risk-weighted assets is independent of any discounts. Under the limited circumstances described in paragraph 147, discounts may be included in the measurement of total eligible provisions for purposes of the EL-provision calculation set out in Section G.

Exposure measurement for on-balance sheet items

99. On-balance sheet netting of loans and deposits will be recognised subject to the same conditions as under paragraph 190 of the standardised approach. Where currency or maturity mismatched on-balance sheet netting exists, the treatment follows the standardised approach, as set out in paragraphs 126 and 128 to 131.

Exposure measurement for off-balance sheet items (with the exception of derivatives)

100. For off-balance sheet items there are two approaches for the estimation of EAD: a foundation approach and an advanced approach. When only the drawn balances of revolving facilities have been securitised, banks must ensure that they continue to hold required capital against the undrawn balances associated with the securitised exposures.

101. In the foundation approach, EAD is calculated as the committed but undrawn amount multiplied by a CCF. In the advanced approach, EAD for undrawn commitments may be calculated as the committed but undrawn amount multiplied by a CCF or derived from direct estimates of total facility EAD.

EAD under the foundation approach

102. The types of instruments and the CCFs applied to them are the same as those in the standardised approach, as set out in paragraphs 78 to 89.

103. The amount to which the CCF is applied is the lower of the value of the unused committed credit line, and the value that reflects any possible constraining of the availability of the facility, such as the existence of a ceiling on the potential lending amount which is related to a borrower's reported cash flow. If the facility is constrained in this way, the bank must have sufficient line monitoring and management procedures to support this contention.

[15] When credit derivatives do not cover the restructuring of the underlying obligation, the partial recognition set out in paragraph 196 of the standardised approach applies.

104. Where a commitment is obtained on another off-balance sheet exposure, banks under the foundation approach are to apply the lower of the applicable CCFs.

EAD under the advanced approach

105. Banks which meet the minimum requirements for use of their own estimates of EAD (see paragraphs 241 to 250) will be allowed for exposures for which A-IRB is permitted (see paragraph 34) to use their own internal estimates of EAD for undrawn revolving commitments[16] to extend credit, purchase assets or issue credit substitutes provided the exposure is not subject to a CCF of 100% in the foundation approach (see paragraph 102). Standardised approach CCFs must be used for all other off-balance sheet items (for example, undrawn non-revolving commitments), and must be used where the minimum requirements for own estimates of EAD are not met. The EAD for each exposure that is used as input into the risk weight formula and the calculation of expected loss is subject to a floor that is the sum of: (i) the on balance sheet amount; and (ii) 50% of the off balance sheet exposure using the applicable CCF in the standardised approach.

Exposure measurement for transactions that expose banks to counterparty credit risk

106. Measures of exposure for SFTs and OTC derivatives that expose banks to counterparty credit risk under the IRB approach will be calculated as per the rules set forth in the counterparty credit risk standards.

(iv) Effective maturity (M)

107. For banks using the foundation approach for corporate exposures, effective maturity (M) will be 2.5 years except for repo-style transactions where the effective maturity will be 6 months (ie M=0.5). National supervisors may choose to require all banks in their jurisdiction (those using the foundation and advanced approaches) to measure M for each facility using the definition provided below.

108. Banks using any element of the advanced IRB approach are required to measure effective maturity for each facility as defined below. However, national supervisors may allow the effective maturity to be fixed at 2.5 years (the 'fixed maturity treatment') for facilities to certain smaller domestic corporate borrowers if the reported sales (ie turnover) as well as total assets for the consolidated group of which the firm is a part of are less than €500 million. The consolidated group has to be a domestic company based in the country where the fixed maturity treatment is applied. If adopted, national supervisors must apply the fixed maturity treatment to all IRB banks using the advanced approach in that country, rather than on a bank-by-bank basis.

109. Except as noted in paragraph 110, the effective maturity (M) is subject to a floor of one year and a cap of 5 years and is defined as follows:

- For an instrument subject to a determined cash flow schedule, effective maturity M is defined as:

  Effective maturity (M) = $\sum_t t \cdot CF_t \,/\, \sum_t CF_t$

  where CF_t denotes the cash flows (principal, interest payments and fees) contractually payable by the borrower in period t.

- If a bank is not in a position to calculate the effective maturity of the contracted payments as noted above, it is allowed to use a more conservative measure of M such as that it equals the maximum remaining time (in years) that the borrower is permitted to take to fully discharge its

[16] A revolving loan facility is one that lets a borrower obtain a loan where the borrower has the flexibility to decide how often to withdraw from the loan and at what time intervals. A revolving facility allows the borrower to drawdown, repay and re-draw loans advanced to it. Facilities that allow prepayments and subsequent redraws of those prepayments are considered as revolving.

contractual obligation (principal, interest, and fees) under the terms of loan agreement. Normally, this will correspond to the nominal maturity of the instrument.

- For derivatives subject to a master netting agreement, the effective maturity is defined as the weighted average maturity of the transactions within the netting agreement. Further, the notional amount of each transaction should be used for weighting the maturity.
- For revolving exposures, effective maturity must be determined using the maximum contractual termination date of the facility. Banks must not use the repayment date of the current drawing.

110. The one-year floor does not apply to certain short-term exposures, comprising fully or nearly-fully collateralised[17] capital market-driven transactions (ie OTC derivatives transactions and margin lending) and repo-style transactions (ie repos/reverse repos and securities lending/borrowing) with an original maturity of less than one year, where the documentation contains daily remargining clauses. For all eligible transactions the documentation must require daily revaluation, and must include provisions that must allow for the prompt liquidation or setoff of the collateral in the event of default or failure to re-margin. The maturity of such transactions must be calculated as the greater of one-day, and the effective maturity (M, consistent with the definition above), except for transactions subject to a master netting agreement, where the floor is determined by the minimum holding period for the transaction type, as required by paragraph 113.

111. The one-year floor also does not apply to the following exposures:

(i) Short-term self-liquidating trade transactions. Import and export letters of credit and similar transactions should be accounted for at their actual remaining maturity.

(ii) Issued as well as confirmed letters of credit that are short term (ie have a maturity below one year) and self-liquidating.

112. In addition to the transactions considered in paragraph 110 above, other short-term exposures with an original maturity of less than one year that are not part of a bank's ongoing financing of an obligor may be eligible for exemption from the one-year floor. After a careful review of the particular circumstances in their jurisdictions, national supervisors should define the types of short-term exposures that might be considered eligible for this treatment. The results of these reviews might, for example, include transactions such as:

- Some capital market-driven transactions and repo-style transactions that might not fall within the scope of paragraph 110;
- Some trade finance transactions that are not exempted by paragraph 111.
- Some exposures arising from settling securities purchases and sales. This could also include overdrafts arising from failed securities settlements provided that such overdrafts do not continue more than a short, fixed number of business days;
- Some exposures arising from cash settlements by wire transfer, including overdrafts arising from failed transfers provided that such overdrafts do not continue more than a short, fixed number of business days;
- Some exposures to banks arising from foreign exchange settlements; and
- Some short-term loans and deposits.

113. For transactions falling within the scope of paragraph 110 subject to a master netting agreement, the effective maturity is defined as the weighted average maturity of the transactions. A floor equal to the minimum holding period for the transaction type set out in paragraph 170 of the standardised approach

[17] The intention is to include both parties of a transaction meeting these conditions where neither of the parties is systematically under-collateralised.

will apply to the average. Where more than one transaction type is contained in the master netting agreement a floor equal to the highest holding period will apply to the average. Further, the notional amount of each transaction should be used for weighting maturity.

114. Where there is no explicit definition, the effective maturity (M) assigned to all exposures is set at 2.5 years unless otherwise specified in paragraph 107.

Treatment of maturity mismatches

115. The treatment of maturity mismatches under IRB is identical to that in the standardised approach (see paragraphs 126 to 130).

D. Rules for retail exposures

116. Section D presents in detail the method of calculating the UL capital requirements for retail exposures. Section D.1 provides the risk weight functions. Section D.2 presents the risk components to serve as inputs to the risk-weight functions. The method of calculating expected losses, and for determining the difference between that measure and provisions is described in Section G.

1. Risk-weighted assets for retail exposures

117. There are three separate risk-weight functions for retail exposures, as defined in paragraphs 118 to 120. Risk weights for retail exposures are based on separate assessments of PD and LGD as inputs to the risk-weight functions. None of the three retail risk-weight functions contain the full maturity adjustment component that is present in the risk-weight function for exposures to banks and corporates. Throughout this section, PD and LGD are measured as decimals, and EAD is measured as currency (eg euros).

(i) Retail residential mortgage exposures

118. For exposures defined in paragraph 21 that are not in default and are secured or partly secured[18] by residential mortgages, risk weights will be assigned based on the following formula:

Correlation (R) = 0.15

$$\text{Capital requirement (K)} = \left[LGD \cdot N\left[\frac{G(PD)}{\sqrt{(1-R)}} + \sqrt{\frac{R}{1-R}} \cdot G(0.999) \right] - PD \cdot LGD \right]$$

Risk-weighted assets = $K \cdot 12.5 \cdot EAD$

The capital requirement (K) for a defaulted exposure is equal to the greater of zero and the difference between its LGD (described in paragraph 235) and the bank's best estimate of expected loss (described in paragraph 238). The risk-weighted asset amount for the defaulted exposure is the product of K, 12.5 and the EAD.

(ii) Qualifying revolving retail exposures

119. For qualifying revolving retail exposures as defined in paragraphs 24 and 25 that are not in default, risk weights are defined based on the following formula:

[18] This means that risk weights for residential mortgages also apply to the unsecured portion of such residential mortgages.

Correlation (R) = 0.04

$$\text{Capital requirement (K)} = \left[LGD \cdot N\left[\frac{G(PD)}{\sqrt{(1-R)}} + \sqrt{\frac{R}{1-R}} \cdot G(0.999) \right] - PD \cdot LGD \right]$$

Risk-weighted assets = $K \cdot 12.5 \cdot EAD$

The capital requirement (K) for a defaulted exposure is equal to the greater of zero and the difference between its LGD (described in paragraph 235) and the bank's best estimate of expected loss (described in paragraph 238). The risk-weighted asset amount for the defaulted exposure is the product of K, 12.5, and the EAD.

(iii) Other retail exposures

120. For all other retail exposures that are not in default, risk weights are assigned based on the following function, which allows correlation to vary with PD:

$$\text{Correlation (R)} = 0.03 \cdot \frac{\left(1-e^{-35 \cdot PD}\right)}{\left(1-e^{-35}\right)} + 0.16 \cdot \left(1 - \frac{\left(1-e^{-35 \cdot PD}\right)}{\left(1-e^{-35}\right)} \right)$$

$$\text{Capital requirement (K)} = \left[LGD \cdot N\left[\frac{G(PD)}{\sqrt{(1-R)}} + \sqrt{\frac{R}{1-R}} \cdot G(0.999) \right] - PD \cdot LGD \right]$$

Risk-weighted assets = $K \cdot 12.5 \cdot EAD$

The capital requirement (K) for a defaulted exposure is equal to the greater of zero and the difference between its LGD (described in paragraph 235) and the bank's best estimate of expected loss (described in paragraph 238). The risk-weighted asset amount for the defaulted exposure is the product of K, 12.5, and the EAD.

Illustrative risk weights are shown in Annex 5 of the Basel II framework (June 2006).

2. Risk components

(i) Probability of default (PD) and loss given default (LGD)

121. For each identified pool of retail exposures, banks are expected to provide an estimate of the PD and LGD associated with the pool, subject to the minimum requirements as set out in Section H. Additionally, the PD for retail exposures is the greater of: (i) the one-year PD associated with the internal borrower grade to which the pool of retail exposures is assigned; and (ii) 0.1% for QRRE revolvers (see paragraph 25 for the definition of QRRE revolvers) and 0.05% for all other exposures. The LGD for each exposure that is used as input into the risk weight formula and the calculation of expected loss must not be less than the parameter floors indicated in the table below:

LGD parameter floors

	LGD	
	Unsecured	Secured
Retail classes:		
Mortgages	N/A	5%
QRRE (transactors and revolvers)	50%	N/A
Other retail	30%	Varying by collateral type: • 0% financial • 10% receivables • 10% commercial or residential real estate • 15% other physical

The LGD floors for partially secured exposures in the "other retail" category should be calculated according to the formula set out in paragraph 86. The LGD floor for residential mortgages is fixed at 5%, irrespective of the level of collateral provided by the property.

(ii) Recognition of guarantees and credit derivatives

122. Banks may reflect the risk-reducing effects of guarantees and credit derivatives, either in support of an individual obligation or a pool of exposures, through an adjustment of either the PD or LGD estimate, subject to the minimum requirements in paragraphs 252 to 263. Whether adjustments are done through PD or LGD, they must be done in a consistent manner for a given guarantee or credit derivative type. In case the bank applies the standardised approach to direct exposures to the guarantor it must assign the standardised approach risk weight to the covered portion of the exposure.

123. Consistent with the requirements outlined above for corporate and bank exposures, banks must not include the effect of double default in such adjustments. The adjusted risk weight must not be less than that of a comparable direct exposure to the protection provider. Consistent with the standardised approach, banks may choose not to recognise credit protection if doing so would result in a higher capital requirement.

(iii) Exposure at default (EAD)

124. Both on and off-balance sheet retail exposures are measured gross of specific provisions or partial write-offs. The EAD on drawn amounts should not be less than the sum of: (i) the amount by which a bank's regulatory capital would be reduced if the exposure were written-off fully; and (ii) any specific provisions and partial write-offs. When the difference between the instrument's EAD and the sum of (i) and (ii) is positive, this amount is termed a discount. The calculation of risk-weighted assets is independent of any discounts. Under the limited circumstances described in paragraph 147, discounts may be included in the measurement of total eligible provisions for purposes of the EL-provision calculation set out in Section G.

125. On-balance sheet netting of loans and deposits of a bank to or from a retail customer will be permitted subject to the same conditions outlined in paragraph 190 of the standardised approach. Banks must use their own estimates of EAD for undrawn revolving commitments to extend credit, purchase assets or issue credit substitutes provided the exposure is not subject to a CCF of 100% in the standardised approach (see paragraph 79 of the standardised approach) and the minimum requirements in paragraphs 241 to 251 are satisfied. Foundation approach CCFs must be used for all other off-balance sheet items (for example, undrawn non-revolving commitments), and must be used where the minimum requirements for own estimates of EAD are not met.

126. For retail exposures with uncertain future drawdown such as credit cards, banks must take into account their history and/or expectation of additional drawings prior to default in their overall calibration

of loss estimates. In particular, where a bank does not reflect conversion factors for undrawn lines in its EAD estimates, it must reflect in its LGD estimates the likelihood of additional drawings prior to default. Conversely, if the bank does not incorporate the possibility of additional drawings in its LGD estimates, it must do so in its EAD estimates.

127. When only the drawn balances of revolving retail facilities have been securitised, banks must ensure that they continue to hold required capital against the undrawn balances associated with the securitised exposures using the IRB approach to credit risk for commitments.

128. To the extent that foreign exchange and interest rate commitments exist within a bank's retail portfolio for IRB purposes, banks are not permitted to provide their internal assessments of credit equivalent amounts. Instead, the rules for the standardised approach continue to apply.

F. Rules for purchased receivables

129. Section F presents the method of calculating the UL capital requirements for purchased receivables. For such assets, there are IRB capital charges for both default risk and dilution risk. Section F.1 discusses the calculation of risk-weighted assets for default risk. The calculation of risk-weighted assets for dilution risk is provided in Section F.2. The method of calculating expected losses, and for determining the difference between that measure and provisions, is described in Section G.

1. Risk-weighted assets for default risk

130. For receivables belonging unambiguously to one asset class, the IRB risk weight for default risk is based on the risk-weight function applicable to that particular exposure type, as long as the bank can meet the qualification standards for this particular risk-weight function. For example, if banks cannot comply with the standards for qualifying revolving retail exposures (defined in paragraph 24), they should use the risk-weight function for other retail exposures. For hybrid pools containing mixtures of exposure types, if the purchasing bank cannot separate the exposures by type, the risk-weight function producing the highest capital requirements for the exposure types in the receivable pool applies.

(i) Purchased retail receivables

131. For purchased retail receivables, a bank must meet the risk quantification standards for retail exposures but can utilise external and internal reference data to estimate the PDs and LGDs. The estimates for PD and LGD (or EL) must be calculated for the receivables on a stand-alone basis; that is, without regard to any assumption of recourse or guarantees from the seller or other parties.

(ii) Purchased corporate receivables

132. For purchased corporate receivables the purchasing bank is expected to apply the existing IRB risk quantification standards for the bottom-up approach. However, for eligible purchased corporate receivables, and subject to supervisory permission, a bank may employ the following top-down procedure for calculating IRB risk weights for default risk:

- The purchasing bank will estimate the pool's one-year EL for default risk, expressed in percentage of the exposure amount (ie the total EAD amount to the bank by all obligors in the receivables pool). The estimated EL must be calculated for the receivables on a stand-alone basis; that is, without regard to any assumption of recourse or guarantees from the seller or other parties. The treatment of recourse or guarantees covering default risk (and/or dilution risk) is discussed separately below.

- Given the EL estimate for the pool's default losses, the risk weight for default risk is determined by the risk-weight function for corporate exposures.[19] As described below, the precise calculation of risk weights for default risk depends on the bank's ability to decompose EL into its PD and LGD components in a reliable manner. Banks can utilise external and internal data to estimate PDs and LGDs. However, the advanced approach will not be available for banks that use the foundation approach for corporate exposures.

Foundation IRB treatment

133. If the purchasing bank is unable to decompose EL into its PD and LGD components in a reliable manner, the risk weight is determined from the corporate risk-weight function using the following specifications: if the bank can demonstrate that the exposures are exclusively senior claims to corporate borrowers, an LGD of 40% can be used. PD will be calculated by dividing the EL using this LGD. EAD will be calculated as the outstanding amount minus the capital charge for dilution prior to credit risk mitigation ($K_{Dilution}$). Otherwise, PD is the bank's estimate of EL; LGD will be 100%; and EAD is the amount outstanding minus $K_{Dilution}$. EAD for a revolving purchase facility is the sum of the current amount of receivables purchased plus 40% of any undrawn purchase commitments minus $K_{Dilution}$. If the purchasing bank is able to estimate PD in a reliable manner, the risk weight is determined from the corporate risk-weight functions according to the specifications for LGD, M and the treatment of guarantees under the foundation approach as given in paragraphs 70 to 83, 89 to 95, and 107.

Advanced IRB treatment

134. If the purchasing bank can estimate either the pool's default-weighted average loss rates given default (as defined in paragraph 235) or average PD in a reliable manner, the bank may estimate the other parameter based on an estimate of the expected long-run loss rate. The bank may: (i) use an appropriate PD estimate to infer the long-run default-weighted average loss rate given default; or (ii) use a long-run default-weighted average loss rate given default to infer the appropriate PD. In either case, it is important to recognise that the LGD used for the IRB capital calculation for purchased receivables cannot be less than the long-run default-weighted average loss rate given default and must be consistent with the concepts defined in paragraph 235. The risk weight for the purchased receivables will be determined using the bank's estimated PD and LGD as inputs to the corporate risk-weight function. Similar to the foundation IRB treatment, EAD will be the amount outstanding minus $K_{Dilution}$. EAD for a revolving purchase facility will be the sum of the current amount of receivables purchased plus 40% of any undrawn purchase commitments minus $K_{Dilution}$ (thus, banks using the advanced IRB approach will not be permitted to use their internal EAD estimates for undrawn purchase commitments).

135. For drawn amounts, M will equal the pool's exposure-weighted average effective maturity (as defined in paragraphs 109 to 114). This same value of M will also be used for undrawn amounts under a committed purchase facility provided the facility contains effective covenants, early amortisation triggers, or other features that protect the purchasing bank against a significant deterioration in the quality of the future receivables it is required to purchase over the facility's term. Absent such effective protections, the

[19] The firm-size adjustment for SME, as defined in paragraph 54, will be the weighted average by individual exposure of the pool of purchased corporate receivables. If the bank does not have the information to calculate the average size of the pool, the firm-size adjustment will not apply.

M for undrawn amounts will be calculated as the sum of: (a) the longest-dated potential receivable under the purchase agreement; and (b) the remaining maturity of the purchase facility.

2. Risk-weighted assets for dilution risk

136. Dilution refers to the possibility that the receivable amount is reduced through cash or non-cash credits to the receivable's obligor.[20] For both corporate and retail receivables, unless the bank can demonstrate to its supervisor that the dilution risk for the purchasing bank is immaterial, the treatment of dilution risk must be the following: at the level of either the pool as a whole (top-down approach) or the individual receivables making up the pool (bottom-up approach), the purchasing bank will estimate the one-year EL for dilution risk, also expressed in percentage of the receivables amount. Banks can utilise external and internal data to estimate EL. As with the treatments of default risk, this estimate must be computed on a stand-alone basis; that is, under the assumption of no recourse or other support from the seller or third-party guarantors. For the purpose of calculating risk weights for dilution risk, the corporate risk-weight function must be used with the following settings: the PD must be set equal to the estimated EL, and the LGD must be set at 100%. An appropriate maturity treatment applies when determining the capital requirement for dilution risk. If a bank can demonstrate that the dilution risk is appropriately monitored and managed to be resolved within one year, the supervisor may allow the bank to apply a one-year maturity.

137. This treatment will be applied regardless of whether the underlying receivables are corporate or retail exposures, and regardless of whether the risk weights for default risk are computed using the standard IRB treatments or, for corporate receivables, the top-down treatment described above.

3. Treatment of purchase price discounts for receivables

138. In many cases, the purchase price of receivables will reflect a discount (not to be confused with the discount concept defined in paragraphs 98 and 124) that provides first loss protection for default losses, dilution losses or both. To the extent that a portion of such a purchase price discount may be refunded to the seller based on the performance of the receivables, the purchaser may recognise this refundable amount as first-loss protection and hence treat this exposure under the securitisation framework, while the seller providing such a refundable purchase price discount must treat the refundable amount as a first-loss position under the securitisation framework. Non-refundable purchase price discounts for receivables do not affect either the EL-provision calculation in Section G or the calculation of risk-weighted assets.

139. When collateral or partial guarantees obtained on receivables provide first loss protection (collectively referred to as mitigants in this paragraph), and these mitigants cover default losses, dilution losses, or both, they may also be treated as first loss protection under the securitisation framework (see paragraph 51 of the securitisation framework). When the same mitigant covers both default and dilution

20 Examples include offsets or allowances arising from returns of goods sold, disputes regarding product quality, possible debts of the borrower to a receivables obligor, and any payment or promotional discounts offered by the borrower (eg a credit for cash payments within 30 days).

risk, banks using the Securitisation Internal Ratings-Based Approach (SEC-IRBA) that are able to calculate an exposure-weighted LGD must do so as defined in paragraph 60 of the securitisation framework.

4. Recognition of credit risk mitigants

140. Credit risk mitigants will be recognised generally using the same type of framework as set forth in paragraphs 90 to 97.[21] In particular, a guarantee provided by the seller or a third party will be treated using the existing IRB rules for guarantees, regardless of whether the guarantee covers default risk, dilution risk, or both.

- If the guarantee covers both the pool's default risk and dilution risk, the bank will substitute the risk weight for an exposure to the guarantor in place of the pool's total risk weight for default and dilution risk.
- If the guarantee covers only default risk or dilution risk, but not both, the bank will substitute the risk weight for an exposure to the guarantor in place of the pool's risk weight for the corresponding risk component (default or dilution). The capital requirement for the other component will then be added.
- If a guarantee covers only a portion of the default and/or dilution risk, the uncovered portion of the default and/or dilution risk will be treated as per the existing CRM rules for proportional or tranched coverage (ie the risk weights of the uncovered risk components will be added to the risk weights of the covered risk components).

G. Treatment of expected losses and recognition of provisions

141. Section G discusses the method by which the difference between provisions (eg specific provisions, portfolio-specific general provisions such as country risk provisions or general provisions) and expected losses may be included in or must be deducted from regulatory capital, as outlined in the definition of capital section of the Basel III framework (June 2011).

1. Calculation of expected losses

142. A bank must sum the EL amount (defined as EL multiplied by EAD) associated with its exposures to which the IRB approach is applied (excluding the EL amount associated with securitisation exposures) to obtain a total EL amount. The treatment of EL for securitisation exposures is described in paragraph 37 of the securitisation framework.

(i) Expected loss for exposures other than exposures subject to the supervisory slotting criteria

143. Banks must calculate EL as PD x LGD for corporate, bank, and retail exposures not in default. For corporate, bank, and retail exposures that are in default, banks must use their best estimate of expected loss as defined in paragraph 238 for exposures subject to the advanced approach and for exposures subject to the foundation approach banks must use the supervisory LGD. For exposures subject to the supervisory slotting criteria EL is calculated as described in paragraphs 144 to 146. Securitisation exposures do not contribute to the EL amount, as set out in paragraph 37 of the securitisation framework.

[21] At national supervisory discretion, banks may recognise guarantors that are internally rated and associated with a PD equivalent to less than A- under the foundation IRB approach for purposes of determining capital requirements for dilution risk.

(ii) Expected loss for specialised lending (SL) exposures subject to the supervisory slotting criteria

144. For SL exposures subject to the supervisory slotting criteria, the EL amount is determined by multiplying 8% by the risk-weighted assets produced from the appropriate risk weights, as specified below, multiplied by EAD.

Supervisory categories and EL risk weights for non-HVCRE SL exposures

145. The risk weights for SL, other than HVCRE, are as follows:

Strong	Good	Satisfactory	Weak	Default
5%	10%	35%	100%	625%

Where, at national discretion, supervisors allow banks to assign preferential risk weights to non-HVCRE SL exposures falling into the "strong" and "good" supervisory categories as outlined in paragraph 58, the corresponding EL risk weight is 0% for "strong" exposures, and 5% for "good" exposures.

Supervisory categories and EL risk weights for HVCRE

146. The risk weights for HVCRE are as follows:

Strong	Good	Satisfactory	Weak	Default
5%	5%	35%	100%	625%

Even where, at national discretion, supervisors allow banks to assign preferential risk weights to HVCRE exposures falling into the "strong" and "good" supervisory categories as outlined in paragraph 63, the corresponding EL risk weight will remain at 5% for both "strong" and "good" exposures.

2. Calculation of provisions

(i) Exposures subject to the IRB approach

147. Total eligible provisions are defined as the sum of all provisions (eg specific provisions, partial write-offs, portfolio-specific general provisions such as country risk provisions or general provisions) that are attributed to exposures treated under the IRB approach. In addition, total eligible provisions may include any discounts on defaulted assets. Specific provisions set aside against securitisation exposures must not be included in total eligible provisions.

(ii) Portion of exposures subject to the standardised approach for credit risk

148. Banks using the standardised approach for a portion of their credit risk exposures (see paragraphs 44 to 48), must determine the portion of general provisions attributed to the standardised or IRB treatment of provisions according to the methods outlined in paragraphs 149 and 150.

149. Banks should generally attribute total general provisions on a pro rata basis according to the proportion of credit risk-weighted assets subject to the standardised and IRB approaches. However, when one approach to determining credit risk-weighted assets (ie standardised or IRB approach) is used exclusively within an entity, general provisions booked within the entity using the standardised approach may be attributed to the standardised treatment. Similarly, general provisions booked within entities using the IRB approach may be attributed to the total eligible provisions as defined in paragraph 147.

150. At national supervisory discretion, banks using both the standardised and IRB approaches may rely on their internal methods for allocating general provisions for recognition in capital under either the standardised or IRB approach, subject to the following conditions. Where the internal allocation method

is made available, the national supervisor will establish the standards surrounding their use. Banks will need to obtain prior approval from their supervisors to use an internal allocation method for this purpose.

3. Treatment of EL and provisions

151. As specified in paragraphs 61 and 73 of the Basel III framework (June 2011), banks using the IRB approach must compare the total amount of total eligible provisions (as defined in paragraph 147) with the total EL amount as calculated within the IRB approach (as defined in paragraph 142). In addition, paragraph 60 of the Basel III framework (June 2011) outlines the treatment for that portion of a bank that is subject to the standardised approach for credit risk when the bank uses both the standardised and IRB approaches.

152. Where the calculated EL amount is lower than the total eligible provisions of the bank, its supervisors must consider whether the EL fully reflects the conditions in the market in which it operates before allowing the difference to be included in Tier 2 capital. If specific provisions exceed the EL amount on defaulted assets this assessment also needs to be made before using the difference to offset the EL amount on non-defaulted assets.

153. The treatment of EL and provisions related to securitisation exposures is outlined in paragraph 37 of the securitisation framework.

H. Minimum requirements for IRB approach

154. Section H presents the minimum requirements for entry and on-going use of the IRB approach. The minimum requirements are set out in 12 separate sections concerning: (a) composition of minimum requirements; (b) compliance with minimum requirements; (c) rating system design; (d) risk rating system operations; (e) corporate governance and oversight; (f) use of internal ratings; (g) risk quantification; (h) validation of internal estimates; (i) supervisory LGD and EAD estimates; (j) requirements for recognition of leasing; (k) calculation of capital charges for equity exposures; and (l) disclosure requirements. It may be helpful to note that the minimum requirements cut across asset classes. Therefore, more than one asset class may be discussed within the context of a given minimum requirement.

1. Composition of minimum requirements

155. To be eligible for the IRB approach a bank must demonstrate to its supervisor that it meets certain minimum requirements at the outset and on an ongoing basis. Many of these requirements are in the form of objectives that a qualifying bank's risk rating systems must fulfil. The focus is on banks' abilities to rank order and quantify risk in a consistent, reliable and valid fashion.

156. The overarching principle behind these requirements is that rating and risk estimation systems and processes provide for a meaningful assessment of borrower and transaction characteristics; a meaningful differentiation of risk; and reasonably accurate and consistent quantitative estimates of risk. Furthermore, the systems and processes must be consistent with internal use of these estimates. The Committee recognises that differences in markets, rating methodologies, banking products, and practices require banks and supervisors to customise their operational procedures. It is not the Committee's intention to dictate the form or operational detail of banks' risk management policies and practices. Each supervisor will develop detailed review procedures to ensure that banks' systems and controls are adequate to serve as the basis for the IRB approach.

157. The minimum requirements set out in this document apply to all asset classes unless noted otherwise. The standards related to the process of assigning exposures to borrower or facility *grades* (and

the related oversight, validation, etc) apply equally to the process of assigning retail exposures to pools of homogenous exposures, unless noted otherwise.

158. The minimum requirements set out in this document apply to both foundation and advanced approaches unless noted otherwise. Generally, all IRB banks must produce their own estimates of PD[22] and must adhere to the overall requirements for rating system design, operations, controls, and corporate governance, as well as the requisite requirements for estimation and validation of PD measures. Banks wishing to use their own estimates of LGD and EAD must also meet the incremental minimum requirements for these risk factors included in paragraphs 235 to 263.

2. Compliance with minimum requirements

159. To be eligible for an IRB approach, a bank must demonstrate to its supervisor that it meets the IRB requirements in this document, at the outset and on an ongoing basis. Banks' overall credit risk management practices must also be consistent with the evolving sound practice guidelines issued by the Committee and national supervisors.

160. There may be circumstances when a bank is not in complete compliance with all the minimum requirements. Where this is the case, the bank must produce a plan for a timely return to compliance, and seek approval from its supervisor, or the bank must demonstrate that the effect of such non-compliance is immaterial in terms of the risk posed to the institution. Failure to produce an acceptable plan or satisfactorily implement the plan or to demonstrate immateriality will lead supervisors to reconsider the bank's eligibility for the IRB approach. Furthermore, for the duration of any non-compliance, supervisors will consider the need for the bank to hold additional capital under Pillar 2 or take other appropriate supervisory action.

3. Rating system design

161. The term "rating system" comprises all of the methods, processes, controls, and data collection and IT systems that support the assessment of credit risk, the assignment of internal risk ratings, and the quantification of default and loss estimates.

162. Within each asset class, a bank may utilise multiple rating methodologies/systems. For example, a bank may have customised rating systems for specific industries or market segments (eg middle market, and large corporate). If a bank chooses to use multiple systems, the rationale for assigning a borrower to a rating system must be documented and applied in a manner that best reflects the level of risk of the borrower. Banks must not allocate borrowers across rating systems inappropriately to minimise regulatory capital requirements (ie cherry-picking by choice of rating system). Banks must demonstrate that each system used for IRB purposes is in compliance with the minimum requirements at the outset and on an ongoing basis.

(i) Rating dimensions

Standards for corporate and bank exposures

163. A qualifying IRB rating system must have two separate and distinct dimensions: (i) the risk of borrower default; and (ii) transaction-specific factors.

164. The first dimension must be oriented to the risk of borrower default. Separate exposures to the same borrower must be assigned to the same borrower grade, irrespective of any differences in the nature of each specific transaction. There are two exceptions to this. Firstly, in the case of country transfer risk,

[22] Banks are not required to produce their own estimates of PD for exposures subject to the supervisory slotting approach.

where a bank may assign different borrower grades depending on whether the facility is denominated in local or foreign currency. Secondly, when the treatment of associated guarantees to a facility may be reflected in an adjusted borrower grade. In either case, separate exposures may result in multiple grades for the same borrower. A bank must articulate in its credit policy the relationship between borrower grades in terms of the level of risk each grade implies. Perceived and measured risk must increase as credit quality declines from one grade to the next. The policy must articulate the risk of each grade in terms of both a description of the probability of default risk typical for borrowers assigned the grade and the criteria used to distinguish that level of credit risk.

165. The second dimension must reflect transaction-specific factors, such as collateral, seniority, product type, etc. For exposures subject to the foundation IRB approach, this requirement can be fulfilled by the existence of a facility dimension, which reflects both borrower and transaction-specific factors. For example, a rating dimension that reflects EL by incorporating both borrower strength (PD) and loss severity (LGD) considerations would qualify. Likewise a rating system that exclusively reflects LGD would qualify. Where a rating dimension reflects EL and does not separately quantify LGD, the supervisory estimates of LGD must be used.

166. For banks using the advanced approach, facility ratings must reflect exclusively LGD. These ratings can reflect any and all factors that can influence LGD including, but not limited to, the type of collateral, product, industry, and purpose. Borrower characteristics may be included as LGD rating criteria only to the extent they are predictive of LGD. Banks may alter the factors that influence facility grades across segments of the portfolio as long as they can satisfy their supervisor that it improves the relevance and precision of their estimates.

167. Banks using the supervisory slotting criteria are exempt from this two-dimensional requirement for these exposures. Given the interdependence between borrower/transaction characteristics in exposures subject to the supervisory slotting approaches, banks may satisfy the requirements under this heading through a single rating dimension that reflects EL by incorporating both borrower strength (PD) and loss severity (LGD) considerations. This exemption does not apply to banks using the general corporate foundation or advanced approach for the SL sub-class.

Standards for retail exposures

168. Rating systems for retail exposures must be oriented to both borrower and transaction risk, and must capture all relevant borrower and transaction characteristics. Banks must assign each exposure that falls within the definition of retail for IRB purposes into a particular pool. Banks must demonstrate that this process provides for a meaningful differentiation of risk, provides for a grouping of sufficiently homogenous exposures, and allows for accurate and consistent estimation of loss characteristics at pool level.

169. For each pool, banks must estimate PD, LGD, and EAD. Multiple pools may share identical PD, LGD and EAD estimates. At a minimum, banks should consider the following risk drivers when assigning exposures to a pool:

- Borrower risk characteristics (eg borrower type, demographics such as age/occupation);
- Transaction risk characteristics, including product and/or collateral types (eg loan to value measures, seasoning,[23] guarantees; and seniority (first vs. second lien)). Banks must explicitly address cross-collateral provisions where present.

[23] For each pool where the banks estimate PD and LGD, banks should analyse the representativeness of the age of the facilities (in terms of time since origination for PD and time since the date of default for LGD) in the data used to derive the estimates of the bank's actual facilities. In some jurisdictions default rates peak several years after origination or recovery rates show a low point several years after default, banks should adjust the estimates with an adequate margin of conservatism to account for the lack of representativeness as well as anticipated implications of rapid exposure growth.

- Delinquency of exposure: Banks are expected to separately identify exposures that are delinquent and those that are not.

(ii) Rating structure

Standards for corporate and bank exposures

170. A bank must have a meaningful distribution of exposures across grades with no excessive concentrations, on both its borrower-rating and its facility-rating scales.

171. To meet this objective, a bank must have a minimum of seven borrower grades for non-defaulted borrowers and one for those that have defaulted. Banks with lending activities focused on a particular market segment may satisfy this requirement with the minimum number of grades.

172. A borrower grade is defined as an assessment of borrower risk on the basis of a specified and distinct set of rating criteria, from which estimates of PD are derived. The grade definition must include both a description of the degree of default risk typical for borrowers assigned the grade and the criteria used to distinguish that level of credit risk. Furthermore, "+" or "-" modifiers to alpha or numeric grades will only qualify as distinct grades if the bank has developed complete rating descriptions and criteria for their assignment, and separately quantifies PDs for these modified grades.

173. Banks with loan portfolios concentrated in a particular market segment and range of default risk must have enough grades within that range to avoid undue concentrations of borrowers in particular grades. Significant concentrations within a single grade or grades must be supported by convincing empirical evidence that the grade or grades cover reasonably narrow PD bands and that the default risk posed by all borrowers in a grade fall within that band.

174. There is no specific minimum number of facility grades for banks using the advanced approach for estimating LGD. A bank must have a sufficient number of facility grades to avoid grouping facilities with widely varying LGDs into a single grade. The criteria used to define facility grades must be grounded in empirical evidence.

175. Banks using the supervisory slotting criteria must have at least four grades for non-defaulted borrowers, and one for defaulted borrowers. The requirements for SL exposures that qualify for the corporate foundation and advanced approaches are the same as those for general corporate exposures.

Standards for retail exposures

176. For each pool identified, the bank must be able to provide quantitative measures of loss characteristics (PD, LGD, and EAD) for that pool. The level of differentiation for IRB purposes must ensure that the number of exposures in a given pool is sufficient so as to allow for meaningful quantification and validation of the loss characteristics at the pool level. There must be a meaningful distribution of borrowers and exposures across pools. A single pool must not include an undue concentration of the bank's total retail exposure.

(iii) Rating criteria

177. A bank must have specific rating definitions, processes and criteria for assigning exposures to grades within a rating system. The rating definitions and criteria must be both plausible and intuitive and must result in a meaningful differentiation of risk.

- The grade descriptions and criteria must be sufficiently detailed to allow those charged with assigning ratings to consistently assign the same grade to borrowers or facilities posing similar risk. This consistency should exist across lines of business, departments and geographic locations. If rating criteria and procedures differ for different types of borrowers or facilities, the bank must monitor for possible inconsistency, and must alter rating criteria to improve consistency when appropriate.

- Written rating definitions must be clear and detailed enough to allow third parties to understand the assignment of ratings, such as internal audit or an equally independent function and supervisors, to replicate rating assignments and evaluate the appropriateness of the grade/pool assignments.
- The criteria must also be consistent with the bank's internal lending standards and its policies for handling troubled borrowers and facilities.

178. To ensure that banks are consistently taking into account available information, they must use all relevant and material information in assigning ratings to borrowers and facilities. Information must be current. The less information a bank has, the more conservative must be its assignments of exposures to borrower and facility grades or pools. An external rating can be the primary factor determining an internal rating assignment; however, the bank must ensure that it considers other relevant information.

Exposures subject to the supervisory slotting approach

179. Banks using the supervisory slotting criteria must assign exposures to their internal rating grades based on their own criteria, systems and processes, subject to compliance with the requisite minimum requirements. Banks must then map these internal rating grades into the five supervisory rating categories. Tables 1 to 4 in Annex 6 of the Basel II framework (June 2006) provide, for each sub-class of SL exposures, the general assessment factors and characteristics exhibited by the exposures that fall under each of the supervisory categories. Each lending activity has a unique table describing the assessment factors and characteristics.

180. The Committee recognises that the criteria that banks use to assign exposures to internal grades will not perfectly align with criteria that define the supervisory categories; however, banks must demonstrate that their mapping process has resulted in an alignment of grades which is consistent with the preponderance of the characteristics in the respective supervisory category. Banks should take special care to ensure that any overrides of their internal criteria do not render the mapping process ineffective.

(iv) Rating assignment horizon

181. Although the time horizon used in PD estimation is one year (as described in paragraph 215), banks are expected to use a longer time horizon in assigning ratings.

182. A borrower rating must represent the bank's assessment of the borrower's ability and willingness to contractually perform despite adverse economic conditions or the occurrence of unexpected events. The range of economic conditions that are considered when making assessments must be consistent with current conditions and those that are likely to occur over a business cycle within the respective industry/geographic region. Rating systems should be designed in such a way that idiosyncratic or industry-specific changes are a driver of migrations from one category to another, and business cycle effects may also be a driver.

183. PD estimates for borrowers that are highly leveraged or for borrowers whose assets are predominantly traded assets must reflect the performance of the underlying assets based on periods of stressed volatilities.

184. Given the difficulties in forecasting future events and the influence they will have on a particular borrower's financial condition, a bank must take a conservative view of projected information. Furthermore, where limited data are available, a bank must adopt a conservative bias to its analysis.

(v) Use of models

185. The requirements in this section apply to statistical models and other mechanical methods used to assign borrower or facility ratings or in estimation of PDs, LGDs, or EADs. Credit scoring models and other mechanical rating procedures generally use only a subset of available information. Although mechanical rating procedures may sometimes avoid some of the idiosyncratic errors made by rating systems in which human judgement plays a large role, mechanical use of limited information also is a source of rating errors. Credit scoring models and other mechanical procedures are permissible as the primary or partial basis of rating assignments, and may play a role in the estimation of loss characteristics. Sufficient human judgement and human oversight is necessary to ensure that all relevant and material information, including that which is outside the scope of the model, is also taken into consideration, and that the model is used appropriately.

- The burden is on the bank to satisfy its supervisor that a model or procedure has good predictive power and that regulatory capital requirements will not be distorted as a result of its use. The variables that are input to the model must form a reasonable set of predictors. The model must be accurate on average across the range of borrowers or facilities to which the bank is exposed and there must be no known material biases.
- The bank must have in place a process for vetting data inputs into a statistical default or loss prediction model which includes an assessment of the accuracy, completeness and appropriateness of the data specific to the assignment of an approved rating.
- The bank must demonstrate that the data used to build the model are representative of the population of the bank's actual borrowers or facilities.
- When combining model results with human judgement, the judgement must take into account all relevant and material information not considered by the model. The bank must have written guidance describing how human judgement and model results are to be combined.
- The bank must have procedures for human review of model-based rating assignments. Such procedures should focus on finding and limiting errors associated with known model weaknesses and must also include credible ongoing efforts to improve the model's performance.
- The bank must have a regular cycle of model validation that includes monitoring of model performance and stability; review of model relationships; and testing of model outputs against outcomes.

(vi) Documentation of rating system design

186. Banks must document in writing their rating systems' design and operational details. The documentation must evidence banks' compliance with the minimum standards, and must address topics such as portfolio differentiation, rating criteria, responsibilities of parties that rate borrowers and facilities, definition of what constitutes a rating exception, parties that have authority to approve exceptions, frequency of rating reviews, and management oversight of the rating process. A bank must document the rationale for its choice of internal rating criteria and must be able to provide analyses demonstrating that rating criteria and procedures are likely to result in ratings that meaningfully differentiate risk. Rating criteria and procedures must be periodically reviewed to determine whether they remain fully applicable to the current portfolio and to external conditions. In addition, a bank must document a history of major changes in the risk rating process, and such documentation must support identification of changes made to the risk rating process subsequent to the last supervisory review. The organisation of rating assignment, including the internal control structure, must also be documented.

187. Banks must document the specific definitions of default and loss used internally and demonstrate consistency with the reference definitions set out in paragraphs 220 to 228.

188. If the bank employs statistical models in the rating process, the bank must document their methodologies. This material must:

- Provide a detailed outline of the theory, assumptions and/or mathematical and empirical basis of the assignment of estimates to grades, individual obligors, exposures, or pools, and the data source(s) used to estimate the model;
- Establish a rigorous statistical process (including out-of-time and out-of-sample performance tests) for validating the model; and
- Indicate any circumstances under which the model does not work effectively.

189. Use of a model obtained from a third-party vendor that claims proprietary technology is not a justification for exemption from documentation or any other of the requirements for internal rating systems. The burden is on the model's vendor and the bank to satisfy supervisors.

4. Risk rating system operations

(i) Coverage of ratings

190. For corporate, and bank exposures, each borrower and all recognised guarantors must be assigned a rating and each exposure must be associated with a facility rating as part of the loan approval process. Similarly, for retail, each exposure must be assigned to a pool as part of the loan approval process.

191. Each separate legal entity to which the bank is exposed must be separately rated. A bank must have policies acceptable to its supervisor regarding the treatment of individual entities in a connected group including circumstances under which the same rating may or may not be assigned to some or all related entities. Those policies must include a process for the identification of specific wrong way risk for each legal entity to which the bank is exposed. Transactions with counterparties where specific wrong way risk has been identified need to be treated differently when calculating the EAD for such exposures (see paragraph 58 of the counterparty credit risk standards).

(ii) Integrity of rating process

Standards for corporate and bank exposures

192. Rating assignments and periodic rating reviews must be completed or approved by a party that does not directly stand to benefit from the extension of credit. Independence of the rating assignment process can be achieved through a range of practices that will be carefully reviewed by supervisors. These operational processes must be documented in the bank's procedures and incorporated into bank policies. Credit policies and underwriting procedures must reinforce and foster the independence of the rating process.

193. Borrowers and facilities must have their ratings refreshed at least on an annual basis. Certain credits, especially higher risk borrowers or problem exposures, must be subject to more frequent review. In addition, banks must initiate a new rating if material information on the borrower or facility comes to light.

194. The bank must have an effective process to obtain and update relevant and material information on the borrower's financial condition, and on facility characteristics that affect LGDs and EADs (such as the condition of collateral). Upon receipt, the bank needs to have a procedure to update the borrower's rating in a timely fashion.

Standards for retail exposures

195. A bank must review the loss characteristics and delinquency status of each identified risk pool on at least an annual basis. It must also review the status of individual borrowers within each pool as a means of ensuring that exposures continue to be assigned to the correct pool. This requirement may be satisfied by review of a representative sample of exposures in the pool.

(iii) Overrides

196. For rating assignments based on expert judgement, banks must clearly articulate the situations in which bank officers may override the outputs of the rating process, including how and to what extent such overrides can be used and by whom. For model-based ratings, the bank must have guidelines and processes for monitoring cases where human judgement has overridden the model's rating, variables were excluded or inputs were altered. These guidelines must include identifying personnel that are responsible for approving these overrides. Banks must identify overrides and separately track their performance.

(iv) Data maintenance

197. A bank must collect and store data on key borrower and facility characteristics to provide effective support to its internal credit risk measurement and management process, to enable the bank to meet the other requirements in this document, and to serve as a basis for supervisory reporting. These data should be sufficiently detailed to allow retrospective re-allocation of obligors and facilities to grades, for example if increasing sophistication of the internal rating system suggests that finer segregation of portfolios can be achieved. Furthermore, banks must collect and retain data on aspects of their internal ratings as required under Pillar 3 of this Framework.

For corporate and bank exposures

198. Banks must maintain rating histories on borrowers and recognised guarantors, including the rating since the borrower/guarantor was assigned an internal grade, the dates the ratings were assigned, the methodology and key data used to derive the rating and the person/model responsible. The identity of borrowers and facilities that default, and the timing and circumstances of such defaults, must be retained. Banks must also retain data on the PDs and realised default rates associated with rating grades and ratings migration in order to track the predictive power of the borrower rating system.

199. Banks using the advanced IRB approach must also collect and store a complete history of data on the LGD and EAD estimates associated with each facility and the key data used to derive the estimate and the person/model responsible. Banks must also collect data on the estimated and realised LGDs and EADs associated with each defaulted facility. Banks that reflect the credit risk mitigating effects of guarantees/credit derivatives through LGD must retain data on the LGD of the facility before and after evaluation of the effects of the guarantee/credit derivative. Information about the components of loss or recovery for each defaulted exposure must be retained, such as amounts recovered, source of recovery (eg collateral, liquidation proceeds and guarantees), time period required for recovery, and administrative costs.

200. Banks under the foundation approach which utilise supervisory estimates are encouraged to retain the relevant data (ie data on loss and recovery experience for corporate exposures under the foundation approach, data on realised losses for banks using the supervisory slotting criteria).

For retail exposures

201. Banks must retain data used in the process of allocating exposures to pools, including data on borrower and transaction risk characteristics used either directly or through use of a model, as well as data on delinquency. Banks must also retain data on the estimated PDs, LGDs and EADs, associated with pools

of exposures. For defaulted exposures, banks must retain the data on the pools to which the exposure was assigned over the year prior to default and the realised outcomes on LGD and EAD.

(v) Stress tests used in assessment of capital adequacy

202. An IRB bank must have in place sound stress testing processes for use in the assessment of capital adequacy. Stress testing must involve identifying possible events or future changes in economic conditions that could have unfavourable effects on a bank's credit exposures and assessment of the bank's ability to withstand such changes. Examples of scenarios that could be used are (i) economic or industry downturns; (ii) market-risk events; and (iii) liquidity conditions.

203. In addition to the more general tests described above, the bank must perform a credit risk stress test to assess the effect of certain specific conditions on its IRB regulatory capital requirements. The test to be employed would be one chosen by the bank, subject to supervisory review. The test to be employed must be meaningful and reasonably conservative. Individual banks may develop different approaches to undertaking this stress test requirement, depending on their circumstances. For this purpose, the objective is not to require banks to consider worst-case scenarios. The bank's stress test in this context should, however, consider at least the effect of mild recession scenarios. In this case, one example might be to use two consecutive quarters of zero growth to assess the effect on the bank's PDs, LGDs and EADs, taking account – on a conservative basis – of the bank's international diversification.

204. Whatever method is used, the bank must include a consideration of the following sources of information. First, a bank's own data should allow estimation of the ratings migration of at least some of its exposures. Second, banks should consider information about the impact of smaller deterioration in the credit environment on a bank's ratings, giving some information on the likely effect of bigger, stress circumstances. Third, banks should evaluate evidence of ratings migration in external ratings. This would include the bank broadly matching its buckets to rating categories.

205. National supervisors may wish to issue guidance to their banks on how the tests to be used for this purpose should be designed, bearing in mind conditions in their jurisdiction. The results of the stress test may indicate no difference in the capital calculated under the IRB rules described in this section of this Framework if the bank already uses such an approach for its internal rating purposes. Where a bank operates in several markets, it does not need to test for such conditions in all of those markets, but a bank should stress portfolios containing the vast majority of its total exposures.

5. Corporate governance and oversight

(i) Corporate governance

206. All material aspects of the rating and estimation processes must be approved by the bank's board of directors or a designated committee thereof and senior management.[24] These parties must possess a general understanding of the bank's risk rating system and detailed comprehension of its associated management reports. Senior management must provide notice to the board of directors or a designated committee thereof of material changes or exceptions from established policies that will materially impact the operations of the bank's rating system.

[24] This standard refers to a management structure composed of a board of directors and senior management. The Committee is aware that there are significant differences in legislative and regulatory frameworks across countries as regards the functions of the board of directors and senior management. In some countries, the board has the main, if not exclusive, function of supervising the executive body (senior management, general management) so as to ensure that the latter fulfils its tasks. For this reason, in some cases, it is known as a supervisory board. This means that the board has no executive functions. In other countries, by contrast, the board has a broader competence in that it lays down the general framework for the management of the bank. Owing to these differences, the notions of the board of directors and senior management are used in this paper not to identify legal constructs but rather to label two decision-making functions within a bank.

207. Senior management also must have a good understanding of the rating system's design and operation, and must approve material differences between established procedure and actual practice. Management must also ensure, on an ongoing basis, that the rating system is operating properly. Management and staff in the credit control function must meet regularly to discuss the performance of the rating process, areas needing improvement, and the status of efforts to improve previously identified deficiencies.

208. Internal ratings must be an essential part of the reporting to these parties. Reporting must include risk profile by grade, migration across grades, estimation of the relevant parameters per grade, and comparison of realised default rates (and LGDs and EADs for banks on advanced approaches) against expectations. Reporting frequencies may vary with the significance and type of information and the level of the recipient.

(ii) Credit risk control

209. Banks must have independent credit risk control units that are responsible for the design or selection, implementation and performance of their internal rating systems. The unit(s) must be functionally independent from the personnel and management functions responsible for originating exposures. Areas of responsibility must include:

- Testing and monitoring internal grades;
- Production and analysis of summary reports from the bank's rating system, to include historical default data sorted by rating at the time of default and one year prior to default, grade migration analyses, and monitoring of trends in key rating criteria;
- Implementing procedures to verify that rating definitions are consistently applied across departments and geographic areas;
- Reviewing and documenting any changes to the rating process, including the reasons for the changes; and
- Reviewing the rating criteria to evaluate if they remain predictive of risk. Changes to the rating process, criteria or individual rating parameters must be documented and retained for supervisors to review.

210. A credit risk control unit must actively participate in the development, selection, implementation and validation of rating models. It must assume oversight and supervision responsibilities for any models used in the rating process, and ultimate responsibility for the ongoing review and alterations to rating models.

(iii) Internal and external audit

211. Internal audit or an equally independent function must review at least annually the bank's rating system and its operations, including the operations of the credit function and the estimation of PDs, LGDs and EADs. Areas of review include adherence to all applicable minimum requirements. Internal audit must document its findings.

6. Use of internal ratings

212. Internal ratings and default and loss estimates must play an essential role in the credit approval, risk management, internal capital allocations, and corporate governance functions of banks using the IRB approach. Ratings systems and estimates designed and implemented exclusively for the purpose of qualifying for the IRB approach and used only to provide IRB inputs are not acceptable. It is recognised that banks will not necessarily be using exactly the same estimates for both IRB and all internal purposes.

For example, pricing models are likely to use PDs and LGDs relevant to the life of the asset. Where there are such differences, a bank must document them and demonstrate their reasonableness to the supervisor.

213. A bank must have a credible track record in the use of internal ratings information. Thus, the bank must demonstrate that it has been using a rating system that was broadly in line with the minimum requirements articulated in this document for at least the three years prior to qualification. A bank using the advanced IRB approach must demonstrate that it has been estimating and employing LGDs and EADs in a manner that is broadly consistent with the minimum requirements for use of own estimates of LGDs and EADs for at least the three years prior to qualification. Improvements to a bank's rating system will not render a bank non-compliant with the three-year requirement.

7. Risk quantification

(i) Overall requirements for estimation

Structure and intent

214. This section addresses the broad standards for own-estimates of PD, LGD, and EAD. Generally, all banks using the IRB approaches must estimate a PD[25] for each internal borrower grade for corporate and bank exposures or for each pool in the case of retail exposures.

215. PD estimates must be a long-run average of one-year default rates for borrowers in the grade, with the exception of retail exposures as set out in paragraph 233 and 234. Requirements specific to PD estimation are provided in paragraphs 229 to 234. Banks on the advanced approach must estimate an appropriate LGD (as defined in paragraphs 235 to 240) for each of its facilities (or retail pools). For exposures subject to the advanced approach, banks must also estimate an appropriate long-run default-weighted average EAD for each of its facilities as defined in paragraphs 241 and 242. Requirements specific to EAD estimation appear in paragraphs 241 to 251. For corporate and bank exposures, banks that do not meet the requirements for own-estimates of EAD or LGD, above, must use the supervisory estimates of these parameters. Standards for use of such estimates are set out in paragraphs 280 to 297.

216. Internal estimates of PD, LGD, and EAD must incorporate all relevant, material and available data, information and methods. A bank may utilise internal data and data from external sources (including pooled data). Where internal or external data is used, the bank must demonstrate that its estimates are representative of long run experience.

217. Estimates must be grounded in historical experience and empirical evidence, and not based purely on subjective or judgmental considerations. Any changes in lending practice or the process for pursuing recoveries over the observation period must be taken into account. A bank's estimates must promptly reflect the implications of technical advances and new data and other information, as it becomes available. Banks must review their estimates on a yearly basis or more frequently.

218. The population of exposures represented in the data used for estimation, and lending standards in use when the data were generated, and other relevant characteristics should be closely matched to or at least comparable with those of the bank's exposures and standards. The bank must also demonstrate that economic or market conditions that underlie the data are relevant to current and foreseeable conditions. For estimates of LGD and EAD, banks must take into account paragraphs 235 to 251. The number of exposures in the sample and the data period used for quantification must be sufficient to provide the bank with confidence in the accuracy and robustness of its estimates. The estimation technique must perform well in out-of-sample tests.

25 Banks are not required to produce their own estimates of PD for exposures subject to the supervisory slotting approach.

219. In general, estimates of PDs, LGDs, and EADs are likely to involve unpredictable errors. In order to avoid over-optimism, a bank must add to its estimates a margin of conservatism that is related to the likely range of errors. Where methods and data are less satisfactory and the likely range of errors is larger, the margin of conservatism must be larger. Supervisors may allow some flexibility in application of the required standards for data that are collected prior to the date of implementation of this Framework. However, in such cases banks must demonstrate to their supervisors that appropriate adjustments have been made to achieve broad equivalence to the data without such flexibility. Data collected beyond the date of implementation must conform to the minimum standards unless otherwise stated.

(ii) Definition of default

220. A default is considered to have occurred with regard to a particular obligor when either or both of the two following events have taken place.

- The bank considers that the obligor is unlikely to pay its credit obligations to the banking group in full, without recourse by the bank to actions such as realising security (if held).
- The obligor is past due more than 90 days on any material credit obligation to the banking group.[26] Overdrafts will be considered as being past due once the customer has breached an advised limit or been advised of a limit smaller than current outstandings.

221. The elements to be taken as indications of unlikeliness to pay include:

- The bank puts the credit obligation on non-accrued status.
- The bank makes a charge-off or account-specific provision resulting from a significant perceived decline in credit quality subsequent to the bank taking on the exposure.
- The bank sells the credit obligation at a material credit-related economic loss.
- The bank consents to a distressed restructuring of the credit obligation where this is likely to result in a diminished financial obligation caused by the material forgiveness, or postponement, of principal, interest or (where relevant) fees.
- The bank has filed for the obligor's bankruptcy or a similar order in respect of the obligor's credit obligation to the banking group.
- The obligor has sought or has been placed in bankruptcy or similar protection where this would avoid or delay repayment of the credit obligation to the banking group.

222. National supervisors will provide appropriate guidance as to how these elements must be implemented and monitored.

223. For retail exposures, the definition of default can be applied at the level of a particular facility, rather than at the level of the obligor. As such, default by a borrower on one obligation does not require a bank to treat all other obligations to the banking group as defaulted.

224. A bank must record actual defaults on IRB exposure classes using this reference definition. A bank must also use the reference definition for its estimation of PDs, and (where relevant) LGDs and EADs. In arriving at these estimations, a bank may use external data available to it that is not itself consistent with that definition, subject to the requirements set out in paragraph 230. However, in such cases, banks must demonstrate to their supervisors that appropriate adjustments to the data have been made to achieve broad equivalence with the reference definition. This same condition would apply to any internal data used up to implementation of this Framework. Internal data (including that pooled by banks) used in such

[26] In the case of retail and PSE obligations, for the 90 days figure, a supervisor may substitute a figure up to 180 days for different products, as it considers appropriate to local conditions.

estimates beyond the date of implementation of this Framework must be consistent with the reference definition.

225. If the bank considers that a previously defaulted exposure's status is such that no trigger of the reference definition any longer applies, the bank must rate the borrower and estimate LGD as they would for a non-defaulted facility. Should the reference definition subsequently be triggered, a second default would be deemed to have occurred.

(iii) Re-ageing

226. The bank must have clearly articulated and documented policies in respect of the counting of days past due, in particular in respect of the re-ageing of the facilities and the granting of extensions, deferrals, renewals and rewrites to existing accounts. At a minimum, the re-ageing policy must include: (a) approval authorities and reporting requirements; (b) minimum age of a facility before it is eligible for re-ageing; (c) delinquency levels of facilities that are eligible for re-ageing; (d) maximum number of re-ageings per facility; and (e) a reassessment of the borrower's capacity to repay. These policies must be applied consistently over time, and must support the 'use test' (ie if a bank treats a re-aged exposure in a similar fashion to other delinquent exposures more than the past-due cut off point, this exposure must be recorded as in default for IRB purposes).

(iv) Treatment of overdrafts

227. Authorised overdrafts must be subject to a credit limit set by the bank and brought to the knowledge of the client. Any break of this limit must be monitored; if the account were not brought under the limit after 90 to 180 days (subject to the applicable past-due trigger), it would be considered as defaulted. Non-authorised overdrafts will be associated with a zero limit for IRB purposes. Thus, days past due commence once any credit is granted to an unauthorised customer; if such credit were not repaid within 90 to 180 days, the exposure would be considered in default. Banks must have in place rigorous internal policies for assessing the creditworthiness of customers who are offered overdraft accounts.

(v) Definition of loss for all asset classes

228. The definition of loss used in estimating LGD is economic loss. When measuring economic loss, all relevant factors should be taken into account. This must include material discount effects and material direct and indirect costs associated with collecting on the exposure. Banks must not simply measure the loss recorded in accounting records, although they must be able to compare accounting and economic losses. The bank's own workout and collection expertise significantly influences their recovery rates and must be reflected in their LGD estimates, but adjustments to estimates for such expertise must be conservative until the bank has sufficient internal empirical evidence of the impact of its expertise.

(vi) Requirements specific to PD estimation

Corporate and bank exposures

229. Banks must use information and techniques that take appropriate account of the long-run experience when estimating the average PD for each rating grade. For example, banks may use one or more of the three specific techniques set out below: internal default experience, mapping to external data, and statistical default models.

230. Banks may have a primary technique and use others as a point of comparison and potential adjustment. Supervisors will not be satisfied by mechanical application of a technique without supporting analysis. Banks must recognise the importance of judgmental considerations in combining results of techniques and in making adjustments for limitations of techniques and information.

- A bank may use data on internal default experience for the estimation of PD. A bank must demonstrate in its analysis that the estimates are reflective of underwriting standards and of any differences in the rating system that generated the data and the current rating system. Where only limited data are available, or where underwriting standards or rating systems have changed, the bank must add a greater margin of conservatism in its estimate of PD. The use of pooled data across institutions may also be recognised. A bank must demonstrate that the internal rating systems and criteria of other banks in the pool are comparable with its own.
- Banks may associate or map their internal grades to the scale used by an external credit assessment institution or similar institution and then attribute the default rate observed for the external institution's grades to the bank's grades. Mappings must be based on a comparison of internal rating criteria to the criteria used by the external institution and on a comparison of the internal and external ratings of any common borrowers. Biases or inconsistencies in the mapping approach or underlying data must be avoided. The external institution's criteria underlying the data used for quantification must be oriented to the risk of the borrower and not reflect transaction characteristics. The bank's analysis must include a comparison of the default definitions used, subject to the requirements in paragraph 220 to 225. The bank must document the basis for the mapping.
- A bank is allowed to use a simple average of default-probability estimates for individual borrowers in a given grade, where such estimates are drawn from statistical default prediction models. The bank's use of default probability models for this purpose must meet the standards specified in paragraph 185.

For all methods above, banks must estimate a PD for each rating grade based on the observed historical average one-year default rate that is a simple average based on number of obligors (count weighted). Weighting approaches, such as EAD weighting, are not permitted.

231. Irrespective of whether a bank is using external, internal, or pooled data sources, or a combination of the three, for its PD estimation, the length of the underlying historical observation period used must be at least five years for at least one source. If the available observation period spans a longer period for any source, and this data are relevant and material, this longer period must be used. The data should include a representative mix of good and bad years.

Retail exposures

232. Given the bank-specific basis of assigning exposures to pools, banks must regard internal data as the primary source of information for estimating loss characteristics. Banks are permitted to use external data or statistical models for quantification provided a strong link can be demonstrated between: (a) the bank's process of assigning exposures to a pool and the process used by the external data source; and (b) between the bank's internal risk profile and the composition of the external data. In all cases banks must use all relevant and material data sources as points of comparison.

233. One method for deriving long-run average estimates of PD and default-weighted average loss rates given default (as defined in paragraph 235) for retail would be based on an estimate of the expected long-run loss rate. A bank may (i) use an appropriate PD estimate to infer the long-run default-weighted average loss rate given default, or (ii) use a long-run default-weighted average loss rate given default to infer the appropriate PD. In either case, it is important to recognise that the LGD used for the IRB capital calculation cannot be less than the long-run default-weighted average loss rate given default and must be consistent with the concepts defined in paragraph 235.

234. Irrespective of whether banks are using external, internal, pooled data sources, or a combination of the three, for their estimation of loss characteristics, the length of the underlying historical observation period used must be at least five years. If the available observation spans a longer period for any source, and these data are relevant, this longer period must be used. The data should include a representative mix

of good and bad years of the economic cycle relevant for the portfolio. The PD should be based on the observed historical average one-year default rate.

(vii) Requirements specific to own-LGD estimates

Standards for all asset classes

235. A bank must estimate an LGD for each facility that aims to reflect economic downturn conditions where necessary to capture the relevant risks. This LGD cannot be less than the long-run default-weighted average loss rate given default calculated based on the average economic loss of all observed defaults within the data source for that type of facility. In addition, a bank must take into account the potential for the LGD of the facility to be higher than the default-weighted average during a period when credit losses are substantially higher than average. For certain types of exposures, loss severities may not exhibit such cyclical variability and LGD estimates may not differ materially from the long-run default-weighted average. However, for other exposures, this cyclical variability in loss severities may be important and banks will need to incorporate it into their LGD estimates. For this purpose, banks may make reference to the averages of loss severities observed during periods of high credit losses, forecasts based on appropriately conservative assumptions, or other similar methods. Appropriate estimates of LGD during periods of high credit losses might be formed using either internal and/or external data. Supervisors will continue to monitor and encourage the development of appropriate approaches to this issue.

236. In its analysis, the bank must consider the extent of any dependence between the risk of the borrower and that of the collateral or collateral provider. Cases where there is a significant degree of dependence must be addressed in a conservative manner. Any currency mismatch between the underlying obligation and the collateral must also be considered and treated conservatively in the bank's assessment of LGD.

237. LGD estimates must be grounded in historical recovery rates and, when applicable, must not solely be based on the collateral's estimated market value. This requirement recognises the potential inability of banks to gain both control of their collateral and liquidate it expeditiously. To the extent that LGD estimates take into account the existence of collateral, banks must establish internal requirements for collateral management, operational procedures, legal certainty and risk management process that are generally consistent with those required for the foundation IRB approach.

238. Recognising the principle that realised losses can at times systematically exceed expected levels, the LGD assigned to a defaulted asset should reflect the possibility that the bank would have to recognise additional, unexpected losses during the recovery period. For each defaulted asset, the bank must also construct its best estimate of the expected loss on that asset based on current economic circumstances and facility status. The amount, if any, by which the LGD on a defaulted asset exceeds the bank's best estimate of expected loss on the asset represents the capital requirement for that asset, and should be set by the bank on a risk-sensitive basis in accordance with paragraphs 53 and 118 to 120. Instances where the best estimate of expected loss on a defaulted asset is less than the sum of specific provisions and partial charge-offs on that asset will attract supervisory scrutiny and must be justified by the bank.

Additional standards for corporate exposures

239. Estimates of LGD must be based on a minimum data observation period that should ideally cover at least one complete economic cycle but must in any case be no shorter than a period of seven years for at least one source. If the available observation period spans a longer period for any source, and the data are relevant, this longer period must be used.

Additional standards for retail exposures

240. The minimum data observation period for LGD estimates for retail exposures is five years. The less data a bank has, the more conservative it must be in its estimation.

(viii) Requirements specific to own-EAD estimates

Standards for all asset classes

241. EAD for an on-balance sheet or off-balance sheet item is defined as the expected gross exposure of the facility upon default of the obligor. For on-balance sheet items, banks must estimate EAD at no less than the current drawn amount, subject to recognising the effects of on-balance sheet netting as specified in the foundation approach. The minimum requirements for the recognition of netting are the same as those under the foundation approach. The additional minimum requirements for internal estimation of EAD under the advanced approach, therefore, focus on the estimation of EAD for off-balance sheet items (excluding transactions that expose banks to counterparty credit risk as set out in the counterparty credit risk standards). Banks using the advanced approach must have established procedures in place for the estimation of EAD for off-balance sheet items. These must specify the estimates of EAD to be used for each facility type. Banks' estimates of EAD should reflect the possibility of additional drawings by the borrower up to and after the time a default event is triggered. Where estimates of EAD differ by facility type, the delineation of these facilities must be clear and unambiguous.

242. Under the advanced approach, banks must assign an estimate of EAD for each eligible facility. It must be an estimate of the long-run default-weighted average EAD for similar facilities and borrowers over a sufficiently long period of time, but with a margin of conservatism appropriate to the likely range of errors in the estimate. If a positive correlation can reasonably be expected between the default frequency and the magnitude of EAD, the EAD estimate must incorporate a larger margin of conservatism. Moreover, for exposures for which EAD estimates are volatile over the economic cycle, the bank must use EAD estimates that are appropriate for an economic downturn, if these are more conservative than the long-run average. For banks that have been able to develop their own EAD models, this could be achieved by considering the cyclical nature, if any, of the drivers of such models. Other banks may have sufficient internal data to examine the impact of previous recession(s). However, some banks may only have the option of making conservative use of external data. Moreover, where a bank bases its estimates on alternative measures of central tendency (such as the median or a higher percentile estimate) or only on 'downturn' data, it should explicitly confirm that the basic downturn requirement of the framework is met, ie the bank's estimates do not fall below a (conservative) estimate of the long-run default-weighted average EAD for similar facilities.

243. The criteria by which estimates of EAD are derived must be plausible and intuitive, and represent what the bank believes to be the material drivers of EAD. The choices must be supported by credible internal analysis by the bank. The bank must be able to provide a breakdown of its EAD experience by the factors it sees as the drivers of EAD. A bank must use all relevant and material information in its derivation of EAD estimates. Across facility types, a bank must review its estimates of EAD when material new information comes to light and at least on an annual basis.

244. Due consideration must be paid by the bank to its specific policies and strategies adopted in respect of account monitoring and payment processing. The bank must also consider its ability and willingness to prevent further drawings in circumstances short of payment default, such as covenant violations or other technical default events. Banks must also have adequate systems and procedures in place to monitor facility amounts, current outstandings against committed lines and changes in outstandings per borrower and per grade. The bank must be able to monitor outstanding balances on a daily basis.

245. Banks' EAD estimates must be developed using a 12-month fixed-horizon approach; ie for each observation in the reference data set, default outcomes must be linked to relevant obligor and facility characteristics twelve months prior to default.

246. As set out in paragraph 218, banks' EAD estimates should be based on reference data that reflect the obligor, facility and bank management practice characteristics of the exposures to which the estimates

are applied. Consistent with this principle, EAD estimates applied to particular exposures should not be based on data that comingle the effects of disparate characteristics or data from exposures that exhibit different characteristics (eg same broad product grouping but different customers that are managed differently by the bank). The estimates should be based on appropriately homogenous segments. Alternatively, the estimates should be based on an estimation approach that effectively disentangles the impact of the different characteristics exhibited within the relevant dataset. Practices that generally do not comply with this principle include use of estimates based or partly based on:

- SME/midmarket data being applied to large corporate obligors.
- Data from commitments with 'small' unused limit availability being applied to facilities with 'large' unused limit availability.
- Data from obligors already identified as problematic at reference date being applied to current obligors with no known issues (eg customers at reference date who were already delinquent, watchlisted by the bank, subject to recent bank-initiated limit reductions, blocked from further drawdowns or subject to other types of collections activity).
- Data that has been affected by changes in obligors' mix of borrowing and other credit-related products over the observation period unless that data has been effectively mitigated for such changes, eg by adjusting the data to remove the effects of the changes in the product mix. Supervisors should expect banks to demonstrate a detailed understanding of the impact of changes in customer product mix on EAD reference data sets (and associated EAD estimates) and that the impact is immaterial or has been effectively mitigated within each bank's estimation process. Banks' analyses in this regard should be actively challenged by supervisors. Effective mitigation would not include: setting floors to CCF/EAD observations; use of obligor-level estimates that do not fully cover the relevant product transformation options or inappropriately combine products with very different characteristics (eg revolving and non-revolving products); adjusting only 'material' observations affected by product transformation; generally excluding observations affected by product profile transformation (thereby potentially distorting the representativeness of the remaining data).

247. A well-known feature of the commonly used undrawn limit factor (ULF) approach[27] to estimating CCFs is the region of instability associated with facilities close to being fully drawn at reference date. Banks should ensure that their EAD estimates are effectively quarantined from the potential effects of this region of instability.

- An acceptable approach could include using an estimation method other than the ULF approach that avoids the instability issue by not using potentially small undrawn limits that could approach zero in the denominator or, as appropriate, switching to a method other than the ULF as the region of instability is approached, eg a limit factor, balance factor or additional utilisation factor approach.[28] Note that, consistent with paragraph 246, including limit utilisation as a driver in EAD models could quarantine much of the relevant portfolio from this issue but, in the absence of

[27] A specific type of CCF, where predicted additional drawings in the lead-up to default are expressed as a percentage of the undrawn limit that remains available to the obligor under the terms and conditions of a facility, ie EAD=B0=Bt+ULF[Lt –Bt], where B0 = facility balance at date of default; Bt = current balance (for predicted EAD) or balance at reference date (for observed EAD); Lt = current limit (for predicted EAD) or limit at reference date (for realised/observed EAD).

[28] A limit factor (LF) is a specific type of CCF, where the predicted balance at default is expressed as a percentage of the total limit that is available to the obligor under the terms and conditions of a credit facility, ie EAD=B0= LF[Lt], where B0 = facility balance at date of default; Bt = current balance (for predicted EAD) or balance at reference date (for observed EAD); Lt = current limit (for predicted EAD) or limit at reference date (for realised/observed EAD). A balance factor (BF) is a specific type of CCF, where the predicted balance at default is expressed as a percentage of the current balance that has been drawn down under a credit facility, ie EAD=B0=BF[Bt]. An additional utilisation factor (AUF) is a specific type of CCF, where predicted additional drawings in the lead-up to default are expressed as a percentage of the total limit that is available to the obligor under the terms and conditions of a credit facility, ie EAD = B0 = Bt + AUF[Lt].

other actions, leaves open how to develop appropriate EAD estimates to be applied to exposures within the region of instability.

- Common but ineffective approaches to mitigating this issue include capping and flooring reference data (eg observed CCFs at 100 per cent and zero respectively) or omitting observations that are judged to be affected.

248. EAD reference data must not be capped to the principal amount outstanding or facility limits. Accrued interest, other due payments and limit excesses should be included in EAD reference data.

249. For transactions that expose banks to counterparty credit risk, estimates of EAD must fulfil the requirements set forth in the counterparty credit risk standards.

Additional standards for corporate exposures

250. Estimates of EAD must be based on a time period that must ideally cover a complete economic cycle but must in any case be no shorter than a period of seven years. If the available observation period spans a longer period for any source, and the data are relevant, this longer period must be used. EAD estimates must be calculated using a default-weighted average and not a time-weighted average.

Additional standards for retail exposures

251. The minimum data observation period for EAD estimates for retail exposures is five years. The less data a bank has, the more conservative it must be in its estimation. A bank need not give equal importance to historic data if it can demonstrate to its supervisor that more recent data are a better predictor of drawdowns.

(ix) Minimum requirements for assessing effect of guarantees and credit derivatives

Standards for corporate exposures where own estimates of LGD are used and standards for retail exposures

Guarantees

252. When a bank uses its own estimates of LGD, it may reflect the risk-mitigating effect of guarantees through an adjustment to PD or LGD estimates. The option to adjust LGDs is available only to those banks that have been approved to use their own internal estimates of LGD. For retail exposures, where guarantees exist, either in support of an individual obligation or a pool of exposures, a bank may reflect the risk-reducing effect either through its estimates of PD or LGD, provided this is done consistently. In adopting one or the other technique, a bank must adopt a consistent approach, both across types of guarantees and over time.

253. In all cases, both the borrower and all recognised guarantors must be assigned a borrower rating at the outset and on an ongoing basis. A bank must follow all minimum requirements for assigning borrower ratings set out in this document, including the regular monitoring of the guarantor's condition and ability and willingness to honour its obligations. Consistent with the requirements in paragraphs 198 and 199, a bank must retain all relevant information on the borrower absent the guarantee and the guarantor. In the case of retail guarantees, these requirements also apply to the assignment of an exposure to a pool, and the estimation of PD.

254. In no case can the bank assign the guaranteed exposure an adjusted PD or LGD such that the adjusted risk weight would be lower than that of a comparable, direct exposure to the guarantor. Neither criteria nor rating processes are permitted to consider possible favourable effects of imperfect expected correlation between default events for the borrower and guarantor for purposes of regulatory minimum capital requirements. As such, the adjusted risk weight must not reflect the risk mitigation of "double default."

255. In case the bank applies the standardised approach to direct exposures to the guarantor, the guarantee may only be recognised by treating the covered portion of the exposure as a direct exposure to the guarantor under the standardised approach. Similarly, in case the bank applies the F-IRB approach to direct exposures to the guarantor, the guarantee may only be recognised by applying the F-IRB approach to the covered portion of the exposure. Alternatively, banks may choose to not recognise the effect of guarantees on their exposures.

Eligible guarantors and guarantees

256. There are no restrictions on the types of eligible guarantors. The bank must, however, have clearly specified criteria for the types of guarantors it will recognise for regulatory capital purposes.

257. The guarantee must be evidenced in writing, non-cancellable on the part of the guarantor, in force until the debt is satisfied in full (to the extent of the amount and tenor of the guarantee) and legally enforceable against the guarantor in a jurisdiction where the guarantor has assets to attach and enforce a judgement. The guarantee must also be unconditional; there should be no clause in the protection contract outside the direct control of the bank that could prevent the protection provider from being obliged to pay out in a timely manner in the event that the original counterparty fails to make the payment(s) due. However, as an exception for the purposes of own estimates of EAD under the A-IRB, guarantees that only cover loss remaining after the bank has first pursued the original obligor for payment and has completed the workout process may be recognised.

258. In case of guarantees where the bank applies the standardised approach to the covered portion of the exposure, the scope of guarantors and the minimum requirements as under the standardised approach apply.

Adjustment criteria

259. A bank must have clearly specified criteria for adjusting borrower grades or LGD estimates (or in the case of retail and eligible purchased receivables, the process of allocating exposures to pools) to reflect the impact of guarantees for regulatory capital purposes. These criteria must be as detailed as the criteria for assigning exposures to grades consistent with paragraphs 177 and 178, and must follow all minimum requirements for assigning borrower or facility ratings set out in this document.

260. The criteria must be plausible and intuitive, and must address the guarantor's ability and willingness to perform under the guarantee. The criteria must also address the likely timing of any payments and the degree to which the guarantor's ability to perform under the guarantee is correlated with the borrower's ability to repay. The bank's criteria must also consider the extent to which residual risk to the borrower remains, for example a currency mismatch between the guarantee and the underlying exposure.

261. In adjusting borrower grades or LGD estimates (or in the case of retail and eligible purchased receivables, the process of allocating exposures to pools), banks must take all relevant available information into account.

Credit derivatives

262. The minimum requirements for guarantees are relevant also for single-name credit derivatives. Additional considerations arise in respect of asset mismatches. The criteria used for assigning adjusted borrower grades or LGD estimates (or pools) for exposures hedged with credit derivatives must require that the asset on which the protection is based (the reference asset) cannot be different from the underlying asset, unless the conditions outlined in the foundation approach are met.

263. In addition, the criteria must address the payout structure of the credit derivative and conservatively assess the impact this has on the level and timing of recoveries. The bank must also consider the extent to which other forms of residual risk remain.

For banks using foundation LGD estimates

264. The minimum requirements outlined in paragraphs 252 to 263 apply to banks using the foundation LGD estimates with the following exceptions:

(i) The bank is not able to use an 'LGD-adjustment' option; and

(ii) The range of eligible guarantees and guarantors is limited to those outlined in paragraph 92.

(x) Requirements specific to estimating PD and LGD (or EL) for qualifying purchased receivables

265. The following minimum requirements for risk quantification must be satisfied for any purchased receivables (corporate or retail) making use of the top-down treatment of default risk and/or the IRB treatments of dilution risk.

266. The purchasing bank will be required to group the receivables into sufficiently homogeneous pools so that accurate and consistent estimates of PD and LGD (or EL) for default losses and EL estimates of dilution losses can be determined. In general, the risk bucketing process will reflect the seller's underwriting practices and the heterogeneity of its customers. In addition, methods and data for estimating PD, LGD, and EL must comply with the existing risk quantification standards for retail exposures. In particular, quantification should reflect all information available to the purchasing bank regarding the quality of the underlying receivables, including data for similar pools provided by the seller, by the purchasing bank, or by external sources. The purchasing bank must determine whether the data provided by the seller are consistent with expectations agreed upon by both parties concerning, for example, the type, volume and on-going quality of receivables purchased. Where this is not the case, the purchasing bank is expected to obtain and rely upon more relevant data.

Minimum operational requirements

267. A bank purchasing receivables has to justify confidence that current and future advances can be repaid from the liquidation of (or collections against) the receivables pool. To qualify for the top-down treatment of default risk, the receivable pool and overall lending relationship should be closely monitored and controlled. Specifically, a bank will have to demonstrate the following:

Legal certainty

268. The structure of the facility must ensure that under all foreseeable circumstances the bank has effective ownership and control of the cash remittances from the receivables, including incidences of seller or servicer distress and bankruptcy. When the obligor makes payments directly to a seller or servicer, the bank must verify regularly that payments are forwarded completely and within the contractually agreed terms. As well, ownership over the receivables and cash receipts should be protected against bankruptcy 'stays' or legal challenges that could materially delay the lender's ability to liquidate/assign the receivables or retain control over cash receipts.

Effectiveness of monitoring systems

269. The bank must be able to monitor both the quality of the receivables and the financial condition of the seller and servicer. In particular:

- The bank must (a) assess the correlation among the quality of the receivables and the financial condition of both the seller and servicer, and (b) have in place internal policies and procedures that provide adequate safeguards to protect against such contingencies, including the assignment of an internal risk rating for each seller and servicer.
- The bank must have clear and effective policies and procedures for determining seller and servicer eligibility. The bank or its agent must conduct periodic reviews of sellers and servicers in

order to verify the accuracy of reports from the seller/servicer, detect fraud or operational weaknesses, and verify the quality of the seller's credit policies and servicer's collection policies and procedures. The findings of these reviews must be well documented.

- The bank must have the ability to assess the characteristics of the receivables pool, including: (a) over-advances; (b) history of the seller's arrears, bad debts, and bad debt allowances; (c) payment terms; and (d) potential contra accounts.
- The bank must have effective policies and procedures for monitoring on an aggregate basis single-obligor concentrations both within and across receivables pools.
- The bank must receive timely and sufficiently detailed reports of receivables ageings and dilutions to (a) ensure compliance with the bank's eligibility criteria and advancing policies governing purchased receivables, and (b) provide an effective means with which to monitor and confirm the seller's terms of sale (eg invoice date ageing) and dilution.

Effectiveness of work-out systems

270. An effective programme requires systems and procedures not only for detecting deterioration in the seller's financial condition and deterioration in the quality of the receivables at an early stage, but also for addressing emerging problems pro-actively. In particular,

- The bank should have clear and effective policies, procedures, and information systems to monitor compliance with (a) all contractual terms of the facility (including covenants, advancing formulas, concentration limits, early amortisation triggers, etc) as well as (b) the bank's internal policies governing advance rates and receivables eligibility. The bank's systems should track covenant violations and waivers as well as exceptions to established policies and procedures.
- To limit inappropriate draws, the bank should have effective policies and procedures for detecting, approving, monitoring, and correcting over-advances.
- The bank should have effective policies and procedures for dealing with financially weakened sellers or servicers and/or deterioration in the quality of receivable pools. These include, but are not necessarily limited to, early termination triggers in revolving facilities and other covenant protections, a structured and disciplined approach to dealing with covenant violations, and clear and effective policies and procedures for initiating legal actions and dealing with problem receivables.

Effectiveness of systems for controlling collateral, credit availability, and cash

271. The bank must have clear and effective policies and procedures governing the control of receivables, credit, and cash. In particular,

- Written internal policies must specify all material elements of the receivables purchase programme, including the advancing rates, eligible collateral, necessary documentation, concentration limits, and how cash receipts are to be handled. These elements should take appropriate account of all relevant and material factors, including the seller's/servicer's financial condition, risk concentrations, and trends in the quality of the receivables and the seller's customer base.
- Internal systems must ensure that funds are advanced only against specified supporting collateral and documentation (such as servicer attestations, invoices, shipping documents, etc).

Compliance with the bank's internal policies and procedures

272. Given the reliance on monitoring and control systems to limit credit risk, the bank should have an effective internal process for assessing compliance with all critical policies and procedures, including

- regular internal and/or external audits of all critical phases of the bank's receivables purchase programme.
- verification of the separation of duties (i) between the assessment of the seller/servicer and the assessment of the obligor and (ii) between the assessment of the seller/servicer and the field audit of the seller/servicer.

273. A bank's effective internal process for assessing compliance with all critical policies and procedures should also include evaluations of back office operations, with particular focus on qualifications, experience, staffing levels, and supporting systems.

8. Validation of internal estimates

274. Banks must have a robust system in place to validate the accuracy and consistency of rating systems, processes, and the estimation of all relevant risk components. A bank must demonstrate to its supervisor that the internal validation process enables it to assess the performance of internal rating and risk estimation systems consistently and meaningfully.

275. Banks must regularly compare realised default rates with estimated PDs for each grade and be able to demonstrate that the realised default rates are within the expected range for that grade. Banks using the advanced IRB approach must complete such analysis for their estimates of LGDs and EADs. Such comparisons must make use of historical data that are over as long a period as possible. The methods and data used in such comparisons by the bank must be clearly documented by the bank. This analysis and documentation must be updated at least annually.

276. Banks must also use other quantitative validation tools and comparisons with relevant external data sources. The analysis must be based on data that are appropriate to the portfolio, are updated regularly, and cover a relevant observation period. Banks' internal assessments of the performance of their own rating systems must be based on long data histories, covering a range of economic conditions, and ideally one or more complete business cycles.

277. Banks must demonstrate that quantitative testing methods and other validation methods do not vary systematically with the economic cycle. Changes in methods and data (both data sources and periods covered) must be clearly and thoroughly documented.

278. Banks must have well-articulated internal standards for situations where deviations in realised PDs, LGDs and EADs from expectations become significant enough to call the validity of the estimates into question. These standards must take account of business cycles and similar systematic variability in default experiences. Where realised values continue to be higher than expected values, banks must revise estimates upward to reflect their default and loss experience.

279. Where banks rely on supervisory, rather than internal, estimates of risk parameters, they are encouraged to compare realised LGDs and EADs to those set by the supervisors. The information on realised LGDs and EADs should form part of the bank's assessment of economic capital.

9. Supervisory LGD and EAD estimates

280. Banks under the foundation IRB approach, which do not meet the requirements for own-estimates of LGD and EAD, above, must meet the minimum requirements described in the standardised approach to receive recognition for eligible financial collateral (as set out in the credit risk mitigation section (Section D) of the standardised approach). They must meet the following additional minimum requirements in order to receive recognition for additional collateral types.

(i) Definition of eligibility of CRE and RRE as collateral

281. Eligible CRE and RRE collateral for corporate and bank exposures are defined as:

- Collateral where the risk of the borrower is not materially dependent upon the performance of the underlying property or project, but rather on the underlying capacity of the borrower to repay the debt from other sources. As such, repayment of the facility is not materially dependent on any cash flow generated by the underlying CRE/RRE serving as collateral;[29] and
- Additionally, the value of the collateral pledged must not be materially dependent on the performance of the borrower. This requirement is not intended to preclude situations where purely macro-economic factors affect both the value of the collateral and the performance of the borrower.

282. In light of the generic description above and the definition of corporate exposures, income producing real estate that falls under the SL asset class is specifically excluded from recognition as collateral for corporate exposures.[30]

(ii) Operational requirements for eligible CRE/RRE

283. Subject to meeting the definition above, CRE and RRE will be eligible for recognition as collateral for corporate claims only if all of the following operational requirements are met.

- *Legal enforceability*: any claim on collateral taken must be legally enforceable in all relevant jurisdictions, and any claim on collateral must be properly filed on a timely basis. Collateral interests must reflect a perfected lien (ie all legal requirements for establishing the claim have been fulfilled). Furthermore, the collateral agreement and the legal process underpinning it must be such that they provide for the bank to realise the value of the collateral within a reasonable timeframe.
- *Objective market value of collateral*: the collateral must be valued at or less than the current fair value under which the property could be sold under private contract between a willing seller and an arm's-length buyer on the date of valuation.

[29] The Committee recognises that in some countries where multifamily housing makes up an important part of the housing market and where public policy is supportive of that sector, including specially established public sector companies as major providers, the risk characteristics of lending secured by mortgage on such residential real estate can be similar to those of traditional corporate exposures. The national supervisor may under such circumstances recognise mortgage on multifamily residential real estate as eligible collateral for corporate exposures.

[30] In exceptional circumstances for well-developed and long-established markets, mortgages on office and/or multi-purpose commercial premises and/or multi-tenanted commercial premises may have the potential to receive recognition as collateral in the corporate portfolio. This exceptional treatment will be subject to very strict conditions. In particular, two tests must be fulfilled, namely that (i) losses stemming from commercial real estate lending up to the lower of 50% of the market value or 60% of loan-to value (LTV) based on mortgage-lending-value (MLV) must not exceed 0.3% of the outstanding loans in any given year; and that (ii) overall losses stemming from commercial real estate lending must not exceed 0.5% of the outstanding loans in any given year. This is, if either of these tests is not satisfied in a given year, the eligibility to use this treatment will cease and the original eligibility criteria would need to be satisfied again before it could be applied in the future. Countries applying such a treatment must publicly disclose that these are met.

- *Frequent revaluation*: the bank is expected to monitor the value of the collateral on a frequent basis and at a minimum once every year. More frequent monitoring is suggested where the market is subject to significant changes in conditions. Statistical methods of evaluation (eg reference to house price indices, sampling) may be used to update estimates or to identify collateral that may have declined in value and that may need re-appraisal. A qualified professional must evaluate the property when information indicates that the value of the collateral may have declined materially relative to general market prices or when a credit event, such as default, occurs.
- *Junior liens*: In some member countries, eligible collateral will be restricted to situations where the lender has a first charge over the property.[31] Junior liens may be taken into account where there is no doubt that the claim for collateral is legally enforceable and constitutes an efficient credit risk mitigant. Where junior liens are recognised the bank must first take the haircut value of the collateral, then reduce it by the sum of all loans with liens that rank higher than the junior lien, the remaining value is the collateral that supports the loan with the junior lien. In cases where liens are held by third parties that rank pari passu with the lien of the bank, only the proportion of the collateral (after the application of haircuts and reductions due to the value of loans with liens that rank higher than the lien of the bank) that is attributable to the bank may be recognised.

284. Additional collateral management requirements are as follows:

- The types of CRE and RRE collateral accepted by the bank and lending policies (advance rates) when this type of collateral is taken must be clearly documented.
- The bank must take steps to ensure that the property taken as collateral is adequately insured against damage or deterioration.
- The bank must monitor on an ongoing basis the extent of any permissible prior claims (eg tax) on the property.
- The bank must appropriately monitor the risk of environmental liability arising in respect of the collateral, such as the presence of toxic material on a property.

(iii) Requirements for recognition of financial receivables

Definition of eligible receivables

285. Eligible financial receivables are claims with an original maturity of less than or equal to one year where repayment will occur through the commercial or financial flows related to the underlying assets of the borrower. This includes both self-liquidating debt arising from the sale of goods or services linked to a commercial transaction and general amounts owed by buyers, suppliers, renters, national and local governmental authorities, or other non-affiliated parties not related to the sale of goods or services linked to a commercial transaction. Eligible receivables do not include those associated with securitisations, sub-participations or credit derivatives.

Operational requirements

Legal certainty

286. The legal mechanism by which collateral is given must be robust and ensure that the lender has clear rights over the proceeds from the collateral.

[31] In some of these jurisdictions, first liens are subject to the prior right of preferential creditors, such as outstanding tax claims and employees' wages.

287. Banks must take all steps necessary to fulfil local requirements in respect of the enforceability of security interest, eg by registering a security interest with a registrar. There should be a framework that allows the potential lender to have a perfected first priority claim over the collateral.

288. All documentation used in collateralised transactions must be binding on all parties and legally enforceable in all relevant jurisdictions. Banks must have conducted sufficient legal review to verify this and have a well-founded legal basis to reach this conclusion, and undertake such further review as necessary to ensure continuing enforceability.

289. The collateral arrangements must be properly documented, with a clear and robust procedure for the timely collection of collateral proceeds. Banks' procedures should ensure that any legal conditions required for declaring the default of the customer and timely collection of collateral are observed. In the event of the obligor's financial distress or default, the bank should have legal authority to sell or assign the receivables to other parties without consent of the receivables' obligors.

Risk management

290. The bank must have a sound process for determining the credit risk in the receivables. Such a process should include, among other things, analyses of the borrower's business and industry (eg effects of the business cycle) and the types of customers with whom the borrower does business. Where the bank relies on the borrower to ascertain the credit risk of the customers, the bank must review the borrower's credit policy to ascertain its soundness and credibility.

291. The margin between the amount of the exposure and the value of the receivables must reflect all appropriate factors, including the cost of collection, concentration within the receivables pool pledged by an individual borrower, and potential concentration risk within the bank's total exposures.

292. The bank must maintain a continuous monitoring process that is appropriate for the specific exposures (either immediate or contingent) attributable to the collateral to be utilised as a risk mitigant. This process may include, as appropriate and relevant, ageing reports, control of trade documents, borrowing base certificates, frequent audits of collateral, confirmation of accounts, control of the proceeds of accounts paid, analyses of dilution (credits given by the borrower to the issuers) and regular financial analysis of both the borrower and the issuers of the receivables, especially in the case when a small number of large-sized receivables are taken as collateral. Observance of the bank's overall concentration limits should be monitored. Additionally, compliance with loan covenants, environmental restrictions, and other legal requirements should be reviewed on a regular basis.

293. The receivables pledged by a borrower should be diversified and not be unduly correlated with the borrower. Where the correlation is high, eg where some issuers of the receivables are reliant on the borrower for their viability or the borrower and the issuers belong to a common industry, the attendant risks should be taken into account in the setting of margins for the collateral pool as a whole. Receivables from affiliates of the borrower (including subsidiaries and employees) will not be recognised as risk mitigants.

294. The bank should have a documented process for collecting receivable payments in distressed situations. The requisite facilities for collection should be in place, even when the bank normally looks to the borrower for collections.

Requirements for recognition of other physical collateral

295. Supervisors may allow for recognition of the credit risk mitigating effect of certain other physical collateral when the following conditions are met:

- The bank demonstrates to the satisfaction of the supervisor that there are liquid markets for disposal of collateral in an expeditious and economically efficient manner. Banks must carry out a reassessment of this condition both periodically and when information indicates material changes in the market.

- The bank demonstrates to the satisfaction of the supervisor that there are well established, publicly available market prices for the collateral. Banks must also demonstrate that the amount they receive when collateral is realised does not deviate significantly from these market prices.

296. In order for a given bank to receive recognition for additional physical collateral, it must meet all the standards in paragraphs 283 and 284, subject to the following modifications.

- First Claim: With the sole exception of permissible prior claims specified in footnote 31, only first liens on, or charges over, collateral are permissible. As such, the bank must have priority over all other lenders to the realised proceeds of the collateral.
- The loan agreement must include detailed descriptions of the collateral and the right to examine and revalue the collateral whenever this is deemed necessary by the lending bank.
- The types of physical collateral accepted by the bank and policies and practices in respect of the appropriate amount of each type of collateral relative to the exposure amount must be clearly documented in internal credit policies and procedures and available for examination and/or audit review.
- Bank credit policies with regard to the transaction structure must address appropriate collateral requirements relative to the exposure amount, the ability to liquidate the collateral readily, the ability to establish objectively a price or market value, the frequency with which the value can readily be obtained (including a professional appraisal or valuation), and the volatility of the value of the collateral. The periodic revaluation process must pay particular attention to "fashion-sensitive" collateral to ensure that valuations are appropriately adjusted downward of fashion, or model-year, obsolescence as well as physical obsolescence or deterioration.
- In cases of inventories (eg raw materials, work-in-process, finished goods, dealers' inventories of autos) and equipment, the periodic revaluation process must include physical inspection of the collateral.

297. General Security Agreements, and other forms of floating charge, can provide the lending bank with a registered claim over a company's assets. In cases where the registered claim includes both assets that are not eligible as collateral under the F-IRB and assets that are eligible as collateral under the F-IRB, the bank may recognise the latter. Recognition is conditional on the claims meeting the operational requirements set out paragraphs 280 to 296.

10. Requirements for recognition of leasing

298. Leases other than those that expose the bank to residual value risk (see paragraph 299) will be accorded the same treatment as exposures collateralised by the same type of collateral. The minimum requirements for the collateral type must be met (CRE/RRE or other collateral). In addition, the bank must also meet the following standards:

- Robust risk management on the part of the lessor with respect to the location of the asset, the use to which it is put, its age, and planned obsolescence;
- A robust legal framework establishing the lessor's legal ownership of the asset and its ability to exercise its rights as owner in a timely fashion; and
- The difference between the rate of depreciation of the physical asset and the rate of amortisation of the lease payments must not be so large as to overstate the CRM attributed to the leased assets.

299. Leases that expose the bank to residual value risk will be treated in the following manner. Residual value risk is the bank's exposure to potential loss due to the fair value of the equipment declining below its residual estimate at lease inception.

- The discounted lease payment stream will receive a risk weight appropriate for the lessee's financial strength (PD) and supervisory or own-estimate of LGD, whichever is appropriate.
- The residual value will be risk-weighted at 100%.

11. Disclosure requirements

300. In order to be eligible for the IRB approach, banks must meet the disclosure requirements set out in Pillar 3. These are minimum requirements for use of IRB: failure to meet these will render banks ineligible to use the relevant IRB approach.

Minimum capital requirements for CVA risk

A. General provisions

1. In the context of this document, CVA stands for credit valuation adjustment specified at a counterparty level. CVA reflects the adjustment of default risk-free prices of derivatives and securities financing transactions (SFTs) as defined in paragraphs 4 and 5 of Annex 4 of the Basel II framework[1] due to a potential default of the counterparty. Regulatory CVA may differ from CVA used for accounting purposes as follows: (i) regulatory CVA excludes the effect of the bank's own default; (ii) several constraints reflecting best practice in accounting CVA are imposed on calculations of regulatory CVA, so some banks may find that regulatory CVA deviates from their accounting CVA. Unless explicitly specified otherwise, the term "CVA" in this document means "regulatory CVA".

2. CVA risk is defined as the risk of losses arising from changing CVA values in response to changes in counterparty credit spreads and market risk factors that drive prices of derivative transactions and SFTs.

3. The capital requirement for CVA risk must be calculated by all banks involved in covered transactions. Covered transactions include all derivatives except those transacted directly with a qualified central counterparty. Furthermore, covered transactions also include SFTs that are fair-valued by a bank for accounting purposes.

4. The CVA risk capital requirement is calculated for a bank's "CVA portfolio" on a standalone basis. The CVA portfolio includes CVA for a bank's entire portfolio of covered transactions and eligible CVA hedges.

5. Two approaches are available for calculating CVA capital: the standardised approach (SA-CVA) and the basic approach (BA-CVA). Banks must use the BA-CVA unless they receive approval from their relevant supervisory authority to use the SA-CVA.[2]

6. Banks that have received approval of their supervisory authority to use the SA-CVA may carve out from the SA-CVA calculations any number of netting sets. CVA capital for all carved out netting sets must be calculated via the BA-CVA.

7. A materiality threshold is established. Any bank whose aggregate notional amount of non-centrally cleared derivatives is less than or equal to 100 billion euro is deemed as being below the materiality threshold. Any bank below the materiality threshold may choose to set its CVA capital equal to 100% of the bank's capital requirement for counterparty credit risk (CCR). CVA hedges are not recognised under this treatment. If chosen, this treatment must be applied to the bank's entire portfolio instead of the BA-CVA or the SA-CVA. A bank's relevant supervisory authority, however, can remove this option if it determines that CVA risk resulting from the bank's derivative positions materially contributes to the bank's overall risk.

8. Eligibility criteria for CVA hedges are specified in paragraphs 15 to 17 for the BA-CVA and in paragraphs 36 to 38 for the SA-CVA.

9. CVA hedging instruments can be external (ie with an external counterparty) or internal (ie with one of the bank's trading desks).

[1] See Basel Committee on Banking Supervision, *Basel II: International Convergence of Capital Measurement and Capital Standards – Comprehensive Version*, June 2006, www.bis.org/publ/bcbs128.htm.

[2] Note that this is in contrast to the revised market risk framework, where banks do not need supervisory approval to use the standardised approach.

- All external CVA hedges (whether eligible or not) that are covered transactions must be included in the CVA calculation for the counterparty to the hedge.
- All eligible external CVA hedges must be excluded from a bank's market risk capital charge calculations in the trading book.
- Non-eligible external CVA hedges are treated as trading book instruments and are capitalised via the revised market risk standard.[3]
- An internal CVA hedge involves two perfectly offsetting positions: one of the CVA desk and the opposite position of the trading desk.
  - If an internal CVA hedge is ineligible, both positions belong to the trading book where they cancel each other, so there is no impact on either CVA portfolio or the trading book.
  - If an internal CVA hedge is eligible, the CVA desk's position is part of the CVA portfolio where it is capitalised via the revised CVA framework, while the trading desk's position is part of the trading book where it is capitalised via the revised market risk standard.
- If an internal CVA hedge involves an instrument that is subject to curvature risk, default risk charge or the residual risk add-on under the standardised approach of the revised market risk standard, it can be eligible only if the trading desk that is the CVA desk's "counterparty" executes a transaction with an external counterparty that exactly offsets the trading desk's position with the CVA desk.

10. Banks that use the BA-CVA or the SA-CVA for calculating CVA capital requirements may cap the maturity adjustment factor at 1 for all netting sets contributing to CVA capital when they calculate CCR capital under the Internal Ratings Based (IRB) approach.

B. Basic Approach for CVA

1. General provisions

11. The BA-CVA calculations may be performed either via the reduced version or the full version. The full version recognises counterparty spread hedges and is intended for banks that hedge CVA risk. The reduced version is obtained from the full version via elimination of hedging recognition. The reduced version is designed to simplify BA-CVA implementation for less sophisticated banks that do not hedge CVA. The reduced BA-CVA is also part of the full BA-CVA capital calculations as a conservative means to restrict hedging efficiency, so all banks using the BA-CVA must make these calculations. Any bank under the BA-CVA approach can choose whether to implement the full version or the reduced version.

2. Reduced version of the BA-CVA (hedges are not recognised)

12. The capital requirement for CVA risk under the reduced version of the BA-CVA ($K_{reduced}$) is calculated as follows, where the summations are taken over all counterparties that are within scope of the CVA charge:

$$K_{reduced} = \sqrt{\left(\rho \cdot \sum_c SCVA_c\right)^2 + \left(1-\rho^2\right) \cdot \sum_c SCVA_c^2}$$

[3] Basel Committee on Banking Supervision, *Minimum capital requirements for market risk*, January 2016, www.bis.org/bcbs/publ/d352.pdf.

where:

- $SCVA_c$ is the CVA capital requirement that counterparty *c* would receive if considered on a stand-alone basis (referred to as "stand-alone CVA capital" below). See paragraph 13 for its calculation.

- ρ= 50%. It is the supervisory correlation parameter. Its square, ρ^2=25%, represents the correlation between credit spreads of any two counterparties.[4] In the formula above, the effect of ρ is to recognise the fact that the CVA risk to which a bank is exposed is less that the sum of the CVA risk for each counterparty, given that the credit spreads of counterparties are typically not perfectly correlated.

  The first term under the square root in the formula above aggregates the systematic components of CVA risk, and the second term under the square root aggregates the idiosyncratic components of CVA risk.

13. The stand-alone CVA capital for counterparty *c* that is used in the formula in paragraph 12 ($SCVA_c$) is calculated as follows (where the summation is across all netting sets with the counterparty):

$$SCVA_c = \frac{1}{\alpha} \cdot RW_c \cdot \sum_{NS} M_{NS} \cdot EAD_{NS} \cdot DF_{NS}$$

where:

- RW_c is the risk weight for counterparty *c* that reflects the volatility of its credit spread. These risk weights are based on a combination of sector and credit quality of the counterparty as prescribed in paragraph 14.

- M_{NS} is the effective maturity for the netting set *NS*. For banks that have supervisory approval to use IMM (internal models method) , M_{NS} is calculated as per paragraphs 38 and 39 of Annex 4 of the Basel II framework, with the exception that the five year cap in paragraph 38 is not applied. For banks that do not have supervisory approval to use IMM, M_{NS} is calculated according to paragraphs 320 to 323 of the Basel II framework, with the exception that the five year cap in paragraph 320 is not applied.

- EAD_{NS} is the exposure at default (EAD) of the netting set *NS*, calculated in the same way as the bank calculates it for minimum capital requirements for CCR.

- DF_{NS} is a supervisory discount factor. It is 1 for banks using the (IMM to calculate EAD, and is $\frac{1-e^{-0.05 \cdot M_{NS}}}{0.05 \cdot M_{NS}}$ for banks not using IMM.[5]

- α = 1.4.[6]

14. The supervisory risk weights (RW_C) are given in the tables below. Credit quality is specified as either investment grade (IG), high yield (HY), or not rated (NR). Where there are no external ratings or where external ratings are not recognised within a jurisdiction, banks may, subject to supervisory approval,

4 One of the basic assumptions underlying the BA-CVA is that systematic credit spread risk is driven by a single factor. Under this assumption, ρ can be interpreted as the correlation between the credit spread of a counterparty and the single credit spread systematic factor.

5 DF is the supervisory discount factor averaged over time between today and the netting set's effective maturity date. The interest rate used for discounting is set at 5%, hence 0.05 in the formula. The product of EAD and effective maturity in the BA-CVA formula is a proxy for the area under the discounted expected exposure (EE) profile of the netting set. The IMM definition of effective maturity already includes this discount factor, hence DF is set to 1 for IMM banks. Outside IMM, netting set effective maturity is defined as an average of actual trade maturities. This definition lacks discounting, so the supervisory discount factor is added to compensate for this.

6 α is the multiplier used to convert Effective Expected Positive Exposure (EEPE) to EAD in both SA-CCR and IMM. Its role in the calculation, therefore, is to convert the EAD of the netting set (EAD_{NS}) back to EEPE.

map the internal rating to an external rating and assign a risk weight corresponding to either IG or HY. Otherwise, the risk weights corresponding to NR is to be applied.

Sector of counterparty	Credit quality of counterparty	
	IG	HY and NR
Sovereigns including central banks, multilateral development banks	0.5%	3.0%
Local government, government-backed non-financials, education and public administration	1.0%	4.0%
Financials including government-backed financials	5.0%	12.0%
Basic materials, energy, industrials, agriculture, manufacturing, mining and quarrying	3.0%	7.0%
Consumer goods and services, transportation and storage, administrative and support service activities	3.0%	8.5%
Technology, telecommunications	2.0%	5.5%
Health care, utilities, professional and technical activities	1.5%	5.0%
Other sector	5.0%	12.0%

3. Full version of the BA-CVA (hedges are recognised)

(a) Eligible hedges

15. Only transactions used for the purpose of mitigating the counterparty credit spread component of CVA risk, and managed as such, can be eligible hedges.

16. Only single-name CDS, single-name contingent CDS and index CDS can be eligible CVA hedges.

17. Eligible single-name credit instruments must: (i) reference the counterparty directly; (ii) reference an entity legally related to the counterparty; or (iii) reference an entity that belongs to the same sector and region as the counterparty.

(b) Calculations

18. Banks that intend to use the full version of BA-CVA must calculate $K_{reduced}$ as well. Under the full version, capital requirement for CVA risk K_{full} is calculated as follows:

$$K_{full} = \beta \cdot K_{reduced} + (1-\beta) \cdot K_{hedged}$$

where β=0.25 and is the supervisory parameter that is used to provide a floor that limits the extent to which hedging can reduce the capital that is required to cover CVA risk.

19. The part of capital requirements that recognises eligible hedges (K_{hedged}) is calculated using the following formula, where the summations are taken over all counterparties c that are within scope of the CVA charge:

$$K_{hedged} = \sqrt{\left(\rho \cdot \sum_c (SCVA_c - SNH_c) - IH\right)^2 + (1-\rho^2)\sum_c (SCVA_c - SNH_c)^2 + \sum_c HMA_c}$$

where:

- Both the stand-alone CVA capital ($SCVA_C$) and the correlation parameter (ρ) are defined in exactly the same way as for the reduced form calculation BA-CVA.

- SNH_C is a parameter that gives recognition to the reduction in CVA risk of the counterparty c arising from the bank's use of single-name hedges of credit spread risk. See paragraph 21 for its calculation.
- IH is a parameter that gives recognition to the reduction in CVA risk across all counterparties arising from the bank's use of index hedges. See paragraph 22 for its calculation.
- HMA_C is a hedging misalignment parameter, which is designed to limit the extent to which indirect hedges can reduce capital requirements given that they will not fully offset movements in a counterparty's credit spread. That is, with indirect hedges present K_{hedged} cannot reach zero. See paragraph 23 for its calculation.

20. Regarding the main three terms in the formula for K_{hedged} in paragraph 19:

- The first term $\left(\rho \cdot \sum_c (SCVA_c - SNH_c) - IH\right)^2$ aggregates the systematic components of CVA risk arising from the bank's counterparties, the single-name hedges and the index hedges.
- The second term $\left(1-\rho^2\right)\sum_c (SCVA_c - SNH_c)^2$ aggregates the idiosyncratic components of CVA risk arising from the bank's counterparties and the single-name hedges.
- The third term $\sum_c HMA_c$ aggregates the components of indirect hedges that are not aligned with counterparties' credit spreads.

21. The quantity SNH_c is calculated as follows (where the summation is across all single name hedges h that the bank has taken out to hedge the CVA risk of counterparty c):

$$SNH_c = \sum_{h \in c} r_{hc} \cdot RW_h \cdot M_h^{SN} \cdot B_h^{SN} \cdot DF_h^{SN}$$

where:

- r_{hc} is the supervisory prescribed correlation between the credit spread of counterparty c and the credit spread of a single-name hedge h of counterparty c. It is set using the table under paragraph 24. It is set at 100% if the hedge directly references the counterparty, and set at lower values if it does not.
- M_h^{SN} is the remaining maturity of single-name hedge h.
- B_h^{SN} is the notional of single-name hedge h. For single-name contingent CDS, the notional is determined by the current market value of the reference portfolio or instrument.
- DF_h^{SN} is the supervisory discount factor calculated as $\dfrac{1-e^{-0.05 \cdot M_h^{SN}}}{0.05 \cdot M_h^{SN}}$
- RW_h is the supervisory risk weight of single-name hedge h that reflects the volatility of the credit spread of the reference name of the hedging instrument. These risk weights are based on a combination of sector and credit quality of the reference name of the hedging instrument as prescribed in paragraph 14.

22. The quantity IH is calculated as follows (where the summation is across all index hedges i that the bank has taken out to hedge CVA risk):

$$IH = \sum_i RW_i \cdot M_i^{ind} \cdot B_i^{ind} \cdot DF_i^{ind}$$

where

- M_i^{ind} is the remaining maturity of index hedge *i*.
- B_i^{ind} is the notional of the index hedge *i*.
- DF_i^{ind} is the supervisory discount factor calculated as $\dfrac{1-e^{-0.05 \cdot M_i^{ind}}}{0.05 \cdot M_i^{ind}}$
- RW_i is the supervisory risk weight of the index hedge *i*. RW_i is taken from the table in paragraph 14 based on the sector and credit quality of the index constituents and adjusted as follows:
  - For indices where all index constituents belong to the same sector and are of the same credit quality, the relevant value in the table in paragraph 14 is multiplied by 0.7 to account for diversification of idiosyncratic risk within the index.
  - For indices spanning multiple sectors or with a mixture of investment grade constituents and other constituents, the name-weighted average of the risk weights from the table in paragraph 14 should be calculated and then multiplied by 0.7.

23. The quantity HMA_C is calculated as follows:

$$HMA_c = \sum_{h \in c} \left(1 - r_{hc}^2\right) \cdot \left(RW_h \cdot M_h^{SN} \cdot B_h^{SN} \cdot DF_h^{SN}\right)^2$$

where the summation is across all single name hedges *h* that have been taken out to hedge the CVA risk of counterparty *c*, and where r_{hc}, M_h^{SN}, B_h^{SN}, DF_h^{SN} and RW_h have the same definitions as set out in paragraph 21.

24. The supervisory prescribed correlations r_{hc} between the credit spread of counterparty *c* and the credit spread of its single-name hedge *h* are set as follows:

Single-name hedge *h* of counterparty *c*	Value of r_{hc}
references counterparty *c* directly	100%
has legal relation with counterparty *c*	80%
shares sector and region with counterparty *c*	50%

C. Standardised approach for CVA

1. General provisions

25. The standardised approach for CVA (SA-CVA) is an adaptation of the standardised approach for market risk (SA-TB) under the revised market risk standard. The primary differences of the SA-CVA from the SA-TB are: (i) the SA-CVA features a reduced granularity of market risk factors; (ii) the SA-CVA does not include default risk and curvature risk; (iii) the SA-CVA uses a more conservative risk aggregation; (iv) the SA-CVA uses the conservativeness multiplier m_{CVA}.

26. The SA-CVA must be calculated and reported to supervisors at the same monthly frequency as the SA-TB. In addition, banks using the SA-CVA must calculate, and have the ability to produce to their supervisors, SA-CVA calculations on demand.

27. The SA-CVA uses as inputs the sensitivities of regulatory CVA to counterparty credit spreads and market risk factors driving covered transactions' values. Sensitivities must be computed by banks in accordance with the sensitivity validation standards described for the SA-TB in the revised market risk standard.

28. The minimum criteria for the SA-CVA eligibility include the following:

- A bank must be able to model exposure and calculate, on at least a monthly basis, CVA and CVA sensitivities to the market risk factors specified in Section C.6 of this framework.
- A bank must have a CVA desk (or a similar dedicated function) responsible for risk management and hedging of CVA.

2. Regulatory CVA calculations

29. Regulatory CVA is the base for the calculation of the CVA risk capital requirement under the SA-CVA. Calculations of regulatory CVA must be performed for each counterparty with which a bank has at least one covered position.

30. Regulatory CVA at a counterparty level must be calculated according to the following principles, with the bank's adherence to the principles to be demonstrated by the bank to its relevant supervisor:

- Regulatory CVA must be calculated as the expectation of future losses resulting from default of the counterparty under the assumption that the bank itself is default risk-free.
- The calculation must be based on at least the following inputs: (i) term structure of market-implied probability of default (PD); (ii) market-consensus expected loss given default (ELGD); (3) simulated paths of discounted future exposure.
- The term structure of market-implied PD must be estimated from credit spreads observed in the markets. For counterparties whose credit is not actively traded (ie illiquid counterparties), the market-implied PD must be estimated from proxy credit spreads estimated for these counterparties according to the following requirements:
  - A bank must estimate the credit spread curves of illiquid counterparties from credit spreads observed in the markets of the counterparty's liquid peers via an algorithm that discriminates on at least three variables: a measure of credit quality (eg rating), industry, and region.
  - In certain cases, mapping an illiquid counterparty to a single liquid reference name can be allowed. A typical example would be mapping a municipality to its home country (ie setting the municipality credit spread equal to the sovereign credit spread plus a premium). A bank must justify to its supervisor every case of mapping to single names.
  - When no credit spreads of any of the counterparty's peers is available due to the counterparty's specific type (eg project finance, funds), a bank is allowed to use a more fundamental analysis of credit risk to proxy the spread of an illiquid counterparty. However, where historical PDs are used as part of this assessment, the resulting spread cannot be based on historical PD only – it must relate to credit markets.
- The market-consensus ELGD value used for regulatory CVA calculation must be the same as the one used to calculate the risk-neutral PD from credit spreads unless the bank can demonstrate that the seniority of the derivative exposure differs from the seniority of senior unsecured bonds. Collateral provided by the counterparty does not change the seniority of the derivative exposure.
- The paths of discounted future exposure are produced via pricing of all derivative transactions with the counterparty on simulated paths of relevant market risk factors and discounting the prices to today using risk-free interest rates along the path.
- All market risk factors material for the transactions with a counterparty must be simulated as stochastic processes for an appropriate number of paths defined on an appropriate set of future time points extending to the maturity of the longest transaction.

- For transactions with a significant level of dependence between exposure and the counterparty's credit quality, this dependence should be taken into account.
- For margined counterparties, collateral is permitted to be recognised as a risk mitigant under the following conditions:
  - Collateral management requirements outlined in paragraph 51(i)–(ii) of Annex 4 of the Basel II framework are satisfied.
  - All documentation used in collateralised transactions must be binding on all parties and legally enforceable in all relevant jurisdictions. Banks must have conducted sufficient legal review to verify this and have a well-founded legal basis to reach this conclusion, and undertake such further review as necessary to ensure continuing enforceability.
- For margined counterparties, the exposure simulation must capture the effects of margining collateral that is recognised as a risk mitigant along each exposure path. All the relevant contractual features such as the nature of the margin agreement (unilateral vs bilateral), the frequency of margin calls, the type of collateral, thresholds, independent amounts, initial margins and minimum transfer amounts must be appropriately captured by the exposure model. To determine collateral available to a bank at a given exposure measurement time point, the exposure model must assume that the counterparty will not post or return any collateral within a certain time period immediately prior to that time point. The assumed value of this time period, known as the margin period of risk (MPoR), cannot be less than a supervisory floor. The supervisory floor is equal to 9 + N business days, where N is the re-margining period specified in the margin agreement (in particular, for margin agreements with daily or intra-daily exchange of margin, the minimum MPoR is 10 business days).

31. The paths of discounted exposure are obtained via exposure models used by a bank for calculating front office/accounting CVA, adjusted (if needed) to meet the requirements imposed for regulatory CVA calculation. Model calibration process (with the exception of the MPoR), market and transaction data used for regulatory CVA calculation must be the same as the ones used for accounting CVA calculation.

32. The generation of market risk factor paths underlying the exposure models must satisfy the following requirements, with the bank's adherence to these requirements to be demonstrated by the bank to its relevant supervisor:

- Drifts of risk factors must be consistent with a risk-neutral probability measure. Historical calibration of drifts is not allowed.
- The volatilities and correlations of market risk factors must be calibrated to market data whenever sufficient data exists in a given market. Otherwise, historical calibration is permissible.
- The distribution of modelled risk factors must account for the possible non-normality of the distribution of exposures, including the existence of leptokurtosis ("fat tails"), where appropriate.

33. Netting recognition is the same as in the accounting CVA calculations. In particular, netting uncertainty can be modelled.

34. The requirements for illiquid positions, which are accounted for at fair value in the revised market risk framework extend to accounting-based CVA calculations. In particular, all components of accounting-based exposure models must be independently validated.

35. The following requirements apply, with the bank's adherence to these requirements to be demonstrated by the bank to its relevant supervisor:

- Exposure models used for calculating regulatory CVA must be part of a CVA risk management framework that includes the identification, measurement, management, approval and internal reporting of CVA market risk. A bank must have a credible track record in using these exposure models for calculating CVA and CVA sensitivities to market risk factors.

- Senior management should be actively involved in the risk control process and must regard CVA risk control as an essential aspect of the business to which significant resources need to be devoted.
- Banks must have a process in place for ensuring compliance with a documented set of internal policies, controls and procedures concerning the operation of the exposure system used for accounting CVA calculations.
- Banks must have an independent control unit that is responsible for the effective initial and ongoing validation of the exposure models. This unit must be independent from business credit and trading units (including the CVA desk), must be adequately staffed and must report directly to senior management of the firm.
- Banks must document the process for initial and ongoing validation of their exposure models to a level of detail that would enable a third party to understand how the model operates, its limitations, and its key assumptions; and recreate the analysis. This documentation must set out the minimum frequency with which ongoing validation will be conducted as well as other circumstances (such as a sudden change in market behaviour). In addition, the documentation must describe how the validation is conducted with respect to data flows and portfolios, what analyses are used and how representative counterparty portfolios are constructed.
- The pricing models used to calculate exposure for a given path of market risk factors must be tested against appropriate independent benchmarks for a wide range of market states as part of the initial and ongoing model validation process. Pricing models for options must account for the non-linearity of option value with respect to market risk factors.
- An independent review of the overall CVA risk management process should be carried out regularly in the bank's own internal auditing process. This review should include both the activities of the CVA desk and of the independent risk control unit.
- Banks must define criteria on which to assess the exposure models and their inputs and have a written policy in place to describe the process by which unacceptable performance will be determined and remedied.
- An exposure model must capture transaction-specific information in order to aggregate exposures at the level of the netting set. Banks must verify that transactions are assigned to the appropriate netting set within the model.
- The exposure models must reflect transaction terms and specifications in a timely, complete, and conservative fashion. The terms and specifications must reside in a secure database that is subject to formal and periodic audit. The transmission of transaction terms and specifications data to the exposure model must also be subject to internal audit, and formal reconciliation processes must be in place between the internal model and source data systems to verify on an ongoing basis that transaction terms and specifications are being reflected in the exposure system correctly or at least conservatively.
- The current and historical market data must be acquired independently of the lines of business and be compliant with accounting. They must be fed into the exposure model in a timely and complete fashion, and maintained in a secure database subject to formal and periodic audit. Banks must also have a well-developed data integrity process to handle the data of erroneous and/or anomalous observations. To the extent that the exposure model relies on proxy market data, internal policies must identify suitable proxies and the bank must demonstrate empirically on an ongoing basis that the proxy provides a conservative representation of the underlying risk under adverse market conditions.

3. Eligible hedges

36. Only whole transactions[7] that are used for the purpose of mitigating CVA risk, and managed as such, can be eligible hedges.

37. Hedges of both the counterparty credit spread and exposure components of CVA risk can be eligible.

38. Instruments that cannot be included in the Internal Model Approach for market risk under the revised market risk standard (eg tranched credit derivatives) cannot be eligible CVA hedges.

4. Multiplier

39. To compensate for a higher level of model risk in calculation of CVA sensitivities in comparison to sensitivities of market value of trading book instruments, the equivalent measure used in the revised market risk standard is scaled up via a multiplier m_{CVA}.

40. Multiplier m_{CVA} has a default value of 1.25. However, the default value of the multiplier can be increased by the bank's supervisory authority if it determines that the bank's CVA model risk warrants it (eg the dependence between the bank's exposure to a counterparty and the counterparty's credit quality is not taken into account in its CVA calculations).

5. Calculations

41. The SA-CVA capital requirement is calculated as the sum of the capital requirements for delta and vega risks calculated for the entire CVA portfolio (including eligible hedges).

42. The capital requirement for delta risk is calculated as the simple sum of delta capital requirements calculated independently for the following six risk types: (i) interest rate (IR); (ii) foreign exchange (FX); (iii) counterparty credit spreads; (iv) reference credit spreads (ie credit spreads that drive exposure); (v) equity; (vi) commodity.

43. If an instrument is deemed as an eligible hedge for credit spread delta risk, it must be assigned in its entirety (see footnote 7) either to the counterparty credit spread or to the reference credit spread risk type. Instruments cannot be split between the two risk types.

44. The capital requirement for vega risk is calculated as the simple sum of vega capital requirements calculated independently for the following five risk types: (i) interest rates (IR); (ii) foreign exchange (FX); (iii) reference credit spreads; (iv) equity; (v) commodity. There is no vega capital requirement for counterparty credit spread risk.

45. Delta and vega capital requirements are calculated via the same procedure described below in paragraphs 46 to 52.

46. For a given risk type, calculate the sensitivity of the aggregate CVA, s_k^{CVA}, and the sensitivity of the market value of all eligible hedging instruments in the CVA portfolio, s_k^{Hdg}, to each risk factor k in the risk type. The sensitivities are defined as the ratio of the change of the quantity in question (aggregate CVA or market value of all CVA hedges) caused by a small change of the risk factor current value to the size of the change. More specific definitions are provided for each asset class in Section C.6. These definitions include specific values of risk factor shifts. However, a bank may use smaller values of risk factor shifts if doing so is consistent with internal risk management calculations.

[7] Transactions cannot be split into several effective transactions.

47. When CVA sensitivities for vega risk are calculated, the volatility shift must apply to both types of volatilities that appear in exposure models: (i) volatilities used for generating risk factor paths; and (ii) volatilities used for pricing options. CVA sensitivities for vega risk are always material and must be calculated regardless of whether or not the portfolio includes options.

48. If a hedging instrument is an index, its sensitivities to all risk factors upon which the value of the index depends must be calculated. The index sensitivity to risk factor *k* must be calculated via applying the shift of risk factor *k* to all index constituents that depend on this risk factor and recalculating the index. For example, to calculate delta sensitivity of S&P500 to large financial companies, banks must apply the relevant shift to equity prices of all large financial companies that are constituents of S&P500 and re-compute the index.

49. Obtain the weighted sensitivities WS_k^{CVA} and WS_k^{Hdg} for each risk factor *k* by multiplying the net sensitivities s_k^{CVA} and s_k^{Hdg}, respectively, by the corresponding risk weight RW_k (the risk weights applicable to each risk type are specified in Section C.6).

$$WS_k^{CVA} = RW_k \cdot s_k^{CVA} \qquad\qquad WS_k^{Hdg} = RW_k \cdot s_k^{Hdg}$$

50. The net weighted sensitivity of the CVA portfolio s_k to risk factor *k* is obtained via:

$$WS_k = WS_k^{CVA} + WS_k^{Hdg}$$

51. Weighted sensitivities must be aggregated into a capital charge K_b within each bucket *b* (the buckets and correlation parameters ρ_{kl} applicable to each risk type are specified in Section C.6).

$$K_b = \sqrt{\left[\sum_{k \in b} WS_k^2 + \sum_{k \in b} \sum_{l \in b; l \neq k} \rho_{kl} \cdot WS_k \cdot WS_l\right] + R \cdot \sum_{k \in b}\left[(WS_k^{Hdg})^2\right]}$$

where *R* is the hedging disallowance parameter, set at 0.01, that prevents the possibility of perfect hedging of CVA risk.

52. Bucket-level capital charges must then be aggregated across buckets within each risk type (the correlation parameters γ_{bc} applicable to each risk type are specified in Section C.6.

$$K = m_{CVA} \cdot \sqrt{\sum_b K_b^2 + \sum_b \sum_{c \neq b} \gamma_{bc} \cdot K_b \cdot K_c}$$

Note that this equation differs from the corresponding equation in the revised market risk standard by the absence of a residual value and of quantities S_b and the presence of multiplier m_{CVA}.

6. Buckets, risk factors, sensitivities, risk weights and correlations[8]

(a) Interest rates

53. For interest rate delta and vega risks, buckets are individual currencies.

54. For interest rate delta and vega risks, cross-bucket correlation is $\gamma_{bc} = 0.5$ for all currency pairs.

55. Interest rate delta risk factors for a bank's domestic currency and for the following currencies: USD, EUR, GBP, AUD, CAD, SEK or JPY:

8 The risk weights and correlations match the ones in the SA-TB, except for interest rate cross-tenor correlations that are obtained via the formula underlying interest rate correlations in the SA-CCR (see pages 14-17 of "Foundations of the standardised approach for measuring counterparty credit risk exposures", www.bis.org/publ/bcbs_wp26.pdf). The numbers in the tables are subject to change if calibration of the SA-TB changes.

- Interest rate delta risk factors are the absolute changes of the inflation rate and of the risk-free yields for the following five tenors: 1 year, 2 years, 5 years, 10 years and 30 years.
- Sensitivities to the abovementioned yields are measured by changing the risk-free yield in a given currency by 1 basis point (0.0001 in absolute terms) and dividing the resulting change in the aggregate CVA (or the value of CVA hedges) by 0.0001. Sensitivity to the inflation rate is obtained by changing the inflation rate by 1 basis point and dividing the resulting change in the aggregate CVA (or the value of CVA hedges) by 0.0001.
- Risk weights RW_k are given by:

Risk factor	1 year	2 years	5 years	10 years	30 years	Inflation
Risk weight	1.59%	1.33%	1.06%	1.06%	1.06%	1.59%

- Correlations ρ_{kl} between pairs of risk factors are:

	1 year	**2 years**	**5 years**	**10 years**	**30 years**	**Inflation**
1 year	100%	91%	72%	55%	31%	40%
2 years		100%	87%	72%	45%	40%
5 years			100%	91%	68%	40%
10 years				100%	83%	40%
30 years					100%	40%
Inflation						100%

56. Interest rate delta risk factors for any currency not specified in paragraph 55:

- Interest rate risk factors are the absolute change of the inflation rate and the parallel shift of the entire risk-free yield curve for a given currency.
- Sensitivity to the yield curve is measured by shifting all risk-free yield curves in a given currency by 1 basis point (0.0001 in absolute terms) and dividing the resulting change in the aggregate CVA (or the value of CVA hedges) by 0.0001. Sensitivity to the inflation rate is obtained by changing the inflation rate by 1 basis point and dividing the resulting change in the aggregate CVA (or the value of CVA hedges) by 0.0001.
- Risk weights for both risk-free yield curve and inflation rate are set at $RW_k = 2.25\%$.
- Correlations between risk-free yield curve and inflation rate are set at $\rho_{kl} = 40\%$.

57. Interest rate vega risk factors for any currency:

- Interest rate vega risk factors are a simultaneous relative change of all volatilities for the inflation rate and a simultaneous relative change of all interest rate volatilities for a given currency.
- Sensitivity to the interest rate (or inflation rate) volatilities is measured by simultaneously shifting all interest rate- (or inflation rate-) volatilities by 1% relative to their current values and dividing the resulting change in the aggregate CVA (or the value of CVA hedges) by 0.01.
- Risk weights for both interest rate and inflation volatilities are set to $RW_k = RW_\sigma \cdot \sqrt{6}$, where RW_σ is set at 55%.
- Correlations between interest rate volatilities and inflation volatilities are set at $\rho_{kl} = 40\%$.

(b) Foreign exchange (FX)

58. For FX delta and vega risks, buckets are individual currencies except for a bank's domestic currency.

59. For FX delta and vega risks, cross-bucket correlation is $\gamma_{bc} = 0.6$ for all currency pairs.

60. FX delta risk factors for any foreign currency:

- The single FX delta risk factor is the relative change of the FX spot rate between a given foreign currency and a bank's domestic currency (ie only foreign-domestic exchange rates are risk factors).
- Sensitivities to the FX spot rate are measured by shifting a given foreign-domestic exchange rate by 1% relative to its current value and dividing the resulting change in the aggregate CVA (or the value of CVA hedges) by 0.01. All foreign-foreign rates involving the currency of the shifted foreign-domestic rate are shifted accordingly via the representation of the foreign-foreign rate as the ratio of two foreign-domestic rates (for example, if EUR is the domestic currency and USDEUR is shifted, the shifted value of USDGBP is obtained as the ratio of the shifted value of USDEUR to the unshifted value of GBPEUR).
- Risk weights for all foreign-domestic exchange rates are set at $RW_k = 21\%$.

61. FX vega risk factors for any foreign currency:

- The single FX vega risk factor is a simultaneous relative change of all volatilities for a given foreign-domestic exchange rate.
- Sensitivities to the FX volatilities are measured by simultaneously shifting all volatilities for a given foreign-domestic exchange rate by 1% relative to their current values and dividing the resulting change in the aggregate CVA (or the value of CVA hedges) by 0.01. Volatilities of all foreign-foreign exchange rates involving the shifted currency are shifted according to the representation of the foreign-foreign exchange rate volatility via two foreign-domestic exchange rate volatilities and the relevant implied correlation (the latter is assumed to be fixed).
- Risk weights for FX volatilities are set to $RW_k = RW_\sigma \cdot \sqrt{4}$, where RW_σ is set at 55%.

(c) Counterparty credit spread

62. For counterparty credit spread, vega risk is not calculated. Buckets for delta risk are:

Bucket number	Sector
1	a) Sovereigns including central banks, multilateral development banks
	b) Local government, government-backed non-financials, education and public administration
2	Financials including government-backed financials
3	Basic materials, energy, industrials, agriculture, manufacturing, mining and quarrying
4	Consumer goods and services, transportation and storage, administrative and support service activities
5	Technology, telecommunications
6	Health care, utilities, professional and technical activities
7	Other sector

63. For counterparty credit spread delta risk, cross-bucket correlations γ_{bc} are given by

Bucket	1	2	3	4	5	6
1	100%	10%	20%	25%	20%	15%
2		100%	5%	15%	20%	5%
3			100%	20%	25%	5%
4				100%	25%	5%
5					100%	5%
6						100%

- For cross-bucket correlations γ_{bc} applying across bucket 7 and another bucket, γ_{bc} = 0%.

64. Counterparty credit spread delta risk factors for a given bucket:

- Counterparty credit spread delta risk factors are absolute shifts of credit spreads of individual entities (counterparties and reference names for counterparty credit spread hedges) at the following tenors: 0.5 years, 1 year, 3 years, 5 years and 10 years.
- For a given entity and tenor point, the sensitivities are measured by shifting the relevant credit spread by 1 basis point (0.0001 in absolute terms) and dividing the resulting change in the aggregate CVA (or the value of CVA hedges) by 0.0001.
- Risk weights RW_k are the same for all tenors and depend on the entity's bucket according to:

Bucket	1 a)	1 b)	2	3	4	5	6	7
IG names	0.5%	1.0%	5.0%	3.0%	3.0%	2.0%	1.5%	5.0%
HY and NR names	3.0%	4.0%	12.0%	7.0%	8.5%	5.5%	5.0%	12.0%

where IG, HY and NR are the shorthand notations for "investment grade", "high yield" and "not rated". This credit quality designation is the same as in the BA-CVA (see paragraph 14).

- Correlations ρ_{kl} between different tenors for the same entity are set to 90%.

For unrelated entities of the same credit quality (IG and IG or HY/NR and HY/NR):

- Correlations ρ_{kl} between the same tenors are set to 50%.
- Correlations ρ_{kl} between different tenors are set to 45%.

For unrelated entities of different credit quality (IG and HY/NR):

- Correlations ρ_{kl} between the same tenors are set to 40%.
- Correlations ρ_{kl} between different tenors are set to 36%.

For entities that are legally related:

- Correlations ρ_{kl} between the same tenors are set to 90%.
- Correlations ρ_{kl} between different tenors are set to 81%.

(d) Reference credit spread

65. For reference credit spreads, both delta and vega risks are calculated. Buckets for delta and vega risks are as follows (with the IG, HY and NR credit quality designations the same as in paragraph 14 of the BA-CVA):

Bucket number	Credit quality	Sector
1	Investment grade (IG)	Sovereigns including central banks, multilateral development banks
2		Local government, government-backed non-financials, education and public administration
3		Financials including government-backed financials
4		Basic materials, energy, industrials, agriculture, manufacturing, mining and quarrying
5		Consumer goods and services, transportation and storage, administrative and support service activities
6		Technology, telecommunications
7		Health care, utilities, professional and technical activities
8	High yield (HY) & non-rated (NR)	Sovereigns including central banks, multilateral development banks
9		Local government, government-backed non-financials, education and public administration
10		Financials including government-backed financials
11		Basic materials, energy, industrials, agriculture, manufacturing, mining and quarrying
12		Consumer goods and services, transportation and storage, administrative and support service activities
13		Technology, telecommunications
14		Health care, utilities, professional and technical activities
15	(Not applicable)	Other sector

66. For reference credit spread delta and vega risks, cross-bucket correlations γ_{bc} within the same credit quality category (ie either IG or HY&NR) are given by

Bucket	1/8	2/9	3/10	4/11	5/12	6/13	7/14
1/8	100%	75%	10%	20%	25%	20%	15%
2/9		100%	5%	15%	20%	15%	10%
3/10			100%	5%	15%	20%	5%
4/11				100%	20%	25%	5%
5/12					100%	25%	5%
6/13						100%	5%
7/14							100%

- For cross-bucket correlations γ_{bc} applying across IG and HY&NR categories, these correlations are divided by 2.
- For cross-bucket correlations γ_{bc} applying across bucket 15 and another bucket, γ_{bc} is set to 0%.

67. Reference credit spread delta risk factors for a given bucket:

- The single reference credit spread delta risk factor is a simultaneous absolute shift of credit spreads of all tenors for all reference names in the bucket.
- Sensitivity to reference credit spreads is measured by shifting the credit spreads of all reference names in the bucket by 1 basis point (0.0001 in absolute terms) and dividing the resulting change in the aggregate CVA (or the value of CVA hedges) by 0.0001.

- Risk weights RW_k depend on the reference name's bucket according to:

IG bucket	1	2	3	4	5	6	7
Risk weight	0.5%	1.0%	5.0%	3.0%	3.0%	2.0%	1.5%

HY/NR bucket	8	9	10	11	12	13	14	15
Risk weight	3.0%	4.0%	12.0%	7.0%	8.5%	5.5%	5.0%	12.0%

68. Reference credit spread vega risk factors for a given bucket:

- The single reference credit spread vega risk factor is a simultaneous relative shift of the volatilities of credit spreads of all tenors for all reference names in the bucket.
- Sensitivity to volatility of reference credit spread is measured by shifting the volatilities of credit spreads of all reference names in the bucket by 1% relative to their current values and dividing the resulting change in the aggregate CVA (or the value of CVA hedges) by 0.01.
- Risk weights for reference credit spread volatilities are set to $RW_k = RW_\sigma \cdot \sqrt{12}$, where RW_σ is set at 55%.

(e) Equity

69. For equity delta and vega risks, buckets are defined as:

Bucket number	Size	Region	Sector
1	Large	Emerging market economies	Consumer goods and services, transportation and storage, administrative and support service activities, healthcare, utilities
2			Telecommunications, industrials
3			Basic materials, energy, agriculture, manufacturing, mining and quarrying
4			Financials including government-backed financials, real estate activities, technology
5		Advanced economies	Consumer goods and services, transportation and storage, administrative and support service activities, healthcare, utilities
6			Telecommunications, industrials
7			Basic materials, energy, agriculture, manufacturing, mining and quarrying
8			Financials including government-backed financials, real estate activities, technology
9	Small	Emerging market economies	All sectors described under bucket numbers 1, 2, 3, and 4
10		Advanced economies	All sectors described under bucket numbers 5, 6, 7, and 8
11	(Not applicable)		Other sector

The terminology used in the equity bucket definition should be understood as follows:

- Market capitalisation ("market cap") is defined as the sum of the market capitalisations of the same legal entity or group of legal entities across all stock markets globally.
- "Large market cap" is defined as a market capitalisation equal to or greater than USD 2 billion and "small market cap" is defined as a market capitalisation of less than USD 2 billion.

- The advanced economies are Canada, the United States, Mexico, the euro area, the non-euro area western European countries (the United Kingdom, Norway, Sweden, Denmark and Switzerland), Japan, Oceania (Australia and New Zealand), Singapore and Hong Kong SAR.
- To assign a risk exposure to a sector, banks must rely on a classification that is commonly used in the market for grouping issuers by industry sector. The bank must assign each issuer to one of the sector buckets in the table above and it must assign all issuers from the same industry to the same sector. Risk positions from any issuer that a bank cannot assign to a sector in this fashion must be assigned to the "other sector" (ie bucket 11). For multinational multi-sector equity issuers, the allocation to a particular bucket must be done according to the most material region and sector in which the issuer operates.

70. For equity delta and vega risks, cross-bucket correlation γ_{bc} = 15% for all cross-bucket pairs that fall within bucket numbers 1 to 10. γ_{bc} = 0% for all cross-bucket pairs that include bucket 11.

71. Equity delta risk factors for a given bucket:

- The single equity delta risk factor is a simultaneous relative shift of equity spot prices for all reference names in the bucket.
- The sensitivities to equity delta risk factors are measured by shifting the equity spot prices for all reference names in the bucket by 1% relative to their current values and dividing the resulting change in the aggregate CVA (or the value of CVA hedges) by 0.01.
- Risk weights RW_k depend on the reference name's bucket according to the following table:

Bucket number	Risk weight
1	55%
2	60%
3	45%
4	55%
5	30%
6	35%
7	40%
8	50%
9	70%
10	50%
11	70%

72. Equity vega risk factors for a given bucket:

- The single equity vega risk factor is a simultaneous relative shift of the volatilities for all reference names in the bucket.
- The sensitivities to equity vega risk factors are measured by shifting the volatilities for all reference names in the bucket by 1% relative to their current values and dividing the resulting change in the aggregate CVA (or the value of CVA hedges) by 0.01.
- Risk weights for equity volatilities are set to $RW_k = RW_\sigma \cdot \sqrt{2}$ for large capitalisation buckets and to $RW_k = RW_\sigma \cdot \sqrt{6}$ for small capitalisation buckets, where RW_σ is set at 55%.

(f) Commodity

73. For commodity delta and vega risks, buckets are defined as:

Bucket	Commodity group	Examples
1	Energy – Solid combustibles	coal, charcoal, wood pellets, nuclear fuel (such as uranium)
2	Energy – Liquid combustibles	crude oil (such as Light-sweet, heavy, WTI and Brent); biofuels (such as bioethanol and biodiesel); petrochemicals (such as propane, ethane, gasoline, methanol and butane); refined fuels (such as jet fuel, kerosene, gasoil, fuel oil, naptha, heating oil and diesel)
3	Energy – Electricity and carbon trading	electricity (such as spot, day-ahead, peak and off-peak); carbon emissions trading (such as certified emissions reductions, in-delivery month EUA, RGGI CO2 allowance and renewable energy certificates)
4	Freight	dry-bulk route (such as capesize, panamex, handysize and supramax); liquid-bulk/gas shipping route (such as suezmax, aframax and very large crude carriers)
5	Metals – non-precious	base metal (such as aluminium, copper, lead, nickel, tin and zinc); steel raw materials (such as steel billet, steel wire, steel coil, steel scrap and steel rebar, iron ore, tungsten, vanadium, titanium and tantalum); minor metals (such as cobalt, manganese, molybdenum)
6	Gaseous combustibles	natural gas; liquefied natural gas
7	Precious metals (including gold)	gold; silver; platinum; palladium
8	Grains & oilseed	corn; wheat; soybean (such as soybean seed, soybean oil and soybean meal); oats; palm oil; canola; barley; rapeseed (such as rapeseed seed, rapeseed oil, and rapeseed meal); red bean, sorghum; coconut oil; olive oil; peanut oil; sunflower oil; rice
9	Livestock & dairy	cattle (such live and feeder); hog; poultry; lamb; fish; shrimp; dairy (such as milk, whey, eggs, butter and cheese)
10	Softs and other agriculturals	cocoa; coffee (such as arabica and robusta); tea; citrus and orange juice; potatoes; sugar; cotton; wool; lumber and pulp; rubber
11	Other commodity	industrial minerals (such as potash, fertiliser and phosphate rocks), rare earths; terephthalic acid; flat glass

74. For commodity delta and vega risks, cross-bucket correlation γ_{bc} = 20% for all cross-bucket pairs that fall within bucket numbers 1 to 10. γ_{bc} = 0% for all cross-bucket pairs that include bucket 11.

75. Commodity delta risk factors for a given bucket:

- The single commodity delta risk factor is a simultaneous relative shift of commodity spot prices for all commodities in the bucket.
- The sensitivities to commodity delta risk factors are measured by shifting the spot prices of all commodities in the bucket by 1% relative to their current values and dividing the resulting change in the aggregate CVA (or the value of CVA hedges) by 0.01.
- Risk weights RW_k depend on the reference name's bucket according to the following table:

Bucket	1	2	3	4	5	6	7	8	9	10	11
RW	30%	35%	60%	80%	40%	45%	20%	35%	25%	35%	50%

76. Commodity vega risk factors for a given bucket:

- The single commodity vega risk factor is a simultaneous relative shift of the volatilities for all commodities in the bucket.
- The sensitivities to commodity vega risk factors are measured by shifting the volatilities for all commodities in the bucket by 1% relative to their current values and dividing the resulting change in the aggregate CVA (or the value of CVA hedges) by 0.01.
- Risk weights for commodity volatilities are set to $RW_k = RW_\sigma \cdot \sqrt{12}$, where RW_σ is set at 55%.

Minimum capital requirements for operational risk

1. Introduction

1. Operational risk is defined as the risk of loss resulting from inadequate or failed internal processes, people and systems or from external events. This definition includes legal risk,[1] but excludes strategic and reputational risk.

2. The standardised approach for measuring minimum operational risk capital requirements replaces all existing approaches in the Basel II framework.[2] That is, this standard replaces paragraphs 644 to 683 of the Basel II framework.

3. Consistent with Part I (Scope of Application) of the Basel II Framework, the standardised approach applies to internationally active banks on a consolidated basis. Supervisors retain the discretion to apply the standardised approach framework to non-internationally active banks.

2. The standardised approach

4. The standardised approach methodology is based on the following components: (i) the Business Indicator (BI) which is a financial-statement-based proxy for operational risk; (ii) the Business Indicator Component (BIC), which is calculated by multiplying the BI by a set of regulatory determined marginal coefficients (α_i); and (iii) the Internal Loss Multiplier (ILM), which is a scaling factor that is based on a bank's average historical losses and the BIC.

The Business Indicator

5. The Business Indicator (BI) comprises three components: the interest, leases and dividend component (ILDC); the services component (SC), and the financial component (FC).

6. The BI is defined as:

$$BI = ILDC + SC + FC$$

In the formula below, a bar above a term indicates that it is calculated as the average over three years: t, t-1 and t-2, and:[3]

$$ILDC = Min\left[\overline{Abs\left(Interest\ Income - Interest\ Expense\right)};\ 2.25\%\cdot\overline{Interest\ Earning\ Assets}\right] + \overline{Dividend\ Income}$$

$$SC = Max\left[\overline{Other\ Operating\ Income}\ ;\ \overline{Other\ Operating\ Expense}\right] + Max\left[\overline{Fee\ Income}; \overline{Fee\ Expense}\right]$$

$$FC = \overline{Abs\left(Net\ P\ \&\ L\ Trading\ Book\right)} + \overline{Abs\left(Net\ P\ \&\ L\ Banking\ Book\right)}$$

1 Legal risk includes, but is not limited to, exposure to fines, penalties, or punitive damages resulting from supervisory actions, as well as private settlements.

2 Basel Committee on Banking Supervision, *Basel II: International Convergence of Capital Measurement and Capital Standards: A Revised Framework – Comprehensive Version*, June 2006, www.bis.org/pub/bcbs128.htm.

3 The absolute value of net items (eg, interest income – interest expense) should be calculated first year by year. Only after this year by year calculation should the average of the three years be calculated.

7. The definitions for each of the components of the BI are provided in the annex of this section.

The Business Indicator Component

8. To calculate the BIC, the BI is multiplied by the marginal coefficients (α_i). The marginal coefficients increase with the size of the BI as shown in Table 1. For banks in the first bucket (ie with a BI less than or equal to €1bn) the BIC is equal to BI x 12%. The marginal increase in the BIC resulting from a one unit increase in the BI is 12% in bucket 1, 15% in bucket 2 and 18% in bucket 3. For example, given a BI = €35bn, the BIC = (1 x 12%) + (30-1) x 15% + (35-30) x 18% = €5.37bn.

BI ranges and marginal coefficients — Table 1

Bucket	BI range (in €bn)	BI marginal coefficients (α_i)
1	≤1	12%
2	1 < BI ≤30	15%
3	> 30	18%

The Internal Loss Multiplier

9. A bank's internal operational risk loss experience affects the calculation of operational risk capital through the Internal Loss Multiplier (ILM). The ILM is defined as:

$$ILM = Ln\left(\exp(1) - 1 + \left(\frac{LC}{BIC}\right)^{0.8}\right)$$

where the Loss Component (LC) is equal to 15 times average annual operational risk losses incurred over the previous 10 years. The ILM is equal to one where the loss and business indicator components are equal. Where the LC is greater than the BIC, the ILM is greater than one. That is, a bank with losses that are high relative to its BIC is required to hold higher capital due to the incorporation of internal losses into the calculation methodology. Conversely, where the LC is lower than the BIC, the ILM is less than one. That is, a bank with losses that are low relative to its BIC is required to hold lower capital due to the incorporation of internal losses into the calculation methodology.

10. The calculation of average losses in the Loss Component must be based on 10 years of high-quality annual loss data. The qualitative requirements for loss data collection are outlined in paragraphs 19 to 31. As part of the transition to the standardised approach, banks that do not have 10 years of high-quality loss data may use a minimum of five years of data to calculate the Loss Component.[4] Banks that do not have five years of high-quality loss data must calculate the capital requirement based solely on the BI Component. Supervisors may however require a bank to calculate capital requirements using fewer than five years of losses if the ILM is greater than 1 and supervisors believe the losses are representative of the bank's operational risk exposure.

The standardised approach operational risk capital requirement

11. The operational risk capital requirement is determined by the product of the BIC and the ILM. For banks in bucket 1 (ie with BI ≤ €1 billion), internal loss data does not affect the capital calculation. That is, the ILM is equal to 1, so that operational risk capital is equal to the BIC (=12% · BI).

[4] This treatment is not expected to apply to banks that currently use the advanced measurement approaches for determining operational risk capital requirements.

12. At national discretion, supervisors may allow the inclusion of internal loss data into the framework for banks in bucket 1, subject to meeting the loss data collection requirements specified in paragraphs 19 to 31. In addition, at national discretion, supervisors may set the value of ILM equal to 1 for all banks in their jurisdiction. In case this discretion is exercised, banks would still be subject to the full set of disclosure requirements summarised in paragraph 32.

13. Minimum operational risk capital (ORC) is calculated by multiplying the BIC and the ILM:[5]

$$ORC = BIC \cdot ILM$$

3. Application of the standardised approach within a group

14. At the consolidated level, the standardised approach calculations use fully consolidated BI figures, which net all the intragroup income and expenses. The calculations at a sub-consolidated level use BI figures for the banks consolidated at that particular sub-level. The calculations at the subsidiary level use the BI figures from the subsidiary.

15. Similar to bank holding companies, when BI figures for sub-consolidated or subsidiary banks reach bucket 2, these banks are required to use loss experience in the standardised approach calculations. A sub-consolidated bank or a subsidiary bank uses only the losses it has incurred in the standardised approach calculations (and does not include losses incurred by other parts of the bank holding company).

16. In case a subsidiary of a bank belonging to bucket 2 or higher does not meet the qualitative standards for the use of the Loss Component, this subsidiary must calculate the standardised approach capital requirements by applying 100% of the BI Component. In such cases supervisors may require the bank to apply an ILM which is greater than 1.

4. Minimum standards for the use of loss data under the standardised approach

17. Banks with a BI greater than €1bn are required to use loss data as a direct input into the operational risk capital calculations. The soundness of data collection and the quality and integrity of the data are crucial to generating capital outcomes aligned with the bank's operational loss exposure. The minimum loss data standards are outlined in paragraphs 19 to 31. National supervisors should review the quality of banks' loss data periodically.

18. Banks which do not meet the loss data standards are required to hold capital that is at a minimum equal to 100% of the BIC. In such cases supervisors may require the bank to apply an ILM which is greater than 1. The exclusion of internal loss data due to non-compliance with the loss data standards, and the application of any resulting multipliers, must be publicly disclosed.

5. General criteria on loss data identification, collection and treatment

19. The proper identification, collection and treatment of internal loss data are essential prerequisites to capital calculation under the standardised approach. The general criteria for the use of the LC are as follows:

[5] Risk-weighted assets for operational risk are equal to 12.5 times ORC.

(a) Internally generated loss data calculations used for regulatory capital purposes must be based on a 10-year observation period. When the bank first moves to the standardised approach, a five-year observation period is acceptable on an exceptional basis when good-quality data are unavailable for more than five years.

(b) Internal loss data are most relevant when clearly linked to a bank's current business activities, technological processes and risk management procedures. Therefore, a bank must have documented procedures and processes for the identification, collection and treatment of internal loss data. Such procedures and processes must be subject to validation before the use of the loss data within the operational risk capital requirement measurement methodology, and to regular independent reviews by internal and/or external audit functions.

(c) For risk management purposes, and to assist in supervisory validation and/or review, a supervisor may request a bank to map its historical internal loss data into the relevant Level 1 supervisory categories as defined in Annex 9 of the Basel II Framework and to provide this data to supervisors. The bank must document criteria for allocating losses to the specified event types.

(d) A bank's internal loss data must be comprehensive and capture all material activities and exposures from all appropriate subsystems and geographic locations. The minimum threshold for including a loss event in the data collection and calculation of average annual losses is set at €20,000. At national discretion, for the purpose of the calculation of average annual losses, supervisors may increase the threshold to €100,000 for banks in buckets 2 and 3 (ie where the BI is greater than €1 bn).

(e) Aside from information on gross loss amounts, the bank must collect information about the reference dates of operational risk events, including the date when the event happened or first began ("date of occurrence"), where available; the date on which the bank became aware of the event ("date of discovery"); and the date (or dates) when a loss event results in a loss, reserve or provision against a loss being recognised in the bank's profit and loss (P&L) accounts ("date of accounting"). In addition, the bank must collect information on recoveries of gross loss amounts as well as descriptive information about the drivers or causes of the loss event.[6] The level of detail of any descriptive information should be commensurate with the size of the gross loss amount.

(f) Operational loss events related to credit risk and that are accounted for in credit risk RWAs should not be included in the loss data set. Operational loss events that relate to credit risk, but are not accounted for in credit risk RWAs should be included in the loss data set.

(g) Operational risk losses related to market risk are treated as operational risk for the purposes of calculating minimum regulatory capital under this framework and will therefore be subject to the the standardised approach for operational risk.

(h) Banks must have processes to independently review the comprehensiveness and accuracy of loss data.

[6] Tax effects (eg reductions in corporate income tax liability due to operational losses) are not recoveries for purposes of the standardised approach for operational risk.

6. Specific criteria on loss data identification, collection and treatment

Building of the standardised approach loss data set

20. Building an acceptable loss data set from the available internal data requires that the bank develop policies and procedures to address several features, including gross loss definition, reference date and grouped losses.

Gross loss, net loss, and recovery definitions

21. Gross loss is a loss before recoveries of any type. Net loss is defined as the loss after taking into account the impact of recoveries. The recovery is an independent occurrence, related to the original loss event, separate in time, in which funds or inflows of economic benefits are received from a third party.[7]

22. Banks must be able to identify the gross loss amounts, non-insurance recoveries, and insurance recoveries for all operational loss events. Banks should use losses net of recoveries (including insurance recoveries) in the loss dataset. However, recoveries can be used to reduce losses only after the bank receives payment. Receivables do not count as recoveries. Verification of payments received to net losses must be provided to supervisors upon request.

23. The following items must be included in the gross loss computation of the loss data set:

(a) Direct charges, including impairments and settlements, to the bank's P&L accounts and write-downs due to the operational risk event;

(b) Costs incurred as a consequence of the event including external expenses with a direct link to the operational risk event (eg legal expenses directly related to the event and fees paid to advisors, attorneys or suppliers) and costs of repair or replacement, incurred to restore the position that was prevailing before the operational risk event;

(c) Provisions or reserves accounted for in the P&L against the potential operational loss impact;

(d) Losses stemming from operational risk events with a definitive financial impact, which are temporarily booked in transitory and/or suspense accounts and are not yet reflected in the P&L ("pending losses").[8] Material pending losses should be included in the loss data set within a time period commensurate with the size and age of the pending item; and

(e) Negative economic impacts booked in a financial accounting period, due to operational risk events impacting the cash flows or financial statements of previous financial accounting periods (timing losses").[9] Material "timing losses" should be included in the loss data set when they are due to operational risk events that span more than one financial accounting period and give rise to legal risk.

7 Examples of recoveries are payments received from insurers, repayments received from perpetrators of fraud, and recoveries of misdirected transfers.

8 For instance, in some countries, the impact of some events (eg legal events, damage to physical assets) may be known and clearly identifiable before these events are recognised through the establishment of a reserve. Moreover, the way this reserve is established (eg the date of discovery) can vary across banks or countries.

9 Timing impacts typically relate to the occurrence of operational risk events that result in the temporary distortion of an institution's financial accounts (eg revenue overstatement, accounting errors and mark-to-market errors). While these events do not represent a true financial impact on the institution (net impact over time is zero), if the error continues across more than one financial accounting period, it may represent a material misrepresentation of the institution's financial statements.

24. The following items should be excluded from the gross loss computation of the loss data set:

(a) Costs of general maintenance contracts on property, plant or equipment;

(b) Internal or external expenditures to enhance the business after the operational risk losses: upgrades, improvements, risk assessment initiatives and enhancements; and

(c) Insurance premiums.

25. Banks must use the date of accounting for building the loss data set. The bank must use a date no later than the date of accounting for including losses related to legal events in the loss data set. For legal loss events, the date of accounting is the date when a legal reserve is established for the probable estimated loss in the P&L.

26. Losses caused by a common operational risk event or by related operational risk events over time, but posted to the accounts over several years, should be allocated to the corresponding years of the loss database, in line with their accounting treatment.

7. Exclusion of losses from the Loss Component

27. Banking organisations may request supervisory approval to exclude certain operational loss events that are no longer relevant to the banking organisation's risk profile. The exclusion of internal loss events should be rare and supported by strong justification. In evaluating the relevance of operational loss events to the bank's risk profile, supervisors will consider whether the cause of the loss event could occur in other areas of the bank's operations. Taking settled legal exposures and divested businesses as examples, supervisors expect the organisation's analysis to demonstrate that there is no similar or residual legal exposure and that the excluded loss experience has no relevance to other continuing activities or products.

28. The total loss amount and number of exclusions must be disclosed under Pillar 3 with appropriate narratives, including total loss amount and number of exclusions.

29. A request for loss exclusions is subject to a materiality threshold to be set by the supervisor (for example, the excluded loss event should be greater than 5% of the bank's average losses). In addition, losses can only be excluded after being included in a bank's operational risk loss database for a minimum period (for example, three years), to be specified by the supervisor. Losses related to divested activities will not be subject to a minimum operational risk loss database retention period.

8. Exclusions of divested activities from the Business Indicator

30. Banking organisations may request supervisory approval to exclude divested activities from the calculation of the BI. Such exclusions must be disclosed under Pillar 3.

9. Inclusion of losses and BI items related to mergers and acquisitions

31. Losses and the measurement of the BI must include losses and BI items that result from acquisitions of relevant business and mergers.

10. Disclosure

32. All banks with a BI greater than €1bn, or which use internal loss data in the calculation of operational risk capital, are required to disclose their annual loss data for each of the ten years in the ILM calculation window. This includes banks in jurisdictions that have opted to set ILM equal to one. Loss data is required to be reported on both a gross basis and after recoveries and loss exclusions. All banks are required to disclose each of the BI sub-items for each of the three years of the BI component calculation window.[10]

Annex: Definition of Business Indicator components

Business Indicator definitions

<table>
<tr><th>BI Component</th><th>P&L or balance sheet items</th><th>Description</th><th>Typical sub-items</th></tr>
<tr><td rowspan="4">Interest, lease and dividend</td><td>Interest income</td><td>Interest income from all financial assets and other interest income
(includes interest income from financial and operating leases and profits from leased assets)</td><td>• Interest income from loans and advances, assets available for sale, assets held to maturity, trading assets, financial leases and operational leases
• Interest income from hedge accounting derivatives
• Other interest income
• Profits from leased assets</td></tr>
<tr><td>Interest expenses</td><td>Interest expenses from all financial liabilities and other interest expenses
(includes interest expense from financial and operating leases, losses, depreciation and impairment of operating leased assets)</td><td>• Interest expenses from deposits, debt securities issued, financial leases, and operating leases
• Interest expenses from hedge accounting derivatives
• Other interest expenses
• Losses from leased assets
• Depreciation and impairment of operating leased assets</td></tr>
<tr><td>Interest earning assets (balance sheet item)</td><td colspan="2">Total gross outstanding loans, advances, interest bearing securities (including government bonds), and lease assets measured at the end of each financial year</td></tr>
<tr><td>Dividend income</td><td colspan="2">Dividend income from investments in stocks and funds not consolidated in the bank's financial statements, including dividend income from non-consolidated subsidiaries, associates and joint ventures.</td></tr>
<tr><td>Services</td><td>Fee and commission income</td><td>Income received from providing advice and services. Includes income received by the bank as an outsourcer of financial services.</td><td>Fee and commission income from:
• Securities (issuance, origination, reception, transmission, execution of orders on behalf of customers)
• Clearing and settlement; Asset management; Custody; Fiduciary transactions; Payment services; Structured finance; Servicing of securitisations; Loan commitments</td></tr>
</table>

[10] The Committee will undertake a separate public consultation on the operational risk disclosure templates.

			and guarantees given; and foreign transactions
	Fee and commission expenses	Expenses paid for receiving advice and services. Includes outsourcing fees paid by the bank for the supply of financial services, but not outsourcing fees paid for the supply of non-financial services (eg logistical, IT, human resources)	Fee and commission expenses from: • Clearing and settlement; Custody; Servicing of securitisations; Loan commitments and guarantees received; and Foreign transactions
	Other operating income	Income from ordinary banking operations not included in other BI items but of similar nature (income from operating leases should be excluded)	• Rental income from investment properties • Gains from non-current assets and disposal groups classified as held for sale not qualifying as discontinued operations (IFRS 5.37)
	Other operating expenses	Expenses and losses from ordinary banking operations not included in other BI items but of similar nature and from operational loss events (expenses from operating leases should be excluded)	• Losses from non-current assets and disposal groups classified as held for sale not qualifying as discontinued operations (IFRS 5.37) • Losses incurred as a consequence of operational loss events (eg fines, penalties, settlements, replacement cost of damaged assets), which have not been provisioned/reserved for in previous years • Expenses related to establishing provisions/reserves for operational loss events
Financial	Net profit (loss) on the trading book	• Net profit/loss on trading assets and trading liabilities (derivatives, debt securities, equity securities, loans and advances, short positions, other assets and liabilities) • Net profit/loss from hedge accounting • Net profit/loss from exchange differences	
	Net profit (loss) on the banking book	• Net profit/loss on financial assets and liabilities measured at fair value through profit and loss • Realised gains/losses on financial assets and liabilities not measured at fair value through profit and loss (loans and advances, assets available for sale, assets held to maturity, financial liabilities measured at amortised cost) • Net profit/loss from hedge accounting • Net profit/loss from exchange differences	

The following P&L items do not contribute to any of the items of the BI:

- Income and expenses from insurance or reinsurance businesses
- Premiums paid and reimbursements/payments received from insurance or reinsurance policies purchased
- Administrative expenses, including staff expenses, outsourcing fees paid for the supply of non-financial services (eg logistical, IT, human resources), and other administrative expenses (eg IT, utilities, telephone, travel, office supplies, postage)
- Recovery of administrative expenses including recovery of payments on behalf of customers (eg taxes debited to customers)
- Expenses of premises and fixed assets (except when these expenses result from operational loss events)

- Depreciation/amortisation of tangible and intangible assets (except depreciation related to operating lease assets, which should be included in financial and operating lease expenses)
- Provisions/reversal of provisions (eg on pensions, commitments and guarantees given) except for provisions related to operational loss events
- Expenses due to share capital repayable on demand
- Impairment/reversal of impairment (eg on financial assets, non-financial assets, investments in subsidiaries, joint ventures and associates)
- Changes in goodwill recognised in profit or loss
- Corporate income tax (tax based on profits including current tax and deferred).

Output floor

Introduction

1. To reduce excessive variability of risk-weighted assets and to enhance the comparability of risk-weighted capital ratios, banks will be subject to a floor requirement that is applied to risk-weighted assets. The output floor will ensure that banks' capital requirements do not fall below a certain percentage of capital requirements derived under standardised approaches.

Output floor requirements

2. As set out in the Basel III framework, banks must meet the following capital requirements:

- Common Equity Tier 1 must be at least 4.5% of risk-weighted assets at all times.
- Tier 1 capital must be at least 6.0% of risk-weighted assets at all times.
- Total Capital (Tier 1 capital and Tier 2 capital) must be at least 8.0% of risk-weighted assets at all times.[1]

3. In addition, a Common Equity Tier 1 capital conservation buffer is set at 2.5% of risk-weighted assets for all banks.[2] Banks may also be subject to a countercyclical capital buffer requirement. Banks identified as global systemically-important banks (G-SIBs) are also subject to additional higher-loss absorbency requirements and total loss-absorbing capacity requirements.[3]

4. The risk-weighted assets that banks must use to determine compliance with the requirements set out in paragraphs 2 to 3 above must be calculated as the maximum of: (i) the total risk-weighted assets calculated using the approaches that the bank has supervisory approval to use in accordance with the Basel capital framework (including both standardised and internally-modelled based approaches); and (ii) 72.5% of the total risk weighted assets, calculated using only the standardised approaches listed in paragraph 6. The latter element of this requirement is referred to as the output floor.

5. In light of the forthcoming accounting revisions for expected credit loss, the Committee will review the consistency in the treatment of provisions for the purpose of calculating the output floor.

Calculation of the output floor

6. The standardised approaches to be used when calculating the output floor described in paragraph 4 are as follows:

- Credit risk: the standardised approach for credit risk.[4] When calculating the degree of credit risk mitigation, banks must use the carrying value when applying the simple approach or the

[1] The Basel III framework is available at www.bis.org/publ/bcbs189.pdf.

[2] As set out in the Basel III framework, available at www.bis.org/publ/bcbs189.pdf.

[3] As set out in the FSB TLAC term sheet, available at www.fsb.org/wp-content/uploads/TLAC-Principles-and-Term-Sheet-for-publication-final.pdf.

[4] As set out in the revised standardised approach for credit risk described in this document.

comprehensive approach with standard supervisory haircuts. This also includes failed trades and non-delivery-versus-payment transactions as set out in Annex 3 of the Basel II framework (June 2006).

- Counterparty credit risk: to calculate the exposure for derivatives, banks must use the standardised approach for measuring counterparty credit risk (SA-CCR). The exposure amounts must then be multiplied by the relevant borrower risk weight using the standardised approach for credit risk to calculate RWA under the standardised approach for credit risk.
- Credit valuation adjustment risk: the standardised approach for CVA (SA-CVA), the Basic Approach (BA-CVA) or 100% of a bank's counterparty credit risk capital requirement (depending on which approach the bank uses for CVA risk).[5]
- Securitisation framework: the external ratings-based approach (SEC-ERBA), the standardised approach (SEC-SA) or a risk-weight of 1250%[6]
- Market risk: the standardised approach for market risk. The SEC-ERBA, SEC-SA or a risk-weight of 1250% must also be used when determining the default risk charge component for securitisations held in the trading book.[7]
- Operational risk: the standardised approach for operational risk.[8]

7. The table below provides a simple example of how the capital floor must be calculated.

	Pre-floor RWAs	Standardised RWAs	72.5% of standardised RWAs
Credit risk	62	124	89.9
- of which Asset Class A	45	80	58
- of which Asset Class B	5	32	23.2
- of which Asset Class C (not modelled)	12	12	8.7
Market risk	2	4	2.9
Operational risk (not modelled)	12	12	8.7
Total RWA	76	140	101.5

As the floored RWAs (101.5) are higher than the pre-floor RWAs (76) in this example, the bank would use the former to determine the capital requirements set out in paragraphs 2 to 4.

Disclosure requirements

8. Banks must disclose two sets of risk-weighted capital ratios: (i) ratios that exclude the capital floor in the calculation of risk-weighted assets; and (ii) ratios that include the capital floor in the calculation of risk-weighted assets. In addition, banks must disclose more granular information related to the calculation of their risk-weighted assets under internally-modelled and standardised approaches, which will be set out in forthcoming disclosure templates as part of the Committee's Pillar 3 disclosure framework.

[5] As set out in the revised credit valuation adjustment framework in this document.

[6] As set out in the securitisation framework, available at www.bis.org/bcbs/publ/d374.pdf.

[7] As set out in the revised market risk framework, available at www.bis.org/bcbs/publ/d352.pdf.

[8] As set out in the revised operational risk framework in this document.

Implementation date and transitional measures

9. The output floor will be implemented as of 1 January 2022 , based on the following calibration phase-in arrangement:

Date	Output floor calibration
1 Jan 2022	50%
1 Jan 2023	55%
1 Jan 2024	60%
1 Jan 2025	65%
1 Jan 2026	70%
1 Jan 2027	72.5%

10. During the phase-in period, supervisors may exercise national discretion to cap the incremental increase in a bank's total RWAs that results from the application of the floor. This transitional cap will be set at 25% of a bank's RWAs before the application of the floor. In the example shown in paragraph 7, the application of this national discretion by the supervisor would cap the bank's RWAs to 95 (ie a 25% increase of its pre-floor RWAs of 76).

Leverage ratio

Introduction

1. An underlying cause of the global financial crisis was the build-up of excessive on- and off-balance sheet leverage in the banking system. In many cases, banks built up excessive leverage while reporting strong risk-based capital ratios. At the height of the crisis, financial markets forced the banking sector to reduce its leverage in a manner that amplified downward pressures on asset prices. This deleveraging process exacerbated the feedback loop between losses, falling bank capital and contracting credit availability.

2. The Basel III framework introduced a simple, transparent, non-risk-based leverage ratio to act as a credible supplementary measure to the risk-based capital requirements.[1] The leverage ratio is intended to:

- restrict the build-up of leverage in the banking sector to avoid destabilising deleveraging processes that can damage the broader financial system and the economy; and
- reinforce the risk-based requirements with a simple, non-risk-based "backstop" measure.

3. The Committee is of the view that a simple leverage ratio framework is critical and complementary to the risk-based capital framework, and that the leverage ratio should adequately capture both the on- and off-balance sheet sources of banks' leverage.

Definition and requirements

4. The leverage ratio is defined as the capital measure (the numerator) divided by the exposure measure (the denominator), with this ratio expressed as a percentage:

$$\text{Leverage ratio} = \frac{\text{Capital measure}}{\text{Exposure measure}}$$

5. The capital measure for the leverage ratio is Tier 1 capital – comprising Common Equity Tier 1 and/or Additional Tier 1 instruments – as defined in paragraphs 49 to 96 of the Basel III framework. In other words, the capital measure used for the leverage ratio at any particular point in time is the Tier 1 capital measure applicable at that time under the risk-based framework. The exposure measure for the leverage ratio is defined in paragraphs 20 to 59 of this section.

6. Both the capital measure and the exposure measure are to be calculated on a quarter-end basis. However, banks may, subject to supervisory approval, use more frequent calculations (eg daily or monthly averaging) as long as they do so consistently.

7. Banks must meet a 3% leverage ratio minimum requirement at all times.

8. In addition, to maintain the relative roles of the risk-weighted and leverage ratio requirements, banks identified as global systemically-important banks (G-SIBs) according the G-SIB standard must also meet a leverage ratio buffer requirement.[2] Consistent with the capital measure required to meet the

[1] Basel Committee on Banking Supervision, *Basel III: A global regulatory framework for more resilient banks and banking systems*, June 2011, www.bis.org/publ/bcbs189.pdf.

[2] See Basel Committee on Banking Supervision, *Global systemically important banks: updated assessment methodology and the higher loss absorbency requirement*, July 2013, www.bis.org/publ/bcbs255.pdf.

leverage ratio minimum described in paragraph 5, G-SIBs must meet the leverage ratio buffer with Tier 1 capital.

9. The leverage ratio buffer will be set at 50% of a G-SIB's higher-loss absorbency risk-weighted requirements. For example, a G-SIB subject to a 2% higher-loss absorbency requirement would be subject to a 1% leverage ratio buffer requirement.

10. The design of the leverage ratio buffer is akin to the capital buffers in the risk-weighted framework. As such, the leverage ratio buffer will include minimum capital conservation ratios divided in five ranges. Capital distribution constraints will be imposed on a G-SIB which does not meet its leverage ratio buffer requirement.

11. The capital distribution constraints imposed on G-SIBs will depend on the G-SIB's CET1 risk-weighted ratio and its leverage ratio. A G-SIB which meets both its CET1 risk-weighted requirements (defined as a 4.5% minimum requirement, a 2.5% capital conservation buffer, the G-SIB higher loss-absorbency requirement and countercyclical capital buffer if applicable) and its Tier 1 leverage ratio requirement (defined as a 3% leverage ratio minimum requirement and the G-SIB leverage ratio buffer) will not be subject to minimum capital conservation standards. A G-SIB which does not meet one of these requirements will be subject to the associated minimum capital conservation standards. A G-SIB which does not meet both requirements will be subject to the higher minimum capital conservation standard related to its risk-weighted capital requirement or leverage ratio.

12. As an example, the table below shows the minimum capital conservation standards for the CET1 risk-weighted requirements and Tier 1 leverage ratio requirements of a G-SIB in the first bucket of the higher loss-absorbency requirements (ie where a 1% risk-weighted G-SIB capital buffer applies).

CET1 risk-weighted ratio	Tier 1 leverage ratio	Minimum capital conservation ratios (expressed as a percentage of earnings)
4.5%–5.375%	3%–3.125%	100%
> 5.375%–6.25%	> 3.125%–3.25%	80%
> 6.25%–7.125%	> 3.25%–3.375%	60%
> 7.125%–8%	> 3.375%–3.50%	40%
> 8.0%	> 3.50%	0%

Implementation and monitoring

13. The implementation timeline for the leverage ratio requirement is as follows:

- 1 January 2018: Implementation of Pillar 1 minimum requirement per the January 2014 version of the standard[3] (in addition to ongoing Pillar 3 disclosure per the same version of the standard).[4]
- 1 January 2022: Implementation of Pillar 1 minimum requirement (in addition to any applicable G-SIB buffer requirement) and associated Pillar 3 disclosure requirements[5] per the revised version of the standard described in this section.

14. The leverage ratio buffer requirement on 1 January 2022 shall be based on the Financial Stability Board's 2020 list of G-SIBs (based on end-2019 data). For banks that are subsequently identified as G-SIBs or which are no longer identified as G-SIBs, the same transitional arrangements will apply as in the higher-loss absorbency requirement framework

15. The leverage ratio buffer requirement will be updated annually to reflect the annual updated list of G-SIB requirements. G-SIBs subject to a revised higher-loss absorbency requirement would also be subject to a revised leverage ratio buffer requirement, calibrated at 50% of the former requirement. Both requirements would follow the same implementation arrangements. Jurisdictions may impose a higher leverage ratio buffer requirement.

16. The Committee will continue to monitor the impact of the leverage ratio framework by means of the Basel III monitoring Quantitative Impact Study (QIS) exercise. The focus of the Committee's monitoring will include assessments of any impact the standard might have on banks' business activities and financial markets in general, including reviewing any impact on SFT markets and market liquidity.

17. In addition, the Committee will continue to monitor the impact of the leverage ratio's treatment of client cleared derivative transactions and, within two years after this publication of this document, conclude a review of the impact of the leverage ratio on banks' provision of clearing services and any consequent impact on the resilience of central counterparty clearing.

Scope of consolidation

18. The leverage ratio framework follows the same scope of regulatory consolidation, including consolidation criteria, as is used for the risk-based capital framework.[6] This is set out in Part I (Scope of Application) of the Basel II framework (June 2006).

19. *Treatment of investments in the capital of banking, financial, insurance and commercial entities that are outside the regulatory scope of consolidation*: where a banking, financial, insurance or commercial entity is outside the scope of regulatory consolidation, only the investment in the capital of such entities (ie only the carrying value of the investment, as opposed to the underlying assets and other exposures of the investee) is to be included in the leverage ratio exposure measure. However, investments in the capital of such entities that are deducted from Tier 1 capital as set out in paragraph 22 may be excluded from the leverage ratio exposure measure.

[3] Basel Committee on Banking Supervision, *Basel III leverage ratio framework and disclosure requirements*, January 2014, www.bis.org/publ/bcbs270.pdf.

[4] The leverage ratio disclosure requirements were implemented on 1 January 2015. Pillar 3 disclosure requirements for the January 2014 version of the leverage ratio framework were consolidated into a consultative document on Pillar 3 requirements published in March 2016. See Basel Committee on Banking Supervision, *Consultative Document – Pillar 3 disclosure requirements – consolidated and enhanced framework*; March 2016, www.bis.org/bcbs/publ/d356.pdf.

[5] The Committee will propose revisions to disclosure requirements to address the revised version of the leverage ratio framework in a forthcoming phase of the Pillar 3 review process.

[6] For example, if proportional consolidation is applied for regulatory consolidation under the risk-based framework, the same criteria shall be applied for leverage ratio purposes.

Exposure measure

20. The leverage ratio exposure measure generally follows gross accounting values.

21. Unless specified differently below, banks must not take account of physical or financial collateral, guarantees or other credit risk mitigation techniques to reduce the leverage ratio exposure measure, nor may banks net assets and liabilities.

22. To ensure consistency, any item deducted from Tier 1 capital according to the Basel III framework and regulatory adjustments other than those related to liabilities may be deducted from the leverage ratio exposure measure. Three examples follow:

- where a banking, financial or insurance entity is not included in the regulatory scope of consolidation as set out in paragraph 18, the amount of any investment in the capital of that entity that is totally or partially deducted from Common Equity Tier 1 (CET1) capital or from Additional Tier 1 capital of the bank following the corresponding deduction approach in paragraphs 84 to 89 of the Basel III framework may also be deducted from the leverage ratio exposure measure;
- for banks using the internal ratings-based (IRB) approach to determining capital requirements for credit risk, paragraph 73 of the Basel III framework requires any shortfall in the stock of eligible provisions relative to expected loss amounts to be deducted from CET1 capital. The same amount may be deducted from the leverage ratio exposure measure; and
- prudent valuation adjustments (PVAs) for exposures to less liquid positions, other than those related to liabilities, that are deducted from Tier 1 capital as per paragraph 718 (cxii) of the Basel II framework as amended by the standard *Minimum capital requirements for market risk*[7] (hereafter "market risk framework") may be deducted from the leverage ratio exposure measure.

23. Liability items must not be deducted from the leverage ratio exposure measure. For example, gains/losses on fair valued liabilities or accounting value adjustments on derivative liabilities due to changes in the bank's own credit risk as described in paragraph 75 of the Basel III framework must not be deducted from the leverage ratio exposure measure.

24. With regard to traditional securitisations, an originating bank may exclude securitised exposures from its leverage ratio exposure measure if the securitisation meets the operational requirements for the recognition of risk transference according to paragraph 24 of the standard *Revisions to the securitisation framework*.[8] Banks meeting these conditions must include any retained securitisation exposures in their leverage ratio exposure measure. In all other cases, eg traditional securitisations that do not meet the operational requirements for the recognition of risk transference or synthetic securitisations, the securitised exposures must be included in the leverage ratio exposure measure.[9]

25. Banks and supervisors should be particularly vigilant to transactions and structures that have the result of inadequately capturing banks' sources of leverage. Examples of concerns that might arise in such leverage ratio exposure measure minimising transactions and structures may include: securities financing transactions where exposure to the counterparty increases as the counterparty's credit quality decreases or securities financing transactions in which the credit quality of the counterparty is positively correlated

7 Basel Committee on Banking Supervision, *Minimum capital requirements for market risk*, January 2016, www.bis.org/bcbs/publ/d352.pdf.

8 Basel Committee on Banking Supervision, *Revisions to the securitisation framework*, December 2014 (rev. July 2016), www.bis.org/bcbs/publ/d374.pdf.

9 The Committee confirms the treatment specified in paragraph 24 as an interpretation of the January 2014 version of the leverage ratio standard. Therefore, the treatment may also be applied in the January 2014 version of the leverage ratio standard while that version serves as the Pillar 1 minimum requirement.

with the value of the securities received in the transaction (ie the credit quality of the counterparty falls when the value of the securities falls); banks that normally act as principal but adopt an agency model to transact in derivatives and SFTs in order to benefit from the more favourable treatment permitted for agency transactions under the leverage ratio framework; collateral swap trades structured to mitigate inclusion in the leverage ratio exposure measure; or use of structures to move assets off the balance sheet. This list of examples is by no means exhaustive. Where supervisors are concerned that such transactions are not adequately captured in the leverage ratio exposure measure or may lead to a potentially destabilising deleveraging process, they should carefully scrutinise these transactions and consider a range of actions to address such concerns. Supervisory actions may include requiring enhancements in banks' management of leverage, imposing operational requirements (eg additional reporting to supervisors) and/or requiring that the relevant exposure is adequately capitalised through a Pillar 2 capital charge. These examples of supervisory actions are merely indicative and by no means exhaustive.

26. At national discretion, and to facilitate the implementation of monetary policies, a jurisdiction may temporarily exempt central bank reserves from the leverage ratio exposure measure in exceptional macroeconomic circumstances. To maintain the same level of resilience provided by the leverage ratio, a jurisdiction applying this discretion must also increase the calibration of the minimum leverage ratio requirement commensurately to offset the impact of exempting central bank reserves. In addition, in order to maintain the comparability and transparency of the Basel III leverage ratio framework, banks will be required to disclose the impact of any temporary exemption alongside ongoing public disclosure of the leverage ratio without application of such exemption.[10]

27. A bank's total leverage ratio exposure measure is the sum of the following exposures: (a) on-balance sheet exposures (excluding on-balance sheet derivative and securities financing transaction exposures); (b) derivative exposures; (c) securities financing transaction (SFT) exposures; and (d) off-balance sheet (OBS) items. The specific treatments for these four main exposure types are defined below.

(a) On-balance sheet exposures

28. Banks must include all balance sheet assets in their leverage ratio exposure measure, including on-balance sheet derivatives collateral and collateral for SFTs, with the exception of on-balance sheet derivative and SFT assets that are covered in paragraphs 32 to 56 below.[11]

29. On-balance sheet, non-derivative assets are included in the leverage ratio exposure measure at their accounting values less deductions for associated specific provisions. In addition, general provisions or general loan loss reserves as defined in paragraph 60 of the Basel III framework which have reduced Tier 1 capital may be deducted from the leverage ratio exposure measure.[12]

30. The accounting for regular-way purchases or sales[13] of financial assets that have not been settled (hereafter "unsettled trades") differs across and within accounting frameworks, with the result that those unsettled trades can be accounted for either on the trade date (*trade date accounting*) or on the settlement

[10] The treatment specified in paragraph 26 may also be applied in the January 2014 version of the leverage ratio standard while that version serves as the Pillar 1 minimum requirement.

[11] Where a bank according to its operative accounting framework recognises fiduciary assets on the balance sheet, these assets can be excluded from the leverage ratio exposure measure provided that the assets meet the IFRS 9 criteria for derecognition and, where applicable, IFRS 10 for deconsolidation.

[12] Although paragraph 60 of the Basel III framework specifies the treatment of general provisions/general loan-loss reserves for banks using the standardised approach for credit risk, for the purposes of the leverage ratio exposure measure the definition of general provisions/general loan-loss reserves specified in paragraph 60 of the Basel III framework applies to all banks regardless of whether they use the standardised approach or the internal ratings-based (IRB) approach for credit risk for their risk-based capital calculations.

[13] For the purposes of this treatment, "regular-way purchases or sales" are purchases or sales of financial assets under contracts for which the terms require delivery of the assets within the time frame established generally by regulation or convention in the marketplace concerned.

date (*settlement date accounting*). For the purpose of the leverage ratio exposure measure, banks using trade date accounting must reverse out any offsetting between cash receivables for unsettled sales and cash payables for unsettled purchases of financial assets that may be recognised under the applicable accounting framework, but may offset between those cash receivables and cash payables (regardless of whether such offsetting is recognised under the applicable accounting framework) if the following conditions are met:

- the financial assets bought and sold that are associated with cash payables and receivables are fair valued through income and included in the bank's regulatory trading book as specified by paragraphs 8 to 20 of the market risk framework; and
- the transactions of the financial assets are settled on a delivery-versus-payment (DVP) basis.

Banks using settlement date accounting will be subject to the treatment set out in paragraphs 57 to 59 and paragraph 9 of the Annex.

31. Cash pooling refers to arrangements involving treasury products whereby a bank combines the credit and/or debit balances of several individual participating customer accounts into a single account balance to facilitate cash and/or liquidity management. For purposes of the leverage ratio exposure measure, where a cash pooling arrangement entails a transfer at least on a daily basis of the credit and/or debit balances of the individual participating customer accounts into a single account balance, the individual participating customer accounts are deemed to be extinguished and transformed into a single account balance upon the transfer provided the bank is not liable for the balances on an individual basis upon the transfer. Thus, the basis of the leverage ratio exposure measure for such a cash pooling arrangement is the single account balance and not the individual participating customer accounts. When the transfer of credit and/or debit balances of the individual participating customer accounts does not occur daily, for purposes of the leverage ratio exposure measure, extinguishment and transformation into a single account balance is deemed to occur and this single account balance may serve as the basis of the leverage ratio exposure measure provided all of the following conditions are met:

- in addition to providing for the several individual participating customer accounts, the cash pooling arrangement provides for a single account, into which the balances of all individual participating customer accounts can be transferred and thus extinguished;
- the bank (i) has a legally enforceable right to transfer the balances of the individual participating customer accounts into a single account so that the bank is not liable for the balances on an individual basis and (ii) at any point in time, the bank must have the discretion and be in a position to exercise this right;
- the bank's supervisor does not deem as inadequate the frequency by which the balances of individual participating customer accounts are transferred to a single accont;
- there are no maturity mismatches among the balances of the individual participating customer accounts included in the cash pooling arrangement or all balances are either overnight or on demand; and
- the bank charges or pays interest and/or fees based on the combined balance of the individual participating customer accounts included in the cash pooling arrangement.

In the event the abovementioned conditions are not met, the individual balances of the participating customer accounts must be reflected separately in the leverage ratio exposure measure.

(b) Derivative exposures

32. *Treatment of derivatives*: for the purpose of the leverage ratio exposure measure, exposures to derivatives are included by means of two components: (a) replacement cost (RC); and (b) potential future

exposure (PFE). The leverage ratio framework uses the method set out below to capture both of these components.

33. Banks must calculate their exposures associated with all derivative transactions, including where a bank sells protection using a credit derivative, as a scalar multiplier alpha set at 1.4 times the sum of the RC[14] and the PFE, as described in paragraph 34. If the derivative exposure is covered by an eligible bilateral netting contract as specified in the Annex, a specific treatment may be applied.[15] Written credit derivatives are subject to an additional treatment, as set out in paragraphs 44 to 49 below.

34. For derivative transactions not covered by an eligible bilateral netting contract as specified in paragraphs 4 and 5 of the Annex, the amount to be included in the leverage ratio exposure measure is determined, for each transaction separately, as follows:

*exposure measure = alpha * (RC + PFE)*

where

- *alpha* = 1.4;
- *RC* = the replacement cost calculated according to paragraph 2 of the Annex; and
- *PFE* = an amount for PFE calculated according to paragraph 3 of the Annex.

35. *Bilateral netting*: when an eligible bilateral netting contract is in place as specified in paragraphs 4 and 5 of the Annex, the formula in paragraph 34 is applied at the netting set level as described in paragraphs 2 and 3 of the Annex.

36. *Treatment of related collateral*: collateral received in connection with derivative contracts has two countervailing effects on leverage:

- it reduces counterparty exposure; but
- it can also increase the economic resources at the disposal of the bank, as the bank can use the collateral to leverage itself.

37. C*ollateral received* in connection with derivative contracts does not necessarily reduce the leverage inherent in a bank's derivative position, which is generally the case if the settlement exposure arising from the underlying derivative contract is not reduced. As a general principle of the Basel III leverage ratio framework, collateral received may not be netted against derivative exposures whether or not netting is permitted under the bank's operative accounting or risk-based framework. Hence, when calculating the exposure amount by applying paragraphs 33 to 35 above, a bank must not reduce the leverage ratio exposure measure amount by any collateral received from the counterparty. This implies that the RC cannot be reduced by collateral received and that the multiplier referenced in paragraph 3 of

[14] If, under a bank's national accounting standards, there is no accounting measure of exposure for certain derivative instruments because they are held (completely) off balance sheet, the bank must use the sum of positive fair values of these derivatives as the replacement cost.

[15] These are netting rules of the Basel II framework excepting the rules for cross-product netting in Annex 4, Section III (ie netting across product categories such as derivatives and SFTs is not permitted in determining the leverage ratio exposure measure). However, where a bank has a cross-product netting agreement in place that meets the eligibility criteria of paragraphs 4 and 5 of the Annex, it may choose to perform netting separately in each product category provided that all other conditions for netting in this product category that are applicable to the current framework are met.

the Annex is fixed at one for the purpose of the PFE calculation. However, the maturity factor in the PFE add-on calculation can recognise the PFE-reducing effect from the regular exchange of variation margin as specified in paragraph 3 of the Annex.

38. Similarly, with regard to *collateral provided*, banks must gross up their leverage ratio exposure measure by the amount of any derivatives collateral provided where the provision of that collateral has reduced the value of their balance sheet assets under their operative accounting framework.

39. *Treatment of cash variation margin*: in the treatment of derivative exposures for the purpose of the leverage ratio exposure measure, the cash portion of variation margin exchanged between counterparties may be viewed as a form of pre-settlement payment if the following conditions are met:

(i) For trades not cleared through a *qualifying* central counterparty (QCCP)[16] the cash received by the recipient counterparty is not segregated. Cash variation margin would satisfy the non-segregation criterion if the *recipient* counterparty has no restrictions by law, regulation, or any agreement with the counterparty on the ability to use the cash received (ie the cash variation margin received is used as its own cash).

(ii) Variation margin is calculated and exchanged on at least a daily basis based on mark-to-market valuation of derivative positions. To meet this criterion, derivative positions must be valued daily and cash variation margin must be transferred at least daily to the counterparty or to the counterparty's account, as appropriate. Cash variation margin exchanged on the morning of the subsequent trading day based on the previous, end-of-day market values would meet this criterion.

(iii) The variation margin is received in a currency specified in the derivative contract, governing master netting agreement (MNA), credit support annex (CSA) to the qualifying MNA or as defined by any netting agreement with a CCP.

(iv) Variation margin exchanged is the full amount that would be necessary to extinguish the mark-to-market exposure of the derivative subject to the threshold and minimum transfer amounts applicable to the counterparty.[17]

(v) Derivative transactions and variation margins are covered by a single MNA between the legal entities that are the counterparties in the derivative transaction. The MNA must explicitly stipulate that the counterparties agree to settle net any payment obligations covered by such a netting agreement, taking into account any variation margin received or provided if a credit event occurs involving either counterparty. The MNA must be legally enforceable and effective (ie it satisfies the conditions in paragraph 4 (c) and paragraph 5 of the Annex) in all relevant jurisdictions, including in the event of default and bankruptcy or insolvency. For the purposes of this paragraph, the term "MNA" includes any netting agreement that provides legally enforceable rights of offset[18] and a Master MNA may be deemed to be a single MNA.

40. If the conditions in paragraph 39 are met, the cash portion of variation margin received may be used to reduce the replacement cost portion of the leverage ratio exposure measure, and the receivables assets from cash variation margin provided may be deducted from the leverage ratio exposure measure as follows:

16 A QCCP is defined as in Annex 4, Section I, A. General Terms of the Basel II framework as amended by the standard *Capital requirements for bank exposures to central counterparties* (Basel Committee on Banking Supervision, *Capital requirements for bank exposures to central counterparties*, April 2014, www.bis.org/publ/bcbs282.pdf).

17 In situations where a margin dispute arises, the amount of non-disputed variation margin that has been exchanged can be recognised.

18 This is to take into account the fact that, for netting agreements employed by CCPs, no standardisation has currently emerged that would be comparable with respect to over-the-counter netting agreements for bilateral trading.

- In the case of cash variation margin received, the receiving bank may reduce the replacement cost (but not the PFE component) of the exposure amount of the derivative asset as specified in paragraph 2 of the Annex.
- In the case of cash variation margin provided to a counterparty, the posting bank may deduct the resulting receivable from its leverage ratio exposure measure where the cash variation margin has been recognised as an asset under the bank's operative accounting framework, and instead include the cash variation margin provided in the calculation of the derivative replacement cost as specified in paragraph 2 of the Annex.

41. *Treatment of clearing services*: where a bank acting as clearing member (CM)[19] offers clearing services to clients, the CM's trade exposures to the central counterparty (CCP) that arise when the CM is obligated to reimburse the client for any losses suffered due to changes in the value of its transactions in the event that the CCP defaults must be captured by applying the same treatment that applies to any other type of derivative transaction. However, if the CM, based on the contractual arrangements with the client, is not obligated to reimburse the client for any losses suffered in the event that a QCCP defaults, the CM need not recognise the resulting trade exposures to the QCCP in the leverage ratio exposure measure. In addition, where a bank provides clearing services as a "higher level client" within a multi-level client structure,[20] the bank need not recognise in its leverage ratio exposure measure the resulting trade exposures to the CM or to an entity that serves as a higher level client to the bank in the leverage ratio exposure measure if it meets all of the following conditions:

- The offsetting transactions are identified by the QCCP as higher level client transactions and collateral to support them is held by the QCCP and/or the CM, as applicable, under arrangements that prevent any losses to the higher level client due to: (i) the default or insolvency of the CM, (ii) the default or insolvency of the CM's other clients, and (iii) the joint default or insolvency of the CM and any of its other clients;[21]
- The bank must have conducted a sufficient legal review (and undertake such further review as necessary to ensure continuing enforceability) and have a well-founded basis to conclude that, in the event of legal challenge, the relevant courts and administrative authorities would find that such arrangements mentioned above would be legal, valid, binding and enforceable under relevant laws of the relevant jurisdiction(s);
- Relevant laws, regulation, rules, contractual or administrative arrangements provide that the offsetting transactions with the defaulted or insolvent CM are highly likely to continue to be indirectly transacted through the QCCP, or by the QCCP, if the CM defaults or becomes insolvent.[22] In such circumstances, the higher level client positions and collateral with the QCCP will be transferred at market value unless the higher level client requests to close out the position at market value; and

[19] For the purposes of this paragraph, the terms "clearing member", "trade exposure", "central counterparty" and "qualifying central counterparty" are defined as in Annex 4, Section I, A. General Terms of the Basel II framework as amended.

[20] A multi-level client structure is one in which banks can centrally clear as indirect clients; that is, when clearing services are provided to the bank by an institution which is not a direct clearing member, but is itself a client of a clearing member or another clearing client. The term "higher level client" refers to the institution that provides clearing services.

[21] That is, upon the insolvency of the clearing member, there is no legal impediment (other than the need to obtain a court order to which the client is entitled) to the transfer of the collateral belonging to clients of a defaulting clearing member to the QCCP, to one of more other surviving clearing members or to the client or the client's nominee.

[22] If there is a clear precedent for transactions being ported at a QCCP and industry intent for this practice to continue, then these factors must be considered when assessing if trades are highly likely to be ported. The fact that QCCP documentation does not prohibit client trades from being ported is not sufficient to say they are highly likely to be ported.

- The bank is not obligated to reimburse its client for any losses suffered in the event of default of either the CM or the QCCP.

42. Where a client enters directly into a derivative transaction with the CCP and the CM guarantees the performance of its client's derivative trade exposures to the CCP, the bank acting as the CM for the client to the CCP must calculate its related leverage ratio exposure resulting from the guarantee as a derivative exposure as set out in paragraphs 33 to 40, as if it had entered directly into the transaction with the client, including with regard to the receipt or provision of cash variation margin.

43. For the purposes of paragraphs 41 and 42, an entity affiliated to the bank acting as a CM may be considered a client if it is outside the relevant scope of regulatory consolidation at the level at which the leverage ratio is applied. In contrast, if an affiliate entity falls within the regulatory scope of consolidation, the trade between the affiliate entity and the CM is eliminated in the course of consolidation but the CM still has a trade exposure to the CCP. In this case, the transaction with the CCP will be considered proprietary and the exemption in paragraph 41 will not apply.

44. *Additional treatment for written credit derivatives*: in addition to the CCR exposure arising from the fair value of the contracts, written credit derivatives create a notional credit exposure arising from the creditworthiness of the reference entity. The Committee therefore believes that it is appropriate to treat written credit derivatives consistently with cash instruments (eg loans, bonds) for the purposes of the leverage ratio exposure measure.

45. In order to capture the credit exposure to the underlying reference entity, in addition to the above treatment for derivatives and related collateral, the effective notional amount referenced by a written credit derivative is to be included in the leverage ratio exposure measure unless the written credit derivative is included in a transaction cleared on the behalf of a client of the bank acting as a CM (or acting as a clearing services provider in a multi-level client structure as referenced in paragraph 41) and the transaction meets the requirements of paragraph 41 for the exclusion of trade exposures to the QCCP (or, in the case of a multi-level client structure, the requirements of paragraph 41 for the exclusion of trade exposures to the CM or the QCCP). The "effective notional amount" is obtained by adjusting the notional amount to reflect the true exposure of contracts that are leveraged or otherwise enhanced by the structure of the transaction. Further, the effective notional amount of a written credit derivative may be reduced by any negative change in fair value amount that has been incorporated into the calculation of Tier 1 capital with respect to the written credit derivative.[23, 24] The resulting amount may be further reduced by the effective notional amount of a purchased credit derivative on the same reference name, provided that:

- the credit protection purchased through credit derivatives is otherwise subject to the same or more conservative material terms as those in the corresponding written credit derivative. This ensures that if a bank provides written protection via some type of credit derivative, the bank

[23] For example, if a written credit derivative had a positive fair value of 20 on one date and has a negative fair value of 10 on a subsequent reporting date, the effective notional amount of the credit derivative may be reduced by 10. The effective notional amount cannot be reduced by 30. However, if on the subsequent reporting date the credit derivative has a positive fair value of five, the effective notional amount cannot be reduced at all.

[24] This treatment is consistent with the rationale that the effective notional amounts included in the exposure measure may be capped at the level of the maximum potential loss, which means that the maximum potential loss at the reporting date is the notional amount of the credit derivative minus any negative fair value that has already reduced Tier 1 capital.

may only recognise offsetting from another purchased credit derivative to the extent that the purchased protection is certain to deliver a payment in all potential future states. Material terms include the level of subordination, optionality, credit events, reference and any other characteristics relevant to the valuation of the derivative;[25]

- the remaining maturity of the credit protection purchased through credit derivatives is equal to or greater than the remaining maturity of the written credit derivative;
- the credit protection purchased through credit derivatives is not purchased from a counterparty whose credit quality is highly correlated with the value of the reference obligation in the sense specified in paragraph 101 of the Basel III framework;[26]
- in the event that the effective notional amount of a written credit derivative is reduced by any negative change in fair value reflected in the bank's Tier 1 capital, the effective notional amount of the offsetting credit protection purchased through credit derivatives must also be reduced by any resulting positive change in fair value reflected in Tier 1 capital; and
- the credit protection purchased through credit derivatives is not included in a transaction that has been cleared on behalf of a client (or that has been cleared by the bank in its role as a clearing services provider in a multi-level client services structure as referenced in paragraph 41) and for which the effective notional amount referenced by the corresponding written credit derivative is excluded from the leverage ratio exposure measure according to this paragraph.

46. For the purposes of paragraph 45, the term "written credit derivative" refers to a broad range of credit derivatives through which a bank effectively provides credit protection and is not limited solely to credit default swaps and total return swaps. For example, all options where the bank has the obligation to provide credit protection under certain conditions qualify as "written credit derivatives". The effective notional amount of such options sold by the bank may be offset by the effective notional amount of options by which the bank has the right to purchase credit protection which fulfils the conditions of paragraph 45. For example, the condition of same or more conservative material terms as those in the corresponding written credit derivatives as referenced in paragraph 45 can be considered met only when the strike price of the underlying purchased credit protection is equal to or lower than the strike price of the underlying sold credit protection.

47. For the purposes of paragraph 45, two reference names are considered identical only if they refer to the same legal entity. Credit protection on a pool of reference names purchased through credit derivatives may offset credit protection sold on individual reference names if the credit protection purchased is economically equivalent to purchasing credit protection separately on each of the individual names in the pool (this would, for example, be the case if a bank were to purchase credit protection on an entire securitisation structure). If a bank purchases credit protection on a pool of reference names through credit derivatives, but the credit protection purchased does not cover the entire pool (ie the protection covers only a subset of the pool, as in the case of an nth-to-default credit derivative or a securitisation tranche), then the written credit derivatives on the individual reference names may not be offset. However,

[25] For example, the application of the same material terms condition would result in the following treatments:
- in the case of single name credit derivatives, the credit protection purchased through credit derivatives is on a reference obligation which ranks pari passu with or is junior to the underlying reference obligation of the written credit derivative. Credit protection purchased through credit derivatives that references a subordinated position may offset written credit derivatives on a more senior position of the same reference entity as long as a credit event on the senior reference asset would result in a credit event on the subordinated reference asset;
- for tranched products, the credit protection purchased through credit derivatives must be on a reference obligation with the same level of seniority.

[26] Specifically, the credit quality of the counterparty must not be positively correlated with the value of the reference obligation (ie the credit quality of the counterparty falls when the value of the reference obligation falls and the value of the purchased credit derivative increases). In making this determination, there does not need to exist a legal connection between the counterparty and the underlying reference entity.

such purchased credit protection may offset written credit derivatives on a pool provided that the credit protection purchased through credit derivatives covers the entirety of the subset of the pool on which the credit protection has been sold.

48. Where a bank purchases credit protection through a total return swap (TRS) and records the net payments received as net income, but does not record offsetting deterioration in the value of the written credit derivative (either through reductions in fair value or by an addition to reserves) in Tier 1 capital, the credit protection will not be recognised for the purpose of offsetting the effective notional amounts related to written credit derivatives.

49. Since written credit derivatives are included in the leverage ratio exposure measure at their effective notional amounts, and are also subject to amounts for PFE, the leverage ratio exposure measure for written credit derivatives may be overstated. Banks may therefore choose to exclude from the netting set for the PFE calculation the portion of a written credit derivative which is not offset according to paragraph 45 and for which the effective notional amount is included in the leverage ratio exposure measure.

(c) Securities financing transaction exposures

50. SFTs[27] are included in the leverage ratio exposure measure according to the treatment described below. The treatment recognises that secured lending and borrowing in the form of SFTs is an important source of leverage, and ensures consistent international implementation by providing a common measure for dealing with the main differences in the operative accounting frameworks.

51. *General treatment (bank acting as principal)*: the sum of the amounts in subparagraphs (i) and (ii) below is to be included in the leverage ratio exposure measure:

(i) Gross SFT assets[28] recognised for accounting purposes (ie with no recognition of accounting netting),[29] adjusted as follows:

- excluding from the leverage ratio exposure measure the value of any securities received under an SFT, where the bank has recognised the securities as an asset on its balance sheet;[30] and
- cash payables and cash receivables in SFTs with the same counterparty may be measured net if all the following criteria are met:
  - (a) transactions have the same explicit final settlement date; in particular, transactions with no explicit end date but which can be unwound at any time by either party to the transaction are not eligible;

[27] SFTs are transactions such as repurchase agreements, reverse repurchase agreements, security lending and borrowing, and margin lending transactions, where the value of the transactions depends on market valuations and the transactions are often subject to margin agreements.

[28] For SFT assets subject to novation and cleared through QCCPs, "gross SFT assets recognised for accounting purposes" are replaced by the final contractual exposure, ie the exposure to the QCCP after the process of novation has been applied, given that pre-existing contracts have been replaced by new legal obligations through the novation process. However, banks can only net cash receivables and cash payables with a QCCP if the criteria in paragraph 51 (i) are met. Any other netting permitted by the QCCP is not permitted for the purposes of the Basel III leverage ratio.

[29] Gross SFT assets recognised for accounting purposes must not recognise any *accounting* netting of cash payables against cash receivables (eg as currently permitted under the IFRS and US GAAP accounting frameworks). This regulatory treatment has the benefit of avoiding inconsistencies from netting which may arise across different accounting regimes.

[30] This may apply, for example, under US GAAP, where securities received under an SFT may be recognised as assets if the recipient has the right to rehypothecate but has not done so.

(b) the right to set off the amount owed to the counterparty with the amount owed by the counterparty is legally enforceable both currently in the normal course of business and in the event of the counterparty's (i) default; (ii) insolvency; or (iii) bankruptcy; and

(c) the counterparties intend to settle net, settle simultaneously, or the transactions are subject to a settlement mechanism that results in the functional equivalent of net settlement – that is, the cash flows of the transactions are equivalent, in effect, to a single net amount on the settlement date. To achieve such equivalence, both transactions are settled through the same settlement system and the settlement arrangements are supported by cash and/or intraday credit facilities intended to ensure that settlement of both transactions will occur by the end of the business day and any issues arising from the securities legs of the SFTs do not interfere with the completion of the net settlement of the cash receivables and payables. In particular, this latter condition means that the failure of any single securities transaction in the settlement mechanism may delay settlement of only the matching cash leg or create an obligation to the settlement mechanism, supported by an associated credit facility. If there is a failure of the securities leg of a transaction in such a mechanism at the end of the window for settlement in the settlement mechanism, then this transaction and its matching cash leg must be split out from the netting set and treated gross.[31]

(ii) A measure of CCR calculated as the current exposure without an add-on for PFE, calculated as follows:

- Where a qualifying MNA[32] is in place, the current exposure (E^*) is the greater of zero and the total fair value of securities and cash lent to a counterparty for all transactions included in the qualifying MNA ($\sum E_i$), less the total fair value of cash and securities received from the counterparty for those transactions ($\sum C_i$). This is illustrated in the following formula:

$$E^* = \max \{0, [\sum E_i - \sum C_i]\}$$

- Where no qualifying MNA is in place, the current exposure for transactions with a counterparty must be calculated on a transaction-by-transaction basis – that is, each transaction i is treated as its own netting set, as shown in the following formula:

$$E_i^* = \max \{0, [E_i - C_i]\}$$

E_i^* may be set to zero if (i) E_i is the cash lent to a counterparty, (ii) this transaction is treated as its own netting set and (iii) the associated cash receivable is not eligible for the netting treatment in paragraph 51 (i).

For the purposes of this subparagraph, the term "counterparty" includes not only the counterparty of the bilateral repo transactions but also triparty repo agents that receive collateral in deposit and manage the collateral in the case of triparty repo transactions. Therefore, securities deposited at triparty repo agents are included in "total value of securities and cash lent to a counterparty" (E) up to the amount effectively lent to the counterparty in a repo transaction. However, excess collateral that has been deposited at triparty agents but that has not been lent out may be excluded.

31 Specifically, the criteria in paragraph 51 (i) (c) above are not intended to preclude a DVP settlement mechanism or other type of settlement mechanism, provided that the settlement mechanism meets the functional requirements set out in paragraph 51 (i) (c). For example, a settlement mechanism may meet these functional requirements if any failed transactions (ie the securities that failed to transfer and the related cash receivable or payable) can be re-entered in the settlement mechanism until they are settled.

32 A "qualifying" MNA is one that meets the requirements under paragraphs 6 and 7 of the Annex.

52. *Sale accounting transactions*: leverage may remain with the lender of the security in an SFT whether or not sale accounting is achieved under the operative accounting framework. As such, where sale accounting is achieved for an SFT under the bank's operative accounting framework, the bank must reverse all sales-related accounting entries, and then calculate its exposure as if the SFT had been treated as a financing transaction under the operative accounting framework (ie the bank must include the sum of amounts in subparagraphs (i) and (ii) of paragraph 51 for such an SFT) for the purpose of determining its leverage ratio exposure measure.

53. *Bank acting as agent*: a bank acting as agent in an SFT generally provides an indemnity or guarantee to only one of the two parties involved, and only for the difference between the value of the security or cash its customer has lent and the value of collateral the borrower has provided. In this situation, the bank is exposed to the counterparty of its customer for the difference in values rather than to the full exposure to the underlying security or cash of the transaction (as is the case where the bank is one of the principals in the transaction).

54. Where a bank acting as agent in an SFT provides an indemnity or guarantee to a customer or counterparty for any difference between the value of the security or cash the customer has lent and the value of collateral the borrower has provided and the bank does not own or control the underlying cash or security resource, then the bank will be required to calculate its leverage ratio exposure measure by applying only subparagraph (ii) of paragraph 51.[33]

55. A bank acting as agent in an SFT and providing an indemnity or guarantee to a customer or counterparty will be considered eligible for the exceptional treatment set out in paragraph 54 only if the bank's exposure to the transaction is limited to the guaranteed difference between the value of the security or cash its customer has lent and the value of the collateral the borrower has provided. In situations where the bank is further economically exposed (ie beyond the guarantee for the difference) to the underlying security or cash in the transaction,[34] a further exposure equal to the full amount of the security or cash must be included in the leverage ratio exposure measure.

56. Where a bank acting as agent provides an indemnity or guarantee to both parties involved in an SFT (ie securities lender and securities borrower), the bank will be required to calculate its leverage ratio exposure measure in accordance with paragraphs 53 to 55 separately for each party involved in the transaction.

(d) Off-balance sheet (OBS) items

57. This section explains the treatment of OBS items for inclusion in the leverage ratio exposure measure. These treatments reflect those defined in the *standardised approach for credit risk* and the *standard Revisions to the securitisation framework*, as well as treatments unique to the leverage ratio framework. OBS items include commitments (including liquidity facilities), whether or not unconditionally cancellable, direct credit substitutes, acceptances, standby letters of credit and trade letters of credit. If the OBS item is treated as a derivative exposure per the bank's relevant accounting standard, then the item must be measured as a derivative exposure for the purpose of the leverage ratio exposure measure. In this case, the bank does not need to apply the OBS item treatment to the exposure.

33 Where, in addition to the conditions in paragraphs 53 to 55, a bank acting as an agent in an SFT does not provide an indemnity or guarantee to any of the involved parties, the bank is not exposed to the SFT and therefore need not recognise those SFTs in its leverage ratio exposure measure.

34 For example, due to the bank managing collateral received in the bank's name or on its own account rather than on the customer's or borrower's account (eg by on-lending or managing unsegregated collateral, cash or securities). However, this does not apply to client omnibus accounts that are used by agent lenders to hold and manage client collateral provided that client collateral is segregated from the bank's proprietary assets and the bank calculates the exposure on a client-by-client basis.

58. In the risk-based capital framework, OBS items are converted under the standardised approach for credit risk into credit exposure equivalents through the use of credit conversion factors (CCFs). For the purpose of determining the exposure amount of OBS items for the leverage ratio, the CCFs set out in the Annex must be applied to the notional amount.

59. In addition, specific and general provisions set aside against OBS exposures that have decreased Tier 1 capital may be deducted from the credit exposure equivalent amount of those exposures (ie the exposure amount after the application of the relevant CCF). However, the resulting total off-balance sheet equivalent amount for OBS exposures cannot be less than zero.

Annex: Leverage ratio

This annex includes the relevant provisions applicable for the purpose of calculating the leverage ratio.

Derivative exposures

1. The calculation of derivative exposures for the leverage ratio exposure measure is based on a modified version of the standard set out in Annex 4 of the Basel II framework as amended by *The Standardised Approach for measuring counterparty credit risk exposures* (hereafter "SA-CCR framework").[35]

Calculation of replacement cost

2. The replacement cost of a transaction or netting set is measured as follows:

$$RC = \max\left\{V - CVM_r + CVM_p, 0\right\}$$

where (i) V is the market value of the individual derivative transaction or of the derivative transactions in a netting set; (ii) CVM_r is the cash variation margin *received* that meets the conditions set out in paragraph 39 and for which the amount has not already reduced the market value of the derivative transaction V under the bank's operative accounting standard; and (iii) CVM_p is the cash variation margin *provided* by the bank and that meets the same conditions.

Calculation of potential future exposure

3. The potential future exposure (PFE) for derivative exposures must be calculated in accordance with paragraphs 146 to 187 of Annex 4 of the SA-CCR framework. Mathematically:

$$PFE = multiplier \cdot AddOn^{aggregate}$$

For the purposes of the leverage ratio framework, the multiplier is fixed at one. Moreover, when calculating the add-on component, for all margined transactions the maturity factor set out in paragraph 164 of Annex 4 of the SA-CCR framework may be used. Further, as written options create an exposure to the underlying, they must be included in the leverage ratio exposure measure by applying the treatment described in this Annex, even if certain written options are permitted the zero exposure at default (EAD) treatment allowed in the risk-based framework.

Bilateral netting

4. For the purposes of the leverage ratio exposure measure, the following will apply:

(a) Banks may net transactions subject to novation under which any obligation between a bank and its counterparty to deliver a given currency on a given value date is automatically amalgamated with all other obligations for the same currency and value date, legally substituting one single amount for the previous gross obligations.

[35] Basel Committee on Banking Supervision, *The standardised approach for measuring counterparty credit risk exposures*, March 2014 (rev. April 2014), www.bis.org/publ/bcbs279.pdf.

(b) Banks may also net transactions subject to any legally valid form of bilateral netting not covered in (a), including other forms of novation.

(c) In both cases (a) and (b), a bank will need to satisfy its national supervisors that it has:

(i) a netting contract or agreement with the counterparty that creates a single legal obligation, covering all included transactions, such that the bank would have either a claim to receive or obligation to pay only the net sum of the positive and negative mark-to-market values of included individual transactions in the event that a counterparty fails to perform due to any of the following: default, bankruptcy, liquidation or similar circumstances;

(ii) written and reasoned legal opinions that, in the event of a legal challenge, the relevant courts and administrative authorities would find the bank's exposure to be such a net amount under:

- the law of the jurisdiction in which the counterparty is chartered and, if the foreign branch of a counterparty is involved, then also under the law of jurisdiction in which the branch is located;
- the law that governs the individual transactions; and
- the law that governs any contract or agreement necessary to effect the netting.

The national supervisor, after consultation when necessary with other relevant supervisors, must be satisfied that the netting is enforceable under the laws of each of the relevant jurisdictions;[36] and

(iii) procedures in place to ensure that the legal characteristics of netting arrangements are kept under review in the light of possible changes in relevant law.

5. Contracts containing walkaway clauses will not be eligible for netting for the purpose of calculating the leverage ratio exposure measure pursuant to this framework. A walkaway clause is a provision that permits a non-defaulting counterparty to make only limited payments, or no payment at all, to the estate of a defaulter, even if the defaulter is a net creditor.

Securities financing transaction exposures

6. *Qualifying master netting agreement*: the effects of bilateral netting agreements[37] for covering SFTs will be recognised on a counterparty-by-counterparty basis if the agreements are legally enforceable in each relevant jurisdiction upon the occurrence of an event of default and regardless of whether the counterparty is insolvent or bankrupt. In addition, netting agreements must:

(a) provide the non-defaulting party with the right to terminate and close out in a timely manner all transactions under the agreement upon an event of default, including in the event of insolvency or bankruptcy of the counterparty;

(b) provide for the netting of gains and losses on transactions (including the value of any collateral) terminated and closed out under it so that a single net amount is owed by one party to the other;

(c) allow for the prompt liquidation or setoff of collateral upon the event of default; and

[36] Thus, if any of these supervisors are dissatisfied about enforceability under its laws, the netting contract or agreement will not meet the condition and neither counterparty could obtain supervisory benefit.

[37] The provisions related to qualifying master netting agreements for SFTs are intended for the calculation of the counterparty credit risk measure of SFTs as set out in paragraph 51 (ii) only.

(d) be, together with the rights arising from provisions required in (a) and (c) above, legally enforceable in each relevant jurisdiction upon the occurrence of an event of default regardless of the counterparty's insolvency or bankruptcy.

7. Netting across positions held in the banking book and trading book will only be recognised when the netted transactions fulfil the following conditions:

(a) all transactions are marked to market daily; and

(b) the collateral instruments used in the transactions are recognised as eligible financial collateral in the banking book.

Off-balance sheet (OBS) items

8. For the purposes of the leverage ratio, OBS items will be converted into credit exposures by multiplying the committed but undrawn amount by a credit conversion factor (CCF). For these purposes, commitment means any contractual arrangement that has been offered by the bank and accepted by the client to extend credit, purchase assets or issue credit substitutes. It includes any such arrangement that can be unconditionally cancelled by the bank at any time without prior notice to the obligor.[38] It also includes any such arrangement that can be cancelled by the bank if the obligor fails to meet conditions set out in the facility document, including conditions that must be met by the obligor prior to any initial or subsequent drawdown arrangement.

9. A 100% CCF will be applied to the following items:

- Direct credit substitutes, eg general guarantees of indebtedness (including standby letters of credit serving as financial guarantees for loans and securities) and acceptances (including endorsements with the character of acceptances).
- Forward asset purchases, forward forward deposits and partly paid shares and securities, which represent commitments with certain drawdown.
- The exposure amount associated with unsettled financial asset purchases (ie the commitment to pay) where regular-way unsettled trades are accounted for at settlement date. Banks may offset commitments to pay for unsettled purchases and cash to be received for unsettled sales provided that the following conditions are met: (i) the financial assets bought and sold that are associated with cash payables and receivables are fair valued through income and included in the bank's regulatory trading book as specified by paragraphs 8 to 20 of the market risk framework; and (ii) the transactions of the financial assets are settled on a DVP basis.

[38] At national discretion, a jurisdiction may exempt certain arrangements from the definition of commitments provided that the following conditions are met: (i) the bank receives no fees or commissions to establish or maintain the arrangements; (ii) the client is required to apply to the bank for the initial and each subsequent drawdown; (iii) the bank has full authority, regardless of the fulfilment by the client of the conditions set out in the facility documentation, over the execution of each drawdown; and (iv) the bank's decision on the execution of each drawdown is only made after assessing the creditworthiness of the client immediately prior to drawdown. Exempted arrangements that met the above criteria are confined to certain arrangements for corporates and SMEs, where counterparties are closely monitored on an ongoing basis.

- Off-balance sheet items that are credit substitutes not explicitly included in any other category.

10. A 50% CCF will be applied to note issuance facilities (NIFs) and revolving underwriting facilities (RUFs) regardless of the maturity of the underlying facility.

11. A 50% CCF will be applied to certain transaction-related contingent items (eg performance bonds, bid bonds, warranties and standby letters of credit related to particular transactions).

12. A 40% CCF will be applied to commitments, regardless of the maturity of the underlying facility, unless they qualify for a lower CCF.

13. A 20% CCF will be applied to both the issuing and confirming banks of short-term[39] self-liquidating trade letters of credit arising from the movement of goods (eg documentary credits collateralised by the underlying shipment).

14. A 10% CCF will be applied to commitments that are unconditionally cancellable at any time by the bank without prior notice, or that effectively provide for automatic cancellation due to deterioration in a borrower's creditworthiness. National supervisors should evaluate various factors in the jurisdiction, which may constrain banks' ability to cancel the commitment in practice, and consider applying a higher CCF to certain commitments as appropriate.

15. Where there is an undertaking to provide a commitment on an off-balance sheet item, banks are to apply the lower of the two applicable CCFs.[40]

16. OBS securitisation exposures must be treated as per the second bullet of paragraph 20 of the Basel III securitisation framework.[41]

[39] That is, with a maturity below one year. For further details see Basel Committee on Banking Supervision, *Treatment of trade finance under the Basel capital framework*, October 2011, www.bis.org/publ/bcbs205.pdf.

[40] For example, if a bank has a commitment to open short-term self-liquidating trade letters of credit arising from the movement of goods, a 20% CCF will be applied (instead of a 40% CCF); and if a bank has an unconditionally cancellable commitment described in paragraph 59 to issue direct credit substitutes, a 10% CCF will be applied (instead of a 100% CCF).

Statutes
of the Bank for International Settlements

(of 20 January 1930; text as amended
on 7 November 2016)[1]

Chapter I

Name, Seat and Objects

Article 1

There is constituted under the name of the Bank for International Settlements (hereinafter referred to as the Bank) a Company limited by shares.

Article 2

The registered office of the Bank shall be situated at Basle, Switzerland.

Article 3

The objects of the Bank are: to promote the co-operation of central banks and to provide additional facilities for international financial operations; and to act as trustee or

---

[1] Amendments to the original text of the Statutes of 20 January 1930 were adopted by Extraordinary General Meetings held on 3 May 1937, 12 June 1950, 9 October 1961, 9 June 1969, 10 June 1974, 8 July 1975, 14 June 1993, 13 September 1994, 8 November 1999, 8 January 2001, 10 March 2003, 27 June 2005 and 7 November 2016.

agent in regard to international financial settlements entrusted to it under agreements with the parties concerned.

Chapter II

Capital

Article 4

(1) The authorised capital of the Bank shall be three thousand million Special Drawing Rights (SDR), as defined from time to time by the International Monetary Fund.[2]

(2) It shall be divided into 600,000 shares of equal nominal value, consisting of three tranches of 200,000 shares each.

(3) The nominal value of each share and the amount remaining to be paid up shall be stated on the face of the share certificates which may be issued by the Bank pursuant to Article 16.

Article 5

The two first tranches of 200,000 shares each have already been issued.

---

[2] One SDR is the equivalent to the sum of US$ 0.58252, Euro 0.38671, Japanese yen 11.900, Pound sterling 0.085946, and Chinese yuan 1.0174 as approved by the Executive Board of the IMF, effective 1 October 2016; this decision is subject to revision every five years.

Article 6

The Board, upon a decision taken by a two-thirds majority, may, when it considers it advisable, issue on one or more occasions a third tranche of 200,000 shares and distribute them in accordance with the provisions of Article 8.

Article 7

(1) Twenty-five per cent. only of the value of each share shall be paid up at the time of subscription. The balance may be called up at a later date or dates at the discretion of the Board. Three months' notice shall be given of any such calls.

(2) If a shareholder fails to pay any call on a share on the day appointed for payment thereof the Board may, after giving reasonable notice to such shareholder, forfeit the share in respect of which the call remains unpaid. A forfeited share may be sold on such terms and in such manner as the Board may think fit, and the Board may execute a transfer in favour of the person or corporation to whom the share is sold. The proceeds of sale may be received by the Bank, which will pay to the defaulting shareholder any part of the net proceeds over and above the amount of the call due and unpaid.

Article 8

(1) The capital of the Bank may be increased or reduced on the proposal of the Board acting by a two-thirds majority and adopted by a two-thirds majority of the General Meeting.

(2) In the event of an increase in the authorised capital of the Bank and of a further issue of shares, the distribution among countries shall be decided by a two-thirds majority of the Board. The central banks of Belgium, England, France, Germany, Italy and the United States of America, or some other financial institution of the last-named country acceptable to the foregoing central banks, shall be entitled to subscribe or arrange for the subscription in equal proportions of at least fifty-five per cent. of such additional shares.

(3) In extending invitations to subscribe for the amount of the increase in capital not taken up by the banks referred to in clause (2), consideration shall be given by the Board to the desirability of associating with the Bank the largest possible number of central banks that make a substantial contribution to international monetary co-operation and to the Bank's activities.

Article 9

Shares subscribed in pursuance of Article 8 by the banks referred to in clause (2) of that Article may be placed at the Bank's disposal at any time for the purposes of cancellation and the issue of an equivalent number of shares. The necessary measures shall be taken by the Board by a two-thirds majority.

Article 10

No shares shall be issued below par.

Article 11

The liability of shareholders is limited to the nominal value of their shares.

Article 12

(1) The shares shall be registered and transferable in the books of the Bank.

(2) No share may be transferred without the prior consent of the Bank and of the central bank, or the institution acting in lieu of a central bank, by or through whom the shares in question were issued.

Article 13

The shares shall carry equal rights to participate in the profits of the Bank and in any distribution of assets under Articles 51, 52 and 53 of the Statutes.

Article 14

The ownership of shares of the Bank carries no right of voting or representation at the General Meeting. The right of representation and of voting, in proportion to the number of shares subscribed in each country, may be exercised by the central bank of that country or by its nominee. Should the central bank of any country not desire to exercise these rights, they may be exercised by a financial institution of widely recognised standing and of the same nationality, appointed by the Board, and not objected to by the central bank of the country in question. In cases where there is no central bank, these rights may be exercised, if the Board thinks fit, by an appropriate financial institution of the country in question appointed by the Board.

Article 15

Shares may be subscribed or acquired only by central banks, or by financial institutions appointed by the Board in accordance with the terms and conditions laid down in Article 14.

Article 16

The Bank may at its discretion issue share certificates to its shareholders.

Article 17

Ownership of shares of the Bank implies acceptance of the Statutes of the Bank.

Article 18

The registration of the name of a shareholder in the books of the Bank establishes the title to ownership of the shares so registered.

Article 18(A)
(Transitional provisions)

In accordance with the resolutions of the Extraordinary General Meeting held on 8 January 2001 and in order to implement Article 15 of the Statutes as amended, the Bank will, on a compulsory basis, repurchase each share which, as of that date, is registered in the name of a shareholder other than a central bank (a "private shareholder"), against payment of compensation of CHF 16,000 for each share, as follows:

(1) On 8 January 2001, the registration of each private shareholder will be cancelled in the books of the Bank. As from this cancellation, every private shareholder will lose all rights appertaining to shares which are repurchased (including all rights to the payment of any future dividend), subject to the provisions of Article 54; every private shareholder will receive, in exchange for every share which is ipso jure transferred to the Bank, a statutory right to the payment of the amount of compensation referred to above.

(2) With a view to the payment of the compensation, the Bank will promptly send each private shareholder a notice inviting that private shareholder: (a) to provide written confirmation that he or she has not transferred or otherwise disposed of any share registered on 8 January 2001 in his or her name; (b) to provide written instructions for payment of the compensation by the Bank; and (c) to return the corresponding share certificates to the Bank.

(3) Upon receiving a complete response to the notice sent out pursuant to Article 18(A)(2), and after it has carried out all appropriate verifications, the Bank will pay each private shareholder the amount of compensation due to that shareholder. If a private shareholder has transferred or

otherwise disposed of any share for which he or she is the registered shareholder prior to 8 January 2001, and the Bank is aware of that transfer, the Bank will pay the amount of compensation due from it to the successor in title of the registered shareholder after it has carried out all appropriate verifications. If there is any doubt as to any entitlement to compensation in respect of any share, or if there is no response or only an incomplete response to the notice sent by the Bank pursuant to Article 18(A)(2), the Bank may, on such terms as it may deem appropriate, place in escrow the amount of compensation until such time as the interested parties appropriately establish their rights. Any transfer of a share which has not been notified to the Bank before the date on which the compensation is paid will have no effect with regard to the Bank.

(4) The Board will redistribute, in the manner in which it considers appropriate, the shares repurchased from private shareholders either (a) by offering them for sale to central bank shareholders against payment of an amount equal to that of the compensation paid to the private shareholders, or (b) by offering them for subscription as bonus shares by central bank shareholders in proportion to the number of shares held (including, if applicable, any share purchased pursuant to (a) above), it being understood that this redistribution may be achieved by a combination of (a) and (b).

(5) The Board is authorised to take all decisions it deems necessary in connection with the implementation of these transitional provisions, including delegating to the General Manager as appropriate responsibility for practical execution.

Chapter III

Powers of the Bank

Article 19

The operations of the Bank shall be in conformity with the monetary policy of the central banks of the countries concerned.

Before any financial operation is carried out by or on behalf of the Bank on a given market or in a given currency, the Board shall afford to the central bank or central banks directly concerned an opportunity to dissent. In the event of disapproval being expressed within such reasonable time as the Board shall specify, the proposed operation shall not take place. A central bank may make its concurrence subject to conditions and may limit its assent to a specific operation, or enter into a general arrangement permitting the Bank to carry on its operations within such limits as to time, character and amount as may be specified. This Article shall not be read as requiring the assent of any central bank to the withdrawal from its market of funds to the introduction of which no objection had been raised by it, in the absence of stipulations to the contrary by the central bank concerned at the time the original operation was carried out.

Any Governor of a central bank, or his alternate or any other Director specially authorised by the central bank of the country of which he is a national to act on its behalf in this matter, shall, if he is present at the meeting of the Board and does not vote against any such proposed operation, be deemed to have given the valid assent of the central bank in question.

If the representative of the central bank in question is absent or if a central bank is not directly represented on the Board, steps shall be taken to afford the central bank or banks concerned an opportunity to express dissent.

Article 20

The operations of the Bank for its own account shall only be carried out in currencies deemed suitable by the Board.

Article 21

The Board shall determine the nature of the operations to be undertaken by the Bank.

The Bank may in particular:

(a) buy and sell gold coin or bullion for its own account or for the account of central banks;

(b) hold gold for its own account under earmark in central banks;

(c) accept the custody of gold for the account of central banks;

(d) make advances to or borrow from central banks against gold, bills of exchange and other short-term obligations of prime liquidity or other approved securities;

(e) discount, rediscount, purchase or sell with or without its endorsement bills of exchange, cheques and other short-term obligations of prime liquidity, including Treasury bills and other such government short-term securities as are currently marketable;

(f) buy and sell exchange for its own account or for the account of central banks;

(g) buy and sell negotiable securities other than shares for its own account or for the account of central banks;

(h) discount for central banks bills taken from their portfolio and rediscount with central banks bills taken from its own portfolio;

(i) open and maintain current or deposit accounts with central banks;

(j) accept:

(i) deposits from central banks on current or deposit account;

(ii) deposits in connection with trustee agreements that may be made between the Bank and Governments in connection with international settlements;

(iii) such other deposits as in the opinion of the Board come within the scope of the Bank's functions.

The Bank may also:

(k) act as agent or correspondent of any central bank;

(l) arrange with any central bank for the latter to act as its agent or correspondent. If a central bank is unable or unwilling to act in this capacity, the Bank may make other arrangements, provided that the central bank concerned does not object. If in such circumstances it should be deemed advisable that the Bank should establish its own agency, the sanction of a two-thirds majority of the Board will be required;

(m) enter into agreements to act as trustee or agent in connection with international settlements, provided that such agreements shall not encroach on the obligations of the Bank towards third parties; and carry out the various operations laid down therein.

Article 22

Any of the operations which the Bank is authorised to carry out with central banks under the preceding Article may be carried out with banks, bankers, corporations or individuals of any country provided that the central bank of that country does not object.

Article 23

The Bank may enter into special agreements with central banks to facilitate the settlement of international transactions between them.

For this purpose it may arrange with central banks to have gold earmarked for their account and transferable on their order, to open accounts through which central banks can transfer their assets from one currency to another and to take such other measures as the Board may think advisable within the limits of the powers granted by these Statutes. The principles and rules governing such accounts shall be fixed by the Board.

Article 24

The Bank may not:

(a) issue notes payable at sight to bearer;

(b) "accept" bills of exchange;

(c) make advances to Governments;

(d) open current accounts in the name of Governments;

(e) acquire a predominant interest in any business concern;

(f) except so far as is necessary for the conduct of its own business, remain the owner of real property for any longer period than is required in order to realise to proper advantage such real property as may come into the possession of the Bank in satisfaction of claims due to it.

Article 25

The Bank shall be administered with particular regard to maintaining its liquidity, and for this purpose shall retain assets appropriate to the maturity and character of its liabilities. Its short-term liquid assets may include bank-notes, cheques payable on sight drawn on first-class banks, claims in course of collection, deposits at sight or at short notice in first-class banks, and prime bills of exchange of not more than ninety days' usance, of a kind usually accepted for rediscount by central banks.

The proportion of the Bank's assets held in any given currency shall be determined by the Board with due regard to the liabilities of the Bank.

Chapter IV

Board and Management

Article 26

The Board shall determine the strategic and policy direction of the Bank, supervise the management, and fulfil the specific tasks given to it by these Statutes, and shall take the decisions necessary to carry out these responsibilities.

Article 27

The Board shall be composed as follows:

(1) The Governors for the time being of the central banks of Belgium, France, Germany, Great Britain, Italy and the United States of America (hereinafter referred to as *ex-officio* Directors).

Any *ex-officio* Director may appoint one person as his alternate who shall be entitled to attend and exercise the powers of a Director at meetings of the Board if the Governor himself is unable to be present.

(2) Six persons representative of finance, industry or commerce, appointed one each by the Governors of the

central banks mentioned in clause (1), and being of the same nationality as the Governor who appoints him.

If for any reason the Governor of any of the six institutions above mentioned is unable or unwilling to serve as Director, or to make an appointment under the preceding paragraph, the Governors of the other institutions referred to or a majority of them may invite to become members of the Board two nationals of the country of the Governor in question, not objected to by the central bank of that country.

Directors appointed as aforesaid, other than *ex-officio* Directors, shall hold office for three years but shall be eligible for reappointment.

(3) Not more than nine persons to be elected by the Board by a two-thirds majority from among the Governors of the central banks of countries in which shares have been subscribed but of which the central bank does not delegate *ex-officio* Directors to the Board.

The Directors so elected shall remain in office for three years but may be re-elected.

Article 28

In the event of a vacancy occurring on the Board for any reason other than the termination of a period of office in accordance with the preceding Article, the vacancy shall be filled in accordance with the procedure by which the member to be replaced was selected. In the case of Directors other than *ex-officio* Directors, the new Director may hold office for the unexpired period of his/her predecessor's term of office. He/she shall be eligible for re-election at the expiration of that term.

Article 29

[*Deleted.*]

Article 30

No person shall be appointed or hold office as a Director who is a member or an official of a Government unless he is the Governor of a central bank and no person shall be so appointed or hold office who is a member of a legislative body unless he is the Governor or a former Governor of a central bank.

Article 31

(1) Meetings of the Board shall be held not less than six times a year. At least four of these shall be held at the registered office of the Bank.

(2) In addition, decisions of the Board may be taken by means of teleconferencing or videoconferencing, or by correspondence, unless at least five Directors request that the decisions be referred to a meeting of the Board.

Article 32

A member of the Board who is not present in person at a meeting of Directors may give a proxy to any other member authorising him to vote at that meeting on his behalf.

Article 33

Unless otherwise provided by the Statutes, decisions of the Board shall be taken by a simple majority of those present or represented by proxy. In the case of an equality of votes, the Chairman shall have a second or casting vote.

The Board shall not be competent to act unless a quorum of Directors is present. This quorum shall be laid down in a regulation adopted by a two-thirds majority of the Board.

Article 34

The members of the Board may receive, in addition to out-of-pocket expenses, a fee for attendance at meeting and/or a remuneration, the amounts of which will be fixed by the Board, subject to the approval of the General Meeting.

Article 35

The proceedings of the Board shall be summarised in minutes which shall be signed by the Chairman.

Copies of or extracts from these minutes for the purpose of production in a court of justice must be certified by the Chairman of the Board or any other person designated by the Board.

A record of decisions taken at each meeting shall be sent within eight days of the meeting to every member.

Article 36

The Board shall represent the Bank in its dealings with third parties and shall have the exclusive right of entering into engagements on behalf of the Bank. It may, however, delegate this right to the Chairman of the Board, to another member or other members of the Board, to the General Manager or to any other member or members of the permanent staff of the Bank, provided that it defines the powers of each person to whom it delegates this right.

Article 37

The Bank shall be legally committed *vis-à-vis* third parties by the signatures of the Chairman of the Board and another member of the Board, or by the signatures of the General Manager and a member of the staff of the Bank who has been duly authorised by the Board to sign on behalf of the Bank, or by the signatures of two members of the staff of the Bank who have been duly authorised by the Board to sign on behalf of the Bank.

Article 38

The Board shall elect from among its members a Chairman and one or more Vice-Chairmen, one of whom shall preside at meetings of the Board in the absence of the Chairman.

At the meeting at which the Board elects its Chairman, the Chair shall be taken by the longest-serving member of the Board present.

The members of the Board so elected shall remain in office for a maximum of three years, and may be re-elected.

Article 39

(1) A General Manager and a Deputy General Manager shall be appointed by the Board on the proposal of the Chairman of the Board. Each appointment shall be made for a maximum of five years and may be renewed.

(2) The General Manager (chief executive officer) will carry out the policy determined by the Board and will be responsible to the Board for the management of the Bank.

(3) The Deputy General Manager will assist the General Manager in the management of the Bank and will exercise the responsibilities of the General Manager in his absence.

(4) Neither the General Manager nor the Deputy General Manager shall hold any other office which, in the judgement of the Board, might interfere with his duties to the Bank.

(5) Unless otherwise determined by the Board, the General Manager and Deputy General Manager shall be entitled to attend and speak at all meetings of the Board. When attending Board meetings, the General Manager, or in his absence, the Deputy General Manager, shall also be entitled to make proposals to the Board and, if he so desires, to have his opinions specially recorded in the minutes.

Article 40

(1) The departmental organisation of the Bank shall be approved by the Board on the proposal of the General Manager.

(2) The Heads of Departments and any other officers of similar rank shall be appointed by the Board on the proposal of the General Manager.

(3) The remainder of the staff shall be appointed by the General Manager.

Article 41

In carrying out his responsibilities, the General Manager shall be assisted by an advisory committee (Executive Committee). The committee will be chaired by the General Manager and will further comprise the Deputy General Manager, the Heads of Department, and all other officers of similar rank appointed by the Board. The terms of reference for the committee shall be approved by the Board.

Article 42

Except in respect of the core responsibilities of the Board, including those matters for which a two-thirds majority of the Board is required under these Statutes, the Board may, on a temporary basis, delegate certain of its powers to one or more committees chosen from among its members.

Article 43

The Board may appoint one or more advisory committees chosen wholly or partly from among its members.

Chapter V

General Meeting

Article 44

General Meetings of the Bank may be attended by nominees of the central banks or other financial institutions referred to in Article 14.

Voting rights shall be in proportion to the number of shares subscribed in the country of each institution represented at the meeting.

The Chair shall be taken at General Meetings by the Chairman of the Board or in his absence by a Vice-Chairman.

At least three weeks' notice of General Meetings shall be given to those entitled to be represented.

Subject to the provisions of these Statutes, the General Meeting shall decide upon its own procedure.

Article 45

Within four months of the end of each financial year of the Bank, an Annual General Meeting shall be held upon such date as the Board may decide.

The meeting shall take place at the registered office of the Bank.

Voting by proxy will be permitted in such manner as the Board may have provided in advance by regulation.

Article 46

The Annual General Meeting shall be invited:

(a) to approve the Annual Report, the Balance Sheet upon the Report of the Auditors, and the Profit and Loss

Account, and any proposed changes in the remuneration, fees or allowances of the members of the Board;

(b) to make appropriations to reserve and to special funds, and to consider the declaration of a dividend and its amount;

(c) to elect the Auditors for the ensuing year and to fix their remuneration; and

(d) to discharge the Board from all personal responsibility in respect of the past financial year.

Article 47

Extraordinary General Meetings shall be summoned to decide upon any proposals of the Board:

(a) to amend the Statutes;

(b) to increase or decrease the capital of the Bank;

(c) to liquidate the Bank.

Chapter VI

Accounts and Profits

Article 48

The financial year of the Bank will begin on 1st April and end on 31st March. The first financial period will end on 31st March, 1931.

Article 49

The Bank shall publish an Annual Report, and at least once a month a Statement of Account in such form as the Board may prescribe.

The Board shall cause to be prepared a Profit and Loss Account and Balance Sheet of the Bank for each financial year in time for submission to the Annual General Meeting.

Article 50

The Accounts and Balance Sheet shall be audited by independent auditors. The Auditors shall have full power to examine all books and accounts of the Bank and to require full information as to all its transactions. The Auditors shall report to the Board and to the General Meeting and shall state in their Report:

(a) whether they have obtained all the information and explanations they have required; and

(b) whether, in their opinion, the Balance Sheet and the Profit and Loss Account dealt with in the Report are properly drawn up so as to exhibit a true and fair view of the state of the Bank's affairs according to the best of their information and the explanations given to them, and as shown by the books of the Bank.

Article 51

The yearly net profits of the Bank shall be applied as follows:

(1) Five per cent. of such net profits, or such proportion of five per cent. as may be required for the purpose, shall be paid to a reserve fund called the Legal Reserve Fund until that Fund reaches an amount equal in value to ten per cent. of the amount of the paid-up capital of the Bank for the time being.

(2) Thereafter the net profits shall be applied in or towards payment of the dividend which is declared by the General Meeting on the proposal of the Board. The portion of the net

profits so applied shall take into account the amount (if any) which the Board decides to draw from the Special Dividend Reserve Fund of the Bank pursuant to Article 52.

(3) After making provision for the foregoing, one-half of the yearly net profits then remaining shall be paid into the General Reserve Fund of the Bank until it equals the paid-up capital. Thereafter forty per cent. shall be so applied until the General Reserve Fund equals twice the paid-up capital; thirty per cent. until it equals three times the paid-up capital; twenty per cent. until it equals four times the paid-up capital; ten per cent. until it equals five times the paid-up capital; and from that point onward, five per cent.

In case the General Reserve Fund, by reason of losses or by reason of an increase in the paid-up capital, falls below the amounts provided for above after having once attained them, the appropriate proportion of the yearly net profits shall again be applied until the position is restored.

(4) The disposal of the remainder of the net profits shall be determined by the General Meeting on the proposal of the Board, provided that a portion of such remainder may be allotted to the shareholders by way of a transfer to the Special Dividend Reserve Fund.

Article 52
Reserve Funds

The General Reserve Fund shall be available for meeting any losses incurred by the Bank. In case it is not adequate for this purpose, recourse may be had to the Legal Reserve Fund provided for in clause (1) of Article 51.

The Special Dividend Reserve Fund shall be available, in case of need, for paying the whole or any part of the dividend declared pursuant to clause (2) of Article 51.

These reserve funds, in the event of liquidation, and after the discharge of the liabilities of the Bank and the costs of liquidation, shall be divided among the shareholders.

Chapter VII

General Provisions

Article 53

(1) The Bank may not be liquidated except by a three-fourths majority of the General Meeting.

(2) In the event of the liquidation of the Bank, the obligations assumed by the Bank under the Staff Pension Scheme and any related special funds, in particular the corresponding liability as published in the latest Balance Sheet or Statement of Account, shall enjoy priority over the discharge of any other liabilities of the Bank, irrespective of whether or not the pension fund of the Bank, which covers the relevant obligations, has separate legal personality at the time of liquidation.

Article 54

(1) If any dispute shall arise between the Bank, on the one side, and any central bank, financial institution, or other bank referred to in the present Statutes, on the other side, or between the Bank and its shareholders, with regard to the interpretation or application of the Statutes of the Bank, the same shall be referred for final decision to the Tribunal provided for by the Hague Agreement of January, 1930.

(2) In the absence of agreement as to the terms of submission either party to a dispute under this Article may refer the same to the Tribunal, which shall have power to decide all questions (including the question of its own jurisdiction) even in default of appearance by the other party.

(3) Before giving a final decision and without prejudice to the questions at issue, the President of the Tribunal, or, if he is unable to act in any case, a member of the Tribunal to be designated by him forthwith, may, on the request of the first

party applying therefor, order any appropriate provisional measures in order to safeguard the respective rights of the parties.

(4) The provisions of this Article shall not prejudice the right of the parties to a dispute to refer the same by common consent to the President or a member of the Tribunal as sole arbitrator.

Article 55

(1) The Bank shall enjoy immunity from jurisdiction, save:

(a) to the extent that such immunity is formally waived in individual cases by the Chairman of the Board, the General Manager, the Deputy General Manager, or their duly authorised representatives; or

(b) in civil or commercial suits, arising from banking or financial transactions, initiated by contractual counterparties of the Bank, except in those cases in which provision for arbitration has been or shall have been made.

(2) Property and assets of the Bank shall, wherever located and by whomsoever held, be immune from any measure of execution (including seizure, attachment, freeze or any other measure of execution, enforcement or sequestration), except if that measure of execution is sought pursuant to a final judgment rendered against the Bank by any court of competent jurisdiction pursuant to sub-paragraph 1(a) or (b) above.

(3) All deposits entrusted to the Bank, all claims against the Bank and the shares issued by the Bank shall, without the express prior agreement of the Bank, wherever located and by whomsoever held, be immune from any measure of execution (including seizure, attachment, freeze or any other measure of execution, enforcement or sequestration).

Article 56

For the purposes of these Statutes:

(a) central bank means the bank or banking system in any country to which has been entrusted the duty of regulating the volume of currency and credit in that country; or, in a cross-border central banking system, the national central banks and the common central banking institution which are entrusted with such duty;

(b) the Governor of a central bank means the person who, subject to the control of his Board or other competent authority, has the direction of the policy and administration of the bank;

(c) a two-thirds majority of the Board means not less than two-thirds of the votes (whether given in person or by proxy) of the whole directorate;

(d) country means a sovereign state, a monetary zone within a sovereign state or a monetary zone extending over more than one sovereign state.

Article 57

Amendments of any Articles of these Statutes other than those enumerated in Article 58 may be proposed by a two-thirds majority of the Board to the General Meeting and if adopted by a majority of the General Meeting shall come into force, provided that such amendments are not inconsistent with the provisions of the Articles enumerated in Article 58.

Article 58

Articles 2, 3, 8, 14, 19, 24, 27, 44, 51, 54, 57 and 58 cannot be amended except subject to the following conditions: the amendment must be adopted by a two-thirds majority of the Board, approved by a majority of the General Meeting and sanctioned by a law supplementing the Charter of the Bank.

Triennial Central Bank Survey

Foreign exchange turnover in April 2016

Monetary and Economic Department

September 2016
Annex tables revised on 11 December 2016

Tools to access and download the results of the BIS Triennial Central Bank Survey:

- BIS website – tables in PDF of the BIS's most current data
- BIS Statistics Explorer – a browsing tool for pre-defined views of the BIS's most current data
- BIS Statistics Warehouse – a search tool for customised queries of the BIS's most current data

Questions about the BIS Triennial Central Bank Survey may be addressed to statistics@bis.org.

This publication is available on the BIS website (www.bis.org/publ/rpfx16.htm).

Foreign exchange turnover in April 2016

Contents

This publication presents the global results of the 2016 BIS Triennial Central Bank Survey of turnover in foreign exchange markets. A separate publication presents the results of turnover in over-the-counter interest rate derivatives markets (www.bis.org/publ/rpfx16.htm). Many participating authorities also publish their national results, links to which are available on the BIS website (www.bis.org/statistics/triennialrep/national.htm). The global results for a companion survey on amounts outstanding in OTC derivatives markets will be published in November 2016.

Data are subject to change. Revised data will be released concurrently with the *BIS Quarterly Review* in December 2016. The December 2016 *BIS Quarterly Review* will include several special feature articles that analyse the results of the 2016 Triennial Survey.

Notations

billion	thousand million
trillion	thousand billion
e	estimated
lhs	left-hand scale
rhs	right-hand scale
$	US dollar unless specified otherwise
…	not available
.	not applicable
–	nil or negligible

Differences in totals are due to rounding.

The term "country" as used in this publication also covers territorial entities that are not states as understood by international law and practice but for which data are separately and independently maintained.

1. BIS Triennial Central Bank Survey

The BIS Triennial Central Bank Survey is the most comprehensive source of information on the size and structure of global foreign exchange (FX) and over-the-counter (OTC) derivatives markets. The Triennial Survey aims to increase the transparency of OTC markets and to help central banks, other authorities and market participants monitor developments in global financial markets. It also helps to inform discussions on reforms to OTC markets.

FX market activity has been surveyed every three years since 1986, and OTC interest rate derivatives market activity since 1995.[1] The Triennial Survey is coordinated by the BIS under the auspices of the Markets Committee (for the FX part) and the Committee on the Global Financial System (for the interest rate derivatives part). It is supported through the Data Gaps Initiative endorsed by the G20.

The latest survey of turnover took place in April 2016. Central banks and other authorities in 52 jurisdictions participated in the 2016 survey (see page 15). They collected data from close to 1,300 banks and other dealers in their jurisdictions and reported national aggregates to the BIS, which then calculated global aggregates. Turnover data are reported by the sales desks of reporting dealers, regardless of where a trade is booked, and are reported on an unconsolidated basis, ie including trades between related entities that are part of the same group.

Highlights

Highlights from the 2016 Triennial Survey of turnover in OTC foreign exchange markets:

- Trading in foreign exchange markets averaged $5.1 trillion per day in April 2016. This is down from $5.4 trillion in April 2013, a month which had seen heightened activity in Japanese yen against the background of monetary policy developments at that time.
- For first time since 2001, spot turnover declined. Spot transactions fell to $1.7 trillion per day in April 2016 from $2.0 trillion in 2013. In contrast, the turnover of FX swaps rose further, reaching $2.4 trillion per day in April 2016. This rise was driven in large part by increased trading of FX swaps involving yen.
- The US dollar remained the dominant vehicle currency, being on one side of 88% of all trades in April 2016. The euro, yen and Australian dollar all lost market share. In contrast, many emerging market currencies increased their share. The renminbi doubled its share, to 4%, to become the world's eighth most actively traded currency and the most actively traded emerging market currency, overtaking the Mexican peso. The rise in the share of renminbi was primarily due to the increase in trading against the US dollar. In April 2016, as much as 95% of renminbi trading volume was against the US dollar.
- The share of trading between reporting dealers grew over the three-year period, accounting for 42% of turnover in April 2016, compared with 39% in April 2013. Banks other than reporting dealers accounted for a further 22% of turnover. Institutional investors were the third largest group of counterparties in FX markets, at 16%.
- In April 2016, sales desks in five countries – the United Kingdom, the United States, Singapore, Hong Kong SAR and Japan – intermediated 77% of foreign exchange trading, up from 75% in April 2013 and 71% in April 2010.

[1] More frequent regional surveys are conducted by local foreign exchange committees in Australia, Canada, London, New York, Singapore and Tokyo. These semiannual surveys focus on the structure of local FX markets, and there are some methodological differences compared with the Triennial Survey. In particular, the Triennial Survey collects data based on the location of the sales desk, whereas some regional surveys are based on the location of the trading desk.

2. Turnover in foreign exchange markets

According to the 2016 Triennial Survey, turnover in global FX markets averaged $5.1 trillion per day in 2016 (Table 1). This is down from $5.4 trillion in April 2013, a month which had seen heightened activity in Japanese yen against the background of monetary policy developments at that time.[2] In addition, exchange rate movements influence comparisons with previous surveys. In particular, the appreciation of the US dollar between 2013 and 2016 reduced the US dollar value of turnover in currencies other than the US dollar. When valued at constant (April 2016) exchange rates, turnover increased slightly, by about 4% between April 2016 and April 2013 (Table 1). Nevertheless, the latest developments contrast with the strong growth in turnover observed between Triennial Surveys since 2001.

Turnover by currencies and currency pairs

The US dollar remained the world's dominant vehicle currency. It was on one side of 88% of all trades in April 2016, up slightly from 87% in April 2013 (Graph 1, left-hand panel). In contrast, trading in the next eight most liquid currencies has shifted notably.

The role of the euro in FX markets has continued to decline since the beginning of the euro area sovereign debt crisis in 2010. The market share of the currency declined to 31% in April 2016 from 33% in April 2013 and 39% in April 2010 (Graph 1, left-hand panel, and Table 2). Trading in the four most actively traded euro currency pairs – USD/EUR, EUR/GBP, EUR/JPY and EUR/CHF – fell. USD/EUR average daily turnover declined by $119 billion, while the relative declines were most pronounced for the EUR/JPY and EUR/CHF pairs (Table 3). In contrast, trading in the EUR/SEK and EUR/NOK currency pairs increased.

The share of the yen in global FX trading also declined, by 1 percentage point to 22% by April 2016 (Graph 1, left-hand panel, and Table 2). This contrasts sharply with the currency's 4 percentage point expansion reported in the previous survey, which coincided with the expansionary monetary policy shift of the Bank of Japan in April 2013. Trading in the three most actively traded yen cross rates – USD/JPY, EUR/JPY and JPY/AUD – contracted significantly from 2013 to 2016.

Among the other heavily traded advanced economy currencies, the Australian dollar and Swiss franc also lost market share, from 8.6% to 6.9% and 5.2% to 4.8%, respectively; in contrast, the pound sterling, Canadian dollar, Swedish krona and Norwegian krone gained shares in global FX turnover.

The 2016 Triennial Survey shows a further significant rise in the global importance of several emerging market currencies. The renminbi became the most actively traded emerging market currency, overtaking the Mexican peso to become the world's eighth most actively traded currency (Table 2). The average daily turnover of renminbi almost doubled, from $120 billion to $202 billion, between April 2013 and April 2016, representing a rise in the share in global FX turnover from 2% to 4%. Ninety-five per cent of renminbi turnover is due to trading against the US dollar. The average turnover of USD/CNY rose from $113 billion to $192 billion over the three-year period, with that pair moving up from ninth to sixth place among the most traded currency pairs (Table 3).

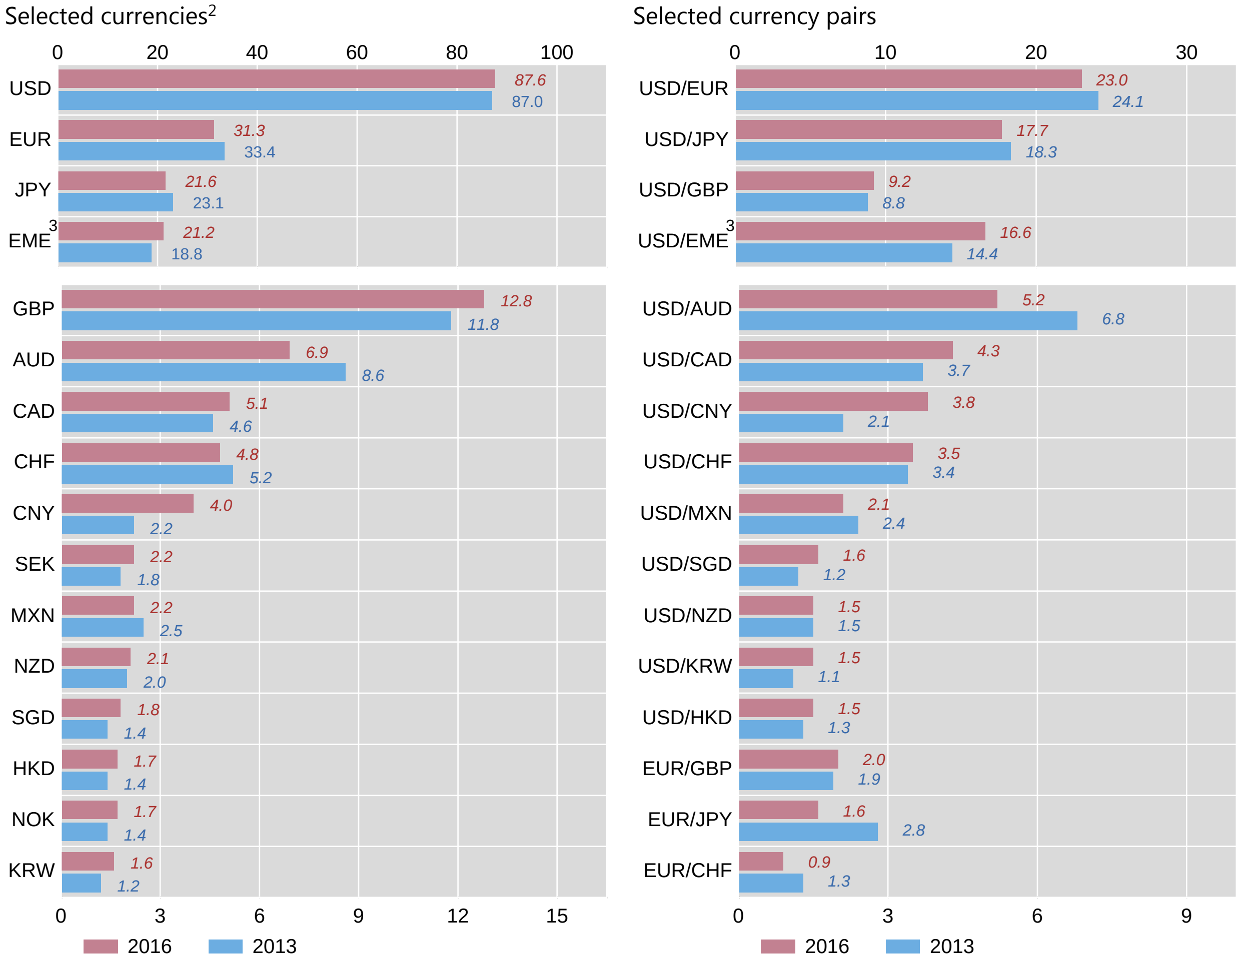
Several other emerging market currencies, particularly from the Asia-Pacific region, gained market share: the Korean won, Indian rupee and Thai baht were among the currencies that advanced in the ranking by two or three places (Table 2). In contrast, the turnover of some emerging market currencies peaked in 2013 and has since exhibited a significant decline (eg the Mexican peso and Russian rouble).

[2] For a discussion of drivers of trading volumes in April 2013, see D Rime and A Schrimpf, "The anatomy of the global FX market through the lens of the 2013 Triennial Survey", *BIS Quarterly Review*, December 2013, pp 27–43, www.bis.org/publ/qtrpdf/r_qt1312e.htm.

Foreign exchange market turnover by currency and currency pairs

Net-net basis,[1] daily averages in April, in per cent

Graph 1



[1] Adjusted for local and cross-border inter-dealer double-counting. [2] As two currencies are involved in each transaction, the sum of shares in individual currencies will total 200%. [3] Emerging market currencies.

Turnover by instrument and maturity

Trading activity has changed unevenly across the main FX instrument categories. In particular, trading volumes of spot trades and FX swaps, the two largest instrument categories, have evolved in opposite directions.

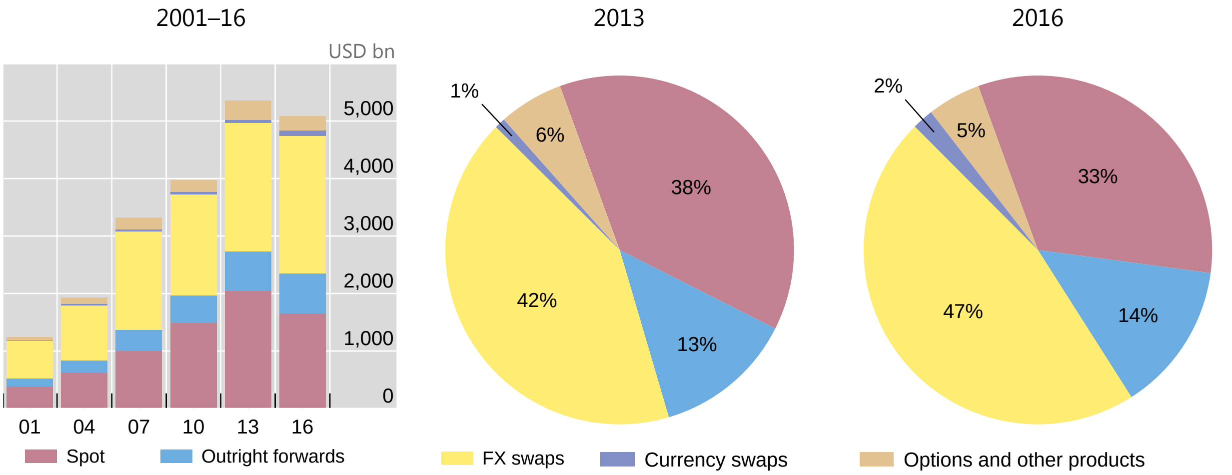
Spot market trading activity fell by 19% to $1.7 trillion per day in April 2016. This is the first time since 2001 that spot turnover has fallen compared with a previous survey (Table 1). The share of spot transactions in total foreign exchange market turnover declined by 5 percentage points between April 2013 and April 2016 to 33% (Graph 2). This decline in spot trading was the main driver behind the overall fall in global FX turnover compared with 2013.

In contrast, turnover in FX swaps rose by 6% to $2.4 trillion per day in April 2016. FX swaps remained the most traded instrument, with their share in turnover rising 5 percentage points to 47% (Table 3). Still, the growth in FX swap turnover was significantly lower than the 27% growth rate between April 2010 and April 2013.

Foreign exchange market turnover by instrument

Net-net basis,[1] daily averages in April

Graph 2



[1] Adjusted for local and cross-border inter-dealer double-counting.

Source: BIS Triennial Central Bank Survey. For additional data by instrument, see Table 1 on page 9.

The US dollar continues to be on one side of 91% of FX swap transactions, a share virtually unchanged compared with previous surveys. The euro was on one side of 34% of FX swap transactions, also a virtually unchanged share since 2013. The share of the yen in total FX swap turnover rose to 19% in April 2016, compared with 15% in 2013.[3]

Trading activity changed unevenly in other parts of the FX OTC derivatives market. Trading volume of outright forwards rose to $700 billion in 2016, a 3% increase from $679 billion in 2013. Trading volume of currency swaps grew much faster than in any other part of the FX market, although this instrument still remains the least traded, owing in part to the long maturity of the contracts. Turnover in currency swaps rose to $96 billion in 2016, a 79% increase from $54 billion in 2013.

In contrast, trading volume of FX options declined to $254 billion in 2016, 24% lower than in 2013. The largest decline took place in yen cross rates, which declined to $74 billion in 2016 (ie by 52% from 2013).[4]

The 2016 survey shows a tendency towards slightly longer maturities of FX swaps and outright forwards. For instance, 30% of FX swaps initiated in April 2016 had a contractual maturity of between seven days and one year, compared with 26% in 2013 (Table 4). Similarly, 59% of outright forwards initiated in April 2016 had a contractual maturity of between seven days and one year, compared with 56% in April 2013.

[3] For an analysis of investor positioning in yen FX swaps and related FX derivatives, see C Borio, R McCauley, P McGuire and V Sushko, "Covered interest parity lost: understanding the cross-currency basis", *BIS Quarterly Review*, September 2016 (forthcoming).

[4] These changes have to be interpreted in the context of the surge in yen options trading in April 2013, when players such as hedge funds used the options market to express their directional views on the yen given the expansionary shift in Japanese monetary policy in April 2013; for a more detailed discussion, see D Rime and A Schrimpf (2013), op cit.

Turnover by counterparty

FX trading continued to be dominated by financial institutions other than reporting dealers, which accounted for 51% of turnover in April 2016 (Graph 3 and Table 4). However, the share of trading between reporting dealers increased for the first time since 1995. Inter-dealer trading, which averaged $2.1 trillion in April 2016, increased from 39% of FX turnover in April 2013 to 42% in April 2016. The rise in inter-dealer trading was primarily driven by the increased trading in FX swaps, an 11% rise since 2013 to $1.2 trillion in April 2016. Turnover in spot activity among reporting dealers declined in absolute terms (Table 4).

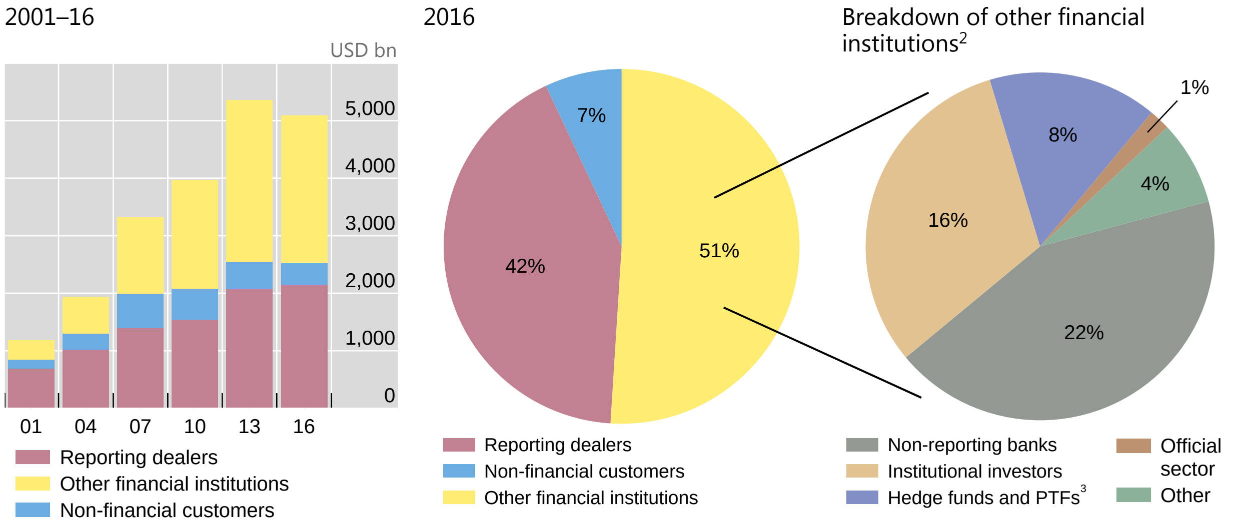
Trading between reporting dealers and other financial institutions fell slightly between 2013 and 2016, to $2.6 trillion. Non-reporting banks – smaller and regional banks that serve as clients of the large FX dealing banks but do not engage in market-making – accounted for roughly 22% of global FX turnover in April 2016 (Graph 3), down from a 24% share in April 2013. At the same time, institutional investors, such as insurance companies and pension funds, further increased their share of FX trading relative to hedge funds and proprietary trading firms: institutional investors were on one side of 16% of daily turnover in April 2016, up from 11% in 2013, whereas the corresponding share of FX trading by hedge funds and proprietary trading firms decreased from 11% to 8%.

The rise in the share of trading by institutional investors is mostly due to an increase in their use of FX swaps. Average daily FX swap turnover with institutional investors as a counterparty rose to $278 billion by April 2016 (Table 5), a 79% increase compared with the 2013 survey.

The fall in the share of trading by non-reporting banks is primarily due to a decline in their activity in the spot market, followed by a decline in their use of FX swaps. Average daily spot turnover with non-reporting banks as a counterparty stood at $354 billion in April 2016, a 30% decline compared with the 2013 survey; and average daily FX swap turnover stood at $564 billion (a 7% decline).

Foreign exchange market turnover by counterparty

Net-net basis,[1] daily averages in April — Graph 3



[1] Adjusted for local and cross-border inter-dealer double-counting. [2] For definitions of counterparties, see page 18. [3] Proprietary trading firms.

Source: BIS Triennial Central Bank Survey. For additional data by counterparty, see Tables 4 and 5 on pages 12 and 13.

The fall in the share of trading by hedge funds and proprietary trading firms was due to a decline in this sector's activity in all three of the main market segments. Average daily spot turnover with hedge funds and proprietary trading firms as a counterparty stood at $200 billion in April 2016, a 29% decline compared with the 2013 survey; trading in outright forwards and FX swaps with this counterparty sector also declined, by 29% and 37%, respectively.

Trading with non-financial customers, such as corporations and governments, contracted, accounting for only 7% of global FX turnover, a continuation of the trend captured in previous surveys.

Geographical distribution of turnover

Trading continues to be concentrated in the largest financial centres. In April 2016, sales desks in five countries – the United Kingdom, the United States, Singapore, Hong Kong SAR and Japan – intermediated 77% of all foreign exchange trading (Table 6). The share of foreign exchange trading taking place in the United States was virtually unchanged relative to the previous survey, at 19% in 2016. Asian financial centres, namely Tokyo, Hong Kong SAR and Singapore, increased their combined share of intermediation to 21%, from 15%.

The share of foreign exchange trading in the United Kingdom declined to 37% in April 2016, from 41%. The decline was broad-based across currency pairs. The market share of the euro area continued to decline, falling to 8% in April 2016 from 9% in 2013, although France maintained its 3% share. The trend decline in the share of trading activity taking place in Switzerland and Australia also continued, to 2% in each country in 2016 compared with 3% in 2013.

Ireland	Central Bank of Ireland	**Turkey**	Central Bank of the Republic of Turkey
Israel	Bank of Israel		
Italy	Bank of Italy	**United Kingdom**	Bank of England
Japan	Bank of Japan	**United States**	Federal Reserve Bank of New York

Coverage

The Triennial Survey of foreign exchange turnover covers spot transactions, outright forwards, foreign exchange swaps, currency swaps, currency options and other OTC foreign exchange transactions with exposure to more than one currency.

The basis for reporting was in principle the location of the sales desk of any trade, even if deals entered into in different locations were booked in a central location. Thus, transactions concluded by offices located abroad were not reported by the country of location of the head office, but by that of the office abroad (insofar as the latter was a reporting institution in one of the other reporting countries). Where no sales desk was involved in a deal, the trading desk was used to determine the location of deals.

The survey collected turnover data for both proprietary and commissioned business of the reporting institutions. Commissioned business refers to reporting institutions' transactions as a result of deals as an agent or trustee in their own name, but on behalf of third parties, such as customers or other entities.

Turnover data

Turnover data provide a measure of market activity, and can also be seen as a rough proxy for market liquidity. Turnover is defined as the gross value of all new deals entered into during a given period, and is measured in terms of the nominal or notional amount of the contracts.

No distinction was made between sales and purchases (eg a purchase of $5 million against sterling and a sale of $7 million against sterling would amount to a gross turnover of $12 million). Direct cross-currency transactions were counted as single transactions (eg if a bank sold $5 million of Swiss francs against the Swedish krona, the reported turnover would be $5 million); however, cross-currency transactions passing through a vehicle currency were recorded as two separate deals against the vehicle currency (eg if a bank sold $5 million of Swiss francs against euros first and then used the euros to purchase kronor, the reported turnover would be $10 million). The gross amount of each transaction was recorded once, and netting arrangements and offsets were ignored.

OTC derivatives transactions that are centrally cleared via central counterparties (CCPs) were reported on a pre-novation basis (ie with the original execution counterpart as counterparty). Any post-trade transaction records that arise from central clearing via CCPs (eg through novation) were not reported as additional transactions.

As in the previous foreign exchange surveys, turnover data were collected over a one-month period, the month of April, in order to reduce the likelihood of very short-term variations in activity contaminating the data. The data collected for the survey reflected all transactions entered into during the calendar month of April 2016, regardless of whether delivery or settlement was made during that month. In order to allow comparison across countries, daily averages of turnover were computed by dividing aggregate monthly turnover for the country in question by the number of days in April on which the foreign exchange and derivatives markets in that country were open.

Transactions are reported to the BIS in US dollar equivalents, with non-dollar amounts generally converted into US dollars using the exchange rate prevailing on the date of the trade.

Instruments

The instruments covered in the foreign exchange turnover part of the survey are defined as follows:

Spot transactions	Single outright transactions involving the exchange of two currencies at a rate agreed on the date of the contract for value or delivery (cash settlement) within two business days. The spot legs of swaps are not included among spot transactions but are reported as swap transactions even when they are due for settlement within two days. This means that spot transactions are exclusive of overnight swaps and spot next swaps, as well as other "tomorrow/next day" transactions.
Outright forwards	Transactions involving the exchange of two currencies at a rate agreed on the date of the contract for value or delivery (cash settlement) at some time in the future (more than two business days later). This category also includes forward foreign exchange agreement transactions (FXAs), non-deliverable forwards (NDFs) and other forward contracts for differences. Outright forwards are generally not traded on organised exchanges, and their contractual terms are not standardised.
Foreign exchange swaps	Transactions involving the actual exchange of two currencies (principal amount only) on a specific date at a rate agreed at the time of the conclusion of the contract (the short leg), and a reverse exchange of the same two currencies at a date further in the future at a rate (generally different from the rate applied to the short leg) agreed at the time of the contract (the long leg). Both spot/forward and forward/forward swaps are included. For *turnover*, only the forward leg is reported as such. The spot leg is not reported at all, ie neither as a spot nor as a foreign exchange swap transaction. Short-term swaps carried out as "tomorrow/next day" transactions are also included in this category.
Currency swaps	Contracts which commit two counterparties to exchange streams of interest payments in different currencies for an agreed period of time and/or to exchange principal amounts in different currencies at a pre-agreed exchange rate at maturity.
OTC options	Option contracts that give the right to buy or sell a currency with another currency at a specified exchange rate during a specified period. This category also includes exotic foreign exchange options such as average rate options and barrier options. OTC options include: • The currency swaption: an OTC option to enter into a currency swap contract. • The currency warrant: a long-dated (over one year) OTC currency option.
Other products	Other derivative products are instruments where decomposition into individual plain vanilla instruments such as forwards, swaps or options is impractical or impossible. An example of "other" products is swaps with underlying notional principal in one currency and fixed or floating interest rate payments based on interest rates in currencies other than the notional (differential swaps or "diff swaps").

Counterparties

Reporting institutions were requested to provide for each instrument a breakdown of contracts by counterparty, as follows: reporting dealers, other financial institutions and non-financial customers, with separate information on local and cross-border transactions. The distinction between local and cross-border was determined according to the location of the counterparty and not its nationality. Starting with the 2013 survey of foreign exchange turnover, other financial institutions were further broken down into five subsectors.

Reporting dealers	Financial institutions that participate as reporters in the Triennial Survey. These are mainly large commercial and investment banks and securities houses that (i) participate in the inter-dealer market and/or (ii) have an active business with large customers, such as large corporate firms, governments and non-reporting financial institutions; in other words, reporting dealers are institutions that actively buy and sell currency and OTC derivatives both for their own account and/or in meeting customer demand. In practice, reporting dealers are often those institutions that actively or regularly deal through electronic platforms, such as EBS or Reuters dealing facilities. This category also includes the branches and subsidiaries of institutions operating in multiple locations that do not have a trading desk but do have a sales desk in those locations that conducts active business with large customers. The identification of transactions with reporting dealers allows the BIS to adjust for double-counting in inter-dealer trades.
Other financial institutions	Financial institutions that are not classified as "reporting dealers" in the survey. These are typically regarded as foreign exchange and interest rate derivatives market end users. They mainly cover all other financial institutions, such as smaller commercial banks, investment banks and securities houses, and mutual funds, pension funds, hedge funds, currency funds, money market funds, building societies, leasing companies, insurance companies, other financial subsidiaries of corporate firms and central banks.
Non-reporting banks	Smaller or regional commercial banks, publicly owned banks, securities firms or investment banks not directly participating as reporting dealers.
Institutional investors	Institutional investors such as mutual funds, pension funds, insurance and reinsurance companies and endowments. Primary motives for market participation are to trade FX instruments eg for hedging, investing and risk management purposes. A common label for this counterparty category is "real money investors".
Hedge funds and proprietary trading firms	(i) Investment funds and various types of money managers, including commodity trading advisers (CTAs), which share (a combination of) the following characteristics: they often follow a relatively broad range of investment strategies that are not subject to borrowing and leverage restrictions, with many of them using high levels of leverage; they often have a different regulatory mandate than "institutional investors" and typically cater to sophisticated investors such as high net worth individuals or institutions; and they often hold long and short positions in various markets, asset classes and instruments, with frequent use of derivatives for speculative purposes. (ii) Proprietary trading firms that invest, hedge or speculate for their own account. This category may include specialised high-frequency trading (HFT) firms that employ high-speed algorithmic trading strategies characterised by numerous frequent trades and very short holding periods.
Official sector financial institutions	Central banks, sovereign wealth funds, international financial institutions in the public sector (BIS, IMF etc), development banks and agencies.
Other	All remaining financial institutions (eg retail aggregators) that cannot be classified in any of the four above-mentioned subcategories for other financial institutions.
Non-financial customers	Any counterparty other than those described above, ie mainly non-financial end users, such as corporations and non-financial government entities. May also include private individuals who directly transact with reporting dealers for investment purposes, either on the online retail trading platforms operated by the reporting dealers or by other means (eg giving trading instructions by phone).

Trading relationships

Reporting dealers were requested to identify how much of their total turnover for each instrument and currency pair was attributed to: (i) transactions conducted in a foreign exchange prime brokerage relationship (with the reporting dealer in the role of FX prime broker); and (ii) transactions that are directly or indirectly generated by retail investors. As in previous surveys, reporting dealers were requested to identify how much of their grand total of foreign exchange turnover was attributed to "related party" transactions.

Prime brokers	Institutions (usually large and highly rated banks) facilitating trades for their clients (often institutional funds, hedge funds and other proprietary trading firms). Prime brokers enable their clients to conduct trades, subject to credit limits, with a group of predetermined third-party banks in the prime broker's name. This may also involve granting the client access to electronic platforms that are traditionally available only to large dealers. In an FX prime brokerage relationship, the client trade is normally "given up" to the prime broker, which is interposed between the third-party bank and the client and therefore becomes the counterparty to both legs of the trade.
Retail-driven transactions	Reporting dealers' (i) transactions with "wholesale" financial counterparties that cater to retail investors (ie electronic retail trading platforms and retail margin brokerage firms), and (ii) direct transactions with "non-wholesale" investors (ie private individuals) executed online or by other means (eg phone), if applicable.
Related party trades	Transactions between desks and offices, transactions with branches and subsidiaries, and transactions between affiliated firms. These trades are included regardless of whether the counterparty is resident in the same country as the reporting dealer or in another country. However, trades conducted as back-to-back deals and trades to facilitate internal bookkeeping and internal risk management within a given reporting dealer are excluded, be they on a local or a cross-border basis.

Currencies and currency pairs

All foreign exchange transactions involving the 24 currencies listed in the table below were collected in the survey. This list of currencies for which reporting is compulsory and consistent across all jurisdictions was expanded from eight currencies in the 2010 survey to 24 in the 2013 survey, the latter total being retained for the 2016 survey.[5] These changes in the reporting setup were introduced to better capture offshore trading in non-major currencies, most of which are emerging market currencies.[6]

Currencies collected in the 2016 survey

AUD	CHF	EUR	HUF	KRW	NZD	SEK	TWD
BRL	CNY[1]	GBP	INR	MXN	PLN	SGD	USD
CAD	DKK	HKD	JPY	NOK	RUB	TRY	ZAR

[1] Includes offshore transactions commonly denoted by CNH.

[5] In the past, several technical features in its reporting setup had limited the Triennial Survey's capacity to capture turnover in non-major currencies in a consistent manner globally. This was less of an issue in the past when non-major currencies were mainly traded onshore, but offshore trading of many non-major currencies has expanded significantly. Given the global nature of the Triennial Survey, it is crucial to have consistent reporting of these currencies across all participating jurisdictions.

[6] In previous surveys, only eight "major" currencies were subject to compulsory reporting on a global basis. Reporting of the other "non-major" currencies was only compulsory in the currencies' "home" jurisdictions, whereas the reporting of these currencies' offshore turnover was left to the discretion of the offshore jurisdictions. Potentially inconsistent treatment of non-major currencies across jurisdictions is known to be associated with problems such as "overnetting", which affects the accuracy of the turnover aggregates.

Data were collected for the following 47 currency pairs. Turnover in currency pairs that are not listed was recorded in aggregate under "other" and "residual".

Currency pairs collected in the 2016 survey

	Domestic currency against	USD against	EUR against	JPY against	Residual[1]
G8 currencies	AUD, CAD, CHF, EUR, GBP, JPY, SEK, USD	AUD, CAD, CHF, EUR, GBP, JPY, SEK,	AUD, CAD, CHF, GBP, JPY, SEK	AUD, CAD	
Non-G8 currencies		BRL, CNY, HKD, INR, KRW, MXN, NOK, NZD, PLN, RUB, SGD, TRY, TWD, ZAR	CNY, DKK, HUF, NOK, PLN, TRY	BRL, NZD, TRY, ZAR	
Other	Other[2]	Other[2]	Other[2]	Other[2]	

[1] Transactions that do not involve the domestic currency, USD, EUR or JPY in one leg. [2] Currencies not explicitly listed in the table.

Given the interest in identifying turnover in all reporting countries' currencies, supplementary information for currencies recorded in aggregate under "other" and "residual" was also collected for the following 35 currencies: ARS, AUD, BGN, BHD, BRL, CAD, CHF, CLP, CNY, COP, CZK, DKK, GBP, HKD, HUF, IDR, ILS, INR, KRW, MXN, MYR, NOK, NZD, PEN, PHP, PLN, RON, RUB, SAR, SEK, SGD, THB, TRY, TWD and ZAR.

Transactions conducted in a special unit of account adjusted to inflation (like CLF, COU and MXV) were treated as having been done in the main currency (respectively, CLP, COP and MXN).

Maturities

Transactions in outright forwards and foreign exchange swaps were broken down between the following original maturity bands: seven days or less; over seven days and up to one year; over one year.

For outright forward contracts, the maturity band for the transaction is determined by the difference between the delivery date and the date of the initiation of the contract. For both spot/forward and forward/forward foreign exchange swaps, the maturity band for the contract is determined by the difference between the due date of the second or long leg of the swap and the date of the initiation of the contract.

Elimination of double-counting

Double-counting arises because transactions between two reporting entities are recorded by each of them, ie twice. In order to derive meaningful measures of overall market size, it is therefore necessary to halve the data on transactions between reporting dealers. To permit this, reporters are asked to distinguish deals contracted with other reporters (dealers).

The following methods of adjustment were applied: data on local deals with other reporters were first divided by two, and this figure was subtracted from total gross data to arrive at so-called "net-gross" figures, ie business net of local inter-dealer double-counting. In a second step, data on cross-border deals with other reporters were also divided by two, and this figure was subtracted from total "net-gross" data to obtain so-called "net-net" figures, ie business net of local and cross-border inter-dealer double-counting.

Gross turnover	Minus	= **Net-gross turnover**	Minus	= **Net-net turnover**
Not adjusted for inter-dealer double-counting (ie "gross-gross" basis)	half of the turnover with local reporting dealers	Adjusted for local inter-dealer double-counting (ie "net-gross" basis)	half of the turnover with reporting dealers abroad	Adjusted for local and cross-border inter-dealer double-counting (ie "net-net" basis)

H. R. 4173

One Hundred Eleventh Congress of the United States of America

AT THE SECOND SESSION

Begun and held at the City of Washington on Tuesday, the fifth day of January, two thousand and ten

An Act

To promote the financial stability of the United States by improving accountability and transparency in the financial system, to end "too big to fail", to protect the American taxpayer by ending bailouts, to protect consumers from abusive financial services practices, and for other purposes.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,

SECTION 1. SHORT TITLE; TABLE OF CONTENTS.

(a) SHORT TITLE.—This Act may be cited as the "Dodd-Frank Wall Street Reform and Consumer Protection Act".

(b) TABLE OF CONTENTS.—The table of contents for this Act is as follows:

Subtitle C—Additional Board of Governors Authority for Certain Nonbank Financial Companies and Bank Holding Companies

TITLE II—ORDERLY LIQUIDATION AUTHORITY

TITLE III—TRANSFER OF POWERS TO THE COMPTROLLER OF THE CURRENCY, THE CORPORATION, AND THE BOARD OF GOVERNORS

Subtitle A—Transfer of Powers and Duties

Subtitle B—Transitional Provisions

SEC. 2. DEFINITIONS.

As used in this Act, the following definitions shall apply, except as the context otherwise requires or as otherwise specifically provided in this Act:

(1) AFFILIATE.—The term "affiliate" has the same meaning as in section 3 of the Federal Deposit Insurance Act (12 U.S.C. 1813).

(2) APPROPRIATE FEDERAL BANKING AGENCY.—On and after the transfer date, the term "appropriate Federal banking agency" has the same meaning as in section 3(q) of the Federal Deposit Insurance Act (12 U.S.C. 1813(q)), as amended by title III.

(3) BOARD OF GOVERNORS.—The term "Board of Governors" means the Board of Governors of the Federal Reserve System.

(4) BUREAU.—The term "Bureau" means the Bureau of Consumer Financial Protection established under title X.

(5) COMMISSION.—The term "Commission" means the Securities and Exchange Commission, except in the context of the Commodity Futures Trading Commission.

(6) COMMODITY FUTURES TERMS.—The terms "futures commission merchant", "swap", "swap dealer", "swap execution facility", "derivatives clearing organization", "board of trade", "commodity trading advisor", "commodity pool", and "commodity pool operator" have the same meanings as given the terms in section 1a of the Commodity Exchange Act (7 U.S.C. 1 et seq.).

(7) CORPORATION.—The term "Corporation" means the Federal Deposit Insurance Corporation.

(8) COUNCIL.—The term "Council" means the Financial Stability Oversight Council established under title I.

(9) CREDIT UNION.—The term "credit union" means a Federal credit union, State credit union, or State-chartered credit union, as those terms are defined in section 101 of the Federal Credit Union Act (12 U.S.C. 1752).

(10) FEDERAL BANKING AGENCY.—The term—

(A) "Federal banking agency" means, individually, the Board of Governors, the Office of the Comptroller of the Currency, and the Corporation; and

(B) "Federal banking agencies" means all of the agencies referred to in subparagraph (A), collectively.

(11) FUNCTIONALLY REGULATED SUBSIDIARY.—The term "functionally regulated subsidiary" has the same meaning as in section 5(c)(5) of the Bank Holding Company Act of 1956 (12 U.S.C. 1844(c)(5)).

(12) PRIMARY FINANCIAL REGULATORY AGENCY.—The term "primary financial regulatory agency" means—

(A) the appropriate Federal banking agency, with respect to institutions described in section 3(q) of the Federal Deposit Insurance Act, except to the extent that an institution is or the activities of an institution are otherwise described in subparagraph (B), (C), (D), or (E);

(B) the Securities and Exchange Commission, with respect to—

(i) any broker or dealer that is registered with the Commission under the Securities Exchange Act of 1934, with respect to the activities of the broker or dealer that require the broker or dealer to be registered under that Act;

(ii) any investment company that is registered with the Commission under the Investment Company Act of 1940, with respect to the activities of the investment company that require the investment company to be registered under that Act;

(iii) any investment adviser that is registered with the Commission under the Investment Advisers Act of 1940, with respect to the investment advisory activities of such company and activities that are incidental to such advisory activities;

(iv) any clearing agency registered with the Commission under the Securities Exchange Act of 1934, with respect to the activities of the clearing agency that require the agency to be registered under such Act;

(v) any nationally recognized statistical rating organization registered with the Commission under the Securities Exchange Act of 1934;

(vi) any transfer agent registered with the Commission under the Securities Exchange Act of 1934;

(vii) any exchange registered as a national securities exchange with the Commission under the Securities Exchange Act of 1934;

(viii) any national securities association registered with the Commission under the Securities Exchange Act of 1934;

(ix) any securities information processor registered with the Commission under the Securities Exchange Act of 1934;

(x) the Municipal Securities Rulemaking Board established under the Securities Exchange Act of 1934;

(xi) the Public Company Accounting Oversight Board established under the Sarbanes-Oxley Act of 2002 (15 U.S.C. 7211 et seq.);

(xii) the Securities Investor Protection Corporation established under the Securities Investor Protection Act of 1970 (15 U.S.C. 78aaa et seq.); and

(xiii) any security-based swap execution facility, security-based swap data repository, security-based swap dealer or major security-based swap participant registered with the Commission under the Securities Exchange Act of 1934, with respect to the security-based swap activities of the person that require such person to be registered under such Act;

(C) the Commodity Futures Trading Commission, with respect to—

(i) any futures commission merchant registered with the Commodity Futures Trading Commission under the Commodity Exchange Act (7 U.S.C. 1 et seq.), with respect to the activities of the futures commission merchant that require the futures commission merchant to be registered under that Act;

(ii) any commodity pool operator registered with the Commodity Futures Trading Commission under the Commodity Exchange Act (7 U.S.C. 1 et seq.), with respect to the activities of the commodity pool operator that require the commodity pool operator to be registered under that Act, or a commodity pool, as defined in that Act;

(iii) any commodity trading advisor or introducing broker registered with the Commodity Futures Trading Commission under the Commodity Exchange Act (7 U.S.C. 1 et seq.), with respect to the activities of the commodity trading advisor or introducing broker that require the commodity trading adviser or introducing broker to be registered under that Act;

(iv) any derivatives clearing organization registered with the Commodity Futures Trading Commission under the Commodity Exchange Act (7 U.S.C. 1 et seq.), with respect to the activities of the derivatives clearing organization that require the derivatives clearing organization to be registered under that Act;

(v) any board of trade designated as a contract market by the Commodity Futures Trading Commission under the Commodity Exchange Act (7 U.S.C. 1 et seq.);

(vi) any futures association registered with the Commodity Futures Trading Commission under the Commodity Exchange Act (7 U.S.C. 1 et seq.);

(vii) any retail foreign exchange dealer registered with the Commodity Futures Trading Commission under the Commodity Exchange Act (7 U.S.C. 1 et seq.), with respect to the activities of the retail foreign exchange dealer that require the retail foreign exchange dealer to be registered under that Act;

(viii) any swap execution facility, swap data repository, swap dealer, or major swap participant registered with the Commodity Futures Trading Commission under the Commodity Exchange Act (7 U.S.C. 1 et seq.) with respect to the swap activities of the person that require such person to be registered under that Act; and

(ix) any registered entity under the Commodity Exchange Act (7 U.S.C. 1 et seq.), with respect to the activities of the registered entity that require the registered entity to be registered under that Act;

(D) the State insurance authority of the State in which an insurance company is domiciled, with respect to the insurance activities and activities that are incidental to such insurance activities of an insurance company that is subject to supervision by the State insurance authority under State insurance law; and

(E) the Federal Housing Finance Agency, with respect to Federal Home Loan Banks or the Federal Home Loan Bank System, and with respect to the Federal National Mortgage Association or the Federal Home Loan Mortgage Corporation.

(13) PRUDENTIAL STANDARDS.—The term "prudential standards" means enhanced supervision and regulatory standards developed by the Board of Governors under section 165.

(14) SECRETARY.—The term "Secretary" means the Secretary of the Treasury.

(15) SECURITIES TERMS.—The—

(A) terms "broker", "dealer", "issuer", "nationally recognized statistical rating organization", "security", and "securities laws" have the same meanings as in section 3 of the Securities Exchange Act of 1934 (15 U.S.C. 78c);

(B) term "investment adviser" has the same meaning as in section 202 of the Investment Advisers Act of 1940 (15 U.S.C. 80b–2); and

(C) term "investment company" has the same meaning as in section 3 of the Investment Company Act of 1940 (15 U.S.C. 80a–3).

(16) STATE.—The term "State" means any State, commonwealth, territory, or possession of the United States, the District of Columbia, the Commonwealth of Puerto Rico, the Commonwealth of the Northern Mariana Islands, American Samoa, Guam, or the United States Virgin Islands.

(17) TRANSFER DATE.—The term "transfer date" means the date established under section 311.

(18) OTHER INCORPORATED DEFINITIONS.—

(A) FEDERAL DEPOSIT INSURANCE ACT.—The terms "bank", "bank holding company", "control", "deposit", "depository institution", "Federal depository institution", "Federal savings association", "foreign bank", "including", "insured branch", "insured depository institution", "national member bank", "national nonmember bank", "savings association", "State bank", "State depository institution", "State member bank", "State nonmember bank", "State savings association", and "subsidiary" have the same meanings as in section 3 of the Federal Deposit Insurance Act (12 U.S.C. 1813).

(B) HOLDING COMPANIES.—The term—

(i) "bank holding company" has the same meaning as in section 2 of the Bank Holding Company Act of 1956 (12 U.S.C. 1841);

(ii) "financial holding company" has the same meaning as in section 2(p) of the Bank Holding Company Act of 1956 (12 U.S.C. 1841(p)); and

(iii) "savings and loan holding company" has the same meaning as in section 10 of the Home Owners' Loan Act (12 U.S.C. 1467a(a)).

SEC. 3. SEVERABILITY.

If any provision of this Act, an amendment made by this Act, or the application of such provision or amendment to any person or circumstance is held to be unconstitutional, the remainder of this Act, the amendments made by this Act, and the application of the provisions of such to any person or circumstance shall not be affected thereby.

SEC. 4. EFFECTIVE DATE.

Except as otherwise specifically provided in this Act or the amendments made by this Act, this Act and such amendments shall take effect 1 day after the date of enactment of this Act.

SEC. 5. BUDGETARY EFFECTS.

The budgetary effects of this Act, for the purpose of complying with the Statutory Pay-As-You-Go-Act of 2010, shall be determined by reference to the latest statement titled "Budgetary Effects of PAYGO Legislation" for this Act, jointly submitted for printing in the Congressional Record by the Chairmen of the House and Senate Budget Committees, provided that such statement has been submitted prior to the vote on passage in the House acting first on this conference report or amendment between the Houses.

SEC. 6. ANTITRUST SAVINGS CLAUSE.

Nothing in this Act, or any amendment made by this Act, shall be construed to modify, impair, or supersede the operation of any of the antitrust laws, unless otherwise specified. For purposes of this section, the term "antitrust laws" has the same meaning as in subsection (a) of the first section of the Clayton Act, except that such term includes section 5 of the Federal Trade Commission Act, to the extent that such section 5 applies to unfair methods of competition.

TITLE I—FINANCIAL STABILITY

SEC. 101. SHORT TITLE.

This title may be cited as the "Financial Stability Act of 2010".

SEC. 102. DEFINITIONS.

(a) IN GENERAL.—For purposes of this title, unless the context otherwise requires, the following definitions shall apply:

(1) BANK HOLDING COMPANY.—The term "bank holding company" has the same meaning as in section 2 of the Bank Holding Company Act of 1956 (12 U.S.C. 1841). A foreign bank or company that is treated as a bank holding company for purposes of the Bank Holding Company Act of 1956, pursuant to section 8(a) of the International Banking Act of 1978 (12 U.S.C. 3106(a)), shall be treated as a bank holding company for purposes of this title.

(2) CHAIRPERSON.—The term "Chairperson" means the Chairperson of the Council.

(3) MEMBER AGENCY.—The term "member agency" means an agency represented by a voting member of the Council.

(4) NONBANK FINANCIAL COMPANY DEFINITIONS.—

(A) FOREIGN NONBANK FINANCIAL COMPANY.—The term "foreign nonbank financial company" means a company (other than a company that is, or is treated in the United States as, a bank holding company) that is—

(i) incorporated or organized in a country other than the United States; and

(ii) predominantly engaged in, including through a branch in the United States, financial activities, as defined in paragraph (6).

(B) U.S. NONBANK FINANCIAL COMPANY.—The term "U.S. nonbank financial company" means a company (other than a bank holding company, a Farm Credit System institution chartered and subject to the provisions of the Farm Credit Act of 1971 (12 U.S.C. 2001 et seq.), or a national securities exchange (or parent thereof), clearing agency (or parent thereof, unless the parent is a bank holding company), security-based swap execution facility, or security-based swap data repository registered with the Commission, or a board of trade designated as a contract market (or parent thereof), or a derivatives clearing organization (or parent thereof, unless the parent is a bank holding company), swap execution facility or a swap data repository registered with the Commodity Futures Trading Commission), that is—

(i) incorporated or organized under the laws of the United States or any State; and

(ii) predominantly engaged in financial activities, as defined in paragraph (6).

(C) NONBANK FINANCIAL COMPANY.—The term "nonbank financial company" means a U.S. nonbank financial company and a foreign nonbank financial company.

(D) NONBANK FINANCIAL COMPANY SUPERVISED BY THE BOARD OF GOVERNORS.—The term "nonbank financial company supervised by the Board of Governors" means a nonbank financial company that the Council has determined under section 113 shall be supervised by the Board of Governors.

(5) OFFICE OF FINANCIAL RESEARCH.—The term "Office of Financial Research" means the office established under section 152.

(6) PREDOMINANTLY ENGAGED.—A company is "predominantly engaged in financial activities" if—

(A) the annual gross revenues derived by the company and all of its subsidiaries from activities that are financial in nature (as defined in section 4(k) of the Bank Holding Company Act of 1956) and, if applicable, from the ownership or control of one or more insured depository institutions, represents 85 percent or more of the consolidated annual gross revenues of the company; or

(B) the consolidated assets of the company and all of its subsidiaries related to activities that are financial in nature (as defined in section 4(k) of the Bank Holding Company Act of 1956) and, if applicable, related to the ownership or control of one or more insured depository institutions, represents 85 percent or more of the consolidated assets of the company.

(7) SIGNIFICANT INSTITUTIONS.—The terms "significant nonbank financial company" and "significant bank holding company" have the meanings given those terms by rule of the Board of Governors, but in no instance shall the term "significant nonbank financial company" include those entities that are excluded under paragraph (4)(B).

(b) DEFINITIONAL CRITERIA.—The Board of Governors shall establish, by regulation, the requirements for determining if a company is predominantly engaged in financial activities, as defined in subsection (a)(6).

(c) FOREIGN NONBANK FINANCIAL COMPANIES.—For purposes of the application of subtitles A and C (other than section 113(b)) with respect to a foreign nonbank financial company, references in this title to "company" or "subsidiary" include only the United States activities and subsidiaries of such foreign company, except as otherwise provided.

Subtitle A—Financial Stability Oversight Council

SEC. 111. FINANCIAL STABILITY OVERSIGHT COUNCIL ESTABLISHED.

(a) ESTABLISHMENT.—Effective on the date of enactment of this Act, there is established the Financial Stability Oversight Council.

(b) MEMBERSHIP.—The Council shall consist of the following members:

(1) VOTING MEMBERS.—The voting members, who shall each have 1 vote on the Council shall be—

(A) the Secretary of the Treasury, who shall serve as Chairperson of the Council;

(B) the Chairman of the Board of Governors;

(C) the Comptroller of the Currency;

(D) the Director of the Bureau;

(E) the Chairman of the Commission;

(F) the Chairperson of the Corporation;

(G) the Chairperson of the Commodity Futures Trading Commission;

(H) the Director of the Federal Housing Finance Agency;

(I) the Chairman of the National Credit Union Administration Board; and

(J) an independent member appointed by the President, by and with the advice and consent of the Senate, having insurance expertise.

(2) NONVOTING MEMBERS.—The nonvoting members, who shall serve in an advisory capacity as a nonvoting member of the Council, shall be—

(A) the Director of the Office of Financial Research;

(B) the Director of the Federal Insurance Office;

(C) a State insurance commissioner, to be designated by a selection process determined by the State insurance commissioners;

(D) a State banking supervisor, to be designated by a selection process determined by the State banking supervisors; and

(E) a State securities commissioner (or an officer performing like functions), to be designated by a selection process determined by such State securities commissioners.

(3) NONVOTING MEMBER PARTICIPATION.—The nonvoting members of the Council shall not be excluded from any of the proceedings, meetings, discussions, or deliberations of the Council, except that the Chairperson may, upon an affirmative vote of the member agencies, exclude the nonvoting members from any of the proceedings, meetings, discussions, or deliberations of the Council when necessary to safeguard and promote the free exchange of confidential supervisory information.

(c) TERMS; VACANCY.—

(1) TERMS.—The independent member of the Council shall serve for a term of 6 years, and each nonvoting member described in subparagraphs (C), (D), and (E) of subsection (b)(2) shall serve for a term of 2 years.

(2) VACANCY.—Any vacancy on the Council shall be filled in the manner in which the original appointment was made.

(3) ACTING OFFICIALS MAY SERVE.—In the event of a vacancy in the office of the head of a member agency or department, and pending the appointment of a successor, or during the absence or disability of the head of a member agency or department, the acting head of the member agency or department shall serve as a member of the Council in the place of that agency or department head.

(d) TECHNICAL AND PROFESSIONAL ADVISORY COMMITTEES.—The Council may appoint such special advisory, technical, or professional committees as may be useful in carrying out the functions of the Council, including an advisory committee consisting of State regulators, and the members of such committees may be members of the Council, or other persons, or both.

(e) MEETINGS.—

(1) TIMING.—The Council shall meet at the call of the Chairperson or a majority of the members then serving, but not less frequently than quarterly.

(2) RULES FOR CONDUCTING BUSINESS.—The Council shall adopt such rules as may be necessary for the conduct of the business of the Council. Such rules shall be rules of agency organization, procedure, or practice for purposes of section 553 of title 5, United States Code.

(f) VOTING.—Unless otherwise specified, the Council shall make all decisions that it is authorized or required to make by a majority vote of the voting members then serving.

(g) NONAPPLICABILITY OF FACA.—The Federal Advisory Committee Act (5 U.S.C. App.) shall not apply to the Council, or to any special advisory, technical, or professional committee appointed by the Council, except that, if an advisory, technical, or professional committee has one or more members who are not employees of or affiliated with the United States Government, the Council shall publish a list of the names of the members of such committee.

(h) ASSISTANCE FROM FEDERAL AGENCIES.—Any department or agency of the United States may provide to the Council and any special advisory, technical, or professional committee appointed by the Council, such services, funds, facilities, staff, and other support services as the Council may determine advisable.

(i) COMPENSATION OF MEMBERS.—

(1) FEDERAL EMPLOYEE MEMBERS.—All members of the Council who are officers or employees of the United States shall serve without compensation in addition to that received for their services as officers or employees of the United States.

(2) COMPENSATION FOR NON-FEDERAL MEMBER.—Section 5314 of title 5, United States Code, is amended by adding at the end the following:

"Independent Member of the Financial Stability Oversight Council (1).".

(j) DETAIL OF GOVERNMENT EMPLOYEES.—Any employee of the Federal Government may be detailed to the Council without reimbursement, and such detail shall be without interruption or loss of civil service status or privilege. An employee of the Federal Government detailed to the Council shall report to and be subject to oversight by the Council during the assignment to the Council, and shall be compensated by the department or agency from which the employee was detailed.

SEC. 112. COUNCIL AUTHORITY.

(a) PURPOSES AND DUTIES OF THE COUNCIL.—

(1) IN GENERAL.—The purposes of the Council are—

(A) to identify risks to the financial stability of the United States that could arise from the material financial distress or failure, or ongoing activities, of large, interconnected bank holding companies or nonbank financial companies, or that could arise outside the financial services marketplace;

(B) to promote market discipline, by eliminating expectations on the part of shareholders, creditors, and counterparties of such companies that the Government will shield them from losses in the event of failure; and

(C) to respond to emerging threats to the stability of the United States financial system.

(2) DUTIES.—The Council shall, in accordance with this title—

(A) collect information from member agencies, other Federal and State financial regulatory agencies, the Federal Insurance Office and, if necessary to assess risks to the United States financial system, direct the Office of Financial Research to collect information from bank holding companies and nonbank financial companies;

(B) provide direction to, and request data and analyses from, the Office of Financial Research to support the work of the Council;

(C) monitor the financial services marketplace in order to identify potential threats to the financial stability of the United States;

(D) to monitor domestic and international financial regulatory proposals and developments, including insurance and accounting issues, and to advise Congress and make recommendations in such areas that will enhance the integrity, efficiency, competitiveness, and stability of the U.S. financial markets;

(E) facilitate information sharing and coordination among the member agencies and other Federal and State agencies regarding domestic financial services policy development, rulemaking, examinations, reporting requirements, and enforcement actions;

(F) recommend to the member agencies general supervisory priorities and principles reflecting the outcome of discussions among the member agencies;

(G) identify gaps in regulation that could pose risks to the financial stability of the United States;

(H) require supervision by the Board of Governors for nonbank financial companies that may pose risks to the financial stability of the United States in the event of their material financial distress or failure, or because of their activities pursuant to section 113;

(I) make recommendations to the Board of Governors concerning the establishment of heightened prudential standards for risk-based capital, leverage, liquidity, contingent capital, resolution plans and credit exposure reports, concentration limits, enhanced public disclosures, and overall risk management for nonbank financial companies and large, interconnected bank holding companies supervised by the Board of Governors;

(J) identify systemically important financial market utilities and payment, clearing, and settlement activities (as that term is defined in title VIII);

(K) make recommendations to primary financial regulatory agencies to apply new or heightened standards and safeguards for financial activities or practices that could create or increase risks of significant liquidity, credit, or other problems spreading among bank holding companies, nonbank financial companies, and United States financial markets;

(L) review and, as appropriate, may submit comments to the Commission and any standard-setting body with respect to an existing or proposed accounting principle, standard, or procedure;

(M) provide a forum for—

(i) discussion and analysis of emerging market developments and financial regulatory issues; and

(ii) resolution of jurisdictional disputes among the members of the Council; and

(N) annually report to and testify before Congress on—

(i) the activities of the Council;

(ii) significant financial market and regulatory developments, including insurance and accounting regulations and standards, along with an assessment of those developments on the stability of the financial system;

(iii) potential emerging threats to the financial stability of the United States;

(iv) all determinations made under section 113 or title VIII, and the basis for such determinations;

(v) all recommendations made under section 119 and the result of such recommendations; and

(vi) recommendations—

(I) to enhance the integrity, efficiency, competitiveness, and stability of United States financial markets;

(II) to promote market discipline; and

(III) to maintain investor confidence.

(b) STATEMENTS BY VOTING MEMBERS OF THE COUNCIL.—At the time at which each report is submitted under subsection (a), each voting member of the Council shall—

(1) if such member believes that the Council, the Government, and the private sector are taking all reasonable steps to ensure financial stability and to mitigate systemic risk that would negatively affect the economy, submit a signed statement to Congress stating such belief; or

(2) if such member does not believe that all reasonable steps described under paragraph (1) are being taken, submit a signed statement to Congress stating what actions such member believes need to be taken in order to ensure that all reasonable steps described under paragraph (1) are taken.

(c) TESTIMONY BY THE CHAIRPERSON.—The Chairperson shall appear before the Committee on Financial Services of the House of Representatives and the Committee on Banking, Housing, and Urban Affairs of the Senate at an annual hearing, after the report is submitted under subsection (a)—

(1) to discuss the efforts, activities, objectives, and plans of the Council; and

(2) to discuss and answer questions concerning such report.

(d) AUTHORITY TO OBTAIN INFORMATION.—

(1) IN GENERAL.—The Council may receive, and may request the submission of, any data or information from the Office of Financial Research, member agencies, and the Federal Insurance Office, as necessary—

(A) to monitor the financial services marketplace to identify potential risks to the financial stability of the United States; or

(B) to otherwise carry out any of the provisions of this title.

(2) SUBMISSIONS BY THE OFFICE AND MEMBER AGENCIES.—Notwithstanding any other provision of law, the Office of Financial Research, any member agency, and the Federal Insurance Office, are authorized to submit information to the Council.

(3) FINANCIAL DATA COLLECTION.—

(A) IN GENERAL.—The Council, acting through the Office of Financial Research, may require the submission of periodic and other reports from any nonbank financial company or bank holding company for the purpose of assessing the extent to which a financial activity or financial market in which the nonbank financial company or bank holding company participates, or the nonbank financial company or bank holding company itself, poses a threat to the financial stability of the United States.

(B) MITIGATION OF REPORT BURDEN.—Before requiring the submission of reports from any nonbank financial company or bank holding company that is regulated by a member agency or any primary financial regulatory agency, the Council, acting through the Office of Financial Research, shall coordinate with such agencies and shall, whenever possible, rely on information available from the Office of Financial Research or such agencies.

(C) MITIGATION IN CASE OF FOREIGN FINANCIAL COMPANIES.—Before requiring the submission of reports from a company that is a foreign nonbank financial company or foreign-based bank holding company, the Council shall, acting through the Office of Financial Research, to the extent appropriate, consult with the appropriate foreign regulator of such company and, whenever possible, rely on information already being collected by such foreign regulator, with English translation.

(4) BACK-UP EXAMINATION BY THE BOARD OF GOVERNORS.—If the Council is unable to determine whether the financial activities of a U.S. nonbank financial company pose a threat to the financial stability of the United States, based on information or reports obtained under paragraphs (1) and (3), discussions with management, and publicly available information, the Council may request the Board of Governors, and the Board of Governors is authorized, to conduct an examination of the U.S. nonbank financial company for the sole purpose of determining whether the nonbank financial company should be supervised by the Board of Governors for purposes of this title.

(5) CONFIDENTIALITY.—

(A) IN GENERAL.—The Council, the Office of Financial Research, and the other member agencies shall maintain the confidentiality of any data, information, and reports submitted under this title.

(B) RETENTION OF PRIVILEGE.—The submission of any nonpublicly available data or information under this subsection and subtitle B shall not constitute a waiver of, or otherwise affect, any privilege arising under Federal or State law (including the rules of any Federal or State court) to which the data or information is otherwise subject.

(C) FREEDOM OF INFORMATION ACT.—Section 552 of title 5, United States Code, including the exceptions thereunder, shall apply to any data or information submitted under this subsection and subtitle B.

SEC. 113. AUTHORITY TO REQUIRE SUPERVISION AND REGULATION OF CERTAIN NONBANK FINANCIAL COMPANIES.

(a) U.S. NONBANK FINANCIAL COMPANIES SUPERVISED BY THE BOARD OF GOVERNORS.—

(1) DETERMINATION.—The Council, on a nondelegable basis and by a vote of not fewer than ⅔ of the voting members then serving, including an affirmative vote by the Chairperson, may determine that a U.S. nonbank financial company shall be supervised by the Board of Governors and shall be subject to prudential standards, in accordance with this title, if the Council determines that material financial distress at the U.S. nonbank financial company, or the nature, scope, size, scale, concentration, interconnectedness, or mix of the activities of the U.S. nonbank financial company, could pose a threat to the financial stability of the United States.

(2) CONSIDERATIONS.—In making a determination under paragraph (1), the Council shall consider—

(A) the extent of the leverage of the company;

(B) the extent and nature of the off-balance-sheet exposures of the company;

(C) the extent and nature of the transactions and relationships of the company with other significant nonbank financial companies and significant bank holding companies;

(D) the importance of the company as a source of credit for households, businesses, and State and local governments and as a source of liquidity for the United States financial system;

(E) the importance of the company as a source of credit for low-income, minority, or underserved communities, and the impact that the failure of such company would have on the availability of credit in such communities;

(F) the extent to which assets are managed rather than owned by the company, and the extent to which ownership of assets under management is diffuse;

(G) the nature, scope, size, scale, concentration, interconnectedness, and mix of the activities of the company;

(H) the degree to which the company is already regulated by 1 or more primary financial regulatory agencies;

(I) the amount and nature of the financial assets of the company;

(J) the amount and types of the liabilities of the company, including the degree of reliance on short-term funding; and

(K) any other risk-related factors that the Council deems appropriate.

(b) FOREIGN NONBANK FINANCIAL COMPANIES SUPERVISED BY THE BOARD OF GOVERNORS.—

(1) DETERMINATION.—The Council, on a nondelegable basis and by a vote of not fewer than ⅔ of the voting members then serving, including an affirmative vote by the Chairperson,

may determine that a foreign nonbank financial company shall be supervised by the Board of Governors and shall be subject to prudential standards, in accordance with this title, if the Council determines that material financial distress at the foreign nonbank financial company, or the nature, scope, size, scale, concentration, interconnectedness, or mix of the activities of the foreign nonbank financial company, could pose a threat to the financial stability of the United States.

(2) CONSIDERATIONS.—In making a determination under paragraph (1), the Council shall consider—

(A) the extent of the leverage of the company;

(B) the extent and nature of the United States related off-balance-sheet exposures of the company;

(C) the extent and nature of the transactions and relationships of the company with other significant nonbank financial companies and significant bank holding companies;

(D) the importance of the company as a source of credit for United States households, businesses, and State and local governments and as a source of liquidity for the United States financial system;

(E) the importance of the company as a source of credit for low-income, minority, or underserved communities in the United States, and the impact that the failure of such company would have on the availability of credit in such communities;

(F) the extent to which assets are managed rather than owned by the company and the extent to which ownership of assets under management is diffuse;

(G) the nature, scope, size, scale, concentration, interconnectedness, and mix of the activities of the company;

(H) the extent to which the company is subject to prudential standards on a consolidated basis in its home country that are administered and enforced by a comparable foreign supervisory authority;

(I) the amount and nature of the United States financial assets of the company;

(J) the amount and nature of the liabilities of the company used to fund activities and operations in the United States, including the degree of reliance on short-term funding; and

(K) any other risk-related factors that the Council deems appropriate.

(c) ANTIEVASION.—

(1) DETERMINATIONS.—In order to avoid evasion of this title, the Council, on its own initiative or at the request of the Board of Governors, may determine, on a nondelegable basis and by a vote of not fewer than ⅔ of the voting members then serving, including an affirmative vote by the Chairperson, that—

(A) material financial distress related to, or the nature, scope, size, scale, concentration, interconnectedness, or mix of, the financial activities conducted directly or indirectly by a company incorporated or organized under the laws of the United States or any State or the financial activities in the United States of a company incorporated or organized in a country other than the United States would pose a threat to the financial stability of the United States, based on consideration of the factors in subsection (a)(2) or (b)(2), as applicable;

(B) the company is organized or operates in such a manner as to evade the application of this title; and

(C) such financial activities of the company shall be supervised by the Board of Governors and subject to prudential standards in accordance with this title, consistent with paragraph (3).

(2) REPORT.—Upon making a determination under paragraph (1), the Council shall submit a report to the appropriate committees of Congress detailing the reasons for making such determination.

(3) CONSOLIDATED SUPERVISION OF ONLY FINANCIAL ACTIVITIES; ESTABLISHMENT OF AN INTERMEDIATE HOLDING COMPANY.—

(A) ESTABLISHMENT OF AN INTERMEDIATE HOLDING COMPANY.—Upon a determination under paragraph (1), the company that is the subject of the determination may establish an intermediate holding company in which the financial activities of such company and its subsidiaries shall be conducted (other than the activities described in section 167(b)(2)) in compliance with any regulations or guidance provided by the Board of Governors. Such intermediate holding company shall be subject to the supervision of the Board of Governors and to prudential standards under this title as if the intermediate holding company were a nonbank financial company supervised by the Board of Governors.

(B) ACTION OF THE BOARD OF GOVERNORS.—To facilitate the supervision of the financial activities subject to the determination in paragraph (1), the Board of Governors may require a company to establish an intermediate holding company, as provided for in section 167, which would be subject to the supervision of the Board of Governors and to prudential standards under this title, as if the intermediate holding company were a nonbank financial company supervised by the Board of Governors.

(4) NOTICE AND OPPORTUNITY FOR HEARING AND FINAL DETERMINATION; JUDICIAL REVIEW.—Subsections (d) through (h) shall apply to determinations made by the Council pursuant to paragraph (1) in the same manner as such subsections apply to nonbank financial companies.

(5) COVERED FINANCIAL ACTIVITIES.—For purposes of this subsection, the term "financial activities"—

(A) means activities that are financial in nature (as defined in section 4(k) of the Bank Holding Company Act of 1956);

(B) includes the ownership or control of one or more insured depository institutions; and

(C) does not include internal financial activities conducted for the company or any affiliate thereof, including internal treasury, investment, and employee benefit functions.

(6) ONLY FINANCIAL ACTIVITIES SUBJECT TO PRUDENTIAL SUPERVISION.—Nonfinancial activities of the company shall not

be subject to supervision by the Board of Governors and prudential standards of the Board. For purposes of this Act, the financial activities that are the subject of the determination in paragraph (1) shall be subject to the same requirements as a nonbank financial company supervised by the Board of Governors. Nothing in this paragraph shall prohibit or limit the authority of the Board of Governors to apply prudential standards under this title to the financial activities that are subject to the determination in paragraph (1).

(d) REEVALUATION AND RESCISSION.—The Council shall—

(1) not less frequently than annually, reevaluate each determination made under subsections (a) and (b) with respect to such nonbank financial company supervised by the Board of Governors; and

(2) rescind any such determination, if the Council, by a vote of not fewer than ⅔ of the voting members then serving, including an affirmative vote by the Chairperson, determines that the nonbank financial company no longer meets the standards under subsection (a) or (b), as applicable.

(e) NOTICE AND OPPORTUNITY FOR HEARING AND FINAL DETERMINATION.—

(1) IN GENERAL.—The Council shall provide to a nonbank financial company written notice of a proposed determination of the Council, including an explanation of the basis of the proposed determination of the Council, that a nonbank financial company shall be supervised by the Board of Governors and shall be subject to prudential standards in accordance with this title.

(2) HEARING.—Not later than 30 days after the date of receipt of any notice of a proposed determination under paragraph (1), the nonbank financial company may request, in writing, an opportunity for a written or oral hearing before the Council to contest the proposed determination. Upon receipt of a timely request, the Council shall fix a time (not later than 30 days after the date of receipt of the request) and place at which such company may appear, personally or through counsel, to submit written materials (or, at the sole discretion of the Council, oral testimony and oral argument).

(3) FINAL DETERMINATION.—Not later than 60 days after the date of a hearing under paragraph (2), the Council shall notify the nonbank financial company of the final determination of the Council, which shall contain a statement of the basis for the decision of the Council.

(4) NO HEARING REQUESTED.—If a nonbank financial company does not make a timely request for a hearing, the Council shall notify the nonbank financial company, in writing, of the final determination of the Council under subsection (a) or (b), as applicable, not later than 10 days after the date by which the company may request a hearing under paragraph (2).

(f) EMERGENCY EXCEPTION.—

(1) IN GENERAL.—The Council may waive or modify the requirements of subsection (e) with respect to a nonbank financial company, if the Council determines, by a vote of not fewer than ⅔ of the voting members then serving, including an affirmative vote by the Chairperson, that such waiver or modification is necessary or appropriate to prevent or mitigate

threats posed by the nonbank financial company to the financial stability of the United States.

(2) NOTICE.—The Council shall provide notice of a waiver or modification under this subsection to the nonbank financial company concerned as soon as practicable, but not later than 24 hours after the waiver or modification is granted.

(3) INTERNATIONAL COORDINATION.—In making a determination under paragraph (1), the Council shall consult with the appropriate home country supervisor, if any, of the foreign nonbank financial company that is being considered for such a determination.

(4) OPPORTUNITY FOR HEARING.—The Council shall allow a nonbank financial company to request, in writing, an opportunity for a written or oral hearing before the Council to contest a waiver or modification under this subsection, not later than 10 days after the date of receipt of notice of the waiver or modification by the company. Upon receipt of a timely request, the Council shall fix a time (not later than 15 days after the date of receipt of the request) and place at which the nonbank financial company may appear, personally or through counsel, to submit written materials (or, at the sole discretion of the Council, oral testimony and oral argument).

(5) NOTICE OF FINAL DETERMINATION.—Not later than 30 days after the date of any hearing under paragraph (4), the Council shall notify the subject nonbank financial company of the final determination of the Council under this subsection, which shall contain a statement of the basis for the decision of the Council.

(g) CONSULTATION.—The Council shall consult with the primary financial regulatory agency, if any, for each nonbank financial company or subsidiary of a nonbank financial company that is being considered for supervision by the Board of Governors under this section before the Council makes any final determination with respect to such nonbank financial company under subsection (a), (b), or (c).

(h) JUDICIAL REVIEW.—If the Council makes a final determination under this section with respect to a nonbank financial company, such nonbank financial company may, not later than 30 days after the date of receipt of the notice of final determination under subsection (d)(2), (e)(3), or (f)(5), bring an action in the United States district court for the judicial district in which the home office of such nonbank financial company is located, or in the United States District Court for the District of Columbia, for an order requiring that the final determination be rescinded, and the court shall, upon review, dismiss such action or direct the final determination to be rescinded. Review of such an action shall be limited to whether the final determination made under this section was arbitrary and capricious.

(i) INTERNATIONAL COORDINATION.—In exercising its duties under this title with respect to foreign nonbank financial companies, foreign-based bank holding companies, and cross-border activities and markets, the Council shall consult with appropriate foreign regulatory authorities, to the extent appropriate.

SEC. 114. REGISTRATION OF NONBANK FINANCIAL COMPANIES SUPERVISED BY THE BOARD OF GOVERNORS.

Not later than 180 days after the date of a final Council determination under section 113 that a nonbank financial company is to be supervised by the Board of Governors, such company shall register with the Board of Governors, on forms prescribed by the Board of Governors, which shall include such information as the Board of Governors, in consultation with the Council, may deem necessary or appropriate to carry out this title.

SEC. 115. ENHANCED SUPERVISION AND PRUDENTIAL STANDARDS FOR NONBANK FINANCIAL COMPANIES SUPERVISED BY THE BOARD OF GOVERNORS AND CERTAIN BANK HOLDING COMPANIES.

(a) IN GENERAL.—

(1) PURPOSE.—In order to prevent or mitigate risks to the financial stability of the United States that could arise from the material financial distress, failure, or ongoing activities of large, interconnected financial institutions, the Council may make recommendations to the Board of Governors concerning the establishment and refinement of prudential standards and reporting and disclosure requirements applicable to nonbank financial companies supervised by the Board of Governors and large, interconnected bank holding companies, that—

(A) are more stringent than those applicable to other nonbank financial companies and bank holding companies that do not present similar risks to the financial stability of the United States; and

(B) increase in stringency, based on the considerations identified in subsection (b)(3).

(2) RECOMMENDED APPLICATION OF REQUIRED STANDARDS.—In making recommendations under this section, the Council may—

(A) differentiate among companies that are subject to heightened standards on an individual basis or by category, taking into consideration their capital structure, riskiness, complexity, financial activities (including the financial activities of their subsidiaries), size, and any other risk-related factors that the Council deems appropriate; or

(B) recommend an asset threshold that is higher than $50,000,000,000 for the application of any standard described in subsections (c) through (g).

(b) DEVELOPMENT OF PRUDENTIAL STANDARDS.—

(1) IN GENERAL.—The recommendations of the Council under subsection (a) may include—

(A) risk-based capital requirements;

(B) leverage limits;

(C) liquidity requirements;

(D) resolution plan and credit exposure report requirements;

(E) concentration limits;

(F) a contingent capital requirement;

(G) enhanced public disclosures;

(H) short-term debt limits; and

(I) overall risk management requirements.

(2) PRUDENTIAL STANDARDS FOR FOREIGN FINANCIAL COMPANIES.—In making recommendations concerning the standards set forth in paragraph (1) that would apply to foreign nonbank financial companies supervised by the Board of Governors or foreign-based bank holding companies, the Council shall—

(A) give due regard to the principle of national treatment and equality of competitive opportunity; and

(B) take into account the extent to which the foreign nonbank financial company or foreign-based bank holding company is subject on a consolidated basis to home country standards that are comparable to those applied to financial companies in the United States.

(3) CONSIDERATIONS.—In making recommendations concerning prudential standards under paragraph (1), the Council shall—

(A) take into account differences among nonbank financial companies supervised by the Board of Governors and bank holding companies described in subsection (a), based on—

(i) the factors described in subsections (a) and (b) of section 113;

(ii) whether the company owns an insured depository institution;

(iii) nonfinancial activities and affiliations of the company; and

(iv) any other factors that the Council determines appropriate;

(B) to the extent possible, ensure that small changes in the factors listed in subsections (a) and (b) of section 113 would not result in sharp, discontinuous changes in the prudential standards established under section 165; and

(C) adapt its recommendations as appropriate in light of any predominant line of business of such company, including assets under management or other activities for which particular standards may not be appropriate.

(c) CONTINGENT CAPITAL.—

(1) STUDY REQUIRED.—The Council shall conduct a study of the feasibility, benefits, costs, and structure of a contingent capital requirement for nonbank financial companies supervised by the Board of Governors and bank holding companies described in subsection (a), which study shall include—

(A) an evaluation of the degree to which such requirement would enhance the safety and soundness of companies subject to the requirement, promote the financial stability of the United States, and reduce risks to United States taxpayers;

(B) an evaluation of the characteristics and amounts of contingent capital that should be required;

(C) an analysis of potential prudential standards that should be used to determine whether the contingent capital of a company would be converted to equity in times of financial stress;

(D) an evaluation of the costs to companies, the effects on the structure and operation of credit and other financial markets, and other economic effects of requiring contingent capital;

(E) an evaluation of the effects of such requirement on the international competitiveness of companies subject to the requirement and the prospects for international coordination in establishing such requirement; and

(F) recommendations for implementing regulations.

(2) REPORT.—The Council shall submit a report to Congress regarding the study required by paragraph (1) not later than 2 years after the date of enactment of this Act.

(3) RECOMMENDATIONS.—

(A) IN GENERAL.—Subsequent to submitting a report to Congress under paragraph (2), the Council may make recommendations to the Board of Governors to require any nonbank financial company supervised by the Board of Governors and any bank holding company described in subsection (a) to maintain a minimum amount of contingent capital that is convertible to equity in times of financial stress.

(B) FACTORS TO CONSIDER.—In making recommendations under this subsection, the Council shall consider—

(i) an appropriate transition period for implementation of a conversion under this subsection;

(ii) the factors described in subsection (b)(3);

(iii) capital requirements applicable to a nonbank financial company supervised by the Board of Governors or a bank holding company described in subsection (a), and subsidiaries thereof;

(iv) results of the study required by paragraph (1); and

(v) any other factor that the Council deems appropriate.

(d) RESOLUTION PLAN AND CREDIT EXPOSURE REPORTS.—

(1) RESOLUTION PLAN.—The Council may make recommendations to the Board of Governors concerning the requirement that each nonbank financial company supervised by the Board of Governors and each bank holding company described in subsection (a) report periodically to the Council, the Board of Governors, and the Corporation, the plan of such company for rapid and orderly resolution in the event of material financial distress or failure.

(2) CREDIT EXPOSURE REPORT.—The Council may make recommendations to the Board of Governors concerning the advisability of requiring each nonbank financial company supervised by the Board of Governors and bank holding company described in subsection (a) to report periodically to the Council, the Board of Governors, and the Corporation on—

(A) the nature and extent to which the company has credit exposure to other significant nonbank financial companies and significant bank holding companies; and

(B) the nature and extent to which other such significant nonbank financial companies and significant bank holding companies have credit exposure to that company.

(e) CONCENTRATION LIMITS.—In order to limit the risks that the failure of any individual company could pose to nonbank financial companies supervised by the Board of Governors or bank holding companies described in subsection (a), the Council may make recommendations to the Board of Governors to prescribe standards to limit such risks, as set forth in section 165.

(f) ENHANCED PUBLIC DISCLOSURES.—The Council may make recommendations to the Board of Governors to require periodic public disclosures by bank holding companies described in subsection (a) and by nonbank financial companies supervised by the Board of Governors, in order to support market evaluation of the risk profile, capital adequacy, and risk management capabilities thereof.

(g) SHORT-TERM DEBT LIMITS.—The Council may make recommendations to the Board of Governors to require short-term debt limits to mitigate the risks that an over-accumulation of such debt could pose to bank holding companies described in subsection (a), nonbank financial companies supervised by the Board of Governors, or the financial system.

SEC. 116. REPORTS.

(a) IN GENERAL.—Subject to subsection (b), the Council, acting through the Office of Financial Research, may require a bank holding company with total consolidated assets of $50,000,000,000 or greater or a nonbank financial company supervised by the Board of Governors, and any subsidiary thereof, to submit certified reports to keep the Council informed as to—

(1) the financial condition of the company;

(2) systems for monitoring and controlling financial, operating, and other risks;

(3) transactions with any subsidiary that is a depository institution; and

(4) the extent to which the activities and operations of the company and any subsidiary thereof, could, under adverse circumstances, have the potential to disrupt financial markets or affect the overall financial stability of the United States.

(b) USE OF EXISTING REPORTS.—

(1) IN GENERAL.—For purposes of compliance with subsection (a), the Council, acting through the Office of Financial Research, shall, to the fullest extent possible, use—

(A) reports that a bank holding company, nonbank financial company supervised by the Board of Governors, or any functionally regulated subsidiary of such company has been required to provide to other Federal or State regulatory agencies or to a relevant foreign supervisory authority;

(B) information that is otherwise required to be reported publicly; and

(C) externally audited financial statements.

(2) AVAILABILITY.—Each bank holding company described in subsection (a) and nonbank financial company supervised by the Board of Governors, and any subsidiary thereof, shall provide to the Council, at the request of the Council, copies of all reports referred to in paragraph (1).

(3) CONFIDENTIALITY.—The Council shall maintain the confidentiality of the reports obtained under subsection (a) and paragraph (1)(A) of this subsection.

SEC. 117. TREATMENT OF CERTAIN COMPANIES THAT CEASE TO BE BANK HOLDING COMPANIES.

(a) APPLICABILITY.—This section shall apply to—

(1) any entity that—

(A) was a bank holding company having total consolidated assets equal to or greater than $50,000,000,000 as of January 1, 2010; and

(B) received financial assistance under or participated in the Capital Purchase Program established under the Troubled Asset Relief Program authorized by the Emergency Economic Stabilization Act of 2008; and

(2) any successor entity (as defined by the Board of Governors, in consultation with the Council) to an entity described in paragraph (1).

(b) TREATMENT.—If an entity described in subsection (a) ceases to be a bank holding company at any time after January 1, 2010, then such entity shall be treated as a nonbank financial company supervised by the Board of Governors, as if the Council had made a determination under section 113 with respect to that entity.

(c) APPEAL.—

(1) REQUEST FOR HEARING.—An entity may request, in writing, an opportunity for a written or oral hearing before the Council to appeal its treatment as a nonbank financial company supervised by the Board of Governors in accordance with this section. Upon receipt of the request, the Council shall fix a time (not later than 30 days after the date of receipt of the request) and place at which such entity may appear, personally or through counsel, to submit written materials (or, at the sole discretion of the Council, oral testimony and oral argument).

(2) DECISION.—

(A) PROPOSED DECISION.—A Council decision to grant an appeal under this subsection shall be made by a vote of not fewer than ⅔ of the voting members then serving, including an affirmative vote by the Chairperson. Not later than 60 days after the date of a hearing under paragraph (1), the Council shall submit a report to, and may testify before, the Committee on Banking, Housing, and Urban Affairs of the Senate and the Committee on Financial Services of the House of Representatives on the proposed decision of the Council regarding an appeal under paragraph (1), which report shall include a statement of the basis for the proposed decision of the Council.

(B) NOTICE OF FINAL DECISION.—The Council shall notify the subject entity of the final decision of the Council regarding an appeal under paragraph (1), which notice shall contain a statement of the basis for the final decision of the Council, not later than 60 days after the later of—

(i) the date of the submission of the report under subparagraph (A); or

(ii) if, not later than 1 year after the date of submission of the report under subparagraph (A), the Committee on Banking, Housing, and Urban Affairs of the Senate or the Committee on Financial Services of the House of Representatives holds one or more hearings regarding such report, the date of the last such hearing.

(C) CONSIDERATIONS.—In making a decision regarding an appeal under paragraph (1), the Council shall consider whether the company meets the standards under section 113(a) or 113(b), as applicable, and the definition of the term "nonbank financial company" under section 102. The decision of the Council shall be final, subject to the review under paragraph (3).

(3) REVIEW.—If the Council denies an appeal under this subsection, the Council shall, not less frequently than annually, review and reevaluate the decision.

SEC. 118. COUNCIL FUNDING.

Any expenses of the Council shall be treated as expenses of, and paid by, the Office of Financial Research.

SEC. 119. RESOLUTION OF SUPERVISORY JURISDICTIONAL DISPUTES AMONG MEMBER AGENCIES.

(a) REQUEST FOR COUNCIL RECOMMENDATION.—The Council shall seek to resolve a dispute among 2 or more member agencies, if—

(1) a member agency has a dispute with another member agency about the respective jurisdiction over a particular bank holding company, nonbank financial company, or financial activity or product (excluding matters for which another dispute mechanism specifically has been provided under title X);

(2) the Council determines that the disputing agencies cannot, after a demonstrated good faith effort, resolve the dispute without the intervention of the Council; and

(3) any of the member agencies involved in the dispute—

(A) provides all other disputants prior notice of the intent to request dispute resolution by the Council; and

(B) requests in writing, not earlier than 14 days after providing the notice described in subparagraph (A), that the Council seek to resolve the dispute.

(b) COUNCIL RECOMMENDATION.—The Council shall seek to resolve each dispute described in subsection (a)—

(1) within a reasonable time after receiving the dispute resolution request;

(2) after consideration of relevant information provided by each agency party to the dispute; and

(3) by agreeing with 1 of the disputants regarding the entirety of the matter, or by determining a compromise position.

(c) FORM OF RECOMMENDATION.—Any Council recommendation under this section shall—

(1) be in writing;

(2) include an explanation of the reasons therefor; and

(3) be approved by the affirmative vote of ⅔ of the voting members of the Council then serving.

(d) NONBINDING EFFECT.—Any recommendation made by the Council under subsection (c) shall not be binding on the Federal agencies that are parties to the dispute.

SEC. 120. ADDITIONAL STANDARDS APPLICABLE TO ACTIVITIES OR PRACTICES FOR FINANCIAL STABILITY PURPOSES.

(a) IN GENERAL.—The Council may provide for more stringent regulation of a financial activity by issuing recommendations to the primary financial regulatory agencies to apply new or heightened standards and safeguards, including standards enumerated in section 115, for a financial activity or practice conducted by bank holding companies or nonbank financial companies under their respective jurisdictions, if the Council determines that the conduct, scope, nature, size, scale, concentration, or interconnectedness of such activity or practice could create or increase the risk of significant liquidity, credit, or other problems spreading among bank holding companies and nonbank financial companies, financial markets of the United States, or low-income, minority, or underserved communities.

(b) PROCEDURE FOR RECOMMENDATIONS TO REGULATORS.—

(1) NOTICE AND OPPORTUNITY FOR COMMENT.—The Council shall consult with the primary financial regulatory agencies and provide notice to the public and opportunity for comment for any proposed recommendation that the primary financial regulatory agencies apply new or heightened standards and safeguards for a financial activity or practice.

(2) CRITERIA.—The new or heightened standards and safeguards for a financial activity or practice recommended under paragraph (1)—

(A) shall take costs to long-term economic growth into account; and

(B) may include prescribing the conduct of the activity or practice in specific ways (such as by limiting its scope, or applying particular capital or risk management requirements to the conduct of the activity) or prohibiting the activity or practice.

(c) IMPLEMENTATION OF RECOMMENDED STANDARDS.—

(1) ROLE OF PRIMARY FINANCIAL REGULATORY AGENCY.—

(A) IN GENERAL.—Each primary financial regulatory agency may impose, require reports regarding, examine for compliance with, and enforce standards in accordance with this section with respect to those entities for which it is the primary financial regulatory agency.

(B) RULE OF CONSTRUCTION.—The authority under this paragraph is in addition to, and does not limit, any other authority of a primary financial regulatory agency. Compliance by an entity with actions taken by a primary financial regulatory agency under this section shall be enforceable in accordance with the statutes governing the respective jurisdiction of the primary financial regulatory agency over the entity, as if the agency action were taken under those statutes.

(2) IMPOSITION OF STANDARDS.—The primary financial regulatory agency shall impose the standards recommended by the Council in accordance with subsection (a), or similar standards that the Council deems acceptable, or shall explain in writing to the Council, not later than 90 days after the date on which the Council issues the recommendation, why the agency has determined not to follow the recommendation of the Council.

(d) REPORT TO CONGRESS.—The Council shall report to Congress on—

(1) any recommendations issued by the Council under this section;

(2) the implementation of, or failure to implement, such recommendation on the part of a primary financial regulatory agency; and

(3) in any case in which no primary financial regulatory agency exists for the nonbank financial company conducting financial activities or practices referred to in subsection (a),

recommendations for legislation that would prevent such activities or practices from threatening the stability of the financial system of the United States.

(e) EFFECT OF RESCISSION OF IDENTIFICATION.—

(1) NOTICE.—The Council may recommend to the relevant primary financial regulatory agency that a financial activity or practice no longer requires any standards or safeguards implemented under this section.

(2) DETERMINATION OF PRIMARY FINANCIAL REGULATORY AGENCY TO CONTINUE.—

(A) IN GENERAL.—Upon receipt of a recommendation under paragraph (1), a primary financial regulatory agency that has imposed standards under this section shall determine whether such standards should remain in effect.

(B) APPEAL PROCESS.—Each primary financial regulatory agency that has imposed standards under this section shall promulgate regulations to establish a procedure under which entities under its jurisdiction may appeal a determination by such agency under this paragraph that standards imposed under this section should remain in effect.

SEC. 121. MITIGATION OF RISKS TO FINANCIAL STABILITY.

(a) MITIGATORY ACTIONS.—If the Board of Governors determines that a bank holding company with total consolidated assets of $50,000,000,000 or more, or a nonbank financial company supervised by the Board of Governors, poses a grave threat to the financial stability of the United States, the Board of Governors, upon an affirmative vote of not fewer than ⅔ of the voting members of the Council then serving, shall—

(1) limit the ability of the company to merge with, acquire, consolidate with, or otherwise become affiliated with another company;

(2) restrict the ability of the company to offer a financial product or products;

(3) require the company to terminate one or more activities;

(4) impose conditions on the manner in which the company conducts 1 or more activities; or

(5) if the Board of Governors determines that the actions described in paragraphs (1) through (4) are inadequate to mitigate a threat to the financial stability of the United States in its recommendation, require the company to sell or otherwise transfer assets or off-balance-sheet items to unaffiliated entities.

(b) NOTICE AND HEARING.—

(1) IN GENERAL.—The Board of Governors, in consultation with the Council, shall provide to a company described in subsection (a) written notice that such company is being considered for mitigatory action pursuant to this section, including an explanation of the basis for, and description of, the proposed mitigatory action.

(2) HEARING.—Not later than 30 days after the date of receipt of notice under paragraph (1), the company may request, in writing, an opportunity for a written or oral hearing before the Board of Governors to contest the proposed mitigatory action. Upon receipt of a timely request, the Board of Governors shall fix a time (not later than 30 days after the date of

receipt of the request) and place at which such company may appear, personally or through counsel, to submit written materials (or, at the discretion of the Board of Governors, in consultation with the Council, oral testimony and oral argument).

(3) DECISION.—Not later than 60 days after the date of a hearing under paragraph (2), or not later than 60 days after the provision of a notice under paragraph (1) if no hearing was held, the Board of Governors shall notify the company of the final decision of the Board of Governors, including the results of the vote of the Council, as described in subsection (a).

(c) FACTORS FOR CONSIDERATION.—The Board of Governors and the Council shall take into consideration the factors set forth in subsection (a) or (b) of section 113, as applicable, in making any determination under subsection (a).

(d) APPLICATION TO FOREIGN FINANCIAL COMPANIES.—The Board of Governors may prescribe regulations regarding the application of this section to foreign nonbank financial companies supervised by the Board of Governors and foreign-based bank holding companies—

(1) giving due regard to the principle of national treatment and equality of competitive opportunity; and

(2) taking into account the extent to which the foreign nonbank financial company or foreign-based bank holding company is subject on a consolidated basis to home country standards that are comparable to those applied to financial companies in the United States.

SEC. 122. GAO AUDIT OF COUNCIL.

(a) AUTHORITY TO AUDIT.—The Comptroller General of the United States may audit the activities of—

(1) the Council; and

(2) any person or entity acting on behalf of or under the authority of the Council, to the extent that such activities relate to work for the Council by such person or entity.

(b) ACCESS TO INFORMATION.—

(1) IN GENERAL.—Notwithstanding any other provision of law, the Comptroller General shall, upon request and at such reasonable time and in such reasonable form as the Comptroller General may request, have access to—

(A) any records or other information under the control of or used by the Council;

(B) any records or other information under the control of a person or entity acting on behalf of or under the authority of the Council, to the extent that such records or other information is relevant to an audit under subsection (a); and

(C) the officers, directors, employees, financial advisors, staff, working groups, and agents and representatives of the Council (as related to the activities on behalf of the Council of such agent or representative), at such reasonable times as the Comptroller General may request.

(2) COPIES.—The Comptroller General may make and retain copies of such books, accounts, and other records, access to which is granted under this section, as the Comptroller General considers appropriate.

SEC. 123. STUDY OF THE EFFECTS OF SIZE AND COMPLEXITY OF FINANCIAL INSTITUTIONS ON CAPITAL MARKET EFFICIENCY AND ECONOMIC GROWTH.

(a) STUDY REQUIRED.—

(1) IN GENERAL.—The Chairperson of the Council shall carry out a study of the economic impact of possible financial services regulatory limitations intended to reduce systemic risk. Such study shall estimate the benefits and costs on the efficiency of capital markets, on the financial sector, and on national economic growth, of—

(A) explicit or implicit limits on the maximum size of banks, bank holding companies, and other large financial institutions;

(B) limits on the organizational complexity and diversification of large financial institutions;

(C) requirements for operational separation between business units of large financial institutions in order to expedite resolution in case of failure;

(D) limits on risk transfer between business units of large financial institutions;

(E) requirements to carry contingent capital or similar mechanisms;

(F) limits on commingling of commercial and financial activities by large financial institutions;

(G) segregation requirements between traditional financial activities and trading or other high-risk operations in large financial institutions; and

(H) other limitations on the activities or structure of large financial institutions that may be useful to limit systemic risk.

(2) RECOMMENDATIONS.—The study required by this section shall include recommendations for the optimal structure of any limits considered in subparagraphs (A) through (E), in order to maximize their effectiveness and minimize their economic impact.

(b) REPORT.—Not later than the end of the 180-day period beginning on the date of enactment of this title, and not later than every 5 years thereafter, the Chairperson shall issue a report to the Congress containing any findings and determinations made in carrying out the study required under subsection (a).

Subtitle B—Office of Financial Research

SEC. 151. DEFINITIONS.

For purposes of this subtitle—

(1) the terms "Office" and "Director" mean the Office of Financial Research established under this subtitle and the Director thereof, respectively;

(2) the term "financial company" has the same meaning as in title II, and includes an insured depository institution and an insurance company;

(3) the term "Data Center" means the data center established under section 154;

(4) the term "Research and Analysis Center" means the research and analysis center established under section 154;

(5) the term "financial transaction data" means the structure and legal description of a financial contract, with sufficient detail to describe the rights and obligations between counterparties and make possible an independent valuation;

(6) the term "position data"—

(A) means data on financial assets or liabilities held on the balance sheet of a financial company, where positions are created or changed by the execution of a financial transaction; and

(B) includes information that identifies counterparties, the valuation by the financial company of the position, and information that makes possible an independent valuation of the position;

(7) the term "financial contract" means a legally binding agreement between 2 or more counterparties, describing rights and obligations relating to the future delivery of items of intrinsic or extrinsic value among the counterparties; and

(8) the term "financial instrument" means a financial contract in which the terms and conditions are publicly available, and the roles of one or more of the counterparties are assignable without the consent of any of the other counterparties (including common stock of a publicly traded company, government bonds, or exchange traded futures and options contracts).

SEC. 152. OFFICE OF FINANCIAL RESEARCH ESTABLISHED.

(a) ESTABLISHMENT.—There is established within the Department of the Treasury the Office of Financial Research.

(b) DIRECTOR.—

(1) IN GENERAL.—The Office shall be headed by a Director, who shall be appointed by the President, by and with the advice and consent of the Senate.

(2) TERM OF SERVICE.—The Director shall serve for a term of 6 years, except that, in the event that a successor is not nominated and confirmed by the end of the term of service of a Director, the Director may continue to serve until such time as the next Director is appointed and confirmed.

(3) EXECUTIVE LEVEL.—The Director shall be compensated at Level III of the Executive Schedule.

(4) PROHIBITION ON DUAL SERVICE.—The individual serving in the position of Director may not, during such service, also serve as the head of any financial regulatory agency.

(5) RESPONSIBILITIES, DUTIES, AND AUTHORITY.—The Director shall have sole discretion in the manner in which the Director fulfills the responsibilities and duties and exercises the authorities described in this subtitle.

(c) BUDGET.—The Director, in consultation with the Chairperson, shall establish the annual budget of the Office.

(d) OFFICE PERSONNEL.—

(1) IN GENERAL.—The Director, in consultation with the Chairperson, may fix the number of, and appoint and direct, all employees of the Office.

(2) COMPENSATION.—The Director, in consultation with the Chairperson, shall fix, adjust, and administer the pay for all employees of the Office, without regard to chapter 51 or subchapter III of chapter 53 of title 5, United States Code, relating to classification of positions and General Schedule pay rates.

(3) COMPARABILITY.—Section 1206(a) of the Financial Institutions Reform, Recovery, and Enforcement Act of 1989 (12 U.S.C. 1833b(a)) is amended—

(A) by striking "Finance Board," and inserting "Finance Board, the Office of Financial Research, and the Bureau of Consumer Financial Protection"; and

(B) by striking "and the Office of Thrift Supervision,".

(4) SENIOR EXECUTIVES.—Section 3132(a)(1)(D) of title 5, United States Code, is amended by striking "and the National Credit Union Administration;" and inserting "the National Credit Union Administration, the Bureau of Consumer Financial Protection, and the Office of Financial Research;".

(e) ASSISTANCE FROM FEDERAL AGENCIES.—Any department or agency of the United States may provide to the Office and any special advisory, technical, or professional committees appointed by the Office, such services, funds, facilities, staff, and other support services as the Office may determine advisable. Any Federal Government employee may be detailed to the Office without reimbursement, and such detail shall be without interruption or loss of civil service status or privilege.

(f) PROCUREMENT OF TEMPORARY AND INTERMITTENT SERVICES.—The Director may procure temporary and intermittent services under section 3109(b) of title 5, United States Code, at rates for individuals which do not exceed the daily equivalent of the annual rate of basic pay prescribed for Level V of the Executive Schedule under section 5316 of such title.

(g) POST-EMPLOYMENT PROHIBITIONS.—The Secretary, with the concurrence of the Director of the Office of Government Ethics, shall issue regulations prohibiting the Director and any employee of the Office who has had access to the transaction or position data maintained by the Data Center or other business confidential information about financial entities required to report to the Office from being employed by or providing advice or consulting services to a financial company, for a period of 1 year after last having had access in the course of official duties to such transaction or position data or business confidential information, regardless of whether that entity is required to report to the Office. For employees whose access to business confidential information was limited, the regulations may provide, on a case-by-case basis, for a shorter period of post-employment prohibition, provided that the shorter period does not compromise business confidential information.

(h) TECHNICAL AND PROFESSIONAL ADVISORY COMMITTEES.—The Office, in consultation with the Chairperson, may appoint such special advisory, technical, or professional committees as may be useful in carrying out the functions of the Office, and the members of such committees may be staff of the Office, or other persons, or both.

(i) FELLOWSHIP PROGRAM.—The Office, in consultation with the Chairperson, may establish and maintain an academic and professional fellowship program, under which qualified academics and professionals shall be invited to spend not longer than 2 years at the Office, to perform research and to provide advanced training for Office personnel.

(j) EXECUTIVE SCHEDULE COMPENSATION.—Section 5314 of title 5, United States Code, is amended by adding at the end the following new item:

"Director of the Office of Financial Research.".

SEC. 153. PURPOSE AND DUTIES OF THE OFFICE.

(a) PURPOSE AND DUTIES.—The purpose of the Office is to support the Council in fulfilling the purposes and duties of the Council, as set forth in subtitle A, and to support member agencies, by—

(1) collecting data on behalf of the Council, and providing such data to the Council and member agencies;

(2) standardizing the types and formats of data reported and collected;

(3) performing applied research and essential long-term research;

(4) developing tools for risk measurement and monitoring;

(5) performing other related services;

(6) making the results of the activities of the Office available to financial regulatory agencies; and

(7) assisting such member agencies in determining the types and formats of data authorized by this Act to be collected by such member agencies.

(b) ADMINISTRATIVE AUTHORITY.—The Office may—

(1) share data and information, including software developed by the Office, with the Council, member agencies, and the Bureau of Economic Analysis, which shared data, information, and software—

(A) shall be maintained with at least the same level of security as is used by the Office; and

(B) may not be shared with any individual or entity without the permission of the Council;

(2) sponsor and conduct research projects; and

(3) assist, on a reimbursable basis, with financial analyses undertaken at the request of other Federal agencies that are not member agencies.

(c) RULEMAKING AUTHORITY.—

(1) SCOPE.—The Office, in consultation with the Chairperson, shall issue rules, regulations, and orders only to the extent necessary to carry out the purposes and duties described in paragraphs (1), (2), and (7) of subsection (a).

(2) STANDARDIZATION.—Member agencies, in consultation with the Office, shall implement regulations promulgated by the Office under paragraph (1) to standardize the types and formats of data reported and collected on behalf of the Council, as described in subsection (a)(2). If a member agency fails to implement such regulations prior to the expiration of the 3-year period following the date of publication of final regulations, the Office, in consultation with the Chairperson, may implement such regulations with respect to the financial entities under the jurisdiction of the member agency. This paragraph shall not supersede or interfere with the independent authority of a member agency under other law to collect data, in such format and manner as the member agency requires.

(d) TESTIMONY.—

(1) IN GENERAL.—The Director of the Office shall report to and testify before the Committee on Banking, Housing, and Urban Affairs of the Senate and the Committee on Financial Services of the House of Representatives annually on the activities of the Office, including the work of the Data Center and the Research and Analysis Center, and the assessment of the

Office of significant financial market developments and potential emerging threats to the financial stability of the United States.

(2) NO PRIOR REVIEW.—No officer or agency of the United States shall have any authority to require the Director to submit the testimony required under paragraph (1) or other congressional testimony to any officer or agency of the United States for approval, comment, or review prior to the submission of such testimony. Any such testimony to Congress shall include a statement that the views expressed therein are those of the Director and do not necessarily represent the views of the President.

(e) ADDITIONAL REPORTS.—The Director may provide additional reports to Congress concerning the financial stability of the United States. The Director shall notify the Council of any such additional reports provided to Congress.

(f) SUBPOENA.—

(1) IN GENERAL.—The Director may require from a financial company, by subpoena, the production of the data requested under subsection (a)(1) and section 154(b)(1), but only upon a written finding by the Director that—

(A) such data is required to carry out the functions described under this subtitle; and

(B) the Office has coordinated with the relevant primary financial regulatory agency, as required under section 154(b)(1)(B)(ii).

(2) FORMAT.—Subpoenas under paragraph (1) shall bear the signature of the Director, and shall be served by any person or class of persons designated by the Director for that purpose.

(3) ENFORCEMENT.—In the case of contumacy or failure to obey a subpoena, the subpoena shall be enforceable by order of any appropriate district court of the United States. Any failure to obey the order of the court may be punished by the court as a contempt of court.

SEC. 154. ORGANIZATIONAL STRUCTURE; RESPONSIBILITIES OF PRIMARY PROGRAMMATIC UNITS.

(a) IN GENERAL.—There are established within the Office, to carry out the programmatic responsibilities of the Office—

(1) the Data Center; and

(2) the Research and Analysis Center.

(b) DATA CENTER.—

(1) GENERAL DUTIES.—

(A) DATA COLLECTION.—The Data Center, on behalf of the Council, shall collect, validate, and maintain all data necessary to carry out the duties of the Data Center, as described in this subtitle. The data assembled shall be obtained from member agencies, commercial data providers, publicly available data sources, and financial entities under subparagraph (B).

(B) AUTHORITY.—

(i) IN GENERAL.—The Office may, as determined by the Council or by the Director in consultation with the Council, require the submission of periodic and other reports from any financial company for the purpose of assessing the extent to which a financial activity or financial market in which the financial company participates, or the financial company itself, poses a threat to the financial stability of the United States.

(ii) MITIGATION OF REPORT BURDEN.—Before requiring the submission of a report from any financial company that is regulated by a member agency, any primary financial regulatory agency, a foreign supervisory authority, or the Office shall coordinate with such agencies or authority, and shall, whenever possible, rely on information available from such agencies or authority.

(iii) COLLECTION OF FINANCIAL TRANSACTION AND POSITION DATA.—The Office shall collect, on a schedule determined by the Director, in consultation with the Council, financial transaction data and position data from financial companies.

(C) RULEMAKING.—The Office shall promulgate regulations pursuant to subsections (a)(1), (a)(2), (a)(7), and (c)(1) of section 153 regarding the type and scope of the data to be collected by the Data Center under this paragraph.

(2) RESPONSIBILITIES.—

(A) PUBLICATION.—The Data Center shall prepare and publish, in a manner that is easily accessible to the public—

(i) a financial company reference database;

(ii) a financial instrument reference database; and

(iii) formats and standards for Office data, including standards for reporting financial transaction and position data to the Office.

(B) CONFIDENTIALITY.—The Data Center shall not publish any confidential data under subparagraph (A).

(3) INFORMATION SECURITY.—The Director shall ensure that data collected and maintained by the Data Center are kept secure and protected against unauthorized disclosure.

(4) CATALOG OF FINANCIAL ENTITIES AND INSTRUMENTS.—The Data Center shall maintain a catalog of the financial entities and instruments reported to the Office.

(5) AVAILABILITY TO THE COUNCIL AND MEMBER AGENCIES.—The Data Center shall make data collected and maintained by the Data Center available to the Council and member agencies, as necessary to support their regulatory responsibilities.

(6) OTHER AUTHORITY.—The Office shall, after consultation with the member agencies, provide certain data to financial industry participants and to the general public to increase market transparency and facilitate research on the financial system, to the extent that intellectual property rights are not violated, business confidential information is properly protected, and the sharing of such information poses no significant threats to the financial system of the United States.

(c) RESEARCH AND ANALYSIS CENTER.—

(1) GENERAL DUTIES.—The Research and Analysis Center, on behalf of the Council, shall develop and maintain independent analytical capabilities and computing resources—

(A) to develop and maintain metrics and reporting systems for risks to the financial stability of the United States;

(B) to monitor, investigate, and report on changes in systemwide risk levels and patterns to the Council and Congress;

(C) to conduct, coordinate, and sponsor research to support and improve regulation of financial entities and markets;

(D) to evaluate and report on stress tests or other stability-related evaluations of financial entities overseen by the member agencies;

(E) to maintain expertise in such areas as may be necessary to support specific requests for advice and assistance from financial regulators;

(F) to investigate disruptions and failures in the financial markets, report findings, and make recommendations to the Council based on those findings;

(G) to conduct studies and provide advice on the impact of policies related to systemic risk; and

(H) to promote best practices for financial risk management.

(d) REPORTING RESPONSIBILITIES.—

(1) REQUIRED REPORTS.—Not later than 2 years after the date of enactment of this Act, and not later than 120 days after the end of each fiscal year thereafter, the Office shall prepare and submit a report to Congress.

(2) CONTENT.—Each report required by this subsection shall assess the state of the United States financial system, including—

(A) an analysis of any threats to the financial stability of the United States;

(B) the status of the efforts of the Office in meeting the mission of the Office; and

(C) key findings from the research and analysis of the financial system by the Office.

SEC. 155. FUNDING.

(a) FINANCIAL RESEARCH FUND.—

(1) FUND ESTABLISHED.—There is established in the Treasury of the United States a separate fund to be known as the "Financial Research Fund".

(2) FUND RECEIPTS.—All amounts provided to the Office under subsection (c), and all assessments that the Office receives under subsection (d) shall be deposited into the Financial Research Fund.

(3) INVESTMENTS AUTHORIZED.—

(A) AMOUNTS IN FUND MAY BE INVESTED.—The Director may request the Secretary to invest the portion of the Financial Research Fund that is not, in the judgment of the Director, required to meet the needs of the Office.

(B) ELIGIBLE INVESTMENTS.—Investments shall be made by the Secretary in obligations of the United States or obligations that are guaranteed as to principal and interest by the United States, with maturities suitable to the needs of the Financial Research Fund, as determined by the Director.

(4) INTEREST AND PROCEEDS CREDITED.—The interest on, and the proceeds from the sale or redemption of, any obligations

held in the Financial Research Fund shall be credited to and form a part of the Financial Research Fund.

(b) USE OF FUNDS.—

(1) IN GENERAL.—Funds obtained by, transferred to, or credited to the Financial Research Fund shall be immediately available to the Office, and shall remain available until expended, to pay the expenses of the Office in carrying out the duties and responsibilities of the Office.

(2) FEES, ASSESSMENTS, AND OTHER FUNDS NOT GOVERNMENT FUNDS.—Funds obtained by, transferred to, or credited to the Financial Research Fund shall not be construed to be Government funds or appropriated moneys.

(3) AMOUNTS NOT SUBJECT TO APPORTIONMENT.—Notwithstanding any other provision of law, amounts in the Financial Research Fund shall not be subject to apportionment for purposes of chapter 15 of title 31, United States Code, or under any other authority, or for any other purpose.

(c) INTERIM FUNDING.—During the 2-year period following the date of enactment of this Act, the Board of Governors shall provide to the Office an amount sufficient to cover the expenses of the Office.

(d) PERMANENT SELF-FUNDING.—Beginning 2 years after the date of enactment of this Act, the Secretary shall establish, by regulation, and with the approval of the Council, an assessment schedule, including the assessment base and rates, applicable to bank holding companies with total consolidated assets of $50,000,000,000 or greater and nonbank financial companies supervised by the Board of Governors, that takes into account differences among such companies, based on the considerations for establishing the prudential standards under section 115, to collect assessments equal to the total expenses of the Office.

SEC. 156. TRANSITION OVERSIGHT.

(a) PURPOSE.—The purpose of this section is to ensure that the Office—

(1) has an orderly and organized startup;

(2) attracts and retains a qualified workforce; and

(3) establishes comprehensive employee training and benefits programs.

(b) REPORTING REQUIREMENT.—

(1) IN GENERAL.—The Office shall submit an annual report to the Committee on Banking, Housing, and Urban Affairs of the Senate and the Committee on Financial Services of the House of Representatives that includes the plans described in paragraph (2).

(2) PLANS.—The plans described in this paragraph are as follows:

(A) TRAINING AND WORKFORCE DEVELOPMENT PLAN.—The Office shall submit a training and workforce development plan that includes, to the extent practicable—

(i) identification of skill and technical expertise needs and actions taken to meet those requirements;

(ii) steps taken to foster innovation and creativity;

(iii) leadership development and succession planning; and

(iv) effective use of technology by employees.

(B) WORKPLACE FLEXIBILITY PLAN.—The Office shall submit a workforce flexibility plan that includes, to the extent practicable—

(i) telework;

(ii) flexible work schedules;

(iii) phased retirement;

(iv) reemployed annuitants;

(v) part-time work;

(vi) job sharing;

(vii) parental leave benefits and childcare assistance;

(viii) domestic partner benefits;

(ix) other workplace flexibilities; or

(x) any combination of the items described in clauses (i) through (ix).

(C) RECRUITMENT AND RETENTION PLAN.—The Office shall submit a recruitment and retention plan that includes, to the extent practicable, provisions relating to—

(i) the steps necessary to target highly qualified applicant pools with diverse backgrounds;

(ii) streamlined employment application processes;

(iii) the provision of timely notification of the status of employment applications to applicants; and

(iv) the collection of information to measure indicators of hiring effectiveness.

(c) EXPIRATION.—The reporting requirement under subsection (b) shall terminate 5 years after the date of enactment of this Act.

(d) RULE OF CONSTRUCTION.—Nothing in this section may be construed to affect—

(1) a collective bargaining agreement, as that term is defined in section 7103(a)(8) of title 5, United States Code, that is in effect on the date of enactment of this Act; or

(2) the rights of employees under chapter 71 of title 5, United States Code.

Subtitle C—Additional Board of Governors Authority for Certain Nonbank Financial Companies and Bank Holding Companies

SEC. 161. REPORTS BY AND EXAMINATIONS OF NONBANK FINANCIAL COMPANIES BY THE BOARD OF GOVERNORS.

(a) REPORTS.—

(1) IN GENERAL.—The Board of Governors may require each nonbank financial company supervised by the Board of Governors, and any subsidiary thereof, to submit reports under oath, to keep the Board of Governors informed as to—

(A) the financial condition of the company or subsidiary, systems of the company or subsidiary for monitoring and controlling financial, operating, and other risks, and the extent to which the activities and operations of the company or subsidiary pose a threat to the financial stability of the United States; and

(B) compliance by the company or subsidiary with the requirements of this title.

(2) USE OF EXISTING REPORTS AND INFORMATION.—In carrying out subsection (a), the Board of Governors shall, to the fullest extent possible, use—

(A) reports and supervisory information that a nonbank financial company or subsidiary thereof has been required to provide to other Federal or State regulatory agencies;

(B) information otherwise obtainable from Federal or State regulatory agencies;

(C) information that is otherwise required to be reported publicly; and

(D) externally audited financial statements of such company or subsidiary.

(3) AVAILABILITY.—Upon the request of the Board of Governors, a nonbank financial company supervised by the Board of Governors, or a subsidiary thereof, shall promptly provide to the Board of Governors any information described in paragraph (2).

(b) EXAMINATIONS.—

(1) IN GENERAL.—Subject to paragraph (2), the Board of Governors may examine any nonbank financial company supervised by the Board of Governors and any subsidiary of such company, to inform the Board of Governors of—

(A) the nature of the operations and financial condition of the company and such subsidiary;

(B) the financial, operational, and other risks of the company or such subsidiary that may pose a threat to the safety and soundness of such company or subsidiary or to the financial stability of the United States;

(C) the systems for monitoring and controlling such risks; and

(D) compliance by the company or such subsidiary with the requirements of this title.

(2) USE OF EXAMINATION REPORTS AND INFORMATION.—For purposes of this subsection, the Board of Governors shall, to the fullest extent possible, rely on reports of examination of any subsidiary depository institution or functionally regulated subsidiary made by the primary financial regulatory agency for that subsidiary, and on information described in subsection (a)(2).

(c) COORDINATION WITH PRIMARY FINANCIAL REGULATORY AGENCY.—The Board of Governors shall—

(1) provide reasonable notice to, and consult with, the primary financial regulatory agency for any subsidiary before requiring a report or commencing an examination of such subsidiary under this section; and

(2) avoid duplication of examination activities, reporting requirements, and requests for information, to the fullest extent possible.

SEC. 162. ENFORCEMENT.

(a) IN GENERAL.—Except as provided in subsection (b), a nonbank financial company supervised by the Board of Governors and any subsidiaries of such company (other than any depository institution subsidiary) shall be subject to the provisions of subsections (b) through (n) of section 8 of the Federal Deposit Insurance Act (12 U.S.C. 1818), in the same manner and to the same extent as if the company were a bank holding company, as provided in section 8(b)(3) of the Federal Deposit Insurance Act (12 U.S.C. 1818(b)(3)).

(b) ENFORCEMENT AUTHORITY FOR FUNCTIONALLY REGULATED SUBSIDIARIES.—

(1) REFERRAL.—If the Board of Governors determines that a condition, practice, or activity of a depository institution subsidiary or functionally regulated subsidiary of a nonbank financial company supervised by the Board of Governors does not comply with the regulations or orders prescribed by the Board of Governors under this Act, or otherwise poses a threat to the financial stability of the United States, the Board of Governors may recommend, in writing, to the primary financial regulatory agency for the subsidiary that such agency initiate a supervisory action or enforcement proceeding. The recommendation shall be accompanied by a written explanation of the concerns giving rise to the recommendation.

(2) BACK-UP AUTHORITY OF THE BOARD OF GOVERNORS.—If, during the 60-day period beginning on the date on which the primary financial regulatory agency receives a recommendation under paragraph (1), the primary financial regulatory agency does not take supervisory or enforcement action against a subsidiary that is acceptable to the Board of Governors, the Board of Governors (upon a vote of its members) may take the recommended supervisory or enforcement action, as if the subsidiary were a bank holding company subject to supervision by the Board of Governors.

SEC. 163. ACQUISITIONS.

(a) ACQUISITIONS OF BANKS; TREATMENT AS A BANK HOLDING COMPANY.—For purposes of section 3 of the Bank Holding Company Act of 1956 (12 U.S.C. 1842), a nonbank financial company supervised by the Board of Governors shall be deemed to be, and shall be treated as, a bank holding company.

(b) ACQUISITION OF NONBANK COMPANIES.—

(1) PRIOR NOTICE FOR LARGE ACQUISITIONS.—Notwithstanding section 4(k)(6)(B) of the Bank Holding Company Act of 1956 (12 U.S.C. 1843(k)(6)(B)), a bank holding company with total consolidated assets equal to or greater than $50,000,000,000 or a nonbank financial company supervised by the Board of Governors shall not acquire direct or indirect ownership or control of any voting shares of any company (other than an insured depository institution) that is engaged in activities described in section 4(k) of the Bank Holding Company Act of 1956 having total consolidated assets of $10,000,000,000 or more, without providing written notice to the Board of Governors in advance of the transaction.

(2) EXEMPTIONS.—The prior notice requirement in paragraph (1) shall not apply with regard to the acquisition of shares that would qualify for the exemptions in section 4(c) or section 4(k)(4)(E) of the Bank Holding Company Act of 1956 (12 U.S.C. 1843(c) and (k)(4)(E)).

(3) NOTICE PROCEDURES.—The notice procedures set forth in section 4(j)(1) of the Bank Holding Company Act of 1956 (12 U.S.C. 1843(j)(1)), without regard to section 4(j)(3) of that Act, shall apply to an acquisition of any company (other than an insured depository institution) by a bank holding company with total consolidated assets equal to or greater than

$50,000,000,000 or a nonbank financial company supervised by the Board of Governors, as described in paragraph (1), including any such company engaged in activities described in section 4(k) of that Act.

(4) STANDARDS FOR REVIEW.—In addition to the standards provided in section 4(j)(2) of the Bank Holding Company Act of 1956 (12 U.S.C. 1843(j)(2)), the Board of Governors shall consider the extent to which the proposed acquisition would result in greater or more concentrated risks to global or United States financial stability or the United States economy.

(5) HART-SCOTT-RODINO FILING REQUIREMENT.—Solely for purposes of section 7A(c)(8) of the Clayton Act (15 U.S.C. 18a(c)(8)), the transactions subject to the requirements of paragraph (1) shall be treated as if Board of Governors approval is not required.

SEC. 164. PROHIBITION AGAINST MANAGEMENT INTERLOCKS BETWEEN CERTAIN FINANCIAL COMPANIES.

A nonbank financial company supervised by the Board of Governors shall be treated as a bank holding company for purposes of the Depository Institutions Management Interlocks Act (12 U.S.C. 3201 et seq.), except that the Board of Governors shall not exercise the authority provided in section 7 of that Act (12 U.S.C. 3207) to permit service by a management official of a nonbank financial company supervised by the Board of Governors as a management official of any bank holding company with total consolidated assets equal to or greater than $50,000,000,000, or other nonaffiliated nonbank financial company supervised by the Board of Governors (other than to provide a temporary exemption for interlocks resulting from a merger, acquisition, or consolidation).

SEC. 165. ENHANCED SUPERVISION AND PRUDENTIAL STANDARDS FOR NONBANK FINANCIAL COMPANIES SUPERVISED BY THE BOARD OF GOVERNORS AND CERTAIN BANK HOLDING COMPANIES.

(a) IN GENERAL.—

(1) PURPOSE.—In order to prevent or mitigate risks to the financial stability of the United States that could arise from the material financial distress or failure, or ongoing activities, of large, interconnected financial institutions, the Board of Governors shall, on its own or pursuant to recommendations by the Council under section 115, establish prudential standards for nonbank financial companies supervised by the Board of Governors and bank holding companies with total consolidated assets equal to or greater than $50,000,000,000 that—

(A) are more stringent than the standards and requirements applicable to nonbank financial companies and bank holding companies that do not present similar risks to the financial stability of the United States; and

(B) increase in stringency, based on the considerations identified in subsection (b)(3).

(2) TAILORED APPLICATION.—

(A) IN GENERAL.—In prescribing more stringent prudential standards under this section, the Board of Governors may, on its own or pursuant to a recommendation by the Council in accordance with section 115, differentiate among companies on an individual basis or by category, taking into consideration their capital structure, riskiness, complexity, financial activities (including the financial activities of their subsidiaries), size, and any other risk-related factors that the Board of Governors deems appropriate.

(B) ADJUSTMENT OF THRESHOLD FOR APPLICATION OF CERTAIN STANDARDS.—The Board of Governors may, pursuant to a recommendation by the Council in accordance with section 115, establish an asset threshold above $50,000,000,000 for the application of any standard established under subsections (c) through (g).

(b) DEVELOPMENT OF PRUDENTIAL STANDARDS.—

(1) IN GENERAL.—

(A) REQUIRED STANDARDS.—The Board of Governors shall establish prudential standards for nonbank financial companies supervised by the Board of Governors and bank holding companies described in subsection (a), that shall include—

(i) risk-based capital requirements and leverage limits, unless the Board of Governors, in consultation with the Council, determines that such requirements are not appropriate for a company subject to more stringent prudential standards because of the activities of such company (such as investment company activities or assets under management) or structure, in which case, the Board of Governors shall apply other standards that result in similarly stringent risk controls;

(ii) liquidity requirements;

(iii) overall risk management requirements;

(iv) resolution plan and credit exposure report requirements; and

(v) concentration limits.

(B) ADDITIONAL STANDARDS AUTHORIZED.—The Board of Governors may establish additional prudential standards for nonbank financial companies supervised by the Board of Governors and bank holding companies described in subsection (a), that include—

(i) a contingent capital requirement;

(ii) enhanced public disclosures;

(iii) short-term debt limits; and

(iv) such other prudential standards as the Board or Governors, on its own or pursuant to a recommendation made by the Council in accordance with section 115, determines are appropriate.

(2) STANDARDS FOR FOREIGN FINANCIAL COMPANIES.—In applying the standards set forth in paragraph (1) to any foreign nonbank financial company supervised by the Board of Governors or foreign-based bank holding company, the Board of Governors shall—

(A) give due regard to the principle of national treatment and equality of competitive opportunity; and

(B) take into account the extent to which the foreign financial company is subject on a consolidated basis to home country standards that are comparable to those applied to financial companies in the United States.

(3) CONSIDERATIONS.—In prescribing prudential standards under paragraph (1), the Board of Governors shall—

(A) take into account differences among nonbank financial companies supervised by the Board of Governors and bank holding companies described in subsection (a), based on—

(i) the factors described in subsections (a) and (b) of section 113;

(ii) whether the company owns an insured depository institution;

(iii) nonfinancial activities and affiliations of the company; and

(iv) any other risk-related factors that the Board of Governors determines appropriate;

(B) to the extent possible, ensure that small changes in the factors listed in subsections (a) and (b) of section 113 would not result in sharp, discontinuous changes in the prudential standards established under paragraph (1) of this subsection;

(C) take into account any recommendations of the Council under section 115; and

(D) adapt the required standards as appropriate in light of any predominant line of business of such company, including assets under management or other activities for which particular standards may not be appropriate.

(4) CONSULTATION.—Before imposing prudential standards or any other requirements pursuant to this section, including notices of deficiencies in resolution plans and more stringent requirements or divestiture orders resulting from such notices, that are likely to have a significant impact on a functionally regulated subsidiary or depository institution subsidiary of a nonbank financial company supervised by the Board of Governors or a bank holding company described in subsection (a), the Board of Governors shall consult with each Council member that primarily supervises any such subsidiary with respect to any such standard or requirement.

(5) REPORT.—The Board of Governors shall submit an annual report to Congress regarding the implementation of the prudential standards required pursuant to paragraph (1), including the use of such standards to mitigate risks to the financial stability of the United States.

(c) CONTINGENT CAPITAL.—

(1) IN GENERAL.—Subsequent to submission by the Council of a report to Congress under section 115(c), the Board of Governors may issue regulations that require each nonbank financial company supervised by the Board of Governors and bank holding companies described in subsection (a) to maintain a minimum amount of contingent capital that is convertible to equity in times of financial stress.

(2) FACTORS TO CONSIDER.—In issuing regulations under this subsection, the Board of Governors shall consider—

(A) the results of the study undertaken by the Council, and any recommendations of the Council, under section 115(c);
