Schemes for reviewing past business

Schemes for reviewing past business.

404.—(1) Subsection (2) applies if the Treasury are satisfied that there is evidence suggesting—

(a) that there has been a widespread or regular failure on the part of authorised persons to comply with rules relating to a particular kind of activity; and

(b) that, as a result, private persons have suffered (or will suffer) loss in respect of which authorised persons are (or will be) liable to make payments ("compensation payments").

(2) The Treasury may by order ("a scheme order") authorise the Authority to establish and operate a scheme for—

(a) determining the nature and extent of the failure;

(b) establishing the liability of authorised persons to make compensation payments; and

(c) determining the amounts payable by way of compensation payments.

(3) An authorised scheme must be made so as to comply with specified requirements.

(4) A scheme order may be made only if—

(a) the Authority has given the Treasury a report about the alleged failure and asked them to make a scheme order;

(b) the report contains details of the scheme which the Authority propose to make; and

(c) the Treasury are satisfied that the proposed scheme is an appropriate way of dealing with the failure.

(5) A scheme order may provide for specified provisions of or made under this Act to apply in relation to any provision of, or determination made under, the resulting authorised scheme subject to such modifications (if any) as may be specified.

(6) For the purposes of this Act, failure on the part of an authorised person to comply with any provision of an authorised scheme is to be treated (subject to any provision made by the scheme order concerned) as a failure on his part to comply with rules.

(7) The Treasury may prescribe circumstances in which loss suffered by a person ("A") acting in a fiduciary or other prescribed capacity is to be treated, for the purposes of an authorised scheme, as suffered by a private person in relation to whom A was acting in that capacity.

(8) This section applies whenever the failure in question occurred.

(9) "Authorised scheme" means a scheme authorised by a scheme order.

(10) "Private person" has such meaning as may be prescribed.

(11) "Specified" means specified in a scheme order.

Third countries

405.—(1) For the purpose of implementing a third country decision, the Treasury may direct the Authority to— Directions.

(a) refuse an application for permission under Part IV made by a body incorporated in, or formed under the law of, any part of the United Kingdom;

(b) defer its decision on such an application either indefinitely or for such period as may be specified in the direction;

(c) give a notice of objection to a person who has served a notice of control to the effect that he proposes to acquire a 50% stake in a UK authorised person; or

(d) give a notice of objection to a person who has acquired a 50% stake in a UK authorised person without having served the required notice of control.

(2) A direction may also be given in relation to—

(a) any person falling within a class specified in the direction;

(b) future applications, notices of control or acquisitions.

(3) The Treasury may revoke a direction at any time.

(4) But revocation does not affect anything done in accordance with the direction before it was revoked.

(5) "Third country decision" means a decision of the Council or the Commission under—

(a) Article 7(5) of the investment services directive;

(b) Article 9(4) of the second banking co-ordination directive;

(c) Article 29b(4) of the first non-life insurance directive; or

(d) Article 32b(4) of the first life insurance directive.

Interpretation of section 405.

406.—(1) For the purposes of section 405, a person ("the acquirer") acquires a 50% stake in a UK authorised person ("A") on first falling within any of the cases set out in subsection (2).

(2) The cases are where the acquirer—

(a) holds 50% or more of the shares in A;

(b) holds 50% or more of the shares in a parent undertaking ("P") of A;

(c) is entitled to exercise, or control the exercise of, 50% or more of the voting power in A; or

(d) is entitled to exercise, or control the exercise of, 50% or more of the voting power in P.

(3) In subsection (2) "the acquirer" means—

(a) the acquirer;

(b) any of the acquirer's associates; or

(c) the acquirer and any of his associates.

(4) "Associate", "shares" and "voting power" have the same meaning as in section 422.

Consequences of a direction under section 405.

407.—(1) If the Authority refuses an application for permission as a result of a direction under section 405(1)(a)—

(a) subsections (7) to (9) of section 52 do not apply in relation to the refusal; but

(b) the Authority must notify the applicant of the refusal and the reasons for it.

(2) If the Authority defers its decision on an application for permission as a result of a direction under section 405(1)(b)—

(a) the time limit for determining the application mentioned in section 52(1) or (2) stops running on the day of the deferral and starts running again (if at all) on the day the period specified in the direction (if any) ends or the day the direction is revoked; and

(b) the Authority must notify the applicant of the deferral and the reasons for it.

(3) If the Authority gives a notice of objection to a person as a result of a direction under section 405(1)(c) or (d)—

(a) sections 189 and 191 have effect as if the notice was a notice of objection within the meaning of Part XII; and

(b) the Authority must state in the notice the reasons for it.

EFTA firms.

408.—(1) If a third country decision has been taken, the Treasury may make a determination in relation to an EFTA firm which is a subsidiary undertaking of a parent undertaking which is governed by the law of the country to which the decision relates.

(2) "Determination" means a determination that the firm concerned does not qualify for authorisation under Schedule 3 even if it satisfies the conditions in paragraph 13 or 14 of that Schedule.

(3) A determination may also be made in relation to any firm falling within a class specified in the determination.

(4) The Treasury may withdraw a determination at any time.

(5) But withdrawal does not affect anything done in accordance with the determination before it was withdrawn.

(6) If the Treasury make a determination in respect of a particular firm, or withdraw such a determination, they must give written notice to that firm.

(7) The Treasury must publish notice of any determination (or the withdrawal of any determination)—

(a) in such a way as they think most suitable for bringing the determination (or withdrawal) to the attention of those likely to be affected by it; and

(b) on, or as soon as practicable after, the date of the determination (or withdrawal).

(8) "EFTA firm" means a firm, institution or undertaking which—

(a) is an EEA firm as a result of paragraph 5(a), (b) or (d) of Schedule 3; and

(b) is incorporated in, or formed under the law of, an EEA State which is not a member State.

(9) "Third country decision" has the same meaning as in section 405.

Gibraltar.

409.—(1) The Treasury may by order—

(a) modify Schedule 3 so as to provide for Gibraltar firms of a specified description to qualify for authorisation under that Schedule in specified circumstances;

(b) modify Schedule 3 so as to make provision in relation to the exercise by UK firms of rights under the law of Gibraltar which correspond to EEA rights;

(c) modify Schedule 4 so as to provide for Gibraltar firms of a specified description to qualify for authorisation under that Schedule in specified circumstances;

(d) modify section 264 so as to make provision in relation to collective investment schemes constituted under the law of Gibraltar;

(e) provide for the Authority to be able to give notice under section 264(2) on grounds relating to the law of Gibraltar;

(f) provide for this Act to apply to a Gibraltar recognised scheme as if the scheme were a scheme recognised under section 264.

(2) The fact that a firm may qualify for authorisation under Schedule 3 as a result of an order under subsection (1) does not prevent it from applying for a Part IV permission.

(3) "Gibraltar firm" means a firm which has its head office in Gibraltar or is otherwise connected with Gibraltar.

(4) "Gibraltar recognised scheme" means a collective investment scheme—

(a) constituted in an EEA State other than the United Kingdom, and

(b) recognised in Gibraltar under provisions which appear to the Treasury to give effect to the provisions of a relevant Community instrument.

(5) "Specified" means specified in the order.

(6) "UK firm" and "EEA right" have the same meaning as in Schedule 3.

International obligations

International obligations.

410.—(1) If it appears to the Treasury that any action proposed to be taken by a relevant person would be incompatible with Community obligations or any other international obligations of the United Kingdom, they may direct that person not to take that action.

(2) If it appears to the Treasury that any action which a relevant person has power to take is required for the purpose of implementing any such obligations, they may direct that person to take that action.

(3) A direction under this section—

(a) may include such supplemental or incidental requirements as the Treasury consider necessary or expedient; and

(b) is enforceable, on an application made by the Treasury, by injunction or, in Scotland, by an order for specific performance under section 45 of the Court of Session Act 1988.

1988 c. 36.

(4) "Relevant person" means—

(a) the Authority;

(b) any person exercising functions conferred by Part VI on the competent authority;

(c) any recognised investment exchange (other than one which is an overseas investment exchange);

(d) any recognised clearing house (other than one which is an overseas clearing house);

(e) a person included in the list maintained under section 301; or

(f) the scheme operator of the ombudsman scheme.

Tax treatment of levies and repayments

Tax treatment of levies and repayments.
1988 c. 1.

411.—(1) In the Income and Corporation Taxes Act 1988 ("the 1988 Act"), in section 76 (expenses of management: insurance companies), for subsections (7) and (7A) substitute—

"(7) For the purposes of this section any sums paid by a company by way of a levy shall be treated as part of its expenses of management.

(7A) "Levy" means—

(a) a payment required under rules made under section 136(2) of the Financial Services and Markets Act 2000 ("the Act of 2000");

(b) a levy imposed under the Financial Services Compensation Scheme;

(c) a payment required under rules made under section 234 of the Act of 2000;

(d) a payment required in accordance with the standard terms fixed under paragraph 18 of Schedule 17 to the Act of 2000."

(2) After section 76 of the 1988 Act insert—

"Levies and repayments under the Financial Services and Markets Act 2000.

76A.—(1) In computing the amount of the profits to be charged under Case I of Schedule D arising from a trade carried on by an authorised person (other than an investment company)—

(a) to the extent that it would not be deductible apart from this section, any sum expended by the authorised person in paying a levy may be deducted as an allowable expense;

(b) any payment which is made to the authorised person as a result of a repayment provision is to be treated as a trading receipt.

(2) "Levy" has the meaning given in section 76(7A).

(3) "Repayment provision" means any provision made by virtue of—

(a) section 136(7) of the Financial Services and Markets Act 2000 ("the Act of 2000");

(b) section 214(1)(e) of the Act of 2000.

(4) "Authorised person" has the same meaning as in the Act of 2000.

Levies and repayments

76B.—(1) For the purposes of section 75 any sums paid by an investment company—

under the Financial Services and Markets Act 2000: investment companies.

(a) by way of a levy, or

(b) as a result of an award of costs under costs rules,

shall be treated as part of its expenses of management.

(2) If a payment is made to an investment company as a result of a repayment provision, the company shall be charged to tax under Case VI of Schedule D on the amount of that payment.

(3) "Levy" has the meaning given in section 76(7A).

(4) "Costs rules" means—

(a) rules made under section 230 of the Financial Services and Markets Act 2000;

(b) provision relating to costs contained in the standard terms fixed under paragraph 18 of Schedule 17 to that Act.

(5) "Repayment provision" has the meaning given in section 76A(3)."

Gaming contracts

Gaming contracts.

412.—(1) No contract to which this section applies is void or unenforceable because of—

1845 c. 109. 1892 c. 9. S.I. 1985/1204 (N.I. 11).

(a) section 18 of the Gaming Act 1845, section 1 of the Gaming Act 1892 or Article 170 of the Betting, Gaming, Lotteries and Amusements (Northern Ireland) Order 1985; or

(b) any rule of the law of Scotland under which a contract by way of gaming or wagering is not legally enforceable.

(2) This section applies to a contract if—

(a) it is entered into by either or each party by way of business;

(b) the entering into or performance of it by either party constitutes an activity of a specified kind or one which falls within a specified class of activity; and

(c) it relates to an investment of a specified kind or one which falls within a specified class of investment.

(3) Part II of Schedule 2 applies for the purposes of subsection (2)(c), with the references to section 22 being read as references to that subsection.

(4) Nothing in Part II of Schedule 2, as applied by subsection (3), limits the power conferred by subsection (2)(c).

(5) "Investment" includes any asset, right or interest.

(6) "Specified" means specified in an order made by the Treasury.

Limitation on powers to require documents

413.—(1) A person may not be required under this Act to produce, disclose or permit the inspection of protected items. Protected items.

(2) "Protected items" means—

(a) communications between a professional legal adviser and his client or any person representing his client which fall within subsection (3);

(b) communications between a professional legal adviser, his client or any person representing his client and any other person which fall within subsection (3) (as a result of paragraph (b) of that subsection);

(c) items which—

(i) are enclosed with, or referred to in, such communications;

(ii) fall within subsection (3); and

(iii) are in the possession of a person entitled to possession of them.

(3) A communication or item falls within this subsection if it is made—

(a) in connection with the giving of legal advice to the client; or

(b) in connection with, or in contemplation of, legal proceedings and for the purposes of those proceedings.

(4) A communication or item is not a protected item if it is held with the intention of furthering a criminal purpose.

Service of notices

414.—(1) The Treasury may by regulations make provision with respect to the procedure to be followed, or rules to be applied, when a provision of or made under this Act requires a notice, direction or document of any kind to be given or authorises the imposition of a requirement. Service of notices.

(2) The regulations may, in particular, make provision—

(a) as to the manner in which a document must be given;

(b) as to the address to which a document must be sent;

(c) requiring, or allowing, a document to be sent electronically;

(d) for treating a document as having been given, or as having been received, on a date or at a time determined in accordance with the regulations;

(e) as to what must, or may, be done if the person to whom a document is required to be given is not an individual;

(f) as to what must, or may, be done if the intended recipient of a document is outside the United Kingdom.

(3) Subsection (1) applies however the obligation to give a document is expressed (and so, in particular, includes a provision which requires a document to be served or sent).

(4) Section 7 of the Interpretation Act 1978 (service of notice by post) has effect in relation to provisions made by or under this Act subject to any provision made by regulations under this section. 1978 c. 30.

Jurisdiction

Jurisdiction in civil proceedings.

415.—(1) Proceedings arising out of any act or omission (or proposed act or omission) of—

(a) the Authority,

(b) the competent authority for the purposes of Part VI,

(c) the scheme manager, or

(d) the scheme operator,

in the discharge or purported discharge of any of its functions under this Act may be brought before the High Court or the Court of Session.

(2) The jurisdiction conferred by subsection (1) is in addition to any other jurisdiction exercisable by those courts.

Removal of certain unnecessary provisions

Provisions relating to industrial assurance and certain other enactments.

416.—(1) The following enactments are to cease to have effect—

1923 c. 8.

1948 c. 39.

1977 c. 46.

S.I. 1979/1574 (N.I. 13).

(a) the Industrial Assurance Act 1923;

(b) the Industrial Assurance and Friendly Societies Act 1948;

(c) the Insurance Brokers (Registration) Act 1977.

(2) The Industrial Assurance (Northern Ireland) Order 1979 is revoked.

(3) The following bodies are to cease to exist—

(a) the Insurance Brokers Registration Council;

(b) the Policyholders Protection Board;

(c) the Deposit Protection Board;

(d) the Board of Banking Supervision.

(4) If the Treasury consider that, as a consequence of any provision of this section, it is appropriate to do so, they may by order make any provision of a kind that they could make under this Act (and in particular any provision of a kind mentioned in section 339) with respect to anything done by or under any provision of Part XXI.

(5) Subsection (4) is not to be read as affecting in any way any other power conferred on the Treasury by this Act.

PART XXIX

INTERPRETATION

Definitions.

417.—(1) In this Act—

"appointed representative" has the meaning given in section 39(2);

"auditors and actuaries rules" means rules made under section 340;

"authorisation offence" has the meaning given in section 23(2);

"authorised open-ended investment company" has the meaning given in section 237(3);

"authorised person" has the meaning given in section 31(2);

"the Authority" means the Financial Services Authority;

"body corporate" includes a body corporate constituted under the law of a country or territory outside the United Kingdom;

"chief executive"—

(a) in relation to a body corporate whose principal place of business is within the United Kingdom, means an employee of that body who, alone or jointly with one or more others, is responsible under the immediate authority of the directors, for the conduct of the whole of the business of that body; and

(b) in relation to a body corporate whose principal place of business is outside the United Kingdom, means the person who, alone or jointly with one or more others, is responsible for the conduct of its business within the United Kingdom;

"collective investment scheme" has the meaning given in section 235;

"the Commission" means the European Commission (except in provisions relating to the Competition Commission);

"the compensation scheme" has the meaning given in section 213(2);

"control of information rules" has the meaning given in section 147(1);

"director", in relation to a body corporate, includes—

(a) a person occupying in relation to it the position of a director (by whatever name called); and

(b) a person in accordance with whose directions or instructions (not being advice given in a professional capacity) the directors of that body are accustomed to act;

"documents" includes information recorded in any form and, in relation to information recorded otherwise than in legible form, references to its production include references to producing a copy of the information in legible form;

"exempt person", in relation to a regulated activity, means a person who is exempt from the general prohibition in relation to that activity as a result of an exemption order made under section 38(1) or as a result of section 39(1) or 285(2) or (3);

"financial promotion rules" means rules made under section 145;

"friendly society" means an incorporated or registered friendly society;

"general prohibition" has the meaning given in section 19(2);

"general rules" has the meaning given in section 138(2);

"incorporated friendly society" means a society incorporated under the Friendly Societies Act 1992; 1992 c. 40.

"industrial and provident society" means a society registered or deemed to be registered under the Industrial and Provident Societies Act 1965 or the Industrial and Provident Societies Act (Northern Ireland) 1969; 1965 c. 12. 1969 c. 24. (N.I.)

"market abuse" has the meaning given in section 118;

"Minister of the Crown" has the same meaning as in the Ministers of the Crown Act 1975; 1975 c. 26.

"money laundering rules" means rules made under section 146;

"notice of control" has the meaning given in section 178(5);

"the ombudsman scheme" has the meaning given in section 225(3);

"open-ended investment company" has the meaning given in section 236;

"Part IV permission" has the meaning given in section 40(4);

"partnership" includes a partnership constituted under the law of a country or territory outside the United Kingdom;

"prescribed" (where not otherwise defined) means prescribed in regulations made by the Treasury;

"price stabilising rules" means rules made under section 144;

"private company" has the meaning given in section 1(3) of the Companies Act 1985 or in Article 12(3) of the Companies (Northern Ireland) Order 1986;

1985 c. 6.
S.I. 1986/1032 (N.I. 6).

"prohibition order" has the meaning given in section 56(2);

"recognised clearing house" and "recognised investment exchange" have the meaning given in section 285;

"registered friendly society" means a society which is—

(a) a friendly society within the meaning of section 7(1)(a) of the Friendly Societies Act 1974; and

1992 c. 40.

(b) registered within the meaning of that Act;

"regulated activity" has the meaning given in section 22;

"regulating provisions" has the meaning given in section 159(1);

"regulatory objectives" means the objectives mentioned in section 2;

"regulatory provisions" has the meaning given in section 302;

"rule" means a rule made by the Authority under this Act;

"rule-making instrument" has the meaning given in section 153;

"the scheme manager" has the meaning given in section 212(1);

"the scheme operator" has the meaning given in section 225(2);

"scheme particulars rules" has the meaning given in section 248(1);

"Seventh Company Law Directive" means the European Council Seventh Company Law Directive of 13 June 1983 on consolidated accounts (No. 83/349/EEC);

"threshold conditions", in relation to a regulated activity, has the meaning given in section 41;

"the Treaty" means the treaty establishing the European Community;

"trust scheme rules" has the meaning given in section 247(1);

"UK authorised person" has the meaning given in section 178(4); and

"unit trust scheme" has the meaning given in section 237.

(2) In the application of this Act to Scotland, references to a matter being actionable at the suit of a person are to be read as references to the matter being actionable at the instance of that person.

(3) For the purposes of any provision of this Act authorising or requiring a person to do anything within a specified number of days no account is to be taken of any day which is a public holiday in any part of the United Kingdom.

Carrying on regulated activities in the United Kingdom.

418.—(1) In the four cases described in this section, a person who—

(a) is carrying on a regulated activity, but

(b) would not otherwise be regarded as carrying it on in the United Kingdom,

is, for the purposes of this Act, to be regarded as carrying it on in the United Kingdom.

(2) The first case is where—

(a) his registered office (or if he does not have a registered office his head office) is in the United Kingdom;

(b) he is entitled to exercise rights under a single market directive as a UK firm; and

(c) he is carrying on in another EEA State a regulated activity to which that directive applies.

(3) The second case is where—

(a) his registered office (or if he does not have a registered office his head office) is in the United Kingdom;

(b) he is the manager of a scheme which is entitled to enjoy the rights conferred by an instrument which is a relevant Community instrument for the purposes of section 264; and

(c) persons in another EEA State are invited to become participants in the scheme.

(4) The third case is where—

(a) his registered office (or if he does not have a registered office his head office) is in the United Kingdom;

(b) the day-to-day management of the carrying on of the regulated activity is the responsibility of—

(i) his registered office (or head office); or

(ii) another establishment maintained by him in the United Kingdom.

(5) The fourth case is where—

(a) his head office is not in the United Kingdom; but

(b) the activity is carried on from an establishment maintained by him in the United Kingdom.

(6) For the purposes of subsections (2) to (5) it is irrelevant where the person with whom the activity is carried on is situated.

Carrying on regulated activities by way of business.

419.—(1) The Treasury may by order make provision—

(a) as to the circumstances in which a person who would otherwise not be regarded as carrying on a regulated activity by way of business is to be regarded as doing so;

(b) as to the circumstances in which a person who would otherwise be regarded as carrying on a regulated activity by way of business is to be regarded as not doing so.

(2) An order under subsection (1) may be made so as to apply—

(a) generally in relation to all regulated activities;

(b) in relation to a specified category of regulated activity; or

(c) in relation to a particular regulated activity.

(3) An order under subsection (1) may be made so as to apply—

(a) for the purposes of all provisions;

(b) for a specified group of provisions; or

(c) for a specified provision.

(4) "Provision" means a provision of, or made under, this Act.

(5) Nothing in this section is to be read as affecting the provisions of section 428(3).

Parent and subsidiary undertaking.

1985 c. 6.

S.I. 1986/1032 (N.I. 6).

420.—(1) In this Act, except in relation to an incorporated friendly society, "parent undertaking" and "subsidiary undertaking" have the same meaning as in Part VII of the Companies Act 1985 (or Part VIII of the Companies (Northern Ireland) Order 1986).

(2) But—

(a) "parent undertaking" also includes an individual who would be a parent undertaking for the purposes of those provisions if he were taken to be an undertaking (and "subsidiary undertaking" is to be read accordingly);

(b) "subsidiary undertaking" also includes, in relation to a body incorporated in or formed under the law of an EEA State other than the United Kingdom, an undertaking which is a subsidiary undertaking within the meaning of any rule of law in force in that State for purposes connected with implementation of the Seventh Company Law Directive (and "parent undertaking" is to be read accordingly).

1992 c. 40.

(3) In this Act "subsidiary undertaking", in relation to an incorporated friendly society, means a body corporate of which the society has control within the meaning of section 13(9)(a) or (aa) of the Friendly Societies Act 1992 (and "parent undertaking" is to be read accordingly).

Group.

421.—(1) In this Act "group", in relation to a person ("A"), means A and any person who is—

(a) a parent undertaking of A;

(b) a subsidiary undertaking of A;

(c) a subsidiary undertaking of a parent undertaking of A;

(d) a parent undertaking of a subsidiary undertaking of A;

(e) an undertaking in which A or an undertaking mentioned in paragraph (a), (b), (c) or (d) has a participating interest;

(f) if A or an undertaking mentioned in paragraph (a) or (d) is a building society, an associated undertaking of the society; or

(g) if A or an undertaking mentioned in paragraph (a) or (d) is an incorporated friendly society, a body corporate of which the society has joint control (within the meaning of section 13(9)(c) or (cc) of the Friendly Societies Act 1992).

(2) "Participating interest" has the same meaning as in Part VII of the Companies Act 1985 or Part VIII of the Companies (Northern Ireland) Order 1986; but also includes an interest held by an individual which would be a participating interest for the purposes of those provisions if he were taken to be an undertaking. 1985 c. 6. S.I. 1986/1032 (N.I. 6).

(3) "Associated undertaking" has the meaning given in section 119(1) of the Building Societies Act 1986. 1986 c. 53.

Controller.

422.—(1) In this Act "controller", in relation to an undertaking ("A"), means a person who falls within any of the cases in subsection (2).

(2) The cases are where the person—

(a) holds 10% or more of the shares in A;

(b) is able to exercise significant influence over the management of A by virtue of his shareholding in A;

(c) holds 10% or more of the shares in a parent undertaking ("P") of A;

(d) is able to exercise significant influence over the management of P by virtue of his shareholding in P;

(e) is entitled to exercise, or control the exercise of, 10% or more of the voting power in A;

(f) is able to exercise significant influence over the management of A by virtue of his voting power in A;

(g) is entitled to exercise, or control the exercise of, 10% or more of the voting power in P; or

(h) is able to exercise significant influence over the management of P by virtue of his voting power in P.

(3) In subsection (2) "the person" means—

(a) the person;

(b) any of the person's associates; or

(c) the person and any of his associates.

(4) "Associate", in relation to a person ("H") holding shares in an undertaking ("C") or entitled to exercise or control the exercise of voting power in relation to another undertaking ("D"), means—

(a) the spouse of H;

(b) a child or stepchild of H (if under 18);

(c) the trustee of any settlement under which H has a life interest in possession (or in Scotland a life interest);

(d) an undertaking of which H is a director;

(e) a person who is an employee or partner of H;

(f) if H is an undertaking—

(i) a director of H;

(ii) a subsidiary undertaking of H;

(iii) a director or employee of such a subsidiary undertaking; and

(g) if H has with any other person an agreement or arrangement with respect to the acquisition, holding or disposal of shares or other interests in C or D or under which they undertake to act together in exercising their voting power in relation to C or D, that other person.

(5) "Settlement", in subsection (4)(c), includes any disposition or arrangement under which property is held on trust (or subject to a comparable obligation).

(6) "Shares"—

(a) in relation to an undertaking with a share capital, means allotted shares;

(b) in relation to an undertaking with capital but no share capital, means rights to share in the capital of the undertaking;

(c) in relation to an undertaking without capital, means interests—

(i) conferring any right to share in the profits, or liability to contribute to the losses, of the undertaking; or

(ii) giving rise to an obligation to contribute to the debts or expenses of the undertaking in the event of a winding up.

(7) "Voting power", in relation to an undertaking which does not have general meetings at which matters are decided by the exercise of voting rights, means the right under the constitution of the undertaking to direct the overall policy of the undertaking or alter the terms of its constitution.

Manager.

423.—(1) In this Act, except in relation to a unit trust scheme or a registered friendly society, "manager" means an employee who—

(a) under the immediate authority of his employer is responsible, either alone or jointly with one or more other persons, for the conduct of his employer's business; or

(b) under the immediate authority of his employer or of a person who is a manager by virtue of paragraph (a) exercises managerial functions or is responsible for maintaining accounts or other records of his employer.

(2) If the employer is not an individual, references in subsection (1) to the authority of the employer are references to the authority—

(a) in the case of a body corporate, of the directors;

(b) in the case of a partnership, of the partners; and

(c) in the case of an unincorporated association, of its officers or the members of its governing body.

(3) "Manager", in relation to a body corporate, means a person (other than an employee of the body) who is appointed by the body to manage any part of its business and includes an employee of the body corporate (other than the chief executive) who, under the immediate authority of a director or chief executive of the body corporate, exercises managerial functions or is responsible for maintaining accounts or other records of the body corporate.

Insurance.

424.—(1) In this Act, references to—

(a) contracts of insurance,

(b) reinsurance,

(c) contracts of long-term insurance,

(d) contracts of general insurance,

are to be read with section 22 and Schedule 2.

(2) In this Act "policy" and "policyholder", in relation to a contract of insurance, have such meaning as the Treasury may by order specify.

(3) The law applicable to a contract of insurance, the effecting of which constitutes the carrying on of a regulated activity, is to be determined, if it is of a prescribed description, in accordance with regulations made by the Treasury.

Expressions relating to authorisation elsewhere in the single market.

425.—(1) In this Act—

(a) "EEA authorisation", "EEA firm", "EEA right", "EEA State", "first life insurance directive", "first non-life insurance directive", "insurance directives", "investment services directive", "single market directives" and "second banking co-ordination directive" have the meaning given in Schedule 3; and

(b) "home state regulator", in relation to an EEA firm, has the meaning given in Schedule 3.

(2) In this Act—

(a) "home state authorisation" has the meaning given in Schedule 4;

(a) "Treaty firm" has the meaning given in Schedule 4; and

(c) "home state regulator", in relation to a Treaty firm, has the meaning given in Schedule 4.

PART XXX

SUPPLEMENTAL

Consequential and supplementary provision.

426.—(1) A Minister of the Crown may by order make such incidental, consequential, transitional or supplemental provision as he considers necessary or expedient for the general purposes, or any particular purpose, of this Act or in consequence of any provision made by or under this Act or for giving full effect to this Act or any such provision.

(2) An order under subsection (1) may, in particular, make provision—

(a) for enabling any person by whom any powers will become exercisable, on a date set by or under this Act, by virtue of any provision made by or under this Act to take before that date any steps which are necessary as a preliminary to the exercise of those powers;

(b) for applying (with or without modifications) or amending, repealing or revoking any provision of or made under an Act passed before this Act or in the same Session;

(c) dissolving any body corporate established by any Act passed, or instrument made, before the passing of this Act;

(d) for making savings, or additional savings, from the effect of any repeal or revocation made by or under this Act.

(3) Amendments made under this section are additional, and without prejudice, to those made by or under any other provision of this Act.

(4) No other provision of this Act restricts the powers conferred by this section.

Transitional provisions.

427.—(1) Subsections (2) and (3) apply to an order under section 426 which makes transitional provisions or savings.

(2) The order may, in particular—

(a) if it makes provision about the authorisation and permission of persons who before commencement were entitled to carry on any activities, also include provision for such persons not to be treated as having any authorisation or permission (whether on an application to the Authority or otherwise);

(b) make provision enabling the Authority to require persons of such descriptions as it may direct to re-apply for permissions having effect by virtue of the order;

(c) make provision for the continuation as rules of such provisions (including primary and subordinate legislation) as may be designated in accordance with the order by the Authority, including provision for the modification by the Authority of provisions designated;

(d) make provision about the effect of requirements imposed, liabilities incurred and any other things done before commencement, including provision for and about investigations, penalties and the taking or continuing of any other action in respect of contraventions;

(e) make provision for the continuation of disciplinary and other proceedings begun before commencement, including provision about the decisions available to bodies before which such proceedings take place and the effect of their decisions;

(f) make provision as regards the Authority's obligation to maintain a record under section 347 as respects persons in relation to whom provision is made by the order.

(3) The order may—

(a) confer functions on the Treasury, the Secretary of State, the Authority, the scheme manager, the scheme operator, members of the panel established under paragraph 4 of Schedule 17, the Competition Commission or the Director General of Fair Trading;

(b) confer jurisdiction on the Tribunal;

(c) provide for fees to be charged in connection with the carrying out of functions conferred under the order;

(d) modify, exclude or apply (with or without modifications) any primary or subordinate legislation (including any provision of, or made under, this Act).

(4) In subsection (2) "commencement" means the commencement of such provisions of this Act as may be specified by the order.

Regulations and orders.

428.—(1) Any power to make an order which is conferred on a Minister of the Crown by this Act and any power to make regulations which is conferred by this Act is exercisable by statutory instrument.

(2) The Lord Chancellor's power to make rules under section 132 is exercisable by statutory instrument.

(3) Any statutory instrument made under this Act may—

(a) contain such incidental, supplemental, consequential and transitional provision as the person making it considers appropriate; and

(b) make different provision for different cases.

Parliamentary control of statutory instruments.

429.—(1) No order is to be made under—

(a) section 144(4), 192(b) or (e), 236(5), 404 or 419, or

(b) paragraph 1 of Schedule 8,

unless a draft of the order has been laid before Parliament and approved by a resolution of each House.

(2) No regulations are to be made under section 262 unless a draft of the regulations has been laid before Parliament and approved by a resolution of each House.

(3) An order to which, if it is made, subsection (4) or (5) will apply is not to be made unless a draft of the order has been laid before Parliament and approved by a resolution of each House.

(4) This subsection applies to an order under section 21 if—

(a) it is the first order to be made, or to contain provisions made, under section 21(4);

(b) it varies an order made under section 21(4) so as to make section 21(1) apply in circumstances in which it did not previously apply;

(c) it is the first order to be made, or to contain provision made, under section 21(5);

(d) it varies a previous order made under section 21(5) so as to make section 21(1) apply in circumstances in which it did not, as a result of that previous order, apply;

(e) it is the first order to be made, or to contain provisions made, under section 21(9) or (10);

(f) it adds one or more activities to those that are controlled activities for the purposes of section 21; or

(g) it adds one or more investments to those which are controlled investments for the purposes of section 21.

(5) This subsection applies to an order under section 38 if—

(a) it is the first order to be made, or to contain provisions made, under that section; or

(b) it contains provisions restricting or removing an exemption provided by an earlier order made under that section.

(6) An order containing a provision to which, if the order is made, subsection (7) will apply is not to be made unless a draft of the order has been laid before Parliament and approved by a resolution of each House.

(7) This subsection applies to a provision contained in an order if—

(a) it is the first to be made in the exercise of the power conferred by subsection (1) of section 326 or it removes a body from those for the time being designated under that subsection; or

(b) it is the first to be made in the exercise of the power conferred by subsection (6) of section 327 or it adds a description of regulated activity or investment to those for the time being specified for the purposes of that subsection.

(8) Any other statutory instrument made under this Act, apart from one made under section 431(2) or to which paragraph 26 of Schedule 2 applies, shall be subject to annulment in pursuance of a resolution of either House of Parliament.

Extent.

430.—(1) This Act, except Chapter IV of Part XVII, extends to Northern Ireland.

(2) Except where Her Majesty by Order in Council provides otherwise, the extent of any amendment or repeal made by or under this Act is the same as the extent of the provision amended or repealed.

(3) Her Majesty may by Order in Council provide for any provision of or made under this Act relating to a matter which is the subject of other legislation which extends to any of the Channel Islands or the Isle of Man to extend there with such modifications (if any) as may be specified in the Order.

Commencement.

431.—(1) The following provisions come into force on the passing of this Act—

(a) this section;

(b) sections 428, 430 and 433;

(c) paragraphs 1 and 2 of Schedule 21.

(2) The other provisions of this Act come into force on such day as the Treasury may by order appoint; and different days may be appointed for different purposes.

Minor and consequential amendments, transitional provisions and repeals.

432.—(1) Schedule 20 makes minor and consequential amendments.

(2) Schedule 21 makes transitional provisions.

(3) The enactments set out in Schedule 22 are repealed.

Short title.

433. This Act may be cited as the Financial Services and Markets Act 2000.

SCHEDULES

SCHEDULE 1

Section 1.

THE FINANCIAL SERVICES AUTHORITY

PART I

GENERAL

Interpretation

1.—(1) In this Schedule—

"the 1985 Act" means the Companies Act 1985; 1985 c. 6.

"non-executive committee" means the committee maintained under paragraph 3;

"functions", in relation to the Authority, means functions conferred on the Authority by or under any provision of this Act.

(2) For the purposes of this Schedule, the following are the Authority's legislative functions—

(a) making rules;

(b) issuing codes under section 64 or 119;

(c) issuing statements under section 64, 69, 124 or 210;

(d) giving directions under section 316, 318 or 328;

(e) issuing general guidance (as defined by section 158(5)).

Constitution

2.—(1) The constitution of the Authority must continue to provide for the Authority to have—

(a) a chairman; and

(b) a governing body.

(2) The governing body must include the chairman.

(3) The chairman and other members of the governing body must be appointed, and be liable to removal from office, by the Treasury.

(4) The validity of any act of the Authority is not affected—

(a) by a vacancy in the office of chairman; or

(b) by a defect in the appointment of a person as a member of the governing body or as chairman.

Non-executive members of the governing body

3.—(1) The Authority must secure—

(a) that the majority of the members of its governing body are non-executive members; and

(b) that a committee of its governing body, consisting solely of the non-executive members, is set up and maintained for the purposes of discharging the functions conferred on the committee by this Schedule.

(2) The members of the non-executive committee are to be appointed by the Authority.

(3) The non-executive committee is to have a chairman appointed by the Treasury from among its members.

Functions of the non-executive committee

4.—(1) In this paragraph "the committee" means the non-executive committee.

(2) The non-executive functions are functions of the Authority but must be discharged by the committee.

(3) The non-executive functions are—

(a) keeping under review the question whether the Authority is, in discharging its functions in accordance with decisions of its governing body, using its resources in the most efficient and economic way;

(b) keeping under review the question whether the Authority's internal financial controls secure the proper conduct of its financial affairs; and

(c) determining the remuneration of—

(i) the chairman of the Authority's governing body; and

(ii) the executive members of that body.

(4) The function mentioned in sub-paragraph (3)(b) and those mentioned in sub-paragraph (3)(c) may be discharged on behalf of the committee by a sub-committee.

(5) Any sub-committee of the committee—

(a) must have as its chairman the chairman of the committee; but

(b) may include persons other than members of the committee.

(6) The committee must prepare a report on the discharge of its functions for inclusion in the Authority's annual report to the Treasury under paragraph 10.

(7) The committee's report must relate to the same period as that covered by the Authority's report.

Arrangements for discharging functions

5.—(1) The Authority may make arrangements for any of its functions to be discharged by a committee, sub-committee, officer or member of staff of the Authority.

(2) But in exercising its legislative functions, the Authority must act through its governing body.

(3) Sub-paragraph (1) does not apply to the non-executive functions.

Monitoring and enforcement

6.—(1) The Authority must maintain arrangements designed to enable it to determine whether persons on whom requirements are imposed by or under this Act are complying with them.

(2) Those arrangements may provide for functions to be performed on behalf of the Authority by any body or person who, in its opinion, is competent to perform them.

(3) The Authority must also maintain arrangements for enforcing the provisions of, or made under, this Act.

(4) Sub-paragraph (2) does not affect the Authority's duty under sub-paragraph (1).

Arrangements for the investigation of complaints

7.—(1) The Authority must—

(a) make arrangements ("the complaints scheme") for the investigation of complaints arising in connection with the exercise of, or failure to exercise, any of its functions (other than its legislative functions); and

(b) appoint an independent person ("the investigator") to be responsible for the conduct of investigations in accordance with the complaints scheme.

(2) The complaints scheme must be designed so that, as far as reasonably practicable, complaints are investigated quickly.

(3) The Treasury's approval is required for the appointment or dismissal of the investigator.

(4) The terms and conditions on which the investigator is appointed must be such as, in the opinion of the Authority, are reasonably designed to secure—

(a) that he will be free at all times to act independently of the Authority; and

(b) that complaints will be investigated under the complaints scheme without favouring the Authority.

(5) Before making the complaints scheme, the Authority must publish a draft of the proposed scheme in the way appearing to the Authority best calculated to bring it to the attention of the public.

(6) The draft must be accompanied by notice that representations about it may be made to the Authority within a specified time.

(7) Before making the proposed complaints scheme, the Authority must have regard to any representations made to it in accordance with sub-paragraph (6).

(8) If the Authority makes the proposed complaints scheme, it must publish an account, in general terms, of—

(a) the representations made to it in accordance with sub-paragraph (6); and

(b) its response to them.

(9) If the complaints scheme differs from the draft published under sub-paragraph (5) in a way which is, in the opinion of the Authority, significant the Authority must (in addition to complying with sub-paragraph (8)) publish details of the difference.

(10) The Authority must publish up-to-date details of the complaints scheme including, in particular, details of—

(a) the provision made under paragraph 8(5); and

(b) the powers which the investigator has to investigate a complaint.

(11) Those details must be published in the way appearing to the Authority to be best calculated to bring them to the attention of the public.

(12) The Authority must, without delay, give the Treasury a copy of any details published by it under this paragraph.

(13) The Authority may charge a reasonable fee for providing a person with a copy of—

(a) a draft published under sub-paragraph (5);

(b) details published under sub-paragraph (10).

(14) Sub-paragraphs (5) to (9) and (13)(a) also apply to a proposal to alter or replace the complaints scheme.

Investigation of complaints

8.—(1) The Authority is not obliged to investigate a complaint in accordance with the complaints scheme which it reasonably considers would be more appropriately dealt with in another way (for example by referring the matter to the Tribunal or by the institution of other legal proceedings).

(2) The complaints scheme must provide—

(a) for reference to the investigator of any complaint which the Authority is investigating; and

(b) for him—

(i) to have the means to conduct a full investigation of the complaint;

(ii) to report on the result of his investigation to the Authority and the complainant; and

(iii) to be able to publish his report (or any part of it) if he considers that it (or the part) ought to be brought to the attention of the public.

(3) If the Authority has decided not to investigate a complaint, it must notify the investigator.

(4) If the investigator considers that a complaint of which he has been notified under sub-paragraph (3) ought to be investigated, he may proceed as if the complaint had been referred to him under the complaints scheme.

(5) The complaints scheme must confer on the investigator the power to recommend, if he thinks it appropriate, that the Authority—

(a) makes a compensatory payment to the complainant,

(b) remedies the matter complained of,

or takes both of those steps.

(6) The complaints scheme must require the Authority, in a case where the investigator—

(a) has reported that a complaint is well-founded, or

(b) has criticised the Authority in his report,

to inform the investigator and the complainant of the steps which it proposes to take in response to the report.

(7) The investigator may require the Authority to publish the whole or a specified part of the response.

(8) The investigator may appoint a person to conduct the investigation on his behalf but subject to his direction.

(9) Neither an officer nor an employee of the Authority may be appointed under sub-paragraph (8).

(10) Sub-paragraph (2) is not to be taken as preventing the Authority from making arrangements for the initial investigation of a complaint to be conducted by the Authority.

Records

9. The Authority must maintain satisfactory arrangements for—

(a) recording decisions made in the exercise of its functions; and

(b) the safe-keeping of those records which it considers ought to be preserved.

Annual report

10.—(1) At least once a year the Authority must make a report to the Treasury on—

(a) the discharge of its functions;

(b) the extent to which, in its opinion, the regulatory objectives have been met;

(c) its consideration of the matters mentioned in section 2(3); and

(d) such other matters as the Treasury may from time to time direct.

(2) The report must be accompanied by—

(a) the report prepared by the non-executive committee under paragraph 4(6); and

(b) such other reports or information, prepared by such persons, as the Treasury may from time to time direct.

(3) The Treasury must lay before Parliament a copy of each report received by them under this paragraph.

(4) The Treasury may—

(a) require the Authority to comply with any provisions of the 1985 Act about accounts and their audit which would not otherwise apply to it; or

(b) direct that any such provision of that Act is to apply to the Authority with such modifications as are specified in the direction.

(5) Compliance with any requirement imposed under sub-paragraph (4)(a) or (b) is enforceable by injunction or, in Scotland, an order under section 45(b) of the Court of Session Act 1988. 1988 c. 36.

(6) Proceedings under sub-paragraph (5) may be brought only by the Treasury.

Annual public meeting

11.—(1) Not later than three months after making a report under paragraph 10, the Authority must hold a public meeting ("the annual meeting") for the purposes of enabling that report to be considered.

(2) The Authority must organise the annual meeting so as to allow—

(a) a general discussion of the contents of the report which is being considered; and

(b) a reasonable opportunity for those attending the meeting to put questions to the Authority about the way in which it discharged, or failed to discharge, its functions during the period to which the report relates.

(3) But otherwise the annual meeting is to be organised and conducted in such a way as the Authority considers appropriate.

(4) The Authority must give reasonable notice of its annual meeting.

(5) That notice must—

(a) give details of the time and place at which the meeting is to be held;

(b) set out the proposed agenda for the meeting;

(c) indicate the proposed duration of the meeting;

(d) give details of the Authority's arrangements for enabling persons to attend; and

(e) be published by the Authority in the way appearing to it to be most suitable for bringing the notice to the attention of the public.

(6) If the Authority proposes to alter any of the arrangements which have been included in the notice given under sub-paragraph (4) it must—

(a) give reasonable notice of the alteration; and

(b) publish that notice in the way appearing to the Authority to be best calculated to bring it to the attention of the public.

Report of annual meeting

12. Not later than one month after its annual meeting, the Authority must publish a report of the proceedings of the meeting.

PART II

STATUS

13. In relation to any of its functions—

(a) the Authority is not to be regarded as acting on behalf of the Crown; and

(b) its members, officers and staff are not to be regarded as Crown servants.

Exemption from requirement of "limited" in Authority's name

14. The Authority is to continue to be exempt from the requirements of the 1985 Act relating to the use of "limited" as part of its name.

15. If the Secretary of State is satisfied that any action taken by the Authority makes it inappropriate for the exemption given by paragraph 14 to continue he may, after consulting the Treasury, give a direction removing it.

PART III

PENALTIES AND FEES

Penalties

16.—(1) In determining its policy with respect to the amounts of penalties to be imposed by it under this Act, the Authority must take no account of the expenses which it incurs, or expects to incur, in discharging its functions.

(2) The Authority must prepare and operate a scheme for ensuring that the amounts paid to the Authority by way of penalties imposed under this Act are applied for the benefit of authorised persons.

(3) The scheme may, in particular, make different provision with respect to different classes of authorised person.

(4) Up to date details of the scheme must be set out in a document ("the scheme details").

(5) The scheme details must be published by the Authority in the way appearing to it to be best calculated to bring them to the attention of the public.

(6) Before making the scheme, the Authority must publish a draft of the proposed scheme in the way appearing to the Authority to be best calculated to bring it to the attention of the public.

(7) The draft must be accompanied by notice that representations about the proposals may be made to the Authority within a specified time.

(8) Before making the scheme, the Authority must have regard to any representations made to it in accordance with sub-paragraph (7).

(9) If the Authority makes the proposed scheme, it must publish an account, in general terms, of—

(a) the representations made to it in accordance with sub-paragraph (7); and

(b) its response to them.

(10) If the scheme differs from the draft published under sub-paragraph (6) in a way which is, in the opinion of the Authority, significant the Authority must (in addition to complying with sub-paragraph (9)) publish details of the difference.

(11) The Authority must, without delay, give the Treasury a copy of any scheme details published by it.

(12) The Authority may charge a reasonable fee for providing a person with a copy of—

(a) a draft published under sub-paragraph (6);

(b) scheme details.

(13) Sub-paragraphs (6) to (10) and (12)(a) also apply to a proposal to alter or replace the complaints scheme.

Fees

17.—(1) The Authority may make rules providing for the payment to it of such fees, in connection with the discharge of any of its functions under or as a result of this Act, as it considers will (taking account of its expected income from fees and charges provided for by any other provision of this Act) enable it—

(a) to meet expenses incurred in carrying out its functions or for any incidental purpose;

(b) to repay the principal of, and pay any interest on, any money which it has borrowed and which has been used for the purpose of meeting expenses incurred in relation to its assumption of functions under this Act or the Bank of England Act 1998; and 1998 c. 11.

(c) to maintain adequate reserves.

(2) In fixing the amount of any fee which is to be payable to the Authority, no account is to be taken of any sums which the Authority receives, or expects to receive, by way of penalties imposed by it under this Act.

(3) Sub-paragraph (1)(b) applies whether expenses were incurred before or after the coming into force of this Act or the Bank of England Act 1998.

(4) Any fee which is owed to the Authority under any provision made by or under this Act may be recovered as a debt due to the Authority.

Services for which fees may not be charged

18. The power conferred by paragraph 17 may not be used to require—

(a) a fee to be paid in respect of the discharge of any of the Authority's functions under paragraphs 13, 14, 19 or 20 of Schedule 3; or

(b) a fee to be paid by any person whose application for approval under section 59 has been granted.

PART IV

MISCELLANEOUS

Exemption from liability in damages

19.—(1) Neither the Authority nor any person who is, or is acting as, a member, officer or member of staff of the Authority is to be liable in damages for anything done or omitted in the discharge, or purported discharge, of the Authority's functions.

(2) Neither the investigator appointed under paragraph 7 nor a person appointed to conduct an investigation on his behalf under paragraph 8(8) is to be liable in damages for anything done or omitted in the discharge, or purported discharge, of his functions in relation to the investigation of a complaint.

(3) Neither sub-paragraph (1) nor sub-paragraph (2) applies—

(a) if the act or omission is shown to have been in bad faith; or

(b) so as to prevent an award of damages made in respect of an act or omission on the ground that the act or omission was unlawful as a result of section 6(1) of the Human Rights Act 1998.

1998 c. 42.

Disqualification for membership of House of Commons

1975 c. 24.

20. In Part III of Schedule 1 to the House of Commons Disqualification Act 1975 (disqualifying offices), insert at the appropriate place—

"Member of the governing body of the Financial Services Authority".

Disqualification for membership of Northern Ireland Assembly

1975 c. 25.

21. In Part III of Schedule 1 to the Northern Ireland Assembly Disqualification Act 1975 (disqualifying offices), insert at the appropriate place—

"Member of the governing body of the Financial Services Authority".

Section 22(2).

SCHEDULE 2

Regulated Activities

Part I

Regulated Activities

General

1. The matters with respect to which provision may be made under section 22(1) in respect of activities include, in particular, those described in general terms in this Part of this Schedule.

Dealing in investments

2.—(1) Buying, selling, subscribing for or underwriting investments or offering or agreeing to do so, either as a principal or as an agent.

(2) In the case of an investment which is a contract of insurance, that includes carrying out the contract.

Arranging deals in investments

3. Making, or offering or agreeing to make—

(a) arrangements with a view to another person buying, selling, subscribing for or underwriting a particular investment;

(b) arrangements with a view to a person who participates in the arrangements buying, selling, subscribing for or underwriting investments.

Deposit taking

4. Accepting deposits.

Safekeeping and administration of assets

5.—(1) Safeguarding and administering assets belonging to another which consist of or include investments or offering or agreeing to do so.

(2) Arranging for the safeguarding and administration of assets belonging to another, or offering or agreeing to do so.

Managing investments

6. Managing, or offering or agreeing to manage, assets belonging to another person where—

(a) the assets consist of or include investments; or

(b) the arrangements for their management are such that the assets may consist of or include investments at the discretion of the person managing or offering or agreeing to manage them.

Investment advice

7. Giving or offering or agreeing to give advice to persons on—

(a) buying, selling, subscribing for or underwriting an investment; or

(b) exercising any right conferred by an investment to acquire, dispose of, underwrite or convert an investment.

Establishing collective investment schemes

8. Establishing, operating or winding up a collective investment scheme, including acting as—

(a) trustee of a unit trust scheme;

(b) depositary of a collective investment scheme other than a unit trust scheme; or

(c) sole director of a body incorporated by virtue of regulations under section 262.

Using computer-based systems for giving investment instructions

9.—(1) Sending on behalf of another person instructions relating to an investment by means of a computer-based system which enables investments to be transferred without a written instrument.

(2) Offering or agreeing to send such instructions by such means on behalf of another person.

(3) Causing such instructions to be sent by such means on behalf of another person.

(4) Offering or agreeing to cause such instructions to be sent by such means on behalf of another person.

PART II

INVESTMENTS

General

10. The matters with respect to which provision may be made under section 22(1) in respect of investments include, in particular, those described in general terms in this Part of this Schedule.

Securities

11.—(1) Shares or stock in the share capital of a company.

(2) "Company" includes—

(a) any body corporate (wherever incorporated), and

(b) any unincorporated body constituted under the law of a country or territory outside the United Kingdom,

other than an open-ended investment company.

Instruments creating or acknowledging indebtedness

12. Any of the following—

(a) debentures;

(b) debenture stock;

(c) loan stock;

(d) bonds;

(e) certificates of deposit;

(f) any other instruments creating or acknowledging a present or future indebtedness.

Government and public securities

13.—(1) Loan stock, bonds and other instruments—

(a) creating or acknowledging indebtedness; and

(b) issued by or on behalf of a government, local authority or public authority.

(2) "Government, local authority or public authority" means—

(a) the government of the United Kingdom, of Northern Ireland, or of any country or territory outside the United Kingdom;

(b) a local authority in the United Kingdom or elsewhere;

(c) any international organisation the members of which include the United Kingdom or another member State.

Instruments giving entitlement to investments

14.—(1) Warrants or other instruments entitling the holder to subscribe for any investment.

(2) It is immaterial whether the investment is in existence or identifiable.

Certificates representing securities

15. Certificates or other instruments which confer contractual or property rights—

(a) in respect of any investment held by someone other than the person on whom the rights are conferred by the certificate or other instrument; and

(b) the transfer of which may be effected without requiring the consent of that person.

Units in collective investment schemes

16.—(1) Shares in or securities of an open-ended investment company.

(2) Any right to participate in a collective investment scheme.

Options

17. Options to acquire or dispose of property.

Futures

18. Rights under a contract for the sale of a commodity or property of any other description under which delivery is to be made at a future date.

Contracts for differences

19. Rights under—

(a) a contract for differences; or

(b) any other contract the purpose or pretended purpose of which is to secure a profit or avoid a loss by reference to fluctuations in—

(i) the value or price of property of any description; or

(ii) an index or other factor designated for that purpose in the contract.

Contracts of insurance

20. Rights under a contract of insurance, including rights under contracts falling within head C of Schedule 2 to the Friendly Societies Act 1992. 1992 c. 40.

Participation in Lloyd's syndicates

21.—(1) The underwriting capacity of a Lloyd's syndicate.

(2) A person's membership (or prospective membership) of a Lloyd's syndicate.

Deposits

22. Rights under any contract under which a sum of money (whether or not denominated in a currency) is paid on terms under which it will be repaid, with or without interest or a premium, and either on demand or at a time or in circumstances agreed by or on behalf of the person making the payment and the person receiving it.

Loans secured on land

23.—(1) Rights under any contract under which—

(a) one person provides another with credit; and

(b) the obligation of the borrower to repay is secured on land.

(2) "Credit" includes any cash loan or other financial accommodation.

(3) "Cash" includes money in any form.

Rights in investments

24. Any right or interest in anything which is an investment as a result of any other provision made under section 22(1).

PART III

SUPPLEMENTAL PROVISIONS

The order-making power

25.—(1) An order under section 22(1) may—

(a) provide for exemptions;

(b) confer powers on the Treasury or the Authority;

(c) authorise the making of regulations or other instruments by the Treasury for purposes of, or connected with, any relevant provision;

(d) authorise the making of rules or other instruments by the Authority for purposes of, or connected with, any relevant provision;

(e) make provision in respect of any information or document which, in the opinion of the Treasury or the Authority, is relevant for purposes of, or connected with, any relevant provision;

SCH. 2

(f) make such consequential, transitional or supplemental provision as the Treasury consider appropriate for purposes of, or connected with, any relevant provision.

(2) Provision made as a result of sub-paragraph (1)(f) may amend any primary or subordinate legislation, including any provision of, or made under, this Act.

(3) "Relevant provision" means any provision—

(a) of section 22 or this Schedule; or

(b) made under that section or this Schedule.

Parliamentary control

26.—(1) This paragraph applies to the first order made under section 22(1).

(2) This paragraph also applies to any subsequent order made under section 22(1) which contains a statement by the Treasury that, in their opinion, the effect (or one of the effects) of the proposed order would be that an activity which is not a regulated activity would become a regulated activity.

(3) An order to which this paragraph applies—

(a) must be laid before Parliament after being made; and

(b) ceases to have effect at the end of the relevant period unless before the end of that period the order is approved by a resolution of each House of Parliament (but without that affecting anything done under the order or the power to make a new order).

(4) "Relevant period" means a period of twenty-eight days beginning with the day on which the order is made.

(5) In calculating the relevant period no account is to be taken of any time during which Parliament is dissolved or prorogued or during which both Houses are adjourned for more than four days.

Interpretation

27.—(1) In this Schedule—

"buying" includes acquiring for valuable consideration;

"offering" includes inviting to treat;

"property" includes currency of the United Kingdom or any other country or territory; and

"selling" includes disposing for valuable consideration.

(2) In sub-paragraph (1) "disposing" includes—

(a) in the case of an investment consisting of rights under a contract—

(i) surrendering, assigning or converting those rights; or

(ii) assuming the corresponding liabilities under the contract;

(b) in the case of an investment consisting of rights under other arrangements, assuming the corresponding liabilities under the contract or arrangements;

(c) in the case of any other investment, issuing or creating the investment or granting the rights or interests of which it consists.

(3) In this Schedule references to an instrument include references to any record (whether or not in the form of a document).

SCHEDULE 3

Sections 31(1)(b) and 37.

EEA PASSPORT RIGHTS

PART I

DEFINED TERMS

The single market directives

1. "The single market directives" means—

(a) the first banking co-ordination directive;

(b) the second banking co-ordination directive;

(c) the insurance directives; and

(d) the investment services directive.

The banking co-ordination directives

2.—(1) "The first banking co-ordination directive" means the Council Directive of 12 December 1977 on the co-ordination of laws, regulations and administrative provisions relating to the taking up and pursuit of the business of credit institutions (No. 77/780/EEC).

(2) "The second banking co-ordination directive" means the Council Directive of 15 December 1989 on the co-ordination of laws, etc, relating to the taking up and pursuit of the business of credit institutions and amending Directive 77/780/EEC (No. 89/646/EEC).

The insurance directives

3.—(1) "The insurance directives" means the first, second and third non-life insurance directives and the first, second and third life insurance directives.

(2) "First non-life insurance directive" means the Council Directive of 24 July 1973 on the co-ordination of laws, regulations and administrative provisions relating to the taking up and pursuit of the business of direct insurance other than life assurance (No. 73/239/EEC).

(3) "Second non-life insurance directive" means the Council Directive of 22 June 1988 on the co-ordination of laws, etc, and laying down provisions to facilitate the effective exercise of freedom to provide services and amending Directive 73/239/EEC (No. 88/357/EEC).

(4) "Third non-life insurance directive" means the Council Directive of 18 June 1992 on the co-ordination of laws, etc, and amending Directives 73/239/EEC and 88/357/EEC (No. 92/49/EEC).

(5) "First life insurance directive" means the Council Directive of 5 March 1979 on the co-ordination of laws, regulations and administrative provisions relating to the taking up and pursuit of the business of direct life assurance (No. 79/267/EEC).

(6) "Second life insurance directive" means the Council Directive of 8 November 1990 on the co-ordination of laws, etc, and laying down provisions to facilitate the effective exercise of freedom to provide services and amending Directive 79/267/EEC (No. 90/619/EEC).

(7) "Third life insurance directive" means the Council Directive of 10 November 1992 on the co-ordination of laws, etc, and amending Directives 79/267/EEC and 90/619/EEC (No. 92/96/EEC).

The investment services directive

4. "The investment services directive" means the Council Directive of 10 May 1993 on investment services in the securities field (No. 93/22/EEC).

EEA firm

5. "EEA firm" means any of the following if it does not have its head office in the United Kingdom—

(a) an investment firm (as defined in Article 1.2 of the investment services directive) which is authorised (within the meaning of Article 3) by its home state regulator;

(b) a credit institution (as defined in Article 1 of the first banking co-ordination directive) which is authorised (within the meaning of Article 1) by its home state regulator;

(c) a financial institution (as defined in Article 1 of the second banking co-ordination directive) which is a subsidiary of the kind mentioned in Article 18.2 and which fulfils the conditions in Article 18; or

(d) an undertaking pursuing the activity of direct insurance (within the meaning of Article 1 of the first life insurance directive or of the first non-life insurance directive) which has received authorisation under Article 6 from its home state regulator.

EEA authorisation

6. "EEA authorisation" means authorisation granted to an EEA firm by its home state regulator for the purpose of the relevant single market directive.

EEA right

7. "EEA right" means the entitlement of a person to establish a branch, or provide services, in an EEA State other than that in which he has his head office—

(a) in accordance with the Treaty as applied in the EEA; and

(b) subject to the conditions of the relevant single market directive.

EEA State

8. "EEA State" means a State which is a contracting party to the agreement on the European Economic Area signed at Oporto on 2 May 1992 as it has effect for the time being.

Home state regulator

9. "Home state regulator" means the competent authority (within the meaning of the relevant single market directive) of an EEA State (other than the United Kingdom) in relation to the EEA firm concerned.

UK firm

10. "UK firm" means a person whose head office is in the UK and who has an EEA right to carry on activity in an EEA State other than the United Kingdom.

Host state regulator

11. "Host state regulator" means the competent authority (within the meaning of the relevant single market directive) of an EEA State (other than the United Kingdom) in relation to a UK firm's exercise of EEA rights there.

PART II

EXERCISE OF PASSPORT RIGHTS BY EEA FIRMS

Firms qualifying for authorisation

12.—(1) Once an EEA firm which is seeking to establish a branch in the United Kingdom in exercise of an EEA right satisfies the establishment conditions, it qualifies for authorisation.

(2) Once an EEA firm which is seeking to provide services in the United Kingdom in exercise of an EEA right satisfies the service conditions, it qualifies for authorisation.

Establishment

13.—(1) The establishment conditions are that—

(a) the Authority has received notice ("a consent notice") from the firm's home state regulator that it has given the firm consent to establish a branch in the United Kingdom;

(b) the consent notice—

(i) is given in accordance with the relevant single market directive;

(ii) identifies the activities to which consent relates; and

(iii) includes such other information as may be prescribed; and

(c) the firm has been informed of the applicable provisions or two months have elapsed beginning with the date when the Authority received the consent notice.

(2) If the Authority has received a consent notice, it must—

(a) prepare for the firm's supervision;

(b) notify the firm of the applicable provisions (if any); and

(c) if the firm falls within paragraph 5(d), notify its home state regulator of the applicable provisions (if any).

(3) A notice under sub-paragraph (2)(b) or (c) must be given before the end of the period of two months beginning with the day on which the Authority received the consent notice.

(4) For the purposes of this paragraph—

"applicable provisions" means the host state rules with which the firm is required to comply when carrying on a permitted activity through a branch in the United Kingdom;

"host state rules" means rules—

(a) made in accordance with the relevant single market directive; and

(b) which are the responsibility of the United Kingdom (both as to implementation and as to supervision of compliance) in accordance with that directive; and

"permitted activity" means an activity identified in the consent notice.

Services

14.—(1) The service conditions are that—

(a) the firm has given its home state regulator notice of its intention to provide services in the United Kingdom ("a notice of intention");

(b) if the firm falls within paragraph 5(a) or (d), the Authority has received notice ("a regulator's notice") from the firm's home state regulator containing such information as may be prescribed; and

(c) if the firm falls within paragraph 5(d), its home state regulator has informed it that the regulator's notice has been sent to the Authority.

(2) If the Authority has received a regulator's notice or, where none is required by sub-paragraph (1), has been informed of the firm's intention to provide services in the United Kingdom, it must—

(a) prepare for the firm's supervision; and

(b) notify the firm of the applicable provisions (if any).

(3) A notice under sub-paragraph (2)(b) must be given before the end of the period of two months beginning on the day on which the Authority received the regulator's notice, or was informed of the firm's intention.

(4) For the purposes of this paragraph—

"applicable provisions" means the host state rules with which the firm is required to comply when carrying on a permitted activity by providing services in the United Kingdom;

"host state rules" means rules—

(a) made in accordance with the relevant single market directive; and

(b) which are the responsibility of the United Kingdom (both as to implementation and as to supervision of compliance) in accordance with that directive; and

"permitted activity" means an activity identified in—

(a) the regulator's notice; or

(b) where none is required by sub-paragraph (1), the notice of intention.

Grant of permission

15.—(1) On qualifying for authorisation as a result of paragraph 12, a firm has, in respect of each permitted activity which is a regulated activity, permission to carry it on through its United Kingdom branch (if it satisfies the establishment conditions) or by providing services in the United Kingdom (if it satisfies the service conditions).

(2) The permission is to be treated as being on terms equivalent to those appearing from the consent notice, regulator's notice or notice of intention.

1974 c. 39. (3) Sections 21, 39(1) and 147(1) of the Consumer Credit Act 1974 (business requiring a licence under that Act) do not apply in relation to the carrying on of a permitted activity which is Consumer Credit Act business by a firm which qualifies for authorisation as a result of paragraph 12, unless the Director General of Fair Trading has exercised the power conferred on him by section 203 in relation to the firm.

(4) "Consumer Credit Act business" has the same meaning as in section 203.

Effect of carrying on regulated activity when not qualified for authorisation

16.—(1) This paragraph applies to an EEA firm which is not qualified for authorisation under paragraph 12.

(2) Section 26 does not apply to an agreement entered into by the firm.

(3) Section 27 does not apply to an agreement in relation to which the firm is a third party for the purposes of that section.

(4) Section 29 does not apply to an agreement in relation to which the firm is the deposit-taker.

Continuing regulation of EEA firms

17. Regulations may—

(a) modify any provision of this Act which is an applicable provision (within the meaning of paragraph 13 or 14) in its application to an EEA firm qualifying for authorisation;

(b) make provision as to any change (or proposed change) of a prescribed kind relating to an EEA firm or to an activity that it carries on in the United Kingdom and as to the procedure to be followed in relation to such cases;

(c) provide that the Authority may treat an EEA firm's notification that it is to cease to carry on regulated activity in the United Kingdom as a request for cancellation of its qualification for authorisation under this Schedule.

Giving up right to authorisation

18. Regulations may provide that in prescribed circumstances an EEA firm falling within paragraph 5(c) may, on following the prescribed procedure—

(a) have its qualification for authorisation under this Schedule cancelled; and

(b) seek to become an authorised person by applying for a Part IV permission.

PART III

EXERCISE OF PASSPORT RIGHTS BY UK FIRMS

Establishment

19.—(1) A UK firm may not exercise an EEA right to establish a branch unless three conditions are satisfied.

(2) The first is that the firm has given the Authority, in the specified way, notice of its intention to establish a branch ("a notice of intention") which—

(a) identifies the activities which it seeks to carry on through the branch; and

(b) includes such other information as may be specified.

(3) The activities identified in a notice of intention may include activities which are not regulated activities.

(4) The second is that the Authority has given notice in specified terms ("a consent notice") to the host state regulator.

(5) The third is that—

(a) the host state regulator has notified the firm (or, where the EEA right in question derives from any of the insurance directives, the Authority) of the applicable provisions; or

(b) two months have elapsed beginning with the date on which the Authority gave the consent notice.

(6) If the firm's EEA right derives from the investment services directive or the second banking coordination directive and the first condition is satisfied, the Authority must give a consent notice to the host state regulator unless it has reason to doubt the adequacy of the firm's resources or its administrative structure.

(7) If the firm's EEA right derives from any of the insurance directives and the first condition is satisfied, the Authority must give a consent notice unless it has reason—

(a) to doubt the adequacy of the firm's resources or its administrative structure, or

(b) to question the reputation, qualifications or experience of the directors or managers of the firm or the person proposed as the branch's authorised agent for the purposes of those directives,

in relation to the business to be conducted through the proposed branch.

(8) If the Authority proposes to refuse to give a consent notice it must give the firm concerned a warning notice.

(9) If the firm's EEA right derives from any of the insurance directives and the host state regulator has notified it of the applicable provisions, the Authority must inform the firm of those provisions.

(10) Rules may specify the procedure to be followed by the Authority in exercising its functions under this paragraph.

(11) If the Authority gives a consent notice it must give written notice that it has done so to the firm concerned.

(12) If the Authority decides to refuse to give a consent notice—

(a) it must, within three months beginning with the date when it received the notice of intention, give the person who gave that notice a decision notice to that effect; and

(b) that person may refer the matter to the Tribunal.

(13) In this paragraph, "applicable provisions" means the host state rules with which the firm will be required to comply when conducting business through the proposed branch in the EEA State concerned.

(14) In sub-paragraph (13), "host state rules" means rules—

(a) made in accordance with the relevant single market directive; and

(b) which are the responsibility of the EEA State concerned (both as to implementation and as to supervision of compliance) in accordance with that directive.

(15) "Specified" means specified in rules.

Services

20.—(1) A UK firm may not exercise an EEA right to provide services unless the firm has given the Authority, in the specified way, notice of its intention to provide services ("a notice of intention") which—

(a) identifies the activities which it seeks to carry out by way of provision of services; and

(b) includes such other information as may be specified.

(2) The activities identified in a notice of intention may include activities which are not regulated activities.

(3) If the firm's EEA right derives from the investment services directive or a banking co-ordination directive, the Authority must, within one month of receiving a notice of intention, send a copy of it to the host state regulator.

(4) When the Authority sends the copy under sub-paragraph (3), it must give written notice to the firm concerned.

(5) If the firm concerned's EEA right derives from the investment services directive, it must not provide the services to which its notice of intention relates until it has received written notice from the Authority under sub-paragraph (4).

(6) "Specified" means specified in rules.

Offence relating to exercise of passport rights

21.—(1) If a UK firm which is not an authorised person contravenes the prohibition imposed by—

(a) sub-paragraph (1) of paragraph 19, or

(b) sub-paragraph (1) or (5) of paragraph 20,

it is guilty of an offence.

(2) A firm guilty of an offence under sub-paragraph (1) is liable—

(a) on summary conviction, to a fine not exceeding the statutory maximum; or

(b) on conviction on indictment, to a fine.

(3) In proceedings for an offence under sub-paragraph (1), it is a defence for the firm to show that it took all reasonable precautions and exercised all due diligence to avoid committing the offence.

Continuing regulation of UK firms

22.—(1) Regulations may make such provision as the Treasury consider appropriate in relation to a UK firm's exercise of EEA rights, and may in particular provide for the application (with or without modification) of any provision of, or made under, this Act in relation to an activity of a UK firm.

(2) Regulations may—

(a) make provision as to any change (or proposed change) of a prescribed kind relating to a UK firm or to an activity that it carries on and as to the procedure to be followed in relation to such cases;

(b) make provision with respect to the consequences of the firm's failure to comply with a provision of the regulations.

(3) Where a provision of the kind mentioned in sub-paragraph (2) requires the Authority's consent to a change (or proposed change)—

(a) consent may be refused only on prescribed grounds; and

(b) if the Authority decides to refuse consent, the firm concerned may refer the matter to the Tribunal.

23.—(1) Sub-paragraph (2) applies if a UK firm—

(a) has a Part IV permission; and

(b) is exercising an EEA right to carry on any Consumer Credit Act business in an EEA State other than the United Kingdom.

(2) The Authority may exercise its power under section 45 in respect of the firm if the Director of Fair Trading has informed the Authority that—

(a) the firm,

(b) any of the firm's employees, agents or associates (whether past or present), or

(c) if the firm is a body corporate, a controller of the firm or an associate of such a controller,

has done any of the things specified in paragraphs (a) to (d) of section 25(2) of the Consumer Credit Act 1974. 1974 c. 39.

(3) "Associate", "Consumer Credit Act business" and "controller" have the same meaning as in section 203.

24.—(1) Sub-paragraph (2) applies if a UK firm—

(a) is not required to have a Part IV permission in relation to the business which it is carrying on; and

(b) is exercising the right conferred by Article 18.2 of the second banking co-ordination directive to carry on that business in an EEA State other than the United Kingdom.

(2) If requested to do so by the host state regulator in the EEA State in which the UK firm's business is being carried on, the Authority may impose any requirement in relation to the firm which it could impose if—

(a) the firm had a Part IV permission in relation to the business which it is carrying on; and

(b) the Authority was entitled to exercise its power under that Part to vary that permission.

Section 31(1)(c).

SCHEDULE 4

TREATY RIGHTS

Definitions

1. In this Schedule—

"consumers" means persons who are consumers for the purposes of section 138;

"Treaty firm" means a person—

(a) whose head office is situated in an EEA State (its "home state") other than the United Kingdom; and

(b) which is recognised under the law of that State as its national; and

"home state regulator", in relation to a Treaty firm, means the competent authority of the firm's home state for the purpose of its home state authorisation (as to which see paragraph 3(1)(a)).

Firms qualifying for authorisation

2. Once a Treaty firm which is seeking to carry on a regulated activity satisfies the conditions set out in paragraph 3(1), it qualifies for authorisation.

Exercise of Treaty rights

3.—(1) The conditions are that—

(a) the firm has received authorisation ("home state authorisation") under the law of its home state to carry on the regulated activity in question ("the permitted activity");

(b) the relevant provisions of the law of the firm's home state—

(i) afford equivalent protection; or

(ii) satisfy the conditions laid down by a Community instrument for the co-ordination or approximation of laws, regulations or administrative provisions of member States relating to the carrying on of that activity; and

(c) the firm has no EEA right to carry on that activity in the manner in which it is seeking to carry it on.

(2) A firm is not to be regarded as having home state authorisation unless its home state regulator has so informed the Authority in writing.

(3) Provisions afford equivalent protection if, in relation to the firm's carrying on of the permitted activity, they afford consumers protection which is at least equivalent to that afforded by or under this Act in relation to that activity.

(4) A certificate issued by the Treasury that the provisions of the law of a particular EEA State afford equivalent protection in relation to the activities specified in the certificate is conclusive evidence of that fact.

Permission

4.—(1) On qualifying for authorisation under this Schedule, a Treaty firm has permission to carry on each permitted activity through its United Kingdom branch or by providing services in the United Kingdom.

(2) The permission is to be treated as being on terms equivalent to those to which the firm's home state authorisation is subject.

(3) If, on qualifying for authorisation under this Schedule, a firm has a Part IV permission which includes permission to carry on a permitted activity, the Authority must give a direction cancelling the permission so far as it relates to that activity.

(4) The Authority need not give a direction under sub-paragraph (3) if it considers that there are good reasons for not doing so.

Notice to Authority

5.—(1) Sub-paragraph (2) applies to a Treaty firm which—

(a) qualifies for authorisation under this Schedule, but

(b) is not carrying on in the United Kingdom the regulated activity, or any of the regulated activities, which it has permission to carry on there.

(2) At least seven days before it begins to carry on such a regulated activity, the firm must give the Authority written notice of its intention to do so.

(3) If a Treaty firm to which sub-paragraph (2) applies has given notice under that sub-paragraph, it need not give such a notice if it again becomes a firm to which that sub-paragraph applies.

(4) Subsections (1), (3) and (6) of section 51 apply to a notice under sub-paragraph (2) as they apply to an application for a Part IV permission.

Offences

6.—(1) A person who contravenes paragraph 5(2) is guilty of an offence.

(2) In proceedings against a person for an offence under sub-paragraph (1) it is a defence for him to show that he took all reasonable precautions and exercised all due diligence to avoid committing the offence.

(3) A person is guilty of an offence if in, or in connection with, a notice given by him under paragraph 5(2) he—

(a) provides information which he knows to be false or misleading in a material particular; or

(b) recklessly provides information which is false or misleading in a material particular.

(4) A person guilty of an offence under this paragraph is liable—

(a) on summary conviction, to a fine not exceeding the statutory maximum;

(b) on conviction on indictment, to a fine.

Section 36.

SCHEDULE 5

PERSONS CONCERNED IN COLLECTIVE INVESTMENT SCHEMES

Authorisation

1.—(1) A person who for the time being is an operator, trustee or depositary of a recognised collective investment scheme is an authorised person.

(2) "Recognised" means recognised by virtue of section 264.

(3) An authorised open-ended investment company is an authorised person.

Permission

2.—(1) A person authorised as a result of paragraph 1(1) has permission to carry on, so far as it is a regulated activity—

(a) any activity, appropriate to the capacity in which he acts in relation to the scheme, of the kind described in paragraph 8 of Schedule 2;

(b) any activity in connection with, or for the purposes of, the scheme.

(2) A person authorised as a result of paragraph 1(3) has permission to carry on, so far as it is a regulated activity—

(a) the operation of the scheme;

(b) any activity in connection with, or for the purposes of, the operation of the scheme.

Section 41.

SCHEDULE 6

THRESHOLD CONDITIONS

PART I

PART IV PERMISSION

Legal status

1.—(1) If the regulated activity concerned is the effecting or carrying out of contracts of insurance the authorised person must be a body corporate, a registered friendly society or a member of Lloyd's.

(2) If the person concerned appears to the Authority to be seeking to carry on, or to be carrying on, a regulated activity constituting accepting deposits, it must be—

(a) a body corporate; or

(b) a partnership.

Location of offices

2.—(1) If the person concerned is a body corporate constituted under the law of any part of the United Kingdom—

(a) its head office, and

(b) if it has a registered office, that office,

must be in the United Kingdom.

(2) If the person concerned has its head office in the United Kingdom but is not a body corporate, it must carry on business in the United Kingdom.

Close links

3.—(1) If the person concerned (“A”) has close links with another person (“CL”) the Authority must be satisfied—

(a) that those links are not likely to prevent the Authority’s effective supervision of A; and

(b) if it appears to the Authority that CL is subject to the laws, regulations or administrative provisions of a territory which is not an EEA State (“the foreign provisions”), that neither the foreign provisions, nor any deficiency in their enforcement, would prevent the Authority’s effective supervision of A.

(2) A has close links with CL if—

(a) CL is a parent undertaking of A;

(b) CL is a subsidiary undertaking of A;

(c) CL is a parent undertaking of a subsidiary undertaking of A;

(d) CL is a subsidiary undertaking of a parent undertaking of A;

(e) CL owns or controls 20% or more of the voting rights or capital of A; or

(f) A owns or controls 20% or more of the voting rights or capital of CL.

(3) “Subsidiary undertaking” includes all the instances mentioned in Article 1(1) and (2) of the Seventh Company Law Directive in which an entity may be a subsidiary of an undertaking.

Adequate resources

4.—(1) The resources of the person concerned must, in the opinion of the Authority, be adequate in relation to the regulated activities that he seeks to carry on, or carries on.

(2) In reaching that opinion, the Authority may—

(a) take into account the person’s membership of a group and any effect which that membership may have; and

(b) have regard to—

(i) the provision he makes and, if he is a member of a group, which other members of the group make in respect of liabilities (including contingent and future liabilities); and

(ii) the means by which he manages and, if he is a member of a group, which other members of the group manage the incidence of risk in connection with his business.

Suitability

5. The person concerned must satisfy the Authority that he is a fit and proper person having regard to all the circumstances, including—

(a) his connection with any person;

(b) the nature of any regulated activity that he carries on or seeks to carry on; and

(c) the need to ensure that his affairs are conducted soundly and prudently.

PART II

AUTHORISATION

Authorisation under Schedule 3

6. In relation to an EEA firm qualifying for authorisation under Schedule 3, the conditions set out in paragraphs 1 and 3 to 5 apply, so far as relevant, to—

(a) an application for permission under Part IV;

(b) exercise of the Authority's own-initiative power under section 45 in relation to a Part IV permission.

Authorisation under Schedule 4

7. In relation to a person who qualifies for authorisation under Schedule 4, the conditions set out in paragraphs 1 and 3 to 5 apply, so far as relevant, to—

(a) an application for an additional permission;

(b) the exercise of the Authority's own-initiative power under section 45 in relation to additional permission.

PART III

ADDITIONAL CONDITIONS

8.—(1) If this paragraph applies to the person concerned, he must, for the purposes of such provisions of this Act as may be specified, satisfy specified additional conditions.

(2) This paragraph applies to a person who—

(a) has his head office outside the EEA; and

(b) appears to the Authority to be seeking to carry on a regulated activity relating to insurance business.

(3) "Specified" means specified in, or in accordance with, an order made by the Treasury.

9. The Treasury may by order—

(a) vary or remove any of the conditions set out in Parts I and II;

(b) add to those conditions.

Section 72(2).

SCHEDULE 7

THE AUTHORITY AS COMPETENT AUTHORITY FOR PART VI

General

1. This Act applies in relation to the Authority when it is exercising functions under Part VI as the competent authority subject to the following modifications.

The Authority's general functions

2. In section 2—

(a) subsection (4)(a) does not apply to listing rules;

(b) subsection (4)(c) does not apply to general guidance given in relation to Part VI; and

(c) subsection (4)(d) does not apply to functions under Part VI.

Duty to consult

3. Section 8 does not apply.

Rules

4.—(1) Sections 149, 153, 154 and 156 do not apply.

(2) Section 155 has effect as if—

(a) the reference in subsection (2)(c) to the general duties of the Authority under section 2 were a reference to its duty under section 73; and

(b) section 99 were included in the provisions referred to in subsection (9).

Statements of policy

5.—(1) Paragraph 5 of Schedule 1 has effect as if the requirement to act through the Authority's governing body applied also to the exercise of its functions of publishing statements under section 93.

(2) Paragraph 1 of Schedule 1 has effect as if section 93 were included in the provisions referred to in sub-paragraph (2)(d).

Penalties

6. Paragraph 16 of Schedule 1 does not apply in relation to penalties under Part VI (for which separate provision is made by section 100).

Fees

7. Paragraph 17 of Schedule 1 does not apply in relation to fees payable under Part VI (for which separate provision is made by section 99).

Exemption from liability in damages

8. Schedule 1 has effect as if—

(a) sub-paragraph (1) of paragraph 19 were omitted (similar provision being made in relation to the competent authority by section 102); and

(b) for the words from the beginning to "(a)" in sub-paragraph (3) of that paragraph, there were substituted "Sub-paragraph (2) does not apply".

SCHEDULE 8

Section 72(3).

TRANSFER OF FUNCTIONS UNDER PART VI

The power to transfer

1.—(1) The Treasury may by order provide for any function conferred on the competent authority which is exercisable for the time being by a particular person to be transferred so as to be exercisable by another person.

(2) An order may be made under this paragraph only if—

(a) the person from whom the relevant functions are to be transferred has agreed in writing that the order should be made;

(b) the Treasury are satisfied that the manner in which, or efficiency with which, the functions are discharged would be significantly improved if they were transferred to the transferee; or

(c) the Treasury are satisfied that it is otherwise in the public interest that the order should be made.

Supplemental

2.—(1) An order under this Schedule does not affect anything previously done by any person ("the previous authority") in the exercise of functions which are transferred by the order to another person ("the new authority").

(2) Such an order may, in particular, include provision—

(a) modifying or excluding any provision of Part VI, IX or XXVI in its application to any such functions;

(b) for reviews similar to that made, in relation to the Authority, by section 12;

(c) imposing on the new authority requirements similar to those imposed, in relation to the Authority, by sections 152, 155 and 354;

(d) as to the giving of guidance by the new authority;

(e) for the delegation by the new authority of the exercise of functions under Part VI and as to the consequences of delegation;

(f) for the transfer of any property, rights or liabilities relating to any such functions from the previous authority to the new authority;

(g) for the carrying on and completion by the new authority of anything in the process of being done by the previous authority when the order takes effect;

(h) for the substitution of the new authority for the previous authority in any instrument, contract or legal proceedings;

(i) for the transfer of persons employed by the previous authority to the new authority and as to the terms on which they are to transfer;

(j) making such amendments to any primary or subordinate legislation (including any provision of, or made under, this Act) as the Treasury consider appropriate in consequence of the transfer of functions effected by the order.

(3) Nothing in this paragraph is to be taken as restricting the powers conferred by section 428.

3. If the Treasury have made an order under paragraph 1 ("the transfer order") they may, by a separate order made under this paragraph, make any provision of a kind that could have been included in the transfer order.

Section 87(5).

SCHEDULE 9

NON-LISTING PROSPECTUSES

General application of Part VI

1. The provisions of Part VI apply in relation to a non-listing prospectus as they apply in relation to listing particulars but with the modifications made by this Schedule.

References to listing particulars

2.—(1) Any reference to listing particulars is to be read as a reference to a prospectus.

(2) Any reference to supplementary listing particulars is to be read as a reference to a supplementary prospectus.

General duty of disclosure

3.—(1) In section 80(1), for "section 79" substitute "section 87".

(2) In section 80(2), omit "as a condition of the admission of the securities to the official list".

Supplementary prospectuses

4. In section 81(1), for "section 79 and before the commencement of dealings in the securities concerned following their admission to the official list" substitute "section 87 and before the end of the period during which the offer to which the prospectus relates remains open".

Exemption from liability for compensation

5.—(1) In paragraphs 1(3) and 2(3) of Schedule 10, for paragraph (d) substitute—

"(d) the securities were acquired after such a lapse of time that he ought in the circumstances to be reasonably excused and, if the securities are dealt in on an approved exchange, he continued in that belief until after the commencement of dealings in the securities on that exchange."

(2) After paragraph 8 of that Schedule, insert—

"Meaning of "approved exchange"

9. "Approved exchange" has such meaning as may be prescribed."

Advertisements

6. In section 98(1), for "If listing particulars are, or are to be, published in connection with an application for listing," substitute "If a prospectus is, or is to be, published in connection with an application for approval, then, until the end of the period during which the offer to which the prospectus relates remains open,".

Fees

7. Listing rules made under section 99 may require the payment of fees to the competent authority in respect of a prospectus submitted for approval under section 87.

SCHEDULE 10

Section 90(2) and (5).

COMPENSATION: EXEMPTIONS

Statements believed to be true

1.—(1) In this paragraph "statement" means—

(a) any untrue or misleading statement in listing particulars; or

(b) the omission from listing particulars of any matter required to be included by section 80 or 81.

(2) A person does not incur any liability under section 90(1) for loss caused by a statement if he satisfies the court that, at the time when the listing particulars were submitted to the competent authority, he reasonably believed (having made such enquiries, if any, as were reasonable) that—

(a) the statement was true and not misleading, or

(b) the matter whose omission caused the loss was properly omitted,

and that one or more of the conditions set out in sub-paragraph (3) are satisfied.

(3) The conditions are that—

(a) he continued in his belief until the time when the securities in question were acquired;

(b) they were acquired before it was reasonably practicable to bring a correction to the attention of persons likely to acquire them;

(c) before the securities were acquired, he had taken all such steps as it was reasonable for him to have taken to secure that a correction was brought to the attention of those persons;

(d) he continued in his belief until after the commencement of dealings in the securities following their admission to the official list and they were acquired after such a lapse of time that he ought in the circumstances to be reasonably excused.

Statements by experts

2.—(1) In this paragraph "statement" means a statement included in listing particulars which—

(a) purports to be made by, or on the authority of, another person as an expert; and

(b) is stated to be included in the listing particulars with that other person's consent.

(2) A person does not incur any liability under section 90(1) for loss in respect of any securities caused by a statement if he satisfies the court that, at the time when the listing particulars were submitted to the competent authority, he reasonably believed that the other person—

(a) was competent to make or authorise the statement, and

(b) had consented to its inclusion in the form and context in which it was included,

and that one or more of the conditions set out in sub-paragraph (3) are satisfied.

(3) The conditions are that—

(a) he continued in his belief until the time when the securities were acquired;

(b) they were acquired before it was reasonably practicable to bring the fact that the expert was not competent, or had not consented, to the attention of persons likely to acquire the securities in question;

(c) before the securities were acquired he had taken all such steps as it was reasonable for him to have taken to secure that that fact was brought to the attention of those persons;

(d) he continued in his belief until after the commencement of dealings in the securities following their admission to the official list and they were acquired after such a lapse of time that he ought in the circumstances to be reasonably excused.

Corrections of statements

3.—(1) In this paragraph "statement" has the same meaning as in paragraph 1.

(2) A person does not incur liability under section 90(1) for loss caused by a statement if he satisfies the court—

(a) that before the securities in question were acquired, a correction had been published in a manner calculated to bring it to the attention of persons likely to acquire the securities; or

(b) that he took all such steps as it was reasonable for him to take to secure such publication and reasonably believed that it had taken place before the securities were acquired.

(3) Nothing in this paragraph is to be taken as affecting paragraph 1.

Corrections of statements by experts

4.—(1) In this paragraph "statement" has the same meaning as in paragraph 2.

(2) A person does not incur liability under section 90(1) for loss caused by a statement if he satisfies the court—

(a) that before the securities in question were acquired, the fact that the expert was not competent or had not consented had been published in a manner calculated to bring it to the attention of persons likely to acquire the securities; or

(b) that he took all such steps as it was reasonable for him to take to secure such publication and reasonably believed that it had taken place before the securities were acquired.

(3) Nothing in this paragraph is to be taken as affecting paragraph 2.

Official statements

5. A person does not incur any liability under section 90(1) for loss resulting from—

(a) a statement made by an official person which is included in the listing particulars, or

(b) a statement contained in a public official document which is included in the listing particulars,

if he satisfies the court that the statement is accurately and fairly reproduced.

False or misleading information known about

6. A person does not incur any liability under section 90(1) or (4) if he satisfies the court that the person suffering the loss acquired the securities in question with knowledge—

(a) that the statement was false or misleading,

(b) of the omitted matter, or

(c) of the change or new matter,

as the case may be.

Belief that supplementary listing particulars not called for

7. A person does not incur any liability under section 90(4) if he satisfies the court that he reasonably believed that the change or new matter in question was not such as to call for supplementary listing particulars.

Meaning of "expert"

8. "Expert" includes any engineer, valuer, accountant or other person whose profession, qualifications or experience give authority to a statement made by him.

Section 103(6).

SCHEDULE 11

OFFERS OF SECURITIES

The general rule

1.—(1) A person offers securities to the public in the United Kingdom if—

(a) to the extent that the offer is made to persons in the United Kingdom, it is made to the public; and

(b) the offer is not an exempt offer.

(2) For this purpose, an offer which is made to any section of the public, whether selected—

(a) as members or debenture holders of a body corporate,

(b) as clients of the person making the offer, or

(c) in any other manner,

is to be regarded as made to the public.

Exempt offers

2.—(1) For the purposes of this Schedule, an offer of securities is an "exempt offer" if, to the extent that the offer is made to persons in the United Kingdom—

(a) the condition specified in any of paragraphs 3 to 24 is satisfied in relation to the offer; or

(b) the condition specified in one relevant paragraph is satisfied in relation to part, but not the whole, of the offer and, in relation to each other part of the offer, the condition specified in a different relevant paragraph is satisfied.

(2) The relevant paragraphs are 3 to 8, 12 to 18 and 21.

Offers for business purposes

3. The securities are offered to persons—

(a) whose ordinary activities involve them in acquiring, holding, managing or disposing of investments (as principal or agent) for the purposes of their businesses, or

(b) who it is reasonable to expect will acquire, hold, manage or dispose of investments (as principal or agent) for the purposes of their businesses,

or are otherwise offered to persons in the context of their trades, professions or occupations.

Offers to limited numbers

4.—(1) The securities are offered to no more than fifty persons.

(2) In determining whether this condition is satisfied, the offer is to be taken together with any other offer of the same securities which was—

(a) made by the same person;

(b) open at any time within the period of 12 months ending with the date on which the offer is first made; and

(c) not an offer to the public in the United Kingdom by virtue of this condition being satisfied.

(3) For the purposes of this paragraph—

(a) the making of an offer of securities to trustees or members of a partnership in their capacity as such, or

(b) the making of such an offer to any other two or more persons jointly,

is to be treated as the making of an offer to a single person.

Clubs and associations

5. The securities are offered to the members of a club or association (whether or not incorporated) and the members can reasonably be regarded as having a common interest with each other and with the club or association in the affairs of the club or association and in what is to be done with the proceeds of the offer.

Restricted circles

6.—(1) The securities are offered to a restricted circle of persons whom the offeror reasonably believes to be sufficiently knowledgeable to understand the risks involved in accepting the offer.

(2) In determining whether a person is sufficiently knowledgeable to understand the risks involved in accepting an offer of securities, any information supplied by the person making the offer is to be disregarded, apart from information about—

(a) the issuer of the securities; or

(b) if the securities confer the right to acquire other securities, the issuer of those other securities.

Underwriting agreements

7. The securities are offered in connection with a genuine invitation to enter into an underwriting agreement with respect to them.

Offers to public authorities

8.—(1) The securities are offered to a public authority.

(2) "Public authority" means—

(a) the government of the United Kingdom;

(b) the government of any country or territory outside the United Kingdom;

(c) a local authority in the United Kingdom or elsewhere;

(d) any international organisation the members of which include the United Kingdom or another EEA State; and

(e) such other bodies, if any, as may be specified.

Maximum consideration

9.—(1) The total consideration payable for the securities cannot exceed 40,000 euros (or an equivalent amount).

(2) In determining whether this condition is satisfied, the offer is to be taken together with any other offer of the same securities which was—

(a) made by the same person;

(b) open at any time within the period of 12 months ending with the date on which the offer is first made; and

(c) not an offer to the public in the United Kingdom by virtue of this condition being satisfied.

(3) An amount (in relation to an amount denominated in euros) is an "equivalent amount" if it is an amount of equal value, calculated at the latest

SCH. 11

practicable date before (but in any event not more than 3 days before) the date on which the offer is first made, denominated wholly or partly in another currency or unit of account.

Minimum consideration

10.—(1) The minimum consideration which may be paid by any person for securities acquired by him pursuant to the offer is at least 40,000 euros (or an equivalent amount).

(2) Paragraph 9(3) also applies for the purposes of this paragraph.

Securities denominated in euros

11.—(1) The securities are denominated in amounts of at least 40,000 euros (or an equivalent amount).

(2) Paragraph 9(3) also applies for the purposes of this paragraph.

Takeovers

12.—(1) The securities are offered in connection with a takeover offer.

(2) "Takeover offer" means—

(a) an offer to acquire shares in a body incorporated in the United Kingdom which is a takeover offer within the meaning of the takeover provisions (or would be such an offer if those provisions applied in relation to any body corporate);

(b) an offer to acquire all or substantially all of the shares, or of the shares of a particular class, in a body incorporated outside the United Kingdom; or

(c) an offer made to all the holders of shares, or of shares of a particular class, in a body corporate to acquire a specified proportion of those shares.

(3) "The takeover provisions" means—

1985 c. 6. (a) Part XIIIA of the Companies Act 1985; or

S.I. 1986/1032 (N.I. 6). (b) in relation to Northern Ireland, Part XIVA of the Companies (Northern Ireland) Order 1986.

(4) For the purposes of sub-paragraph (2)(b), any shares which the offeror or any associate of his holds or has contracted to acquire are to be disregarded.

(5) For the purposes of sub-paragraph (2)(c), the following are not to be regarded as holders of the shares in question—

(a) the offeror;

(b) any associate of the offeror; and

(c) any person whose shares the offeror or any associate of the offeror has contracted to acquire.

(6) "Associate" has the same meaning as in—

(a) section 430E of the Companies Act 1985; or

(b) in relation to Northern Ireland, Article 423E of the Companies (Northern Ireland) Order 1986.

Mergers

13. The securities are offered in connection with a merger (within the meaning of Council Directive No. 78/855/EEC).

Free shares

14.—(1) The securities are shares and are offered free of charge to any or all of the holders of shares in the issuer.

(2) "Holders of shares" means the persons who at the close of business on a date—

(a) specified in the offer, and

(b) falling within the period of 60 days ending with the date on which the offer is first made,

were holders of such shares.

Exchange of shares

15. The securities—

(a) are shares, or investments of a specified kind relating to shares, in a body corporate, and

(b) are offered in exchange for shares in the same body corporate,

and the offer cannot result in any increase in the issued share capital of the body corporate.

Qualifying persons

16.—(1) The securities are issued by a body corporate and are offered—

(a) by the issuer, by a body corporate connected with the issuer or by a relevant trustee;

(b) only to qualifying persons; and

(c) on terms that a contract to acquire any such securities may be entered into only by the qualifying person to whom they were offered or, if the terms of the offer so permit, any qualifying person.

(2) A person is a "qualifying person", in relation to an issuer, if he is a genuine employee or former employee of the issuer or of another body corporate in the same group or the wife, husband, widow, widower or child or stepchild under the age of eighteen of such an employee or former employee.

(3) In relation to an issuer of securities, "connected with" has such meaning as may be prescribed.

(4) "Group" and "relevant trustee" have such meaning as may be prescribed.

Convertible securities

17.—(1) The securities result from the conversion of convertible securities and listing particulars (or a prospectus) relating to the convertible securities were (or was) published in the United Kingdom under or by virtue of Part VI or such other provisions applying in the United Kingdom as may be specified.

(2) "Convertible securities" means securities of a specified kind which can be converted into, or exchanged for, or which confer rights to acquire, other securities.

(3) "Conversion" means conversion into or exchange for, or the exercise of rights conferred by the securities to acquire, other securities.

Charities

18. The securities are issued by—

(a) a charity within the meaning of—

(i) section 96(1) of the Charities Act 1993, or 1993 c. 10.

(ii) section 35 of the Charities Act (Northern Ireland) 1964, 1964 c. 33 (N.I.)

1990 c. 40.

(b) a recognised body within the meaning of section 1(7) of the Law Reform (Miscellaneous Provisions) (Scotland) Act 1990,

(c) a housing association within the meaning of—

1985 c. 68.

(i) section 5(1) of the Housing Act 1985,

1985 c. 69

(ii) section 1 of the Housing Associations Act 1985, or

S.I. 1992/1725 (N.I. 10).

(iii) Article 3 of the Housing (Northern Ireland) Order 1992,

(d) an industrial or provident society registered in accordance with—

1965 c. 12.

(i) section 1(2)(b) of the Industrial and Provident Societies Act 1965, or

1969 c. 24 (N.I.).

(ii) section 1(2)(b) of the Industrial and Provident Societies Act 1969, or

(e) a non-profit making association or body, recognised by the country or territory in which it is established, with objectives similar to those of a body falling within any of paragraphs (a) to (c),

and the proceeds of the offer will be used for the purposes of the issuer's objectives.

Building societies etc.

19. The securities offered are shares which are issued by, or ownership of which entitles the holder to membership of or to obtain the benefit of services provided by—

(a) a building society incorporated under the law of, or of any part of, the United Kingdom;

(b) any body incorporated under the law of, or of any part of, the United Kingdom relating to industrial and provident societies or credit unions; or

(c) a body of a similar nature established in another EEA State.

Euro-securities

20.—(1) The securities offered are Euro-securities and no advertisement relating to the offer is issued in the United Kingdom, or is caused to be so issued—

(a) by the issuer of the Euro-securities;

(b) by any credit institution or other financial institution through which the Euro-securities may be acquired pursuant to the offer; or

(c) by any body corporate which is a member of the same group as the issuer or any of those institutions.

(2) But sub-paragraph (1) does not apply to an advertisement of a prescribed kind.

(3) "Euro-securities" means investments which—

(a) are to be underwritten and distributed by a syndicate at least two of the members of which have their registered offices in different countries or territories;

(b) are to be offered on a significant scale in one or more countries or territories, other than the country or territory in which the issuer has its registered office; and

(c) may be acquired pursuant to the offer only through a credit institution or other financial institution.

(4) "Credit institution" means a credit institution as defined in Article 1 of Council Directive No 77/780/EEC.

(5) "Financial institution" means a financial institution as defined in Article 1 of Council Directive No 89/646/EEC.

(6) "Underwritten" means underwritten by whatever means, including by acquisition or subscription, with a view to resale.

Same class securities

21. The securities are of the same class, and were issued at the same time, as securities in respect of which a prospectus has been published under or by virtue of—

(a) Part VI;

(b) Part III of the Companies Act 1985; or 1985 c. 6.

(c) such other provisions applying in the United Kingdom as may be specified.

Short date securities

22. The securities are investments of a specified kind with a maturity of less than one year from their date of issue.

Government and public securities

23.—(1) The securities are investments of a specified kind creating or acknowledging indebtedness issued by or on behalf of a public authority.

(2) "Public authority" means—

(a) the government of the United Kingdom;

(b) the government of any country or territory outside the United Kingdom;

(c) a local authority in the United Kingdom or elsewhere;

(d) any international organisation the members of which include the United Kingdom or another EEA State; and

(e) such other bodies, if any, as may be specified.

Non-transferable securities

24. The securities are not transferable.

General definitions

25. For the purposes of this Schedule—

"shares" has such meaning as may be specified; and

"specified" means specified in an order made by the Treasury.

SCHEDULE 12

Sections 111(2) and 115.

TRANSFER SCHEMES: CERTIFICATES

PART I

INSURANCE BUSINESS TRANSFER SCHEMES

1.—(1) For the purposes of section 111(2) the appropriate certificates, in relation to an insurance business transfer scheme, are—

(a) a certificate under paragraph 2;

(b) if sub-paragraph (2) applies, a certificate under paragraph 3;

(c) if sub-paragraph (3) applies, a certificate under paragraph 4;

(d) if sub-paragraph (4) applies, a certificate under paragraph 5.

(2) This sub-paragraph applies if—

(a) the authorised person concerned is a UK authorised person which has received authorisation under Article 6 of the first life insurance directive or of the first non-life insurance directive from the Authority; and

(b) the establishment from which the business is to be transferred under the proposed insurance business transfer scheme is in an EEA State other than the United Kingdom.

(3) This sub-paragraph applies if—

(a) the authorised person concerned has received authorisation under Article 6 of the first life insurance directive from the Authority;

(b) the proposed transfer relates to business which consists of the effecting or carrying out of contracts of long-term insurance; and

(c) as regards any policy which is included in the proposed transfer and which evidences a contract of insurance (other than reinsurance), an EEA State other than the United Kingdom is the State of the commitment.

(4) This sub-paragraph applies if—

(a) the authorised person concerned has received authorisation under Article 6 of the first non-life insurance directive from the Authority;

(b) the business to which the proposed insurance business transfer scheme relates is business which consists of the effecting or carrying out of contracts of general insurance; and

(c) as regards any policy which is included in the proposed transfer and which evidences a contract of insurance (other than reinsurance), the risk is situated in an EEA State other than the United Kingdom.

Certificates as to margin of solvency

2.—(1) A certificate under this paragraph is to be given—

(a) by the relevant authority; or

(b) in a case in which there is no relevant authority, by the Authority.

(2) A certificate given under sub-paragraph (1)(a) is one certifying that, taking the proposed transfer into account—

(a) the transferee possesses, or will possess before the scheme takes effect, the necessary margin of solvency; or

(b) there is no necessary margin of solvency applicable to the transferee.

(3) A certificate under sub-paragraph (1)(b) is one certifying that the Authority has received from the authority which it considers to be the authority responsible for supervising persons who effect or carry out contracts of insurance in the place to which the business is to be transferred that, taking the proposed transfer into account—

(a) the transferee possesses or will possess before the scheme takes effect the margin of solvency required under the law applicable in that place; or

(b) there is no such margin of solvency applicable to the transferee .

(4) "Necessary margin of solvency" means the margin of solvency required in relation to the transferee, taking the proposed transfer into account, under the law which it is the responsibility of the relevant authority to apply.

(5) "Margin of solvency" means the excess of the value of the assets of the transferee over the amount of its liabilities.

(6) "Relevant authority" means—

(a) if the transferee is an EEA firm falling within paragraph 5(d) of Schedule 3, its home state regulator;

(b) if the transferee is a Swiss general insurer, the authority responsible in Switzerland for supervising persons who effect or carry out contracts of insurance;

(c) if the transferee is an authorised person not falling within paragraph (a) or (b), the Authority.

(7) In sub-paragraph (6), any reference to a transferee of a particular description includes a reference to a transferee who will be of that description if the proposed scheme takes effect.

(8) "Swiss general insurer" means a body—

(a) whose head office is in Switzerland;

(b) which has permission to carry on regulated activities consisting of the effecting and carrying out of contracts of general insurance; and

(c) whose permission is not restricted to the effecting or carrying out of contracts of reinsurance.

Certificates as to consent

3. A certificate under this paragraph is one given by the Authority and certifying that the host State regulator has been notified of the proposed scheme and that—

(a) that regulator has responded to the notification; or

(b) that it has not responded but the period of three months beginning with the notification has elapsed.

Certificates as to long-term business

4. A certificate under this paragraph is one given by the Authority and certifying that the authority responsible for supervising persons who effect or carry out contracts of insurance in the State of the commitment has been notified of the proposed scheme and that—

(a) that authority has consented to the proposed scheme; or

(b) the period of three months beginning with the notification has elapsed and that authority has not refused its consent.

Certificates as to general business

5. A certificate under this paragraph is one given by the Authority and certifying that the authority responsible for supervising persons who effect or carry out contracts of insurance in the EEA State in which the risk is situated has been notified of the proposed scheme and that—

(a) that authority has consented to the proposed scheme; or

(b) the period of three months beginning with the notification has elapsed and that authority has not refused its consent.

Interpretation of Part I

6.—(1) "State of the commitment", in relation to a commitment entered into at any date, means—

(a) if the policyholder is an individual, the State in which he had his habitual residence at that date;

(b) if the policyholder is not an individual, the State in which the establishment of the policyholder to which the commitment relates was situated at that date.

(2) "Commitment" means a commitment represented by contracts of insurance of a prescribed class.

(3) References to the EEA State in which a risk is situated are—

(a) if the insurance relates to a building or to a building and its contents (so far as the contents are covered by the same policy), to the EEA State in which the building is situated;

(b) if the insurance relates to a vehicle of any type, to the EEA State of registration;

(c) in the case of policies of a duration of four months or less covering travel or holiday risks (whatever the class concerned), to the EEA State in which the policyholder took out the policy;

(d) in a case not covered by paragraphs (a) to (c)—

(i) if the policyholder is an individual, to the EEA State in which he has his habitual residence at the date when the contract is entered into; and

(ii) otherwise, to the EEA State in which the establishment of the policyholder to which the policy relates is situated at that date.

PART II

BANKING BUSINESS TRANSFER SCHEMES

7.—(1) For the purposes of section 111(2) the appropriate certificates, in relation to a banking business transfer scheme, are—

(a) a certificate under paragraph 8; and

(b) if sub-paragraph (2) applies, a certificate under paragraph 9.

(2) This sub-paragraph applies if the authorised person concerned or the transferee is an EEA firm falling within paragraph 5(b) of Schedule 3.

Certificates as to financial resources

8.—(1) A certificate under this paragraph is one given by the relevant authority and certifying that, taking the proposed transfer into account, the transferee possesses, or will possess before the scheme takes effect, adequate financial resources.

(2) "Relevant authority" means—

(a) if the transferee is a person with a Part IV permission or with permission under Schedule 4, the Authority;

(b) if the transferee is an EEA firm falling within paragraph 5(b) of Schedule 3, its home state regulator;

(c) if the transferee does not fall within paragraph (a) or (b), the authority responsible for the supervision of the transferee's business in the place in which the transferee has its head office.

(3) In sub-paragraph (2), any reference to a transferee of a particular description of person includes a reference to a transferee who will be of that description if the proposed banking business transfer scheme takes effect.

Certificates as to consent of home state regulator

9. A certificate under this paragraph is one given by the Authority and certifying that the home State regulator of the authorised person concerned or of the transferee has been notified of the proposed scheme and that—

(a) the home State regulator has responded to the notification; or

(b) the period of three months beginning with the notification has elapsed.

PART III

INSURANCE BUSINESS TRANSFERS EFFECTED OUTSIDE THE UNITED KINGDOM

10.—(1) This paragraph applies to a proposal to execute under provisions corresponding to Part VII in a country or territory other than the United Kingdom an instrument transferring all the rights and obligations of the transferor under general or long-term insurance policies, or under such descriptions of such policies as may be specified in the instrument, to the transferee if any of the conditions in sub-paragraphs (2), (3) or (4) is met in relation to it.

(2) The transferor is an EEA firm falling within paragraph 5(d) of Schedule 3 and the transferee is an authorised person whose margin of solvency is supervised by the Authority.

(3) The transferor is a company authorised in an EEA State other than the United Kingdom under Article 27 of the first life insurance directive, or Article 23 of the first non-life insurance directive and the transferee is a UK authorised person which has received authorisation under Article 6 of either of those directives.

(4) The transferor is a Swiss general insurer and the transferee is a UK authorised person which has received authorisation under Article 6 of the first life insurance directive or the first non-life insurance directive.

(5) In relation to a proposed transfer to which this paragraph applies, the Authority may, if it is satisfied that the transferee possesses the necessary margin of solvency, issue a certificate to that effect.

(6) "Necessary margin of solvency" means the margin of solvency which the transferee, taking the proposed transfer into account, is required by the Authority to maintain.

(7) "Swiss general insurer" has the same meaning as in paragraph 2.

(8) "General policy" means a policy evidencing a contract which, if it had been effected by the transferee, would have constituted the carrying on of a regulated activity consisting of the effecting of contracts of general insurance.

(9) "Long-term policy" means a policy evidencing a contract which, if it had been effected by the transferee, would have constituted the carrying on of a regulated activity consisting of the effecting of contracts of long-term insurance.

SCHEDULE 13

Section 132(4).

THE FINANCIAL SERVICES AND MARKETS TRIBUNAL

PART I

GENERAL

Interpretation

1. In this Schedule—

"panel of chairmen" means the panel established under paragraph 3(1);

"lay panel" means the panel established under paragraph 3(4);

"rules" means rules made by the Lord Chancellor under section 132.

PART II

THE TRIBUNAL

President

2.—(1) The Lord Chancellor must appoint one of the members of the panel of chairmen to preside over the discharge of the Tribunal's functions.

(2) The member so appointed is to be known as the President of the Financial Services and Markets Tribunal (but is referred to in this Act as "the President").

(3) The Lord Chancellor may appoint one of the members of the panel of chairmen to be Deputy President.

(4) The Deputy President is to have such functions in relation to the Tribunal as the President may assign to him.

(5) The Lord Chancellor may not appoint a person to be the President or Deputy President unless that person—

(a) has a ten year general qualification within the meaning of section 71 of the Courts and Legal Services Act 1990; 1990 c. 41.

(b) is an advocate or solicitor in Scotland of at least ten years' standing; or

(c) is—

(i) a member of the Bar of Northern Ireland of at least ten years' standing; or

(ii) a solicitor of the Supreme Court of Northern Ireland of at least ten years' standing.

(6) If the President (or Deputy President) ceases to be a member of the panel of chairmen, he also ceases to be the President (or Deputy President).

(7) The functions of the President may, if he is absent or is otherwise unable to act, be discharged—

(a) by the Deputy President; or

(b) if there is no Deputy President or he too is absent or otherwise unable to act, by a person appointed for that purpose from the panel of chairmen by the Lord Chancellor.

Panels

3.—(1) The Lord Chancellor must appoint a panel of persons for the purposes of serving as chairmen of the Tribunal.

(2) A person is qualified for membership of the panel of chairmen if—

(a) he has a seven year general qualification within the meaning of section 71 of the Courts and Legal Services Act 1990;

(b) he is an advocate or solicitor in Scotland of at least seven years' standing; or

(c) he is—

(i) a member of the Bar of Northern Ireland of at least seven years' standing; or

(ii) a solicitor of the Supreme Court of Northern Ireland of at least seven years' standing.

(3) The panel of chairmen must include at least one member who is a person of the kind mentioned in sub-paragraph (2)(b).

(4) The Lord Chancellor must also appoint a panel of persons who appear to him to be qualified by experience or otherwise to deal with matters of the kind that may be referred to the Tribunal.

Terms of office etc

4.—(1) Subject to the provisions of this Schedule, each member of the panel of chairmen and the lay panel is to hold and vacate office in accordance with the terms of his appointment.

(2) The Lord Chancellor may remove a member of either panel (including the President) on the ground of incapacity or misbehaviour.

(3) A member of either panel—

(a) may at any time resign office by notice in writing to the Lord Chancellor;

(b) is eligible for re-appointment if he ceases to hold office.

Remuneration and expenses

5. The Lord Chancellor may pay to any person, in respect of his service—

(a) as a member of the Tribunal (including service as the President or Deputy President), or

(b) as a person appointed under paragraph 7(4),

such remuneration and allowances as he may determine.

Staff

6.—(1) The Lord Chancellor may appoint such staff for the Tribunal as he may determine.

(2) The remuneration of the Tribunal's staff is to be defrayed by the Lord Chancellor.

(3) Such expenses of the Tribunal as the Lord Chancellor may determine are to be defrayed by the Lord Chancellor.

PART III

CONSTITUTION OF TRIBUNAL

7.—(1) On a reference to the Tribunal, the persons to act as members of the Tribunal for the purposes of the reference are to be selected from the panel of chairmen or the lay panel in accordance with arrangements made by the President for the purposes of this paragraph ("the standing arrangements").

(2) The standing arrangements must provide for at least one member to be selected from the panel of chairmen.

(3) If while a reference is being dealt with, a person serving as member of the Tribunal in respect of the reference becomes unable to act, the reference may be dealt with by—

(a) the other members selected in respect of that reference; or

(b) if it is being dealt with by a single member, such other member of the panel of chairmen as may be selected in accordance with the standing arrangements for the purposes of the reference.

(4) If it appears to the Tribunal that a matter before it involves a question of fact of special difficulty, it may appoint one or more experts to provide assistance.

PART IV

TRIBUNAL PROCEDURE

8. For the purpose of dealing with references, or any matter preliminary or incidental to a reference, the Tribunal must sit at such times and in such place or places as the Lord Chancellor may direct.

SCH. 13

9. Rules made by the Lord Chancellor under section 132 may, in particular, include provision—

(a) as to the manner in which references are to be instituted;

(b) for the holding of hearings in private in such circumstances as may be specified in the rules;

(c) as to the persons who may appear on behalf of the parties;

(d) for a member of the panel of chairmen to hear and determine interlocutory matters arising on a reference;

(e) for the suspension of decisions of the Authority which have taken effect;

(f) as to the withdrawal of references;

(g) as to the registration, publication and proof of decisions and orders.

Practice directions

10. The President of the Tribunal may give directions as to the practice and procedure to be followed by the Tribunal in relation to references to it.

Evidence

11.—(1) The Tribunal may by summons require any person to attend, at such time and place as is specified in the summons, to give evidence or to produce any document in his custody or under his control which the Tribunal considers it necessary to examine.

(2) The Tribunal may—

(a) take evidence on oath and for that purpose administer oaths; or

(b) instead of administering an oath, require the person examined to make and subscribe a declaration of the truth of the matters in respect of which he is examined.

(3) A person who without reasonable excuse—

(a) refuses or fails—

(i) to attend following the issue of a summons by the Tribunal, or

(ii) to give evidence, or

(b) alters, suppresses, conceals or destroys, or refuses to produce a document which he may be required to produce for the purposes of proceedings before the Tribunal,

is guilty of an offence.

(4) A person guilty of an offence under sub-paragraph (3)(a) is liable on summary conviction to a fine not exceeding the statutory maximum.

(5) A person guilty of an offence under sub-paragraph (3)(b) is liable—

(a) on summary conviction, to a fine not exceeding the statutory maximum;

(b) on conviction on indictment, to imprisonment for a term not exceeding two years or a fine or both.

Decisions of Tribunal

12.—(1) A decision of the Tribunal may be taken by a majority.

(2) The decision must—

(a) state whether it was unanimous or taken by a majority;

(b) be recorded in a document which—

(i) contains a statement of the reasons for the decision; and

(ii) is signed and dated by the member of the panel of chairmen dealing with the reference.

(3) The Tribunal must—

(a) inform each party of its decision; and

(b) as soon as reasonably practicable, send to each party and, if different, to any authorised person concerned, a copy of the document mentioned in sub-paragraph (2).

(4) The Tribunal must send the Treasury a copy of its decision.

Costs

13.—(1) If the Tribunal considers that a party to any proceedings on a reference has acted vexatiously, frivolously or unreasonably it may order that party to pay to another party to the proceedings the whole or part of the costs or expenses incurred by the other party in connection with the proceedings.

(2) If, in any proceedings on a reference, the Tribunal considers that a decision of the Authority which is the subject of the reference was unreasonable it may order the Authority to pay to another party to the proceedings the whole or part of the costs or expenses incurred by the other party in connection with the proceedings.

SCHEDULE 14

Section 162.

ROLE OF THE COMPETITION COMMISSION

Provision of information by Treasury

1.—(1) The Treasury's powers under this paragraph are to be exercised only for the purpose of assisting the Commission in carrying out an investigation under section 162.

(2) The Treasury may give to the Commission—

(a) any information in their possession which relates to matters falling within the scope of the investigation; and

(b) other assistance in relation to any such matters.

(3) In carrying out an investigation under section 162, the Commission must have regard to any information given to it under this paragraph.

Consideration of matters arising on a report

2. In considering any matter arising from a report made by the Director under section 160, the Commission must have regard to—

(a) any representations made to it in connection with the matter by any person appearing to the Commission to have a substantial interest in the matter; and

(b) any cost benefit analysis prepared by the Authority (at any time) in connection with the regulatory provision or practice, or any of the regulatory provisions or practices, which are the subject of the report.

Applied provisions

3.—(1) The provisions mentioned in sub-paragraph (2) are to apply in relation to the functions of the Commission under section 162 as they apply in relation to the functions of the Commission in relation to a reference to the Commission under the Fair Trading Act 1973. 1973 c. 41.

(2) The provisions are—

(a) section 82(2), (3) and (4) of the Fair Trading Act 1973 (general provisions about reports);

SCH. 14

(b) section 85 of that Act (attendance of witnesses and production of documents);

(c) section 93B of that Act (false or misleading information);

1980 c. 21. (d) section 24 of the Competition Act 1980 (modifications of provisions about the performance of the Commission's functions);

1998 c. 41. (d) Part II of Schedule 7 to the Competition Act 1998 (performance by the Commission of its general functions).

(3) But the reference in paragraph 15(7)(b) in Schedule 7 to the 1998 Act to section 75(5) of that Act is to be read as a reference to the power of the Commission to decide not to make a report in accordance with section 162(2).

Publication of reports

4.—(1) If the Commission makes a report under section 162, it must publish it in such a way as appears to it to be best calculated to bring it to the attention of the public.

(2) Before publishing the report the Commission must, so far as practicable, exclude any matter which relates to the private affairs of a particular individual the publication of which, in the opinion of the Commission, would or might seriously and prejudicially affect his interests.

(3) Before publishing the report the Commission must, so far as practicable, also exclude any matter which relates to the affairs of a particular body the publication of which, in the opinion of the Commission, would or might seriously and prejudicially affect its interests.

(4) Sub-paragraphs (2) and (3) do not apply in relation to copies of a report which the Commission is required to send under section 162(10).

Sections 165(11) and 171(4).

SCHEDULE 15

INFORMATION AND INVESTIGATIONS: CONNECTED PERSONS

PART I

RULES FOR SPECIFIC BODIES

Corporate bodies

1. If the authorised person ("BC") is a body corporate, a person who is or has been—

(a) an officer or manager of BC or of a parent undertaking of BC;

(b) an employee of BC;

(c) an agent of BC or of a parent undertaking of BC.

Partnerships

2. If the authorised person ("PP") is a partnership, a person who is or has been a member, manager, employee or agent of PP.

Unincorporated associations

3. If the authorised person ("UA") is an unincorporated association of persons which is neither a partnership nor an unincorporated friendly society, a person who is or has been an officer, manager, employee or agent of UA.

Friendly societies

4.—(1) If the authorised person ("FS") is a friendly society, a person who is or has been an officer, manager or employee of FS.

(2) In relation to FS, "officer" and "manager" have the same meaning as in section 119(1) of the Friendly Societies Act 1992. 1992 c. 40.

Building societies

5.—(1) If the authorised person ("BS") is a building society, a person who is or has been an officer or employee of BS.

(2) In relation to BS, "officer" has the same meaning as it has in section 119(1) of the Building Societies Act 1986. 1986 c. 53.

Individuals

6. If the authorised person ("IP") is an individual, a person who is or has been an employee or agent of IP.

Application to sections 171 and 172

7. For the purposes of sections 171 and 172, if the person under investigation is not an authorised person the references in this Part of this Schedule to an authorised person are to be taken to be references to the person under investigation.

PART II

ADDITIONAL RULES

8. A person who is, or at the relevant time was, the partner, manager, employee, agent, appointed representative, banker, auditor, actuary or solicitor of—

(a) the person under investigation ("A");

(b) a parent undertaking of A;

(c) a subsidiary undertaking of A;

(d) a subsidiary undertaking of a parent undertaking of A; or

(e) a parent undertaking of a subsidiary undertaking of A.

SCHEDULE 16

Section 203(8).

PROHIBITIONS AND RESTRICTIONS IMPOSED BY DIRECTOR GENERAL OF FAIR TRADING

Preliminary

1. In this Schedule—

"appeal period" has the same meaning as in the Consumer Credit Act 1974; 1974 c. 39.

"prohibition" means a consumer credit prohibition under section 203;

"restriction" means a restriction under section 204.

Notice of prohibition or restriction

2.—(1) This paragraph applies if the Director proposes, in relation to a firm—

(a) to impose a prohibition;

(b) to impose a restriction; or

(c) to vary a restriction otherwise than with the agreement of the firm.

(2) The Director must by notice—

(a) inform the firm of his proposal, stating his reasons; and

(b) invite the firm to submit representations in accordance with paragraph 4.

(3) If he imposes the prohibition or restriction or varies the restriction, the Director may give directions authorising the firm to carry into effect agreements made before the coming into force of the prohibition, restriction or variation.

(4) A prohibition, restriction or variation is not to come into force before the end of the appeal period.

(5) If the Director imposes a prohibition or restriction or varies a restriction, he must serve a copy of the prohibition, restriction or variation—

(a) on the Authority; and

(b) on the firm's home state regulator.

Application to revoke prohibition or restriction

3.—(1) This paragraph applies if the Director proposes to refuse an application made by a firm for the revocation of a prohibition or restriction.

(2) The Director must by notice—

(a) inform the firm of the proposed refusal, stating his reasons; and

(b) invite the firm to submit representations in accordance with paragraph 4.

Representations to Director

4.—(1) If this paragraph applies to an invitation to submit representations, the Director must invite the firm, within 21 days after the notice containing the invitation is given to it or such longer period as he may allow—

(a) to submit its representations in writing to him; and

(b) to give notice to him, if the firm thinks fit, that it wishes to make representations orally.

(2) If notice is given under sub-paragraph (1)(b), the Director must arrange for the oral representations to be heard.

(3) The Director must give the firm notice of his determination.

Appeals

1974 c. 39. 5. Section 41 of the Consumer Credit Act 1974 (appeals to the Secretary of State) has effect as if—

(a) the following determinations were mentioned in column 1 of the table set out at the end of that section—

(i) imposition of a prohibition or restriction or the variation of a restriction; and

(ii) refusal of an application for the revocation of a prohibition or restriction; and

(b) the firm concerned were mentioned in column 2 of that table in relation to those determinations.

SCHEDULE 17

Section 225(4).

THE OMBUDSMAN SCHEME

PART I

GENERAL

Interpretation

1. In this Schedule—

"ombudsman" means a person who is a member of the panel; and

"the panel" means the panel established under paragraph 4.

PART II

THE SCHEME OPERATOR

Establishment by the Authority

2.—(1) The Authority must establish a body corporate to exercise the functions conferred on the scheme operator by or under this Act.

(2) The Authority must take such steps as are necessary to ensure that the scheme operator is, at all times, capable of exercising those functions.

Constitution

3.—(1) The constitution of the scheme operator must provide for it to have—

(a) a chairman; and

(b) a board (which must include the chairman) whose members are the scheme operator's directors.

(2) The chairman and other members of the board must be persons appointed, and liable to removal from office, by the Authority (acting, in the case of the chairman, with the approval of the Treasury).

(3) But the terms of their appointment (and in particular those governing removal from office) must be such as to secure their independence from the Authority in the operation of the scheme.

(4) The function of making voluntary jurisdiction rules under section 227 and the functions conferred by paragraphs 4, 5, 7, 9 or 14 may be exercised only by the board.

(5) The validity of any act of the scheme operator is unaffected by—

(a) a vacancy in the office of chairman; or

(b) a defect in the appointment of a person as chairman or as a member of the board.

The panel of ombudsmen

4.—(1) The scheme operator must appoint and maintain a panel of persons, appearing to it to have appropriate qualifications and experience, to act as ombudsmen for the purposes of the scheme.

(2) A person's appointment to the panel is to be on such terms (including terms as to the duration and termination of his appointment and as to remuneration) as the scheme operator considers—

(a) consistent with the independence of the person appointed; and

(b) otherwise appropriate.

The Chief Ombudsman

5.—(1) The scheme operator must appoint one member of the panel to act as Chief Ombudsman.

(2) The Chief Ombudsman is to be appointed on such terms (including terms as to the duration and termination of his appointment) as the scheme operator considers appropriate.

Status

6.—(1) The scheme operator is not to be regarded as exercising functions on behalf of the Crown.

(2) The scheme operator's board members, officers and staff are not to be regarded as Crown servants.

(3) Appointment as Chief Ombudsman or to the panel or as a deputy ombudsman does not confer the status of Crown servant.

Annual reports

7.—(1) At least once a year—

(a) the scheme operator must make a report to the Authority on the discharge of its functions; and

(b) the Chief Ombudsman must make a report to the Authority on the discharge of his functions.

(2) Each report must distinguish between functions in relation to the scheme's compulsory jurisdiction and functions in relation to its voluntary jurisdiction.

(3) Each report must also comply with any requirements specified in rules made by the Authority.

(4) The scheme operator must publish each report in the way it considers appropriate.

Guidance

8. The scheme operator may publish guidance consisting of such information and advice as it considers appropriate and may charge for it or distribute it free of charge.

Budget

9.—(1) The scheme operator must, before the start of each of its financial years, adopt an annual budget which has been approved by the Authority.

(2) The scheme operator may, with the approval of the Authority, vary the budget for a financial year at any time after its adoption.

(3) The annual budget must include an indication of—

(a) the distribution of resources deployed in the operation of the scheme, and

(b) the amounts of income of the scheme operator arising or expected to arise from the operation of the scheme,

distinguishing between the scheme's compulsory and voluntary jurisdiction.

Exemption from liability in damages

10.—(1) No person is to be liable in damages for anything done or omitted in the discharge, or purported discharge, of any functions under this Act in relation to the compulsory jurisdiction.

(2) Sub-paragraph (1) does not apply—

(a) if the act or omission is shown to have been in bad faith; or

(b) so as to prevent an award of damages made in respect of an act or omission on the ground that the act or omission was unlawful as a result of section 6(1) of the Human Rights Act 1998. 1998 c. 42.

Privilege

11. For the purposes of the law relating to defamation, proceedings in relation to a complaint which is subject to the compulsory jurisdiction are to be treated as if they were proceedings before a court.

PART III

THE COMPULSORY JURISDICTION

Introduction

12. This Part of this Schedule applies only in relation to the compulsory jurisdiction.

Authority's procedural rules

13.—(1) The Authority must make rules providing that a complaint is not to be entertained unless the complainant has referred it under the ombudsman scheme before the applicable time limit (determined in accordance with the rules) has expired.

(2) The rules may provide that an ombudsman may extend that time limit in specified circumstances.

(3) The Authority may make rules providing that a complaint is not to be entertained (except in specified circumstances) if the complainant has not previously communicated its substance to the respondent and given him a reasonable opportunity to deal with it.

(4) The Authority may make rules requiring an authorised person who may become subject to the compulsory jurisdiction as a respondent to establish such procedures as the Authority considers appropriate for the resolution of complaints which—

(a) may be referred to the scheme; and

(b) arise out of activity to which the Authority's powers under Part X do not apply.

The scheme operator's rules

14.—(1) The scheme operator must make rules, to be known as "scheme rules", which are to set out the procedure for reference of complaints and for their investigation, consideration and determination by an ombudsman.

(2) Scheme rules may, among other things—

(a) specify matters which are to be taken into account in determining whether an act or omission was fair and reasonable;

(b) provide that a complaint may, in specified circumstances, be dismissed without consideration of its merits;

(c) provide for the reference of a complaint, in specified circumstances and with the consent of the complainant, to another body with a view to its being determined by that body instead of by an ombudsman;

(d) make provision as to the evidence which may be required or admitted, the extent to which it should be oral or written and the consequences of a person's failure to produce any information or document which he has been required (under section 231 or otherwise) to produce;

SCH. 17

(e) allow an ombudsman to fix time limits for any aspect of the proceedings and to extend a time limit;

(f) provide for certain things in relation to the reference, investigation or consideration (but not determination) of a complaint to be done by a member of the scheme operator's staff instead of by an ombudsman;

(g) make different provision in relation to different kinds of complaint.

(3) The circumstances specified under sub-paragraph (2)(b) may include the following—

(a) the ombudsman considers the complaint frivolous or vexatious;

(b) legal proceedings have been brought concerning the subject-matter of the complaint and the ombudsman considers that the complaint is best dealt with in those proceedings; or

(c) the ombudsman is satisfied that there are other compelling reasons why it is inappropriate for the complaint to be dealt with under the ombudsman scheme.

(4) If the scheme operator proposes to make any scheme rules it must publish a draft of the proposed rules in the way appearing to it to be best calculated to bring them to the attention of persons appearing to it to be likely to be affected.

(5) The draft must be accompanied by a statement that representations about the proposals may be made to the scheme operator within a time specified in the statement.

(6) Before making the proposed scheme rules, the scheme operator must have regard to any representations made to it under sub-paragraph (5).

(7) The consent of the Authority is required before any scheme rules may be made.

Fees

15.—(1) Scheme rules may require a respondent to pay to the scheme operator such fees as may be specified in the rules.

(2) The rules may, among other things—

(a) provide for the scheme operator to reduce or waive a fee in a particular case;

(b) set different fees for different stages of the proceedings on a complaint;

(c) provide for fees to be refunded in specified circumstances;

(d) make different provision for different kinds of complaint.

Enforcement of money awards

16. A money award, including interest, which has been registered in accordance with scheme rules may—

(a) if a county court so orders in England and Wales, be recovered by execution issued from the county court (or otherwise) as if it were payable under an order of that court;

(b) be enforced in Northern Ireland as a money judgment under the Judgments Enforcement (Northern Ireland) Order 1981;

S.I. 1981/226 (N.I.6).

(c) be enforced in Scotland by the sheriff, as if it were a judgment or order of the sheriff and whether or not the sheriff could himself have granted such judgment or order.

PART IV

THE VOLUNTARY JURISDICTION

Introduction

17. This Part of this Schedule applies only in relation to the voluntary jurisdiction.

Terms of reference to the scheme

18.—(1) Complaints are to be dealt with and determined under the voluntary jurisdiction on standard terms fixed by the scheme operator with the approval of the Authority.

(2) Different standard terms may be fixed with respect to different matters or in relation to different cases.

(3) The standard terms may, in particular—

(a) require the making of payments to the scheme operator by participants in the scheme of such amounts, and at such times, as may be determined by the scheme operator;

(b) make provision as to the award of costs on the determination of a complaint.

(4) The scheme operator may not vary any of the standard terms or add or remove terms without the approval of the Authority.

(5) The standard terms may include provision to the effect that (unless acting in bad faith) none of the following is to be liable in damages for anything done or omitted in the discharge or purported discharge of functions in connection with the voluntary jurisdiction—

(a) the scheme operator;

(b) any member of its governing body;

(c) any member of its staff;

(d) any person acting as an ombudsman for the purposes of the scheme.

Delegation by and to other schemes

19.—(1) The scheme operator may make arrangements with a relevant body—

(a) for the exercise by that body of any part of the voluntary jurisdiction of the ombudsman scheme on behalf of the scheme; or

(b) for the exercise by the scheme of any function of that body as if it were part of the voluntary jurisdiction of the scheme.

(2) A "relevant body" is one which the scheme operator is satisfied—

(a) is responsible for the operation of a broadly comparable scheme (whether or not established by statute) for the resolution of disputes; and

(b) in the case of arrangements under sub-paragraph (1)(a), will exercise the jurisdiction in question in a way compatible with the requirements imposed by or under this Act in relation to complaints of the kind concerned.

(3) Such arrangements require the approval of the Authority.

Voluntary jurisdiction rules: procedure

20.—(1) If the scheme operator makes voluntary jurisdiction rules, it must give a copy to the Authority without delay.

(2) If the scheme operator revokes any such rules, it must give written notice to the Authority without delay.

SCH. 17

(3) The power to make voluntary jurisdiction rules is exercisable in writing.

(4) Immediately after making voluntary jurisdiction rules, the scheme operator must arrange for them to be printed and made available to the public.

(5) The scheme operator may charge a reasonable fee for providing a person with a copy of any voluntary jurisdiction rules.

Verification of the rules

21.—(1) The production of a printed copy of voluntary jurisdiction rules purporting to be made by the scheme operator—

(a) on which is endorsed a certificate signed by a member of the scheme operator's staff authorised by the scheme operator for that purpose, and

(b) which contains the required statements,

is evidence (or in Scotland sufficient evidence) of the facts stated in the certificate.

(2) The required statements are—

(a) that the rules were made by the scheme operator;

(b) that the copy is a true copy of the rules; and

(c) that on a specified date the rules were made available to the public in accordance with paragraph 20(4).

(3) A certificate purporting to be signed as mentioned in sub-paragraph (1) is to be taken to have been duly signed unless the contrary is shown.

Consultation

22.—(1) If the scheme operator proposes to make voluntary jurisdiction rules, it must publish a draft of the proposed rules in the way appearing to it to be best calculated to bring them to the attention of the public.

(2) The draft must be accompanied by—

(a) an explanation of the proposed rules; and

(b) a statement that representations about the proposals may be made to the scheme operator within a specified time.

(3) Before making any voluntary jurisdiction rules, the scheme operator must have regard to any representations made to it in accordance with sub-paragraph (2)(b).

(4) If voluntary jurisdiction rules made by the scheme operator differ from the draft published under sub-paragraph (1) in a way which the scheme operator considers significant, the scheme operator must publish a statement of the difference.

Sections 334, 336 and 338.

SCHEDULE 18

MUTUALS

PART I

FRIENDLY SOCIETIES

The Friendly Societies Act 1974 (c.46)

1. Omit sections 4 (provision for separate registration areas) and 10 (societies registered in one registration area carrying on business in another).

2. In section 7 (societies which may be registered), in subsection (2)(b), for "in the central registration area or in Scotland" substitute "in the United Kingdom, the Channel Islands or the Isle of Man".

3. In section 11 (additional registration requirements for societies with branches), omit "and where any such society has branches in more than one registration area, section 10 above shall apply to that society".

4. In section 99(4) (punishment of fraud etc and recovery of property misapplied), omit "in the central registration area".

The Friendly Societies Act 1992 (c.40)

5. Omit sections 31 to 36A (authorisation of friendly societies business).

6. In section 37 (restrictions on combinations of business), omit subsections (1), (1A) and (7A) to (9).

7. Omit sections 38 to 43 (restrictions on business of certain authorised societies).

8. Omit sections 44 to 50 (regulation of friendly societies business).

PART II

FRIENDLY SOCIETIES: SUBSIDIARIES AND CONTROLLED BODIES

Interpretation

9. In this Part of this Schedule—

"the 1992 Act" means the Friendly Societies Act 1992; and 1992 c. 40.

"section 13" means section 13 of that Act.

Qualifying bodies

10.—(1) Subsections (2) to (5) of section 13 (incorporated friendly societies allowed to form or acquire control or joint control only of qualifying bodies) cease to have effect.

(2) As a result, omit—

(a) subsections (8) and (11) of that section, and

(b) Schedule 7 to the 1992 Act (activities which may be carried on by a subsidiary of, or body jointly controlled by, an incorporated friendly society).

Bodies controlled by societies

11. In section 13(9) (defined terms), after paragraph (a) insert—

"(aa) an incorporated friendly society also has control of a body corporate if the body corporate is itself a body controlled in one of the ways mentioned in paragraph (a)(i), (ii) or (iii) by a body corporate of which the society has control;".

Joint control by societies

12. In section 13(9), after paragraph (c) insert—

"(cc) an incorporated friendly society also has joint control of a body corporate if—

(i) a subsidiary of the society has joint control of the body corporate in a way mentioned in paragraph (c)(i), (ii) or (iii);

(ii) a body corporate of which the society has joint control has joint control of the body corporate in such a way; or

(iii) the body corporate is controlled in a way mentioned in paragraph (a)(i), (ii) or (iii) by a body corporate of which the society has joint control;".

Acquisition of joint control

13. In section 13(9), in the words following paragraph (d), after "paragraph (c)" insert "or (cc)".

Amendment of Schedule 8 to the 1992 Act

14.—(1) Schedule 8 to the 1992 Act (provisions supplementing section 13) is amended as follows.

(2) Omit paragraph 3(2).

(3) After paragraph 3 insert—

"3A.—(1) A body is to be treated for the purposes of section 13(9) as having the right to appoint to a directorship if—

(a) a person's appointment to the directorship follows necessarily from his appointment as an officer of that body; or

(b) the directorship is held by the body itself.

(2) A body ("B") and some other person ("P") together are to be treated, for the purposes of section 13(9), as having the right to appoint to a directorship if—

(a) P is a body corporate which has directors and a person's appointment to the directorship follows necessarily from his appointment both as an officer of B and a director of P;

(b) P is a body corporate which does not have directors and a person's appointment to the directorship follows necessarily from his appointment both as an officer of B and as a member of P's managing body; or

(c) the directorship is held jointly by B and P.

(3) For the purposes of section 13(9), a right to appoint (or remove) which is exercisable only with the consent or agreement of another person must be left out of account unless no other person has a right to appoint (or remove) in relation to that directorship.

(4) Nothing in this paragraph is to be read as restricting the effect of section 13(9)."

(4) In paragraph 9 (exercise of certain rights under instruction by, or in the interests of, incorporated friendly society) insert at the end "or in the interests of any body over which the society has joint control".

Consequential amendments

15.—(1) Section 52 of the 1992 Act is amended as follows.

(2) In subsection (2), omit paragraph (d).

(3) In subsection (3), for "(4) below" substitute "(2)".

(4) For subsection (4) substitute—

"(4) A court may not make an order under subsection (5) unless it is satisfied that one or more of the conditions mentioned in subsection (2) are satisfied.

(5) In subsection (5), omit the words from "or, where" to the end.

References in other enactments

16. References in any provision of, or made under, any enactment to subsidiaries of, or bodies jointly controlled by, an incorporated friendly society are to be read as including references to bodies which are such subsidiaries or bodies as a result of any provision of this Part of this Schedule.

PART III

BUILDING SOCIETIES

The Building Societies Act 1986 (c.53)

17. Omit section 9 (initial authorisation to raise funds and borrow money).

18. Omit Schedule 3 (supplementary provisions about authorisation).

PART IV

INDUSTRIAL AND PROVIDENT SOCIETIES

The Industrial and Provident Societies Act 1965 (c.12)

19. Omit section 8 (provision for separate registration areas for Scotland and for England, Wales and the Channel Islands).

20. Omit section 70 (scale of fees to be paid in respect of transactions and inspection of documents).

PART V

CREDIT UNIONS

The Credit Unions Act 1979 (c.34)

21. In section 6 (minimum and maximum number of members), omit subsections (2) to (6).

22. In section 11 (loans), omit subsections (2) and (6).

23. Omit sections 11B (loans approved by credit unions), 11C (grant of certificates of approval) and 11D (withdrawal of certificates of approval).

24. In section 12, omit subsections (4) and (5).

25. In section 14, omit subsections (2), (3), (5) and (6).

26. In section 28 (offences), omit subsection (2).

Section 351.

SCHEDULE 19

Competition Information

Part I

Persons and functions for the purposes of section 351

1. The Table set out after this paragraph has effect for the purposes of section 351(3)(b).

Table

Person	*Function*
1. The Commission.	Any function of the Commission under Community law relating to competition.
2. The Comptroller and Auditor General.	Any function of his.
3. A Minister of the Crown.	Any function of his under a specified enactment.
4. Director General of Telecommunications.	Any function of his under a specified enactment.
5. Director General of Gas Supply	Any function of his under a specified enactment
6. The Director General of Gas for Northern Ireland.	Any function of his under a specified enactment.
7. The Director General of Electricity Supply.	Any function of his under a specified enactment.
8. The Director General of Electricity Supply for Northern Ireland.	Any function of his under a specified enactment.
9. The Director General of Water Services.	Any function of his under a specified enactment.
10. The Civil Aviation Authority.	Any function of that authority under a specified enactment.
11. The Rail Regulator.	Any function of his under a specified enactment.
12. The Director General of Fair Trading.	Any function of his under a specified enactment.
13. The Competition Commission.	Any function of the Competition Commission under a specified enactment.
14. The Authority.	Any function of the Authority under a specified enactment.
15. A person of a description specified in an order made by the Treasury.	Any function of his which is specified in the order.

Part II

The enactments

1973 c. 41. 1. The Fair Trading Act 1973

1974 c. 39. 2. The Consumer Credit Act 1974

1979 c. 38. 3. The Estate Agents Act 1979

1980 c. 21. 4. The Competition Act 1980

1984 c. 12. 5. The Telecommunications Act 1984

6. The Airports Act 1986 1986 c. 31.

7. The Gas Act 1986 1986 c. 45.

8. The Control of Misleading Advertisements Regulations 1988 S.I. 1988/915.

9. The Electricity Act 1989 1989 c. 29.

10. The Broadcasting Act 1990 1990 c. 42.

11. The Water Industry Act 1991 1991 c. 56.

12. The Electricity (Northern Ireland) Order 1992 S.I. 1992/231 (N.I. 1).

13. The Railways Act 1993 1993 c. 43.

14. Part IV of the Airports (Northern Ireland) Order 1994 S.I. 1994/426 (N.I. 1).

15. The Gas (Northern Ireland) Order 1996 S.I. 1996/275 (N.I. 2).

16. The EC Competition (Articles 88 and 89) Enforcement Regulations 1996 S.I. 1996/2199.

17. The Unfair Terms in Consumer Contracts Regulations 1999 S.I. 1999/2083.

18. This Act.

19. An enactment specified for the purposes of this paragraph in an order made by the Treasury.

SCHEDULE 20

Section 432(1).

MINOR AND CONSEQUENTIAL AMENDMENTS

The House of Commons Disqualification Act 1975 (c. 24)

1. In Part III of Schedule 1 to the House of Commons Disqualification Act 1975 (disqualifying offices)—

(a) omit—

"Any member of the Financial Services Tribunal in receipt of remuneration"; and

(b) at the appropriate place, insert—

"Any member, in receipt of remuneration, of a panel of persons who may be selected to act as members of the Financial Services and Markets Tribunal".

The Northern Ireland Assembly Disqualification Act 1975 (c. 25)

2. In Part III of Schedule 1 to the Northern Ireland Assembly Disqualification Act 1975 (disqualifying offices)—

(a) omit—

"Any member of the Financial Services Tribunal in receipt of remuneration"; and

(b) at the appropriate place, insert—

"Any member, in receipt of remuneration, of a panel of persons who may be selected to act as members of the Financial Services and Markets Tribunal".

The Civil Jurisdiction and Judgments Act 1982 (c. 27)

3. In paragraph 10 of Schedule 5 to the Civil Jurisdiction and Judgments Act 1982 (proceedings excluded from the operation of Schedule 4 to that Act), for "section 188 of the Financial Services Act 1986" substitute "section 415 of the Financial Services and Markets Act 2000".

The Income and Corporation Taxes Act 1988 (c. 1)

4.—(1) The Income and Corporation Taxes Act 1988 is amended as follows.

(2) In section 76 (expenses of management: insurance companies), in subsection (8), omit the definitions of—

"the 1986 Act";

"authorised person";

"investment business";

"investor";

"investor protection scheme";

"prescribed"; and

"recognised self-regulating organisation".

(3) In section 468 (authorised unit trusts), in subsections (6) and (8), for "78 of the Financial Services Act 1986" substitute " 243 of the Financial Services and Markets Act 2000".

(4) In section 469(7) (other unit trust schemes), for "Financial Services Act 1986" substitute "Financial Services and Markets Act 2000".

(5) In section 728 (information in relation to transfers of securities), in subsection (7)(a), for "Financial Services Act 1986" substitute "Financial Services and Markets Act 2000".

(6) In section 841(3) (power to apply certain provisions of the Tax Acts to recognised investment exchange), for "Financial Services Act 1986" substitute "Financial Services and Markets Act 2000".

The Finance Act 1991 (c. 31)

5.—(1) The Finance Act 1991 is amended as follows.

(2) In section 47 (investor protection schemes), omit subsections (1), (2) and (4).

(3) In section 116 (investment exchanges and clearing houses: stamp duty), in subsection (4)(b), for "Financial Services Act 1986" substitute "Financial Services and Markets Act 2000".

The Tribunals and Inquiries Act 1992 (c. 53)

6.—(1) The Tribunals and Inquiries Act 1992 is amended as follows.

(2) In Schedule 1 (tribunals under supervision of the Council on Tribunals), for the entry relating to financial services and paragraph 18, substitute—

"Financial services and markets	18. The Financial Services and Markets Tribunal."

The Judicial Pensions and Retirement Act 1993 (c. 8)

7.—(1) The Judicial Pensions and Retirement Act 1993 is amended as follows.

(2) In Schedule 1 (offices which may be qualifying offices), in Part II, after the entry relating to the President or chairman of the Transport Tribunal insert—

"President or Deputy President of the Financial Services and Markets Tribunal"

(3) In Schedule 5 (relevant offices in relation to retirement provisions)—

(a) omit the entry—

"Member of the Financial Services Tribunal appointed by the Lord Chancellor"; and

(b) at the end insert—

"Member of the Financial Services and Markets Tribunal".

SCHEDULE 21

Section 432(2).

TRANSITIONAL PROVISIONS AND SAVINGS

Self-regulating organisations

1.—(1) No new application under section 9 of the 1986 Act (application for recognition) may be entertained.

(2) No outstanding application made under that section before the passing of this Act may continue to be entertained.

(3) After the date which is the designated date for a recognised self-regulating organisation—

(a) the recognition order for that organisation may not be revoked under section 11 of the 1986 Act (revocation of recognition);

(b) no application may be made to the court under section 12 of the 1986 Act (compliance orders) with respect to that organisation.

(4) The powers conferred by section 13 of the 1986 Act (alteration of rules for protection of investors) may not be exercised.

(5) "Designated date" means such date as the Treasury may by order designate.

(6) Sub-paragraph (3) does not apply to a recognised self-regulating organisation in respect of which a notice of intention to revoke its recognition order was given under section 11(3) of the 1986 Act before the passing of this Act if that notice has not been withdrawn.

(7) Expenditure incurred by the Authority in connection with the winding up of any body which was, immediately before the passing of this Act, a recognised self-regulating organisation is to be treated as having been incurred in connection with the discharge by the Authority of functions under this Act.

(8) "Recognised self-regulating organisation" means an organisation which, immediately before the passing of this Act, was such an organisation for the purposes of the 1986 Act.

(9) "The 1986 Act" means the Financial Services Act 1986. 1986 c. 60.

Self-regulating organisations for friendly societies

2.—(1) No new application under paragraph 2 of Schedule 11 to the 1986 Act (application for recognition) may be entertained.

(2) No outstanding application made under that paragraph before the passing of this Act may continue to be entertained.

(3) After the date which is the designated date for a recognised self-regulating organisation for friendly societies—

(a) the recognition order for that organisation may not be revoked under paragraph 5 of Schedule 11 to the 1986 Act (revocation of recognition);

(b) no application may be made to the court under paragraph 6 of that Schedule (compliance orders) with respect to that organisation.

(4) "Designated date" means such date as the Treasury may by order designate.

(5) Sub-paragraph (3) does not apply to a recognised self-regulating organisation for friendly societies in respect of which a notice of intention to revoke its recognition order was given under section 11(3) of the 1986 Act (as applied by paragraph 5(2) of that Schedule) before the passing of this Act if that notice has not been withdrawn.

(6) Expenditure incurred by the Authority in connection with the winding up of any body which was, immediately before the passing of this Act, a recognised self-regulating organisation for friendly societies is to be treated as having been incurred in connection with the discharge by the Authority of functions under this Act.

(7) "Recognised self-regulating organisation for friendly societies" means an organisation which, immediately before the passing of this Act, was such an organisation for the purposes of the 1986 Act.

1986 c. 60. (8) "The 1986 Act" means the Financial Services Act 1986.

Section 432(3).

SCHEDULE 22

REPEALS

Chapter	Short title	Extent of repeal
1923 c. 8.	The Industrial Assurance Act 1923.	The whole Act.
1948 c. 39.	The Industrial Assurance and Friendly Societies Act 1948.	The whole Act.
1965 c. 12.	The Industrial and Provident Societies Act 1965.	Section 8. Section 70.
1974 c. 46.	The Friendly Societies Act 1974.	Section 4. Section 10. In section 11, from "and where" to "that society". In section 99(4), "in the central registration area".
1975 c. 24.	The House of Commons Disqualification Act 1975.	In Schedule 1, in Part III, "Any member of the Financial Services Tribunal in receipt of remuneration".
1975 c. 25.	The Northern Ireland Assembly Disqualification Act 1975.	In Schedule 1, in Part III, "Any member of the Financial Services Tribunal in receipt of remuneration".
1977 c. 46.	The Insurance Brokers (Registration) Act 1977.	The whole Act.
1979 c. 34.	The Credit Unions Act 1979.	Section 6(2) to (6). Section 11(2) and (6). Sections 11B, 11C and 11D. Section 12(4) and (5). In section 14, subsections (2), (3), (5) and (6). Section 28(2).

Chapter	Short title	Extent of repeal
1986 c. 53.	The Building Societies Act 1986.	Section 9. Schedule 3.
1988 c. 1.	The Income and Corporation Taxes Act 1988.	In section 76, in subsection (8), the definitions of "the 1986 Act", "authorised person", "investment business", "investor", "investor protection scheme", "prescribed" and "recognised self-regulating organisation".
1991 c. 31.	The Finance Act 1991.	In section 47, subsections (1), (2) and (4).
1992 c. 40.	The Friendly Societies Act 1992.	In section 13, subsections (2) to (5), (8) and (11). Sections 31 to 36. In section 37, subsections (1), (1A) and (7A) to (9). Sections 38 to 50. In section 52, subsection (2)(d) and, in subsection (5), the words from "or where" to the end. Schedule 7. In Schedule 8, paragraph 3(2).
1993 c. 8.	The Judicial Pensions and Retirement Act 1993.	In Schedule 5, "Member of the Financial Services Tribunal appointed by the Lord Chancellor".

EXECUTIVE SUMMARY

I. WHAT IS THE AIM OF THE WORLD INEQUALITY REPORT 2018?

The *World Inequality Report 2018* relies on a cutting-edge methodology to measure income and wealth inequality in a systematic and transparent manner. By developing this report, the World Inequality Lab seeks to fill a democratic gap and to equip various actors of society with the necessary facts to engage in informed public debates on inequality.

▶ The objective of the *World Inequality Report 2018* is to contribute to a more informed global democratic debate on economic inequality by bringing the latest and most complete data to the public discussion.

▶ Economic inequality is widespread and to some extent inevitable. It is our belief, however, that if rising inequality is not properly monitored and addressed, it can lead to various sorts of political, economic, and social catastrophes.

▶ Our objective is not to bring everyone into agreement regarding inequality; this will never happen, for the simple reason that no single scientific truth exists about the ideal level of inequality, let alone the most socially desirable mix of policies and institutions to achieve this level. Ultimately, it is up to public deliberation, and political institutions and their processes to make these difficult decisions. But this deliberative process requires more rigorous and transparent information on income and wealth.

▶ To equip citizens to make such decisions, we also seek to relate macroeconomic phenomenon—such as nationalization and privatization policies, capital accumulation, and the evolution of public debt—to microeconomic trends in inequality focused on individuals' earnings and government transfers, personal wealth, and debt.

▶ Reconciling macro and microeconomic inequality data is not a straightforward exercise given that many countries do not publicly release, or may not even produce, detailed and consistent income and wealth inequality statistics. Standard measures of inequality often rely on household surveys, which routinely underestimate the income and wealth of individuals at the top of the social ladder.

▶ To overcome current limitations, we rely on a groundbreaking methodology which combines in a systematic and transparent manner all data sources at our disposal: national income and wealth accounts (including, when possible, offshore wealth estimates); household income and wealth surveys; fiscal data coming from taxes on income; inheritance and wealth data (when they exist); and wealth rankings.

▶ The series presented in this report rely on the collective efforts of more than a hundred researchers, covering all continents, who contribute to the WID.world database. All the data are available online on wir2018.wid.world and are fully reproducible, allowing anyone to perform their own analysis and make up their own mind about inequality.

II. WHAT ARE OUR NEW FINDINGS ON GLOBAL INCOME INEQUALITY?

We show that income inequality has increased in nearly all world regions in recent decades, but at different speeds. The fact that inequality levels are so different among countries, even when countries share similar levels of development, highlights the important roles that national policies and institutions play in shaping inequality.

Income inequality varies greatly across world regions. It is lowest in Europe and highest in the Middle East.

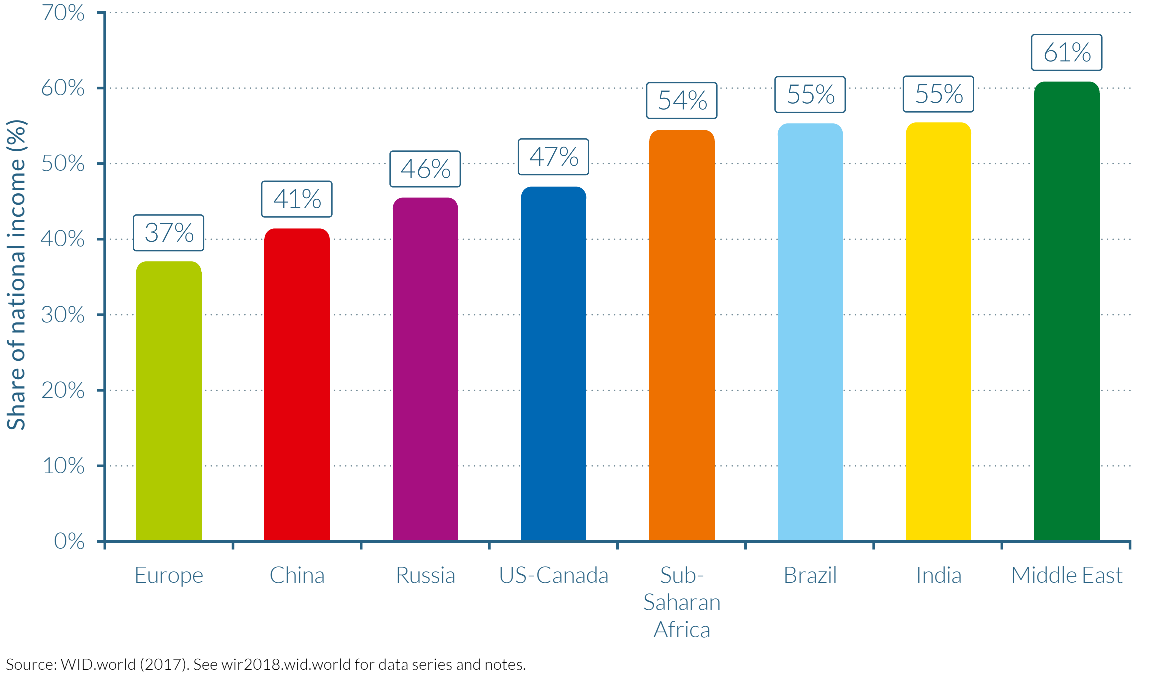
▶ Inequality within world regions varies greatly. In 2016, the share of total national income accounted for by just that nation's top 10% earners (top 10% income share) was 37% in Europe, 41% in China, 46% in Russia, 47% in US-Canada, and around 55% in sub-Saharan Africa, Brazil, and India. In the Middle East, the world's most unequal region according to our estimates, the top 10% capture 61% of national income (**Figure E1**).

In recent decades, income inequality has increased in nearly all countries, but at different speeds, suggesting that institutions and policies matter in shaping inequality.

▶ Since 1980, income inequality has increased rapidly in North America, China, India, and Russia. Inequality has grown moderately in Europe (**Figure E2a**). From a broad historical perspective, this increase in inequality marks the end of a postwar egalitarian regime which took different forms in these regions.

Figure E1

Top 10% national income share across the world, 2016

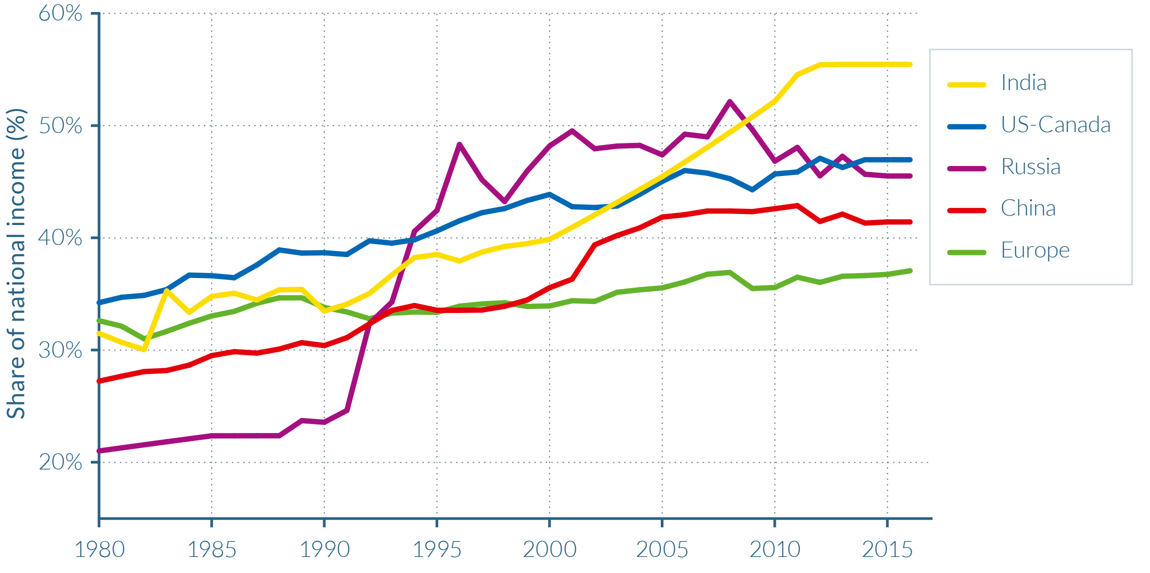


Source: WID.world (2017). See wir2018.wid.world for data series and notes.

In 2016, 37% of national income was received by the Top 10% in Europe against 61% in the Middle-East.

Figure E2a

Top 10% income shares across the world, 1980–2016: Rising inequality almost everywhere, but at different speeds



Source: WID.world (2017). See wir2018.wid.world for data series and notes.

In 2016, 47% of national income was received by the top 10% in US-Canada, compared to 34% in 1980.

▸ There are exceptions to the general pattern. In the Middle East, sub-Saharan Africa, and Brazil, income inequality has remained relatively stable, at extremely high levels (**Figure E2b**). Having never gone through the postwar egalitarian regime, these regions set the world "inequality frontier."

▸ The diversity of trends observed across countries since 1980 shows that income inequality dynamics are shaped by a variety of national, institutional and political contexts.

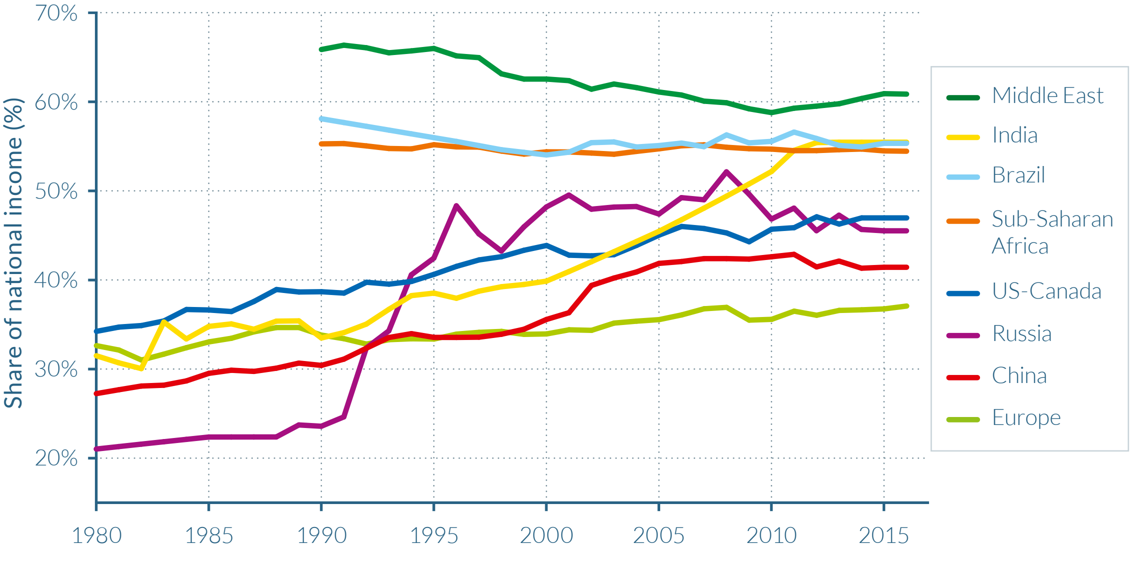
▸ This is illustrated by the different trajectories followed by the former communist or highly regulated countries, China, India, and Russia (**Figure E2a and b**). The rise in inequality was particularly abrupt in Russia, moderate in China, and relatively gradual in India, reflecting different types of deregulation and opening-up policies pursued over the past decades in these countries.

▸ The divergence in inequality levels has been particularly extreme between Western Europe and the United States, which had similar levels of inequality in 1980 but today are in radically different situations. While the top 1% income share was close to 10% in both regions in 1980, it rose only slightly to 12% in 2016 in Western Europe while it shot up to 20% in the United States. Meanwhile, in the United States, the bottom 50% income share decreased from more than 20% in 1980 to 13% in 2016 (**Figure E3**).

▸ The income-inequality trajectory observed in the United States is largely due to massive educational inequalities, combined with a tax system that grew less progressive despite a surge in top labor compensation since the 1980s, and in top capital incomes in the 2000s. Continental Europe meanwhile saw a lesser decline in its tax progressivity, while wage inequality was also moderated by educational and wage-setting policies that were relatively more favorable to low- and middle-income groups. In both regions, income inequality between men and women has declined but remains particularly strong at the top of the distribution.

Figure E2b

Top 10% income shares across the world, 1980–2016: Is world inequality moving towards the high-inequality frontier?



Source: WID.world (2017). See wir2018.wid.world for data series and notes.

In 2016, 55% of national income was received by the Top 10% earners in India, against 31% in 1980.

How has inequality evolved in recent decades among global citizens? We provide the first estimates of how the growth in global income since 1980 has been distributed across the totality of the world population. The global top 1% earners has captured twice as much of that growth as the 50% poorest individuals. The bottom 50% has nevertheless enjoyed important growth rates. The global middle class (which contains all of the poorest 90% income groups in the EU and the United States) has been squeezed.

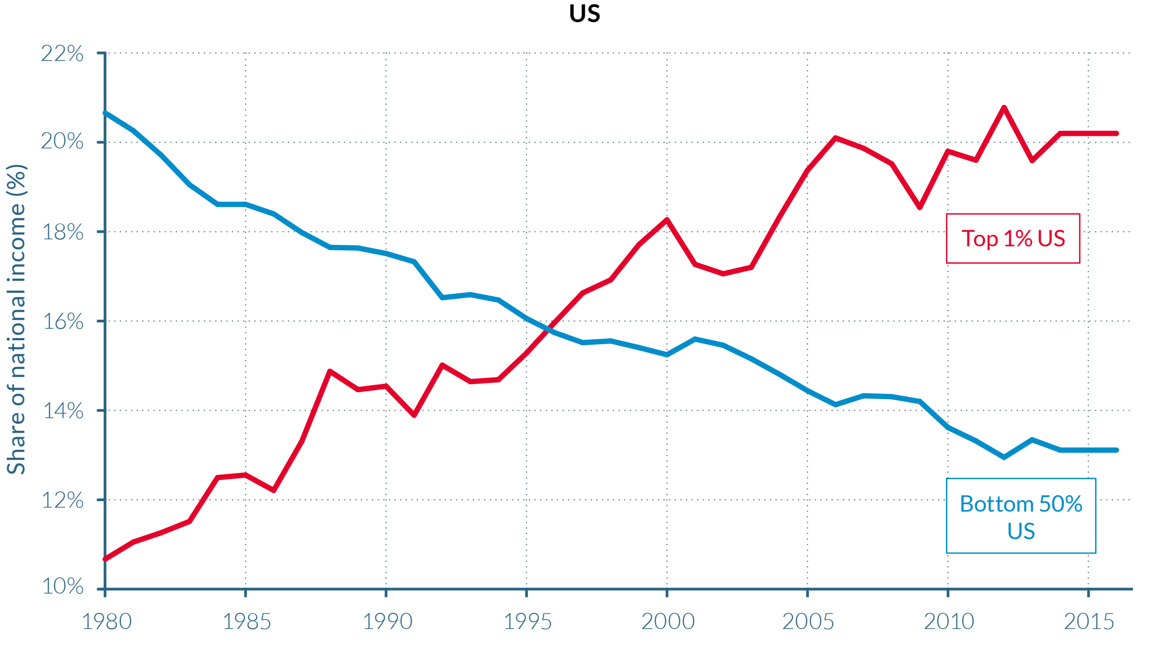
At the global level, inequality has risen sharply since 1980, despite strong growth in China.

▶ The poorest half of the global population has seen its income grow significantly thanks to high growth in Asia (particularly in China and India). However, because of high and rising inequality within countries, the top 1% richest individuals in the world captured twice as much growth as the bottom 50% individuals since 1980 (**Figure E4**). Income growth has been sluggish or even zero for individuals with incomes between the global bottom 50% and top 1% groups. This includes all North American and European lower- and middle-income groups.

▶ The rise of global inequality has not been steady. While the global top 1% income share increased from 16% in 1980 to 22% in 2000, it declined slightly thereafter to 20%. The income share of the global bottom 50% has oscillated around 9% since 1980 (**Figure E5**). The trend break after 2000 is due to a reduction in between-country average income inequality, as within-country inequality has continued to increase.

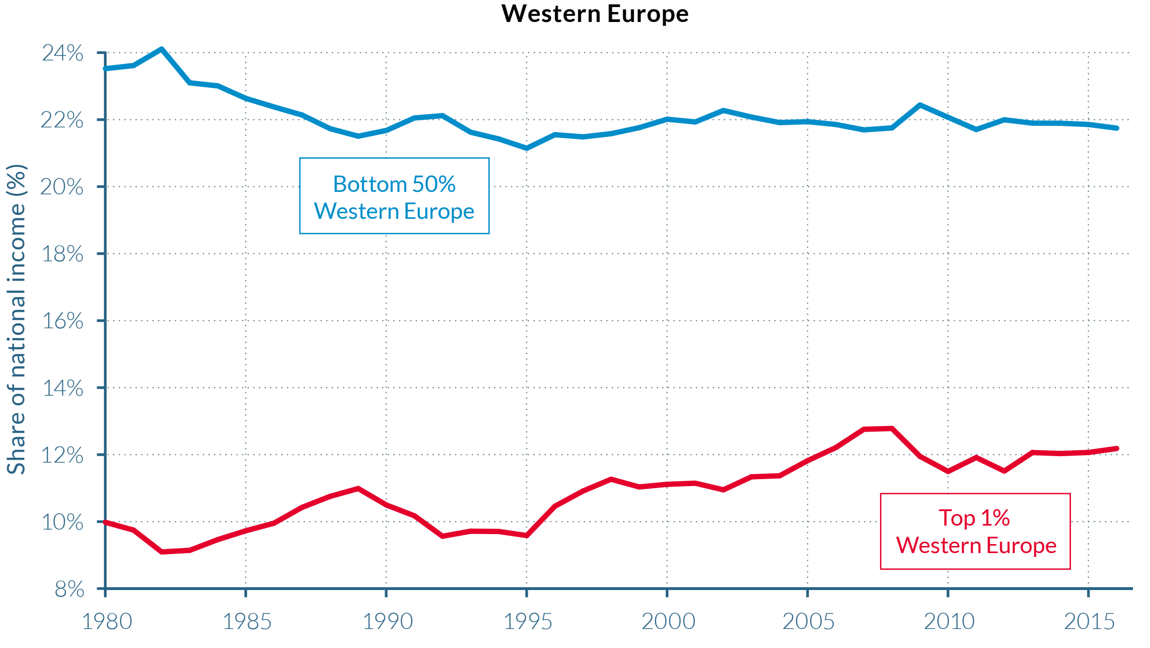
Figure E3

Top 1% vs. Bottom 50% national income shares in the US and Western Europe, 1980–2016: Diverging income inequality trajectories



Source: WID.world (2017). See wir2018.wid.world for data series and notes.

In 2016, 12% of national income was received by the top 1% in Western Europe, compared to 20% in the United States. In 1980, 10% of national income was received by the top 1% in Western Europe, compared to 11% in the United States.

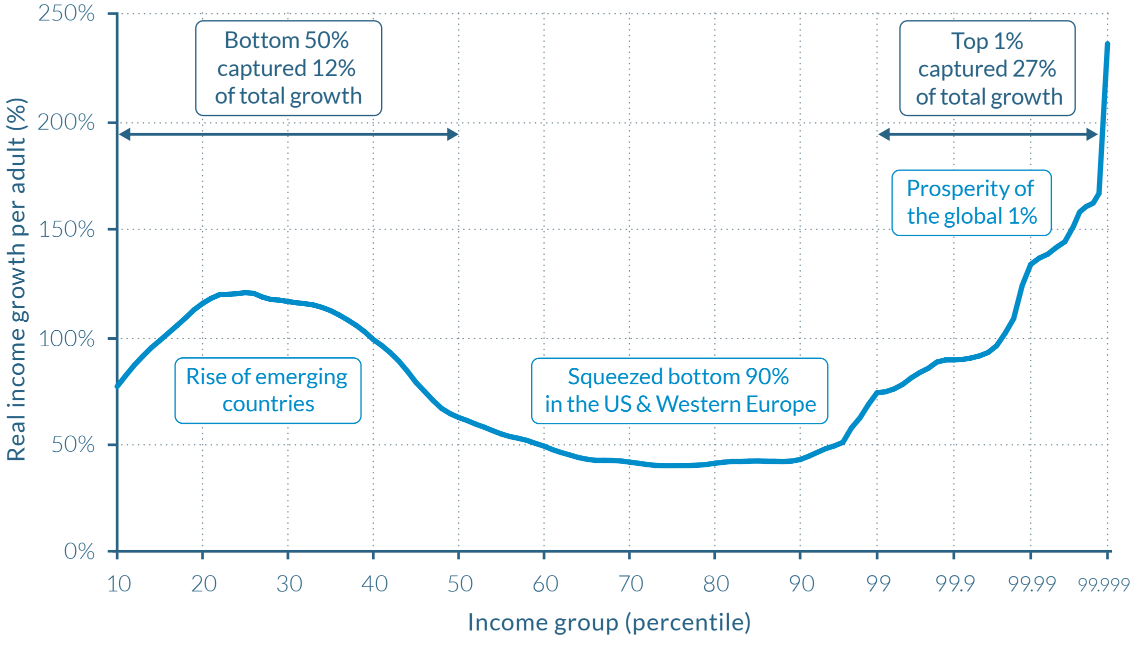


Source: WID.world (2017). See wir2018.wid.world for data series and notes.

In 2016, 22% of national income was received by the Bottom 50% in Western Europe.

Figure E4

The elephant curve of global inequality and growth, 1980–2016

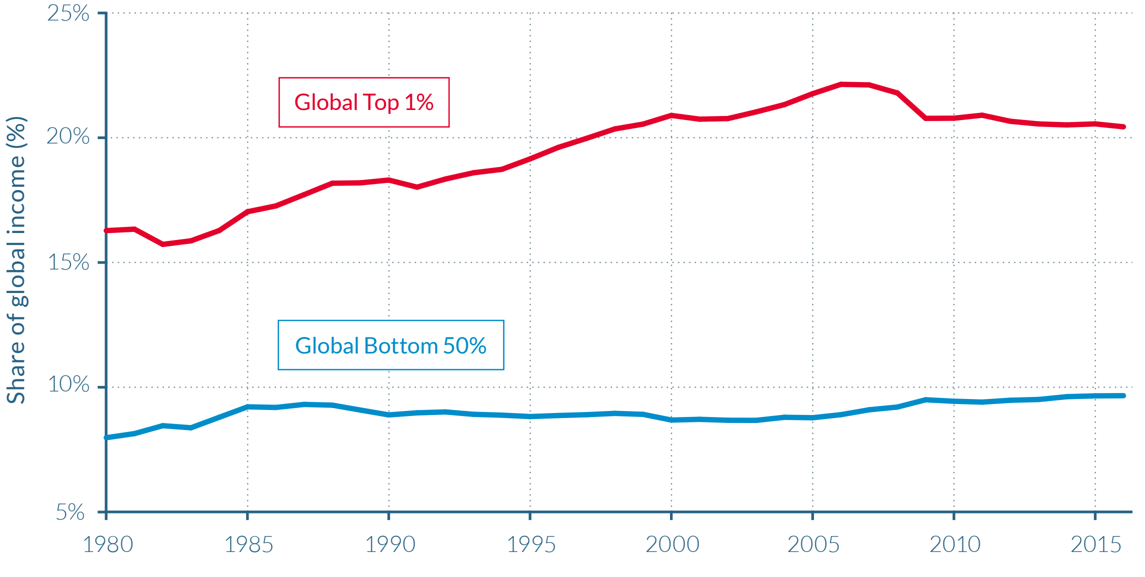


Source: WID.world (2017). See wir2018.wid.world for more details.

On the horizontal axis, the world population is divided into a hundred groups of equal population size and sorted in ascending order from left to right, according to each group's income level. The Top 1% group is divided into ten groups, the richest of these groups is also divided into ten groups, and the very top group is again divided into ten groups of equal population size. The vertical axis shows the total income growth of an average individual in each group between 1980 and 2016. For percentile group p99p99.1 (the poorest 10% among the world's richest 1%), growth was 74% between 1980 and 2016. The Top 1% captured 27% of total growth over this period. Income estimates account for differences in the cost of living between countries. Values are net of inflation.

Figure E5

The rise of the global top 1% versus the stagnation of the global bottom 50%, 1980–2016



Source: WID.world (2017). See wir2018.wid.world for data series and notes.

In 2016, 22% of global income was received by the Top 1% against 10% for the Bottom 50%. In 1980, 16% of global income was received by the Top 1% against 8% for the Bottom 50%.

III. WHY DOES THE EVOLUTION OF PRIVATE AND PUBLIC CAPITAL OWNERSHIP MATTER FOR INEQUALITY?

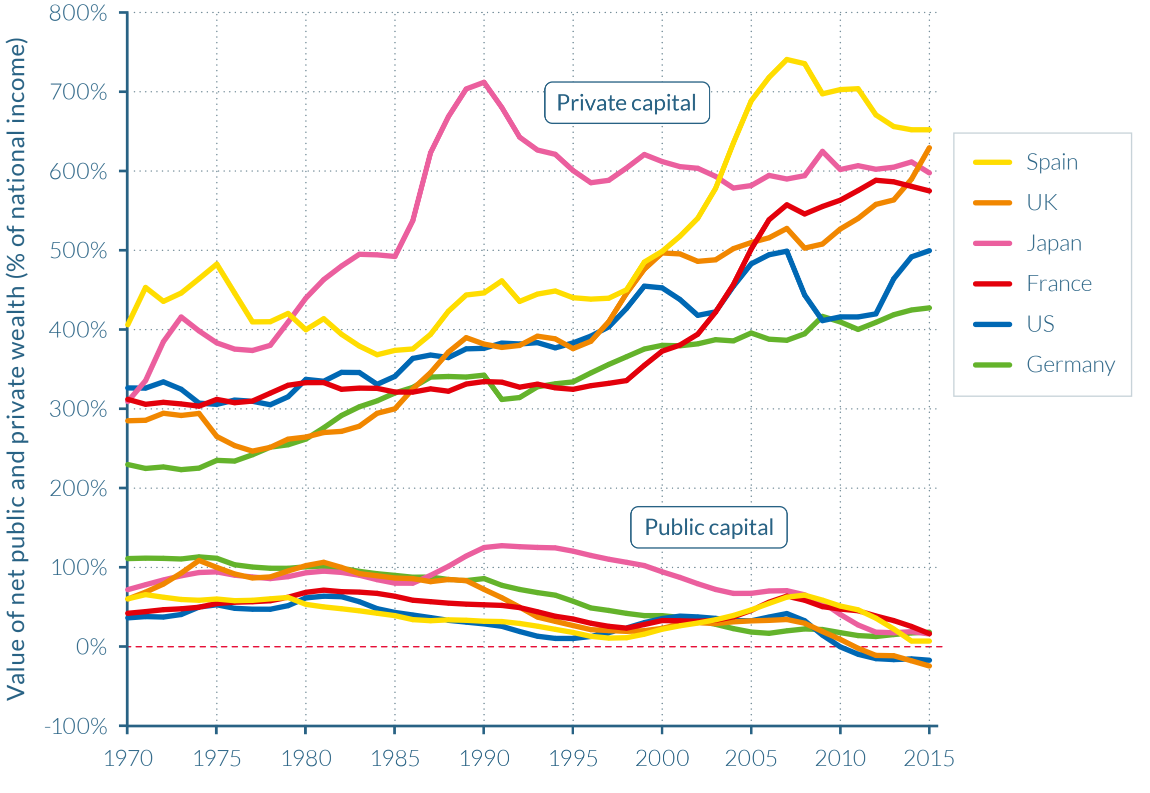
Economic inequality is largely driven by the unequal ownership of capital, which can be either privately or public owned. We show that since 1980, very large transfers of public to private wealth occurred in nearly all countries, whether rich or emerging. While national wealth has substantially increased, public wealth is now negative or close to zero in rich countries. Arguably this limits the ability of governments to tackle inequality; certainly, it has important implications for wealth inequality among individuals.

Over the past decades, countries have become richer but governments have become poor.

▶ The ratio of net private wealth to net national income gives insight into the total value of wealth commanded by individuals in

Figure E6

The rise of private capital and the fall of public capital in rich countries, 1970–2016



Source: WID.world (2017). See wir2018.wid.world for data series and notes.

In 2015, the value of net public wealth (or public capital) in the US was negative (-17% of net national income) while the value of net private wealth (or private capital) was 500% of national income. In 1970, net public wealth amounted to 36% of national income while the figure was 326% for net private wealth. Net private wealth is equal to new private assets minus net private debt. Net public wealth is equal to public assets minus public debt.

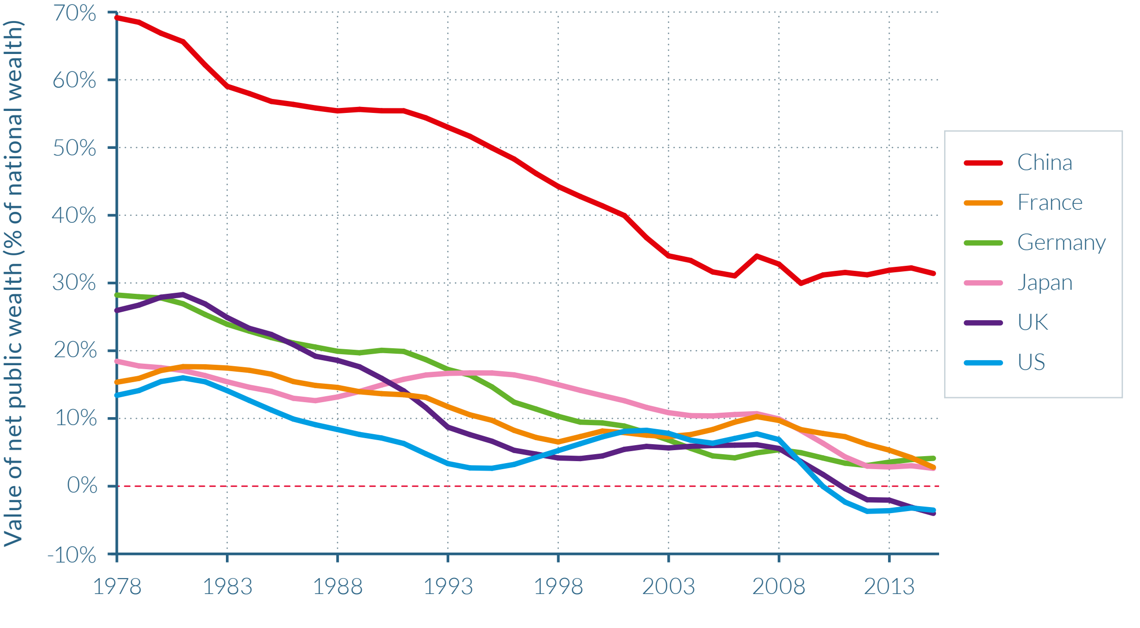
a country, as compared to the public wealth held by governments. The sum of private and public wealth is equal to national wealth. The balance between private and public wealth is a crucial determinant of the level of inequality.

▶ There has been a general rise in net private wealth in recent decades, from 200–350% of national income in most rich countries in 1970 to 400–700% today. This was largely unaffected by the 2008 financial crisis, or by the asset price bubbles seen in some countries such as Japan and Spain (**Figure E6**). In China and Russia there have been unusually large increases in private wealth; following their transitions from communist- to capitalist-oriented economies, they saw it quadruple and triple, respectively. Private wealth–income ratios in these countries are approaching levels observed in France, the UK, and the United States.

▶ Conversely, net public wealth (that is, public assets minus public debts) has declined in nearly all countries since the 1980s. In China and Russia, public wealth declined from 60–70% of national wealth to 20–30%. Net public wealth has even become negative in recent years in the United States and the UK, and is only slightly positive in Japan, Germany, and France (**Figure E7**). This arguably limits government ability to regulate the economy, redistribute income, and mitigate rising inequality. The only exceptions to the general decline in public property are oil-rich countries with large sovereign wealth funds, such as Norway.

Figure E7

The decline of public capital, 1970–2016



Source: WID.world (2017). See wir2018.wid.world for data series and notes.

In 2015, the share of public wealth in national wealth in France was 3%, compared to 17% in 1980.

IV. WHAT ARE OUR NEW FINDINGS ON GLOBAL WEALTH INEQUALITY?

The combination of large privatizations and increasing income inequality within countries has fueled the rise of wealth inequality among individuals. In Russia and the United States, the rise in wealth inequality has been extreme, whereas in Europe it has been more moderate. Wealth inequality has not yet returned to its extremely high early-twentieth-century level in rich countries.

Wealth inequality among individuals has increased at different speeds across countries since 1980.

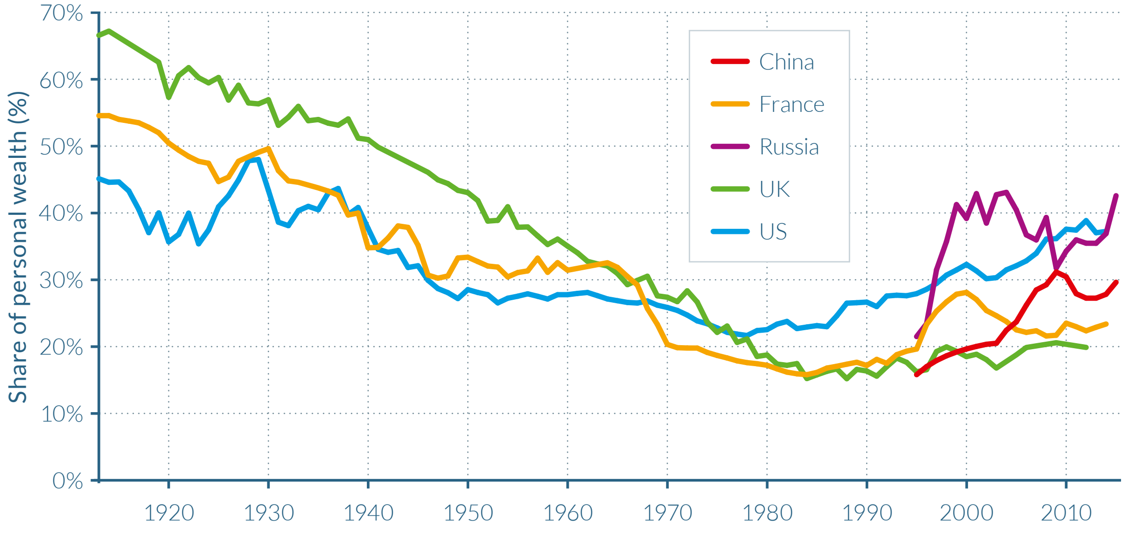
▶ Increasing income inequality and the large transfers of public to private wealth occurring over the past forty years have yielded rising wealth inequality among individuals. Wealth inequality has not, however, yet reached its early-twentieth-century levels in Europe or in the United States.

▶ The rise in wealth inequality has nonetheless been very large in the United States, where the top 1% wealth share rose from 22% in 1980 to 39% in 2014. Most of that increase in inequality was due to the rise of the top 0.1% wealth owners. The increase in top-wealth shares in France and the UK was more moderate over the past forty years, in part due to the dampening effect of the rising housing wealth of the middle class, and a lower level of income inequality than the United States' (**Figure E8**).

▶ Large rises in top-wealth shares have also been experienced in China and Russia following their transitions from communism to more capitalist economies. The top 1% wealth share doubled in both China and Russia between 1995 and 2015, from 15% to 30% and from 22% to 43%, respectively.

Figure E8

Top 1% wealth shares across the world, 1913–2015: the fall and rise of personal wealth inequality



Source: WID.world (2017). See wir2018.wid.world for data series and notes.

In 2015, the Top 1% wealth share was 43% in Russia against 22% in 1995.

V. WHAT IS THE FUTURE OF GLOBAL INEQUALITY AND HOW SHOULD IT BE TACKLED?

We project income and wealth inequality up to 2050 under different scenarios. In a future in which "business as usual" continues, global inequality will further increase. Alternatively, if in the coming decades all countries follow the moderate inequality trajectory of Europe over the past decades, global income inequality can be reduced—in which case there can also be substantial progress in eradicating global poverty.

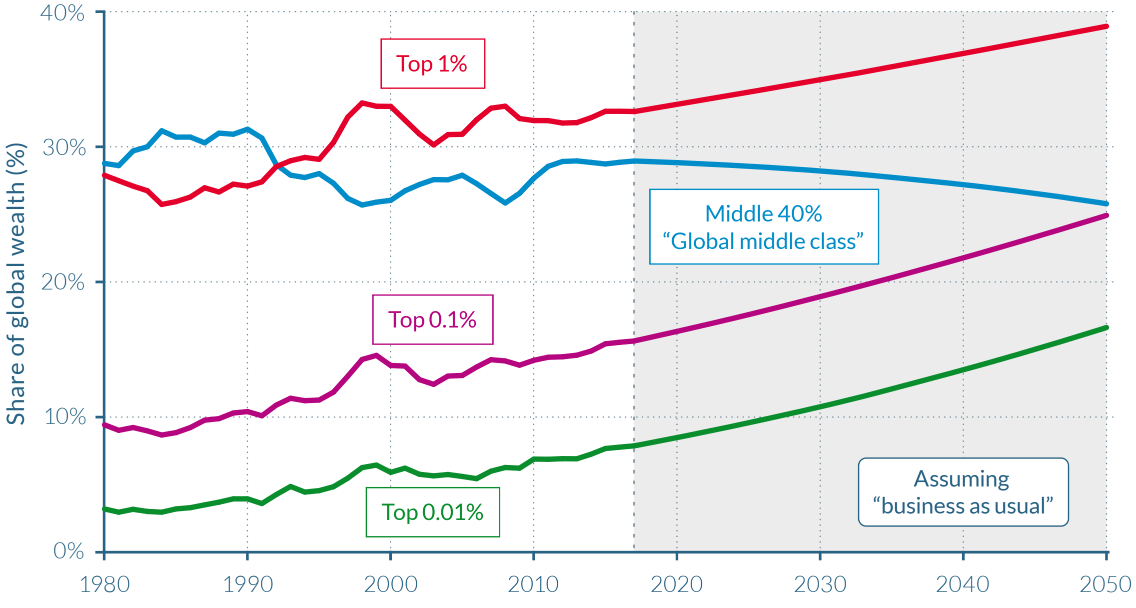
The global wealth middle class will be squeezed under "business as usual."

▶ Rising wealth inequality within countries has helped to spur increases in global wealth inequality. If we assume the world trend to be captured by the combined experience of China, Europe and the United States, the wealth share of the world's top 1% wealthiest people increased from 28% to 33%, while the share commanded by the bottom 75% oscillated around 10% between 1980 and 2016.

▶ The continuation of past wealth-inequality trends will see the wealth share of the top 0.1% global wealth owners (in a world represented by China, the EU, and the United States) catch up with the share of the global wealth middle class by 2050 (**Figure E9**).

Figure E9

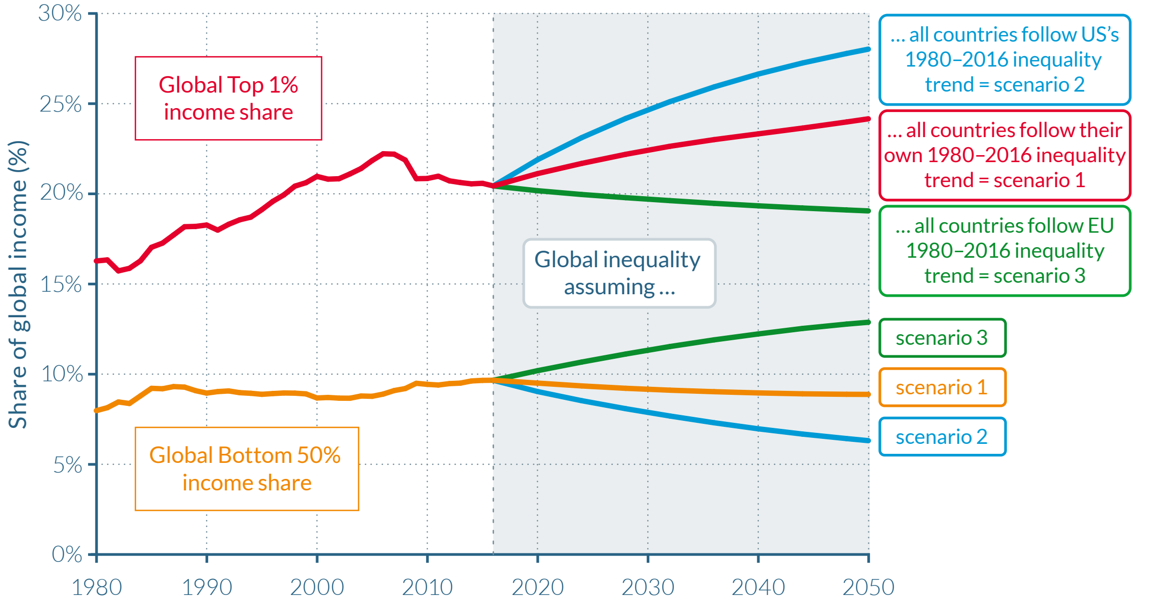
The squeezed global wealth middle class, 1980–2050



Source: WID.world (2017). See wir2018.wid.world for data series and notes.

In 2016, in a world represented by China, Europe and the US, the global wealth share of the Top 1% was 33%. Under "Business as usual", the Top 1% global wealth share would reach 39% by 2050, while the Top 0.1% wealth owners would own nearly as much wealth (26%) as the middle class (27%). The evolution of global wealth groups from 1987 to 2017 is represented by China, Europe and the US. Values are net of inflation.

Figure E10
Rising global income inequality is not inevitable in the future



Source: WID.world (2017). See wir2018.wid.world for data series and notes.

If all countries follow the inequality trajectory of the US between 1980 and 2016 from 2017 to 2050, the income share of the global Top 1% will reach 28% by 2050. Income share estimates are calculated using Purchasing Power Parity (PPP) euros. PPP accounts for differences in the cost of living between countries. Values are net of inflation.

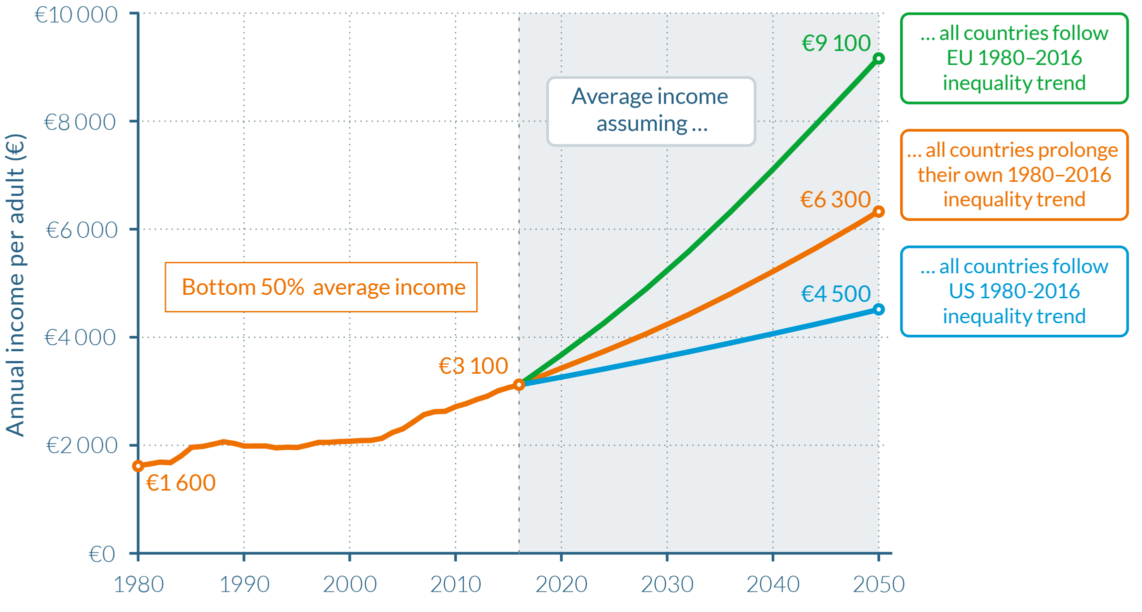
Global income inequality will also increase under a "business as usual" scenario, even with optimistic growth assumptions in emerging countries. This is not inevitable, however.

▸ Global income inequality will also increase if countries prolong the income inequality path they have been on since 1980—even with relatively high income growth predictions in Africa, Latin America, and Asia in the coming three decades. Global income inequality will increase even more if all countries follow the high-inequality trajectory followed by the United States between 1980 and 2016. However, global inequality will decrease moderately if all countries follow the inequality trajectory followed by the EU between 1980 and today (**Figure E10**).

▸ Within-country inequality dynamics have a tremendous impact on the eradication of global poverty. Depending on which inequality trajectory is followed by countries, the incomes of the bottom half of the world population may vary by factor of two by 2050 (**Figure E11**), ranging from €4 500 to € 9100 per year, per adult.

Figure E11

Inequality has substantial impacts on global poverty



Source: WID.world (2017). See wir2018.wid.world for data series and notes.

If all countries follow the inequality trajectory of Europe between 1980 and 2016, the average income of the Bottom 50% of the world population will be €9 100 by 2050. Income estimates are calculated using Purchasing Power Parity (PPP) euros. For comparison, €1 = $1.3 = ¥4.4 at PPP. PPP accounts for differences in the cost of living between countries. Values are net of inflation.

Tackling global income and wealth inequality requires important shifts in national and global tax policies. Educational policies, corporate governance, and wage-setting policies need to be reassessed in many countries. Data transparency is also key.

Tax progressivity is a proven tool to combat rising income and wealth inequality at the top.

▶ Research has demonstrated that tax progressivity is an effective tool to combat inequality. Progressive tax rates do not only reduce post-tax inequality, they also diminish pre-tax inequality by giving top earners less incentive to capture higher shares of growth via aggressive bargaining for pay rises and wealth accumulation. Tax progressivity was sharply reduced in rich and some emerging countries from the 1970s to the mid-2000s. Since the global financial crisis of 2008, the downward trend has leveled off and even reversed in certain countries, but future evolutions remain uncertain and will depend on democratic deliberations. It is also worth noting that inheritance taxes are nonexistent or near zero in high-inequality emerging countries, leaving space for important tax reforms in these countries.

A global financial register recording the ownership of financial assets would deal severe blows to tax evasion, money laundering, and rising inequality.

▶ Although the tax system is a crucial tool for tackling inequality, it also faces potential obstacles. Tax evasion ranks high among these, as recently illustrated by the Paradise

Papers revelations. The wealth held in tax havens has increased considerably since the 1970s and currently represents more than 10% of global GDP. The rise of tax havens makes it difficult to properly measure and tax wealth and capital income in a globalized world. While land and real-estate registries have existed for centuries, they miss a large fraction of the wealth held by households today, as wealth increasingly takes the form of financial securities. Several technical options exist for creating a global financial register, which could be used by national tax authorities to effectively combat fraud.

More equal access to education and well-paying jobs is key to addressing the stagnating or sluggish income growth rates of the poorest half of the population.

▶ Recent research shows that there can be an enormous gap between the public discourse about equal opportunity and the reality of unequal access to education. In the United States, for instance, out of a hundred children whose parents are among the bottom 10% of income earners, only twenty to thirty go to college. However, that figure reaches ninety when parents are within the top 10% earners. On the positive side, research shows that elite colleges who improve openness to students from poor backgrounds need not compromise their outcomes to do so. In both rich and emerging countries, it might be necessary to set transparent and verifiable objectives—while also changing financing and admission systems—to enable equal access to education.

▶ Democratic access to education can achieve much, but without mechanisms to ensure that people at the bottom of the distribution have access to well-paying jobs, education will not prove sufficient to tackle inequality. Better representation of workers in corporate governance bodies, and healthy minimum-wage rates, are important tools to achieve this.

Governments need to invest in the future to address current income and wealth inequality levels, and to prevent further increases in them.

▶ Public investments are needed in education, health, and environmental protection both to tackle existing inequality and to prevent further increases. This is particularly difficult, however, given that governments in rich countries have become poor and largely indebted. Reducing public debt is by no means an easy task, but several options to accomplish it exist—including wealth taxation, debt relief, and inflation— and have been used throughout history when governments were highly indebted, to empower younger generations.

INTRODUCTION

The objective of the *World Inequality Report 2018* is to contribute to a more informed public discussion on inequality by bringing the latest and most complete data to all sides in this global, democratic debate.

Economic inequality is widespread and to some extent inevitable. It is our belief, however, that where rising inequality is not properly addressed, it leads to all manner of political and social catastrophes. Avoiding these begins with careful monitoring.

In all societies, human beings care deeply about inequality. Changes in inequality levels have concrete consequences for people's living conditions, and they challenge our most basic and cherished notions of justice and fairness. Are different social groups getting all they deserve? Is the economic system treating different categories of labor-income earners and property owners in a balanced and equitable manner, both locally and globally? Across the world, people hold strong and often contradictory views on what constitutes acceptable and unacceptable inequality.

Again, to some extent, this will always be so. Our objective is not to bring everyone into agreement about inequality: this will never happen, for the simple reason that no single, scientific truth exists regarding the ideal level of inequality, let alone the ideal social policies and institutions to achieve and maintain it. Ultimately, it is up to public deliberation and political institutions and processes to make these difficult decisions.

Still, without aspiring to make everyone agree on the ideal level of inequality, we can hope and believe it is possible to agree about a number of inequality facts. The immediate objective of this report is to bring together new data series from the World Wealth and Income Database (WID.world) to document a number of newly discovered trends in global inequality.

WID.world is a cumulative and collaborative research process that originated in the early 2000s, and now includes over one hundred researchers covering more than seventy countries on all continents. WID.world provides open access to the most extensive available database on the historical evolution of the world distribution of income and wealth, both within and between countries.

In the context of the present report, we are able to present novel findings along three major lines. First, thanks to newly available data sources, we provide better coverage of emerging countries and of the world as a whole. Until recently, studies of inequality have tended to focus on the developed countries of Europe, North America, and Japan, largely due to better data access. Beginning with the *World Inequality Report 2018* we are able to present findings on inequality dynamics in emerging and developing countries, including China, India, Brazil, South Africa, Russia, and the Middle East. We show that inequality has increased in most world regions in recent decades, but at different speeds, suggesting that different policies and institutions can make a substantial difference. Such geographic coverage now allows us to track income growth rates of global income groups and analyze inequality among world citizens.

Second, we cover the entire distribution of incomes, from the bottom to the top, in a consistent manner. Until recently, most available long-run series on inequality focused on top-income shares. In this report, we present new findings on how the shares going to the lowest groups of populations have evolved. We show that bottom-income shares have declined significantly in many countries. In particular, we document a dramatic collapse of the bottom 50% income share in the United States since 1980 but not in other advanced economies, again suggesting that policies play a key role.

Third, our new series allow us to analyze the distribution of wealth and the structure of property in terms of how these have evolved. Most available series on inequality have focused on income rather than wealth. We are able in the *World Inequality Report 2018* to present new findings on the changing structure of public versus private wealth and the concentration of personal wealth. We show that net public wealth (assets minus debt) is close to zero or even negative in many developed countries, which stands in contrast to the situation observed in some emerging countries (most notably China).

These are important analytical advances, yet we are very much aware that we still face heavy limitations in our ability to measure the evolution of income and wealth inequality. Our objective in WID.world and in the *World Inequality Report* is not to claim that we have perfect data series, but rather to make explicit what we know and what we do not know. We attempt to combine and reconcile in a systematic manner the different data sources at our disposal: national income and wealth accounts; household income and wealth surveys; fiscal data coming from taxes on income, inheritance, and wealth (when they exist); and wealth rankings.

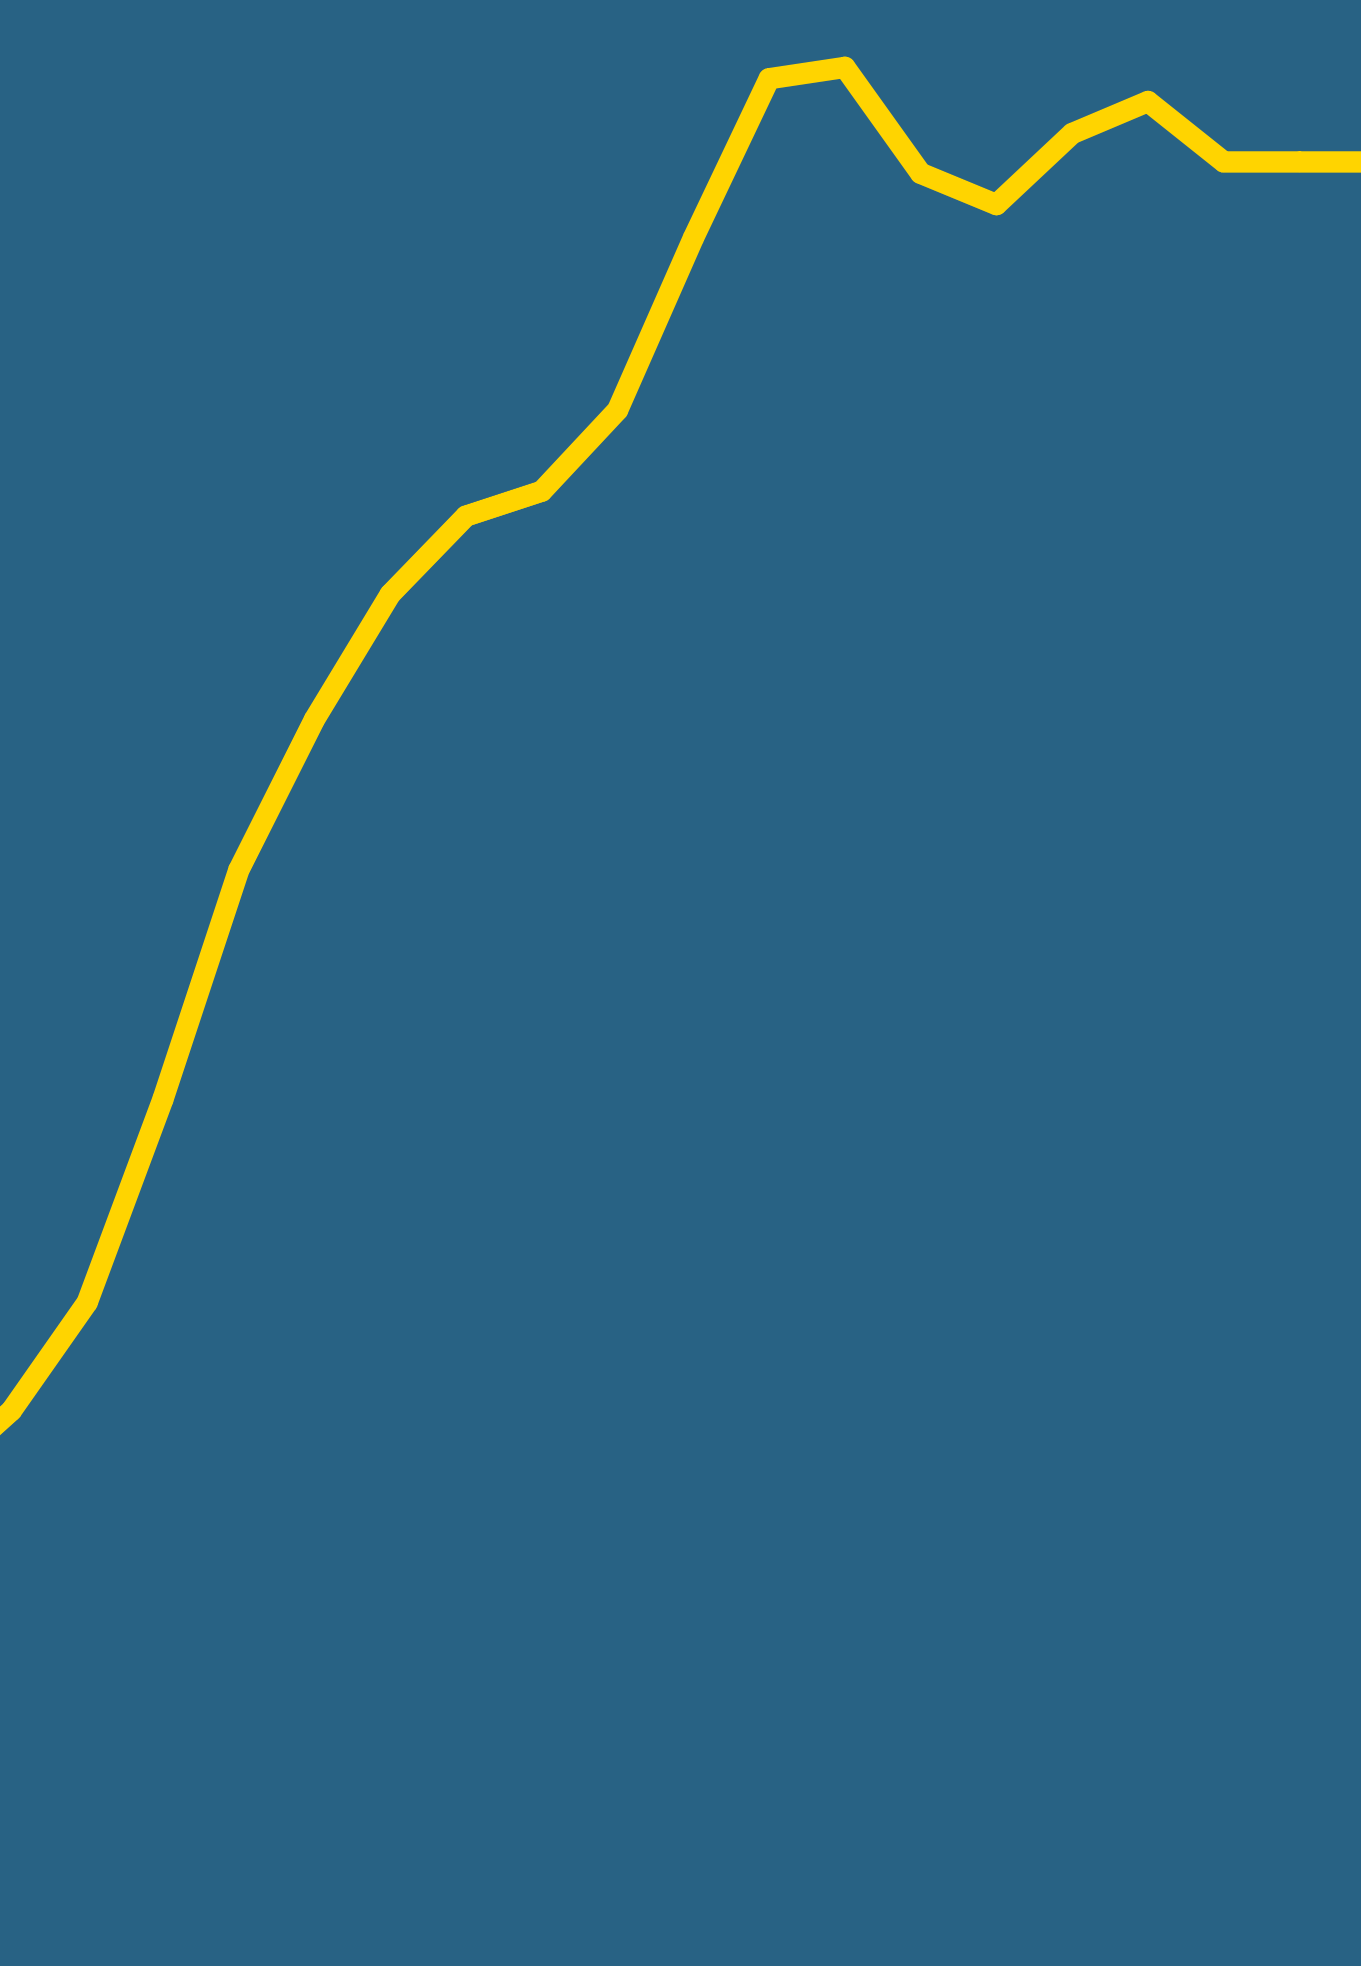
None of these data sources and their associated methodologies is sufficient in itself. In particular, we stress that our ability to measure the distribution of wealth is limited, and that the different data sources at our disposal are not always fully consistent with one another. But we believe that by combining these data sources in ways that are reasonable and explicitly described we can contribute to a better informed public debate. The methods and assumptions underlying our series are transparently presented in research papers available online. We make all raw data sources and computer codes easily accessible so that our work can be reproduced and extended by others.

Part of our aim is to put pressure on governments and international organizations to release more raw data on income and wealth. In our view, the lack of transparency regarding inequality of income and wealth seriously undermines the possibilities for peaceful democratic discussion in today's globalized economy. In particular, it is critical that governments provide public access to reliable and detailed tax statistics, which in turn requires that they operate properly functioning reporting systems for income, inheritance, and wealth. Short of this, it is very difficult to have an informed debate about the evolution of inequality and what should be done about it.

Our most important reason for providing all the necessary details about data sources and concepts is to enable interested citizens to make up their own minds about these important and difficult issues. Economic issues do not belong to economists, statisticians, government officials, or business leaders. They belong to everyone, and it is our chief objective to contribute to the power of the many.

PART I

THE WID.WORLD PROJECT AND THE MEASUREMENT OF ECONOMIC INEQUALITY



1

THE WID.WORLD PROJECT AND THE MEASUREMENT OF ECONOMIC INEQUALITY

This report is based on economic data available on WID.world, the most extensive database on the historical evolution of the world distribution of income and wealth, both within and between countries.

▹ WID.world is a cumulative and collaborative research process that originated in the early 2000s, and now includes over one hundred researchers covering more than seventy countries on all continents.

▹ Official inequality measures mostly rely on self-reported survey data, which frequently underestimate top income levels and usually are inconsistent with macroeconomic growth figures.

▹ Consequently, people often have a difficult time relating the GDP growth figures they hear about in the media to the individual income and wealth trajectories they see around them. This can lead to a lack of trust in economic statistics and get in the way of healthy public debates on inequality.

▹ WID.world attempts to correct for this problem by combining available sources (national accounts, fiscal and wealth data, surveys), spanning time periods as long as two hundred years for some countries, in a consistent and systematic manner.

▹ Our goal is to present inequality statistics that are consistent with macroeconomic statistics such as GDP and that can be easily understood and used by the public, to help ground the democratic debate in facts.

▹ We use modern digital tools to make these data available freely online on WID.world. Our data series are fully transparent and reproducible; our computer codes, assumptions, and detailed research papers are available online so that all interested persons can access and use them.

How to measure income and wealth inequality?

Economic inequality is a complex phenomenon that can be measured in various ways using different indicators and data sources. Choices among these indicators are not neutral and may have substantial impacts on findings. This is not only a matter of academic debate among statisticians. Anyone hoping to design appropriate policies should have a clear understanding of current and past inequality dynamics. We thus briefly discuss below key concepts which are central to understanding the rest of this report.

Whatever the source of data and the metric used to monitor economic inequality, its measurement starts from the same basic input: a distribution. For any income or wealth group, a distribution shows the number of individuals in this group and their shares of the group's total income or wealth. As such, a distribution is a relatively complex set of information, which is not straightforward to summarize. Inequality indices attempt to describe such complex data sets in a synthetic way.

Official inequality reports and statisticians often use synthetic measures of inequality such as the Gini index. Technically speaking, the Gini corresponds to the average distance between the income or wealth of all the pairs of individuals. To make it comparable between countries and over time, it is appropriately normalized so that complete equality corresponds to 0, and complete inequality (one person owning everything) corresponds to 1. The Gini index is often presented as a convenient, synthetic tool that allows comparisons of inequality across time and space.

However, this kind of index is technical both in its calculation and in the mathematical knowledge required of the reader to interpret it. According to the World Bank, for example, the Gini index for consumption inequality in Vietnam in 2014 was equal to 0.38. Is this large or small? A Gini of 0.38 implies that the distance separating Vietnam from perfect inequality (which is 1 on the index) is 0.62. Is this an acceptable distance from perfect inequality? It is not easy for citizens, journalists, and policymakers to make sense of such a metric.

Additionally, the strength of the Gini index—that it combines information on all individuals in a society—is also its main weakness. Because it summarizes a distribution in a single index, a given value for the Gini coefficient can result from distributions that are actually radically different. For example, a country may experience both a Gini-reducing decrease in poverty and a rise in the share of income going to the top 10%, which increases the Gini. If these effects offset each other, the overall Gini can remain constant, creating the impression that the distribution of income is not changing—while in fact the middle class is being squeezed out.

Because of its underlying mathematical properties, the Gini index also tends to downplay shifts happening at the top end and at the bottom of the distribution, precisely where the most evolution has taken place over the last decades. Finally, the raw data used to compute Gini indexes is often of relatively low quality, especially at the top of the distribution: top income and wealth levels are often implausibly low. The use of synthetic indexes can sometimes be a way to sweep such data issues under the rug.

Rather than use a single index, we believe it is preferable to use several metrics of inequality and to be transparent about which specific groups of the population are driving the evolution of inequality. This is the choice we make throughout this report. Distributions can be broken down into concrete social groups representing fixed fractions of the population—for example, the bottom 10% of the population, the next 10%, and so on, all the way up to the top 10% and the top 1%. For each group, it is then possible to measure the average income in that group, and the minimum income required to be part of it. For instance, in the United States in 2016, an adult needs to earn more than $124 000 per year (€95 000) to break into the top 10% group. On average, the top 10% earners make $317 000 per year (€242 000). By stark contrast, the bottom 50% earners make $16 000 per year (€13 000) on average. Arguably, anyone in the United States can relate to such measures and compare these values to their own income.

Another powerful way to measure inequality is to focus on the share of national income captured by each group. In the United States, for example, the top 10% captures 47% of national income in 2016. That is, the average income in the top 10% is 4.7 times larger than the average income in the economy as a whole; this group earns 4.7 times more than it would in a perfectly equal society. The bottom 90%, by contrast, captures 53% of national income, so individuals in the bottom 90% on average earn 59% of the average income per adult (that is, 0.53 divided by 0.90). There is no moral judgment associated with this statement: the shares of the various groups may or may not be justified. What matters here is that this metric is both accurate and meaningful.

The analysis should not stop with the top 10%, but also describe the shares and income levels of other income groups, such as the bottom 50% or the 40% who fall between the bottom 50% and the top 10% and who are often referred to as the “middle class.” One may also want to refine the focus on the top of the distribution, looking at the top 1%, for instance, as recent research has shown that inequality within the top 10% is large and growing. It may then also be relevant to further decompose the top 1% into even smaller groups such as tenths of percentiles. This process can be continued, dividing the top 0.1% into tenths of tenth percentiles, and the top 0.01% into a tenths of tenths of tenth percentiles. Overall, this approach allows for a more detailed but still straightforward description of the level and evolution of inequality relative to what can be achieved by using synthetic indexes.

Where to look for global inequality data

Understandable inequality indices are necessary but not sufficient to enable sound debates on inequality. Ultimately what matter are reliable and trusted economic data sources. Producing reliable inequality statistics takes time, however, and providing such estimates for several countries and over long periods is not possible without the participation of many researchers—researchers with country-specific knowledge, access to data sources, and adequate understanding of the political, economic, and cultural specificities of each country. This may help explain why, thus far, the production of inequality statistics has been decentralized across different research groups, often using different concepts and estimation techniques.

Several world inequality databases exist today. These inequality databases include for instance the World Bank’s PovcalNet, the Luxembourg Income Study (LIS), the Socio-Economic Database for Latin America and the Caribbean (SEDLAC) and the OECD Income Distribution Database (IDD). There are also various sources that combine the aforementioned databases to increase their coverage, the most important being the World Panel Income Distribution (LM-WPID) and the Standardized World Income Inequality Database (SWIID). Lastly, the United Nations compiles the World Income Inequality Database (WIID), which consists of a nearly exhaustive census of all primary databases and individual research initiatives, with detailed information about the concepts used.

These databases have proved useful to researchers, policymakers, journalists, and the general public focusing on the evolution of inequality over the past decades. However, these sources also rely almost exclusively on a specific information source—namely, household surveys—which have important limitations when it comes to measuring inequality. Household surveys consist mostly of face-to-face or virtual interviews with individuals who are asked questions about their incomes, wealth, and other socio-economic aspects of their lives. Surveys are particularly valuable because they gather information about not only income or assets, but also social and demographic dimensions. They thus allow for a better understanding of the determinants of income and wealth inequality, and help place income and wealth inequality in broader contexts—such as racial, spatial, educational, or gender inequality.

The main problem with household surveys, however, is that they usually rely entirely on self-reported information about income and wealth. As a consequence, they misrepresent top income and wealth levels, and therefore overall inequality. This can also contribute to major inconsistencies between macroeconomic growth (as recorded by GDP statistics) and household income growth (as recorded by surveys for the bottom and middle parts of the distribution), thereby leading to a lack of trust in economic statistics. (**Box 1.1**, p. 32)

Fiscal data capture inequality dynamics that survey data cannot

Survey estimates of inequality rely on self-reported information collected from nationally representative groups of the population. The first problem with any such survey is its limited sample size. Given the small number of extremely rich individuals, the likelihood that they will be included in surveys is typically very small. Some surveys attempt to address this issue by oversampling the rich — select more rich individuals to be surveyed—, but this is typically insufficient to obtain reliable information on the wealthy, because non-response rates are high among the rich. Furthermore, because very large self-reported incomes in surveys are sometimes due to reporting errors, surveys often use top codes (or corrections) to clean up extreme values. Therefore, surveys generally severely underestimate the income and wealth levels at the very top of the distribution, precisely where some of the largest changes have occurred over the past decades.

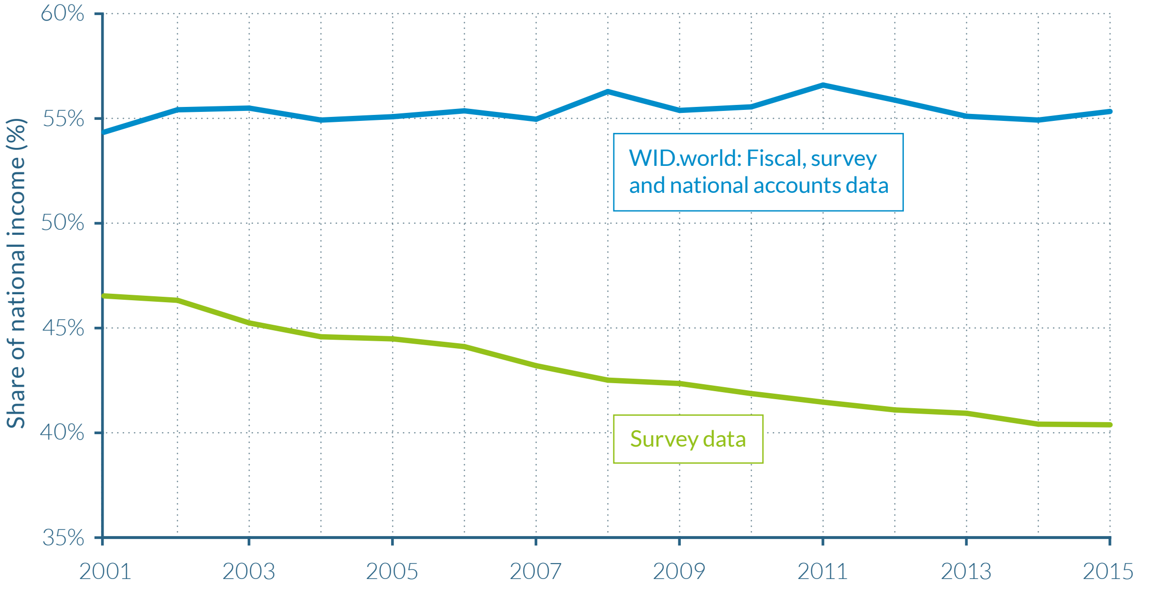
The best way to overcome this limitation is to combine different types of data sources, and in particular to use administrative tax data together with survey data. Initially compiled for tax collection purposes, tax data are also valuable for researchers. As compared to surveys, they give a more complete and reliable picture of the distribution of income and wealth among the wealthy.

To illustrate the differences in inequality estimates between survey and fiscal data, consider the following examples. According to official survey data, the top 1% of Chinese earners captured 6.5% of national income in 2015. However, new estimates produced as part of the WID.world project show that correcting surveys with newly released tax data on high-income earners is enough to increase the income share of the top 1% from 6.5% to close to 11.5% of national income.[1] In Brazil, survey data indicate that the income received by the richest 10% is just over 40% of total income in 2015, but when surveys are combined with fiscal data and national accounts, we find that this group receives, in fact, more than 55% of national income (see **Figure 1.1**). As can be seen from these two examples, the extent to which surveys underestimate top shares can vary from one country to another—and also from one percentile to another—but it is always likely to be substantial. Comparisons between countries are likely to be unreliable if made based on survey data without adjusting for the top by including fiscal and national accounts data.

Poor coverage of the wealthy in household surveys can also impede accurate comparisons across time. For example, according to Brazilian survey data, inequality in the country decreased between 2001 and 2015—but income tax data show that, in fact, inequality remained stubbornly high over this period. Similar results can be found in China, where the income share of the top 10%

Figure 1.1

Top 10% income share in Brazil, 2001–2015: survey vs. national accounts (WID.world) series



Source: Morgan (2017). See wir2018.wid.world for data series and notes.

In 2015, the Top 10% received around 40% of national income according to household surveys. However, corrected estimates using fiscal, survey and national accounts show that their share is 55%.

increased by fifteen percentage points from 1978 to 2015, while, according to official survey estimates, the increase was only by nine percentage points. In India, the absence of top earners in survey data could explain up to 30% of the gap between the very low macroeconomic growth of consumption seen in survey data, and the much faster growth rate seen in national account data.[2]

Administrative tax data are not free from measurement issues at the top. They also tend to underestimate top income and wealth levels, due to tax evasion. For this reason, our inequality estimates should be viewed in most cases as lower-bound estimates—but at least these are more plausible lower bounds than survey-based measures. In all countries, including in countries with potentially widespread evasion, we find that top income levels reported in tax data are substantially larger than in surveys. The reason for this is simple: noncompliant taxpayers face at least some potential sanctions if they underreport their incomes to tax authorities, whereas no such sanctions exist for underreporting income in a survey. Furthermore, tax authorities increasingly collect data from third parties (such as employers and banks), which increases tax compliance.

Another advantage of tax data over surveys is coverage of longer time periods. Administrative tax data are usually available on a yearly basis starting with the beginning of the twentieth century for the income tax, and as far back as the early nineteenth century for the inheritance tax in some countries. In contrast, nationally representative surveys are rarely carried out annually, and were not generally carried out at all before the 1970s–1980s. Using them, it would be impossible to study long-run evolutions—a serious limitation given that some of the most important transformations in inequality span long periods of time. Having data covering many decades helps disentangles long-term trends reflecting major macroeconomic transformations from short-term variations due to episodic shocks or measurement issues.

The renewed focus on income inequality and the World Top Incomes Database

During the past fifteen years, there has been renewed interest in understanding the long-run evolution of income inequality. Many studies have constructed top income share series for a large number of countries.[3] These studies have generated large volumes of data, intended as a research resource for further analysis as well as a source to inform the public debate on inequality trends. To a large extent, this literature followed the pioneering work of Simon Kuznets, extending his income share measurement to more countries and years.[4]

In January 2011, The World Top Incomes Database (WTID) was created to provide convenient and free access to these series. Thanks to the contribution of over a hundred researchers, the WTID expanded to include series on income inequality for more than thirty countries, spanning most of the twentieth and early twenty-first centuries. These series had a large impact on the global inequality debate because they made it possible to compare the income shares of top groups (for example, the top 1%) over long periods of time, revealing new facts and refocusing the discussion on the rise in inequality seen in recent decades.

Although the top income share series available in the WTID all had a common methodological underpinning and goal—using tax data to document the long-run evolution of income concentration—the units of observation, the income concepts, and the statistical methods used were never made fully homogeneous over time and across countries. Attention was restricted for the most part, moreover, to the top decile rather than to the entire distribution, and these series were mostly about income, not wealth. All this pointed to the need for a methodological reexamination and clarification.

In December 2015, the WTID was subsumed into the WID, the World Wealth and Income Database (WID.world). The change in name reflects the extended scope and ambition of the project. The new database aims at measuring not only income but also wealth inequality, and it aims at capturing the dynamics of income and wealth across the entire distribution and not only at the top.

WID.world's key novelty: distributing national accounts in a consistent way

The key novelty of the WID.world project is to produce Distributional National Accounts (DINA) relying on a consistent and systematic combination of fiscal, survey, wealth and national accounts data sources.[5] The complete DINA methodological guidelines (Alvaredo et al., 2016), as well as all computer codes and detailed data series and research papers, are available online on WID.world. Here we summarize only some of the main methodological points.

As explained above, administrative data on income and wealth tend to be more reliable sources of information than surveys. Unfortunately, they provide information on only a subset of the population—namely, the part filing tax returns. This issue is particularly important in emerging countries. In India, for example, income tax payers represent only slightly more than 6% of the adult population; thus, survey data are the only available sources of information to measure inequality in the bottom 94% of the distribution. We must critically and cautiously rely on survey data sources in combination with fiscal and wealth sources and national accounts to estimate the distribution of national income or wealth.

Another limitation of tax data is that they are subject to changes in fiscal concepts over time and across countries. Typically, depending on whether income components (such as labor income, dividends, and capital income) are subject to tax, they may or may not appear in the tax data from which distributional statistics can be computed. These differences can make international and historical comparisons difficult.

To some extent, these harmonization issues can be overcome by using national account data—and in particular, the concepts of national income and national wealth—as a benchmark. Our choice of these concepts for the analysis of inequality does not mean that we consider them perfectly satisfactory. Quite the contrary, our view is that national accounts statistics are insufficient and need to be greatly improved.

In our view, however, the best way to improve on the national accounts is to confront them with other sources and to attempt to distribute national income and wealth across percentiles. The key advantage of national accounts is that they follow internationally standardized definitions for measuring the economic activity of nations. As such, they allow for a more consistent comparison over time and across countries than fiscal data. National accounts definitions, in particular, do not depend upon local variations in tax legislation or other parts of the legal system.

One of the most widely used aggregate of the national accounts is gross domestic product (GDP). But GDP statistics do not provide any information about the extent to which the different social groups benefit (or not) from growth.[6] In addition, GDP is not a satisfactory measure of the total income of a country, because a country with extensive capital depreciation or large income flowing abroad can have a large GDP but much less income to distribute to its residents.

The concept of national income (NI) is a better benchmark indicator to compare countries and to analyze the distribution of income and growth. National income is equal to GDP minus capital depreciation plus net foreign

Box 1.1

What type of economic inequality do we measure in the *World Inequality Report*?

This report attempts to present an integrated and consistent approach to gauging both income and wealth inequality. As its title indicates, the key ambition and novelty of the World Wealth and Income Database (WID.world), upon which this report is built, is indeed to put equal emphasis on wealth and income, and to relate the two aspects of economic inequality as closely as possible.

There are several reasons for this. First, in order to properly analyze income inequality, it is critical to decompose total income into two categories of income flows: income from labor and income from capital. The latter category has played an important role in the rise of inequality in recent decades—and an even bigger role if we look at the evolution of the distribution of income in the very long run.

Next, one of our key goals is to relate macroeconomic issues—such as capital accumulation, the aggregate structure of property, privatization or nationalization policies, and the evolution of public debt—to the microeconomic study of inequality. Far too often, the study of the “capital” side of the economy (that is, focused on capital, investment, debt, and so forth) is separated from the study of the “household” side (that is, looking at wages, transfers, poverty, inequality, and other issues).

We should make clear, however, that a lot of progress needs to be made before we can present a fully integrated approach. The present report should be viewed as one step in this direction. For example, in Part IV of the report, we are able to fully analyze the joint evolution of inequality of income and wealth for a number of countries (in particular, the United States and France). Doing so requires careful measurement not only of the inequality of pre-tax and post-tax income, but also of the distribution of saving rates across the different deciles of the distribution of pre-tax income.

This kind of analysis will gradually be extended to more and more countries, as more data become income. It reflects a nation's income more closely than GDP does. The WID.world database combines macroeconomic data from different sources in order to produce national income series for about two hundred countries. These national income estimates are consistent with those of international organizations, with one important improvement: our series address the issue that some income is missing from published national accounts. In the official data, foreign income paid is higher than foreign income received at the global level—because some of the income received in tax havens is nowhere recorded. We allocate this global missing income drawing on methods first developed by Zucman (2013).[7]

Total fiscal income (as measured by tax data) is always less than national income (as measured in the national accounts). Part of the difference is due to tax-exempt income flows such as imputed rent (the rental value of owner-occupied housing) and undistributed profits (the profits of corporations not distributed to individuals but ultimately benefitting owners of corporations). When data are available and sufficiently precise, we attribute the fraction of national income missing from fiscal data to the income groups who benefit from these sources of income. This operation can have significant implications for the distribution of income. For example, once we add undistributed profits to fiscal income, the share of income earned by the top 1% in China increases from 11.5% to 14% in 2015. A number of recent research papers have attempted to construct inequality statistics accounting for tax-exempt income, both in developed and emerging countries, including the United States, China, France, Brazil, and Russia.

available. The combination of series on the distribution of pre-tax and post-tax income, savings, and wealth will also allow us to relate in a systematic manner the inequality of income, wealth, and consumption (that is, income minus savings).

In our view, however, it would be a mistake to overemphasize the consumption perspective, as the literature on inequality and poverty has sometimes done. Consumption is obviously a very important indicator of wealth, particularly at the bottom of the distribution. The problem is that the household surveys routinely used to study consumption inequality tend to underestimate the consumption, income, and wealth levels reached by the top of the distribution. Also, the notion of consumption is not always well defined for top income groups, which typically save very large proportions of their income. They choose to do so partly in order to consume more in later years, but more generally in order to consume the prestige, security, and economic power conferred by wealth ownership. In order to develop a consistent and global perspective on economic inequality—that is, a perspective that views economic actors not only as consumers and workers but also as owners and investors—it is critical, in our view, to put equal emphasis on income and wealth.

Our various concepts of income and wealth—in particular, pre-tax national income, post-tax national income, and personal wealth—are defined using international guidelines in national income and wealth accounts (SNA 2008). The exact technical definitions are available online in the DINA Guidelines (Distributional National Accounts).[a]

a See F. Alvaredo, A. B. Atkinson, L. Chancel, T. Piketty, E. Saez, and G. Zucman, "Distributional National Accounts (DINA) Guidelines: Concepts and Methods Used in WID.world," WID.world Working Paper no. 2016/2, December 2016, http://wid.world/document/dinaguidelines-v1/.

Data limitations currently make such adjustments impossible, however, in a number of countries, which implies that inequality estimates for these countries tend to be downwardly biased. In such cases, we simply use our national income series to scale up fiscal incomes proportionally so that they add up to national income.[8] This transformation does not affect the distribution of income, but allows us to compare the evolution of income levels over time and across countries more meaningfully. For example, our data show that the average pre-tax national income per adult within the top 1% is similar in India and China in 2013 (€131 000 versus €157 000, respectively) but much higher in Brazil (€436 000) and in the United States (€990 000).

Taking wealth inequality into account

One reason for the growing interest in wealth inequality is the recognition that the increase in income inequality in recent years is partly a result of rising capital incomes (in addition to changes in wages and earned income). These capital incomes include interest, dividends, retained earnings of corporations, and rents. While most of the population earns little capital income, this form of income accounts for a significant proportion of income at the top of the income distribution.

Another reason for the renewed interest in wealth is that aggregate wealth itself is rising faster than income—so the ratio of national wealth to national income is rising fast in many countries (as was first shown by Piketty and Zucman, 2014). One consequence is that inherited wealth—which declined for much of the twentieth century—is taking on renewed significance in a number of countries. There is also extensive evidence (in billionaire rankings, for example) that top global wealth-holders have accumulated wealth at a much faster rate than the average person and have therefore benefited from a substantial increase in their share of global wealth.

Because most countries do not tax wealth directly, producing reliable estimates of wealth inequality requires combining different data sources, such as billionaire rankings and also income tax data and inheritance tax data—as in the pioneering work of A. B. Atkinson and A. Harrison (1978).[9] The globalization of wealth management since the 1980s raises additional new challenges, as a growing amount of world wealth is held in offshore financial centers. Work led by Gabriel Zucman shows that accounting for these offshore assets has large implications for the measurement of wealth at the very top end of the distribution (see **Figure 1.2**).[10] More generally, it is becoming critical to measure the inequality of income and wealth from a global perspective, and not simply at the country level, as we discuss below.

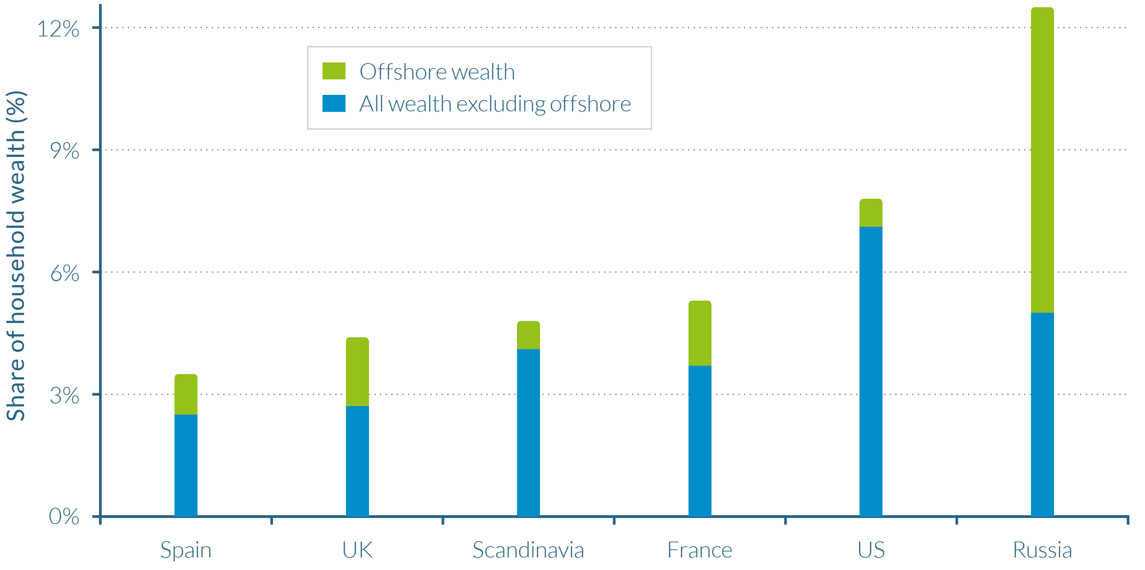
From national to regional and global distributions of income and wealth

One central objective of the WID.world project is to produce global income and wealth distributions. This amounts to ranking individuals from the poorest to the richest at the global level, ignoring national boundaries. We also provide estimates of income and wealth inequality for broad regions, such as Europe and the Middle East.

One might wonder whether it makes sense to produce global inequality estimates, given that most policies (including policies to tackle inequality) are voted and implemented at the national level. In our view, it is complementary to study inequality dynamics at the national, regional, and global levels. First, although there exists no global government, there are attempts to foster global cooperation to tackle issues such tax havens and environmental inequalities. Next, growing economic interdependence implies that one needs to look at global inequality dynamics to fully understand the underlying economic forces shaping national inequality. Finally, political perceptions about inequality might be determined by one's position not only within a given country but also by comparison to others at the regional and global level.

Figure 1.2

Top 0.01% wealth share and its composition in emerging and rich countries, 2000–2009



Source: Alstadsæter, Johannesen and Zucman (2017). See wir2018.wid.world for data series and notes.
Between 2000-2009, the average wealth share of the Top 0.01% in Scandinavia was 4.8%. 0.7 percentage points of this wealth was held offshore.

Since the 1980s the world has evolved towards more economic, financial, and cultural integration. Even if globalization may be called into question today—as recent elections in the UK and the United States have proved—the world remains an interconnected environment where capital, goods, services, and ideas are highly mobile and their circulation is facilitated by innovations in information technology. To some extent, there is already a global community, and in this global environment it is logical for citizens to compare themselves to one another.

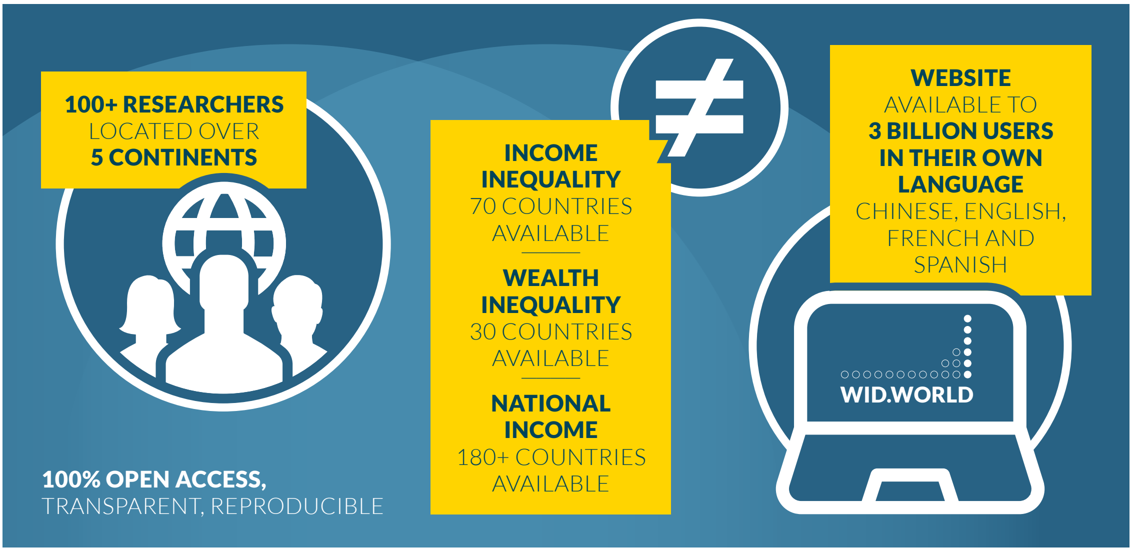
Individuals in one country may feel deeply concerned, from an ethical perspective, by the situations of those at the bottom of the global distribution.[11] They may also be concerned about their own positions in the global or regional distributions of income and wealth. The stagnating or sluggish income growth of lower- and middle-income groups in rich countries, considered in a context of high growth in emerging countries and at the top of the global income pyramid, may have contributed to anti-establishment votes over recent years. National citizens may already be thinking across borders.

Global inequality data are also necessary to analyze the distributional consequences of globalization. Is growth at the global top disproportionately high? Or is the share of total growth captured by the global top 1% small compared to the growth that has accrued to the bottom 50%? The first step toward answering these fundamental questions is to collect and produce global inequality statistics that cover all groups of the population, up to the very top.

As will be described in Chapter 2.1, we move toward this goal carefully, aggregating only regions and countries for which we have consistent data series. We present results for the global distribution of income, but data limitations do not allow us yet to analyze the global distribution of wealth. (Our "global" wealth estimates take into account only the United States, Europe, and China.) Producing truly global wealth distribution series will be

Figure 1.3

The WID.world project in 2018



a major goal of future editions of the *World Inequality Report*. Eventually, we also seek to deepen our understanding of the interplay between global economic inequality and other forms of global inequality, such as environmental injustice.[12] Such inequality metrics can help environmental and economic policy making—for example, when it comes to allocating efforts to tackle climate change across individuals, countries, and regions.

WID.world and the *World Inequality Report:* open access, transparency, and replicability at its core

In January 2017, we released the first version of the WID.world website with the objective of reaching a wide audience of researchers and the general public with a user-friendly interface. Thanks to the work of over a hundred researchers located on five continents, the WID.world website now gathers income inequality data for more than 70 countries, wealth inequality and public and private wealth data for more than 30 countries, and national income and GDP data for more than 180 countries. Thus WID.world provides access to the most extensive available database on the historical evolution of income and wealth inequality, both between and within countries. As part of our attempts to democratize access to inequality data, we have also made WID.world available in four languages—Chinese (Mandarin), English, French, and Spanish—and thus to three billion people in their own language (see **Figure 1.3**).

Open access, transparency, and reproducibility are the core values of the WID.world project. The website was designed to allow anyone, expert or nonexpert, to access and make sense of historical global inequality data. All WID.world series, moreover, are accompanied with a methodological paper providing extensive descriptions of the method and concepts used.

Raw data and the computer codes used to generate inequality estimates are also updated on the website. This level of transparency is another key innovation in the landscape of economic data providers. It allows any interested researcher to refine our estimates, make different assumptions if they wish, and help develop new ideas for how inequality can be better measured and how this data can be used for the benefit of society. Our website comes along with a set of tools to analyze economic inequality.

The *World Inequality Report 2018* is part of this initiative to democratize access to inequality statistics. All the series discussed and presented in the report are also available online and can be entirely reproduced. We should note, however, that this report contains analyses carried out specifically for the report, and hence, the report may not necessarily represent the views of all WID.world fellows. The *World Inequality Report* is a product of the World Inequality Lab, which relies on research completed as part of the WID.world project and novel research on global inequality dynamics.

PART II

TRENDS IN GLOBAL INCOME INEQUALITY

2.1

GLOBAL INCOME INEQUALITY DYNAMICS

The information in this chapter draws on "The Elephant Curve of Global Inequality and Growth," by Facundo Alvaredo, Lucas Chancel, Thomas Piketty, Emmanuel Saez, and Gabriel Zucman, 2017. WID.world Working Paper Series (No. 2017/20), forthcoming in *American Economic Review*.

- ▷ Data series on global inequality are scarce and caution is required in interpreting them. However, by combining consistent and comparable data, as we have done in this *World Inequality Report*, we can provide striking insights.
- ▷ Since 1980, income inequality has increased rapidly in North America and Asia, grown moderately in Europe, and stabilized at an extremely high level in the Middle East, sub-Saharan Africa, and Brazil.
- ▷ The poorest half of the global population has seen its income grow significantly thanks to high growth in Asia. But the top 0.1% has captured as much growth as the bottom half of the world adult population since 1980.
- ▷ Income growth has been sluggish or even nil for individuals between the global bottom 50% and top 1%. This includes North American and European lower- and middle-income groups.
- ▷ The rise of global inequality has not been steady. While the global top 1% income share increased from 16% in 1980 to 22% in 2000, it declined slightly thereafter to 20%. The trend break after 2000 is due to a reduction in between-country average income inequality, as within-country inequality has continued to increase.
- ▷ When measured using market exchange rates, the top 10% share reaches 60% today, instead of 53% when using purchasing power parity (PPP) exchange rates.
- ▷ Global income growth dynamics are driven by strong forces of convergence between countries and divergence within countries. Standard economic trade models fail to explain these dynamics properly—in particular, the rise of inequality at the very top and within emerging countries. Global dynamics are shaped by a variety of national institutional and political contexts, described and discussed in the following chapters of this report.

Managing data limitations to construct a global distribution of income

The dynamics of global inequality have attracted growing attention in recent years.[1] However, we still know relatively little about how the distribution of global income and wealth is evolving. Available studies have largely relied on household surveys, a useful source of information, but one that does not accurately track the evolution of inequality at the top of the distribution. New methodological and empirical work carried out in the context of WID.world allows a better understanding of global income dynamics.

We stress at the outset that the production of global inequality dynamics is in its infancy and will still require much more work. It is critical that national statistical and tax institutions release income and wealth inequality data in many countries where data are not available currently—in particular, in developing and emerging countries. Researchers also need to thoroughly harmonize and analyze these data to produce consistent, comparable estimates. The World Inequality Lab and the WID.world research consortium intend to continue contributing to these tasks in the coming years.

Even if there are uncertainties involved, it is already possible to produce meaningful global income inequality estimates. The WID.world database contains internationally comparable income inequality estimates covering the entire population, from the lowest to the highest income earners, for many countries: the United States, China, India, Russia, Brazil, the Middle East, and the major European countries (such as France, Germany, and the United Kingdom). A great deal can already be inferred by comparing inequality trends in these regions. Using simple assumptions, we have estimated the evolution of incomes in the rest of the world so as to distribute 100% of global income every year since 1980 (**Box 2.1.1**). This exercise should be seen as a first step towards the construction of a fully consistent global distribution of income. We plan to present updated and extended versions of these estimates in the future editions of the *World Inequality Report* and on WID.world, as we gradually manage to access more data sources, particularly in Africa, Latin America, and Asia.

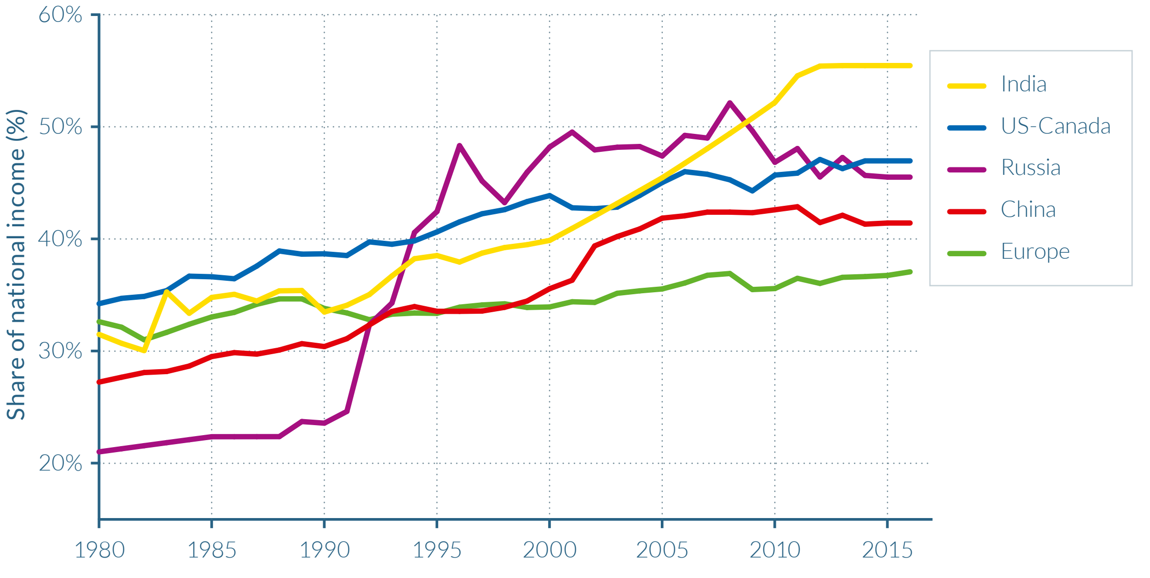
The exploration of global inequality dynamics presented here starts in 1980, for two main reasons. First, 1980 corresponds to a turning point in inequality and redistributive policies in many countries. The early 1980s mark the start of a rising trend in inequality and major policy changes, both in the West (with the elections of Ronald Reagan and Margaret Thatcher, in particular) and in emerging economies (with deregulation policies in China and India). Second, 1980 is the date from which data become available for a large enough number of countries to allow a sound analysis of global dynamics.

We start by presenting our basic findings regarding the evolution of income inequality within the main world regions. Three main findings emerge.

First, we observe rising inequality in most of the world's regions, but with very different magnitudes. More specifically, we display in **Figure 2.1.1a** the evolution of the top 10% income share in Europe (Western and Eastern Europe combined, excluding Ukraine, Belorussia, and Russia), North America (defined as the United States and Canada), China, India, and Russia. The top 10% share has increased in all five of these large world regions since 1980. The top 10% share was around 30–35% in Europe, North America, China, and India in 1980, and only about 20–25% in Russia. If we put these 1980 inequality levels into broader and longer perspective, we find that they were in place since approximately the Second World War, and that these are relatively low inequality levels by historical standards (Piketty, 2014). In effect, despite their many differences, all these world regions went through a relatively egalitarian phase between 1950 and 1980. For simplicity, and for the time being, this rela-

Figure 2.1.1a

Top 10% income shares across the world, 1980–2016: Rising inequality almost everywhere, but at different speeds



Source: WID.world (2017). See wir2018.wid.world for data series and notes.

In 2016, 47% of national income was received by the top 10% in US-Canada, compared to 34% in 1980.

tively low inequality regime can be described as the "post-war egalitarian regime," with obvious important variations between social-democratic, New Deal, socialist, and communist variants to which we will return.

Top 10% income shares then increased in all these regions between 1980 and 2016, but with large variations in magnitude. In Europe, the rise was moderate, with the top 10% share increasing to about 35–40% by 2016. However, in North America, China, India, and even more so in Russia (where the change in policy regime was particularly dramatic), the rise was much more pronounced. In all these regions, the top 10% share rose to about 45–50% of total income in 2016. The fact that the magnitude of rising inequality differs substantially across regions suggests that policies and institutions matter: rising inequality cannot be viewed as a mechanical, deterministic consequence of globalization.

Next, there are exceptions to this general pattern. That is, there are regions—in particular, the Middle East, Brazil (and to some extent Latin America as a whole), and South Africa (and to some extent sub-Saharan Africa as a whole)—where income inequality has remained relatively stable at extremely high levels in recent decades. Unfortunately, data availability is more limited for these three regions, which explains why the series start in 1990, and why we are not able to properly cover all countries in these regions (see **Figure 2.1.1b**).

In spite of their many differences, the striking commonality in these three regions is the extreme and persistent level of inequality. The top 10% receives about 55% of total income in Brazil and sub-Saharan Africa, and in the Middle East, the top 10% income share is typically over 60% (see **Figure 2.1.1c**). In effect, for various historical reasons, these three regions never went through the post-war egalitarian regime and have always been at the world's high-inequality frontier.

Figure 2.1.1b

Top 10% income shares across the world, 1980–2016: Is world inequality moving toward the high-inequality frontier?

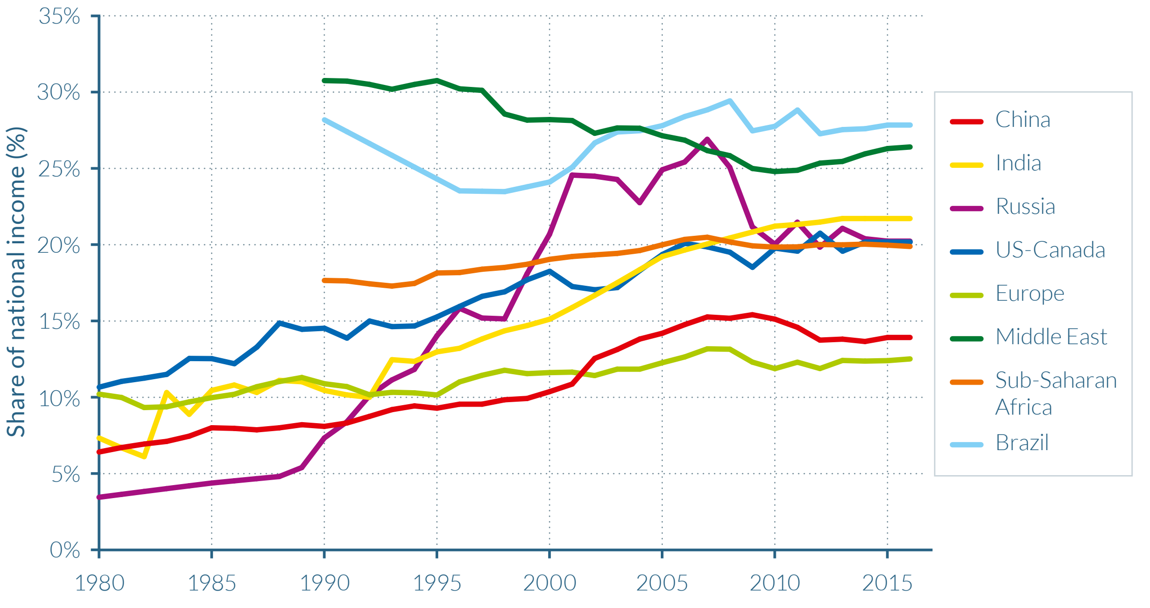
In 2016, 37% of national income was received by the Top 10% in Europe against 61% in the Middle-East.

Figure 2.1.1d

Top 1% income shares across the world, 1980–2016



Source: WID.world (2017). See wir2018.wid.world for data series and notes.

In 2016, 14% of national income was received by the Top 1% in China.

The third striking finding is that the variations in top-income shares over time and across countries are very large in magnitude, and have a major impact on the income shares and levels of the bottom 50% of the population. It is worth keeping in mind the following orders of magnitude: top 10% income shares vary from 20–25% to 60–65% of total income (see **Figures 2.1.1a** and **2.1.1b**). If we focus upon very top incomes, we find that top 1% income shares vary from about 5% to 30% (see **Figure 2.1.1d**), just like the share of income going to the bottom 50% of the population (see **Figure 2.1.1e**).

In other words, the same aggregate income level can give rise to widely different income levels for the bottom and top groups depending on the distribution of income prevailing in the specific country and time period under consideration. In brief, the distribution matters quite a bit.

What have been the growth trajectories of different income groups in these regions since 1980? **Table 2.1.1** presents income growth rates in China, Europe, India, Russia, and North America for key groups of the distribution. The full population grew at very different rates in the five regions. Real per-adult, national income growth reached an impressive 831% in China and 223% in India. In Europe, Russia, and North America, income growth was lower than 100% (40%, 34%, and 74%, respectively). Behind these heterogeneous average growth trajectories, the different regions all share a common, striking characteristic.

In all these countries, income growth is systematically higher for upper income groups. In China, the bottom 50% earners grew at less than 420% while the top 0.001% grew at more than 3 750%. The gap between the bottom 50% and the top 0.001% is even more important in India (less than 110% versus more than 3 000%). In Russia, the top of the distribution had extreme growth rates; this reflects the shift from a regime in which top incomes were constrained by the commu-

nist system towards a market economy with few regulations constraining top incomes. In this global picture, in line with **Figure 2.1.1**, Europe stands as the region with the lowest growth gap between the bottom 50% and the full population, and with the lowest growth gap between the bottom 50% and top 0.001%.

Table 2.1.1

Global income growth and inequality, 1980–2016

	Total cumulative real growth per adult					
Income group	**China**	**Europe**	**India**	**Russia**	**US-Canada**	**World**
Full Population	831%	40%	223%	34%	63%	60%
Bottom 50%	417%	26%	107%	-26%	5%	94%
Middle 40%	785%	34%	112%	5%	44%	43%

Top 1%	1920%	72%	857%	686%	206%	101%
Top 0.1%	2421%	76%	1295%	2562%	320%	133%
Top 0.01%	3112%	87%	2078%	8239%	452%	185%
Top 0.001%	3752%	120%	3083%	25269%	629%	235%

Source: WID.world (2017). See wir2018.wid.world for data series and notes.

From 1980 to 2016, the average income of the Bottom 50% in China grew 417%. Income estimates are calculated using 2016 Purchasing Power Parity (PPP) euros. PPP accounts for differences in the cost of living between countries. Values are net of inflation.

The right-hand column of table 2.1.1 presents income growth rates of different groups at the level of the entire world. These growth rates are obtained once all the individuals of the different regions are pooled together to reconstruct global income groups. Incomes across countries are compared using purchasing power parity (PPP) so that a given income can in principle buy the same bundle of goods and services in all countries. Average global growth is relatively low (60%) compared to emerging countries' growth rates. Interestingly enough, at the world level, growth rates do not rise monotonically with income groups' positions in the distribution. Instead, we observe high growth at the bottom 50% (94%), low growth in the middle 40% (43%), and high growth at the top 1% (more than 100%)—and especially at the top 0.001% (close to 235%).

To better understand the significance of these unequal rates of growth, it is useful to focus on the share of total growth captured by each group over the entire period. **Table 2.1.2** presents the share of growth per adult captured by each group. Focusing on both metrics is important because the top 1% global income group could have enjoyed a substantial growth rate of more than 100% over the past four decades (meaningful at the individual level), but still represent only a little share of total growth. The top 1% captured 35% of total growth in the US-Canada, and an astonishing 69% in Russia.

At the global level, the top 1% captured 27% of total growth—that is, twice as much as the share of growth captured by the bottom 50%. The top 0.1% captured about as much growth as the bottom half of the world population. Therefore, the income growth captured by very top global earners since 1980 was very large, even if demographically they are a very small group.

Building a global inequality distribution brick by brick

A powerful way to visualize the evolution of global income inequality dynamics is to plot the total growth rate of each income groups (see **Box 2.1.2**). This provides a more precise representation of growth dynamics than **Table 2.1.1**. To properly understand the role played by each region in global inequality dynamics, we follow a step-by-step approach to construct this global growth curve by adding one region after another and discussing each step of the exercise.

Table 2.1.2

Share of global growth captured by income groups, 1980–2016

Income group	China	Europe	India	Russia	US-Canada	World
Full Population	100%	100%	100%	100%	100%	100%
Bottom 50%	13%	14%	11%	-24%	2%	12%
Middle 40%	43%	38%	23%	7%	32%	31%
Top 10%	43%	48%	66%	117%	67%	57%
Top 1%	15%	18%	28%	69%	35%	27%
Top 0.1%	7%	7%	12%	41%	18%	13%
Top 0.01%	4%	3%	5%	20%	9%	7%
Top 0.001%	2%	1%	3%	10%	4%	4%

From 1980 to 2016, the Middle 40% in Europe captured 38% of total income growth in the region. Income estimates are calculated using 2016 Purchasing Power Parity (PPP) euros. PPP accounts for differences in the cost of living between countries. Values are net of inflation.

Box 2.1.1

How did we construct global income inequality measures?

Global estimates in the *World Inequality Report* are based on a combination of sources used at the national level (including tax receipts, household surveys and national accounts as discussed in Part I). Consistent estimates of national income inequality are now available for the USA, Western Europe (and in particular France, Germany, the United Kingdom) as well as China, India, Brazil, Russia and the Middle East. These regions represent approximately two thirds of the world adult population and three quarters of global income.

In this chapter on global income inequality, we have ultimately distributed the totality of global income, to the totality of the world population. To achieve this, we had to distribute the quarter of global income to the third of the global population for which there is currently no consistent income inequality data available. One crucial information we have, however, is total national income in each country. This information is essential, as it already determines a large part of global income inequality among individuals.

How then to distribute national income to individuals in countries without inequality data? We tested different ways and found that these had very moderate impacts on the distribution of global income, given the limited share of income and population concerned by these assumptions. In the end, we assumed that countries with missing inequality information had similar levels of inequality as other countries in their region. Take an example, we know the average income level in Malaysia, but not (yet) how national income is distributed to all individuals in this country. We then assumed that the distribution of income in Malaysia was the same, and followed the same trends, as in the region formed by China and India. This is indeed an over simplification, but to some extent this is an acceptable method as alternative assumptions have a limited impact on our general conclusions.

Sub-Saharan Africa is a particular case: we did not have any country with consistent income inequality data over the past decades (whereas in Asia we have consistent estimates for China and India, in Latin America, we have estimates for Brazil, etc.). For Sub-Saharan Africa, we thus relied on household surveys available from the World Bank (these estimates cover 70% of Sub-Saharan Africa's population and yet a higher proportion of the region's income). These surveys were matched with fiscal data available from WID.world so as to provide a better representation of inequality at the top of the social pyramid (see Part I).

Doing so then allowed us to produce a global distribution of income. The methodology we followed[a] is available on wir2018.wid.world, as well as all the computer codes we used, so as to allow anyone make alternative assumptions or contribute to extend this work. In future editions of the *World Inequality Report*, we will progressively expand the geographical coverage of our data.

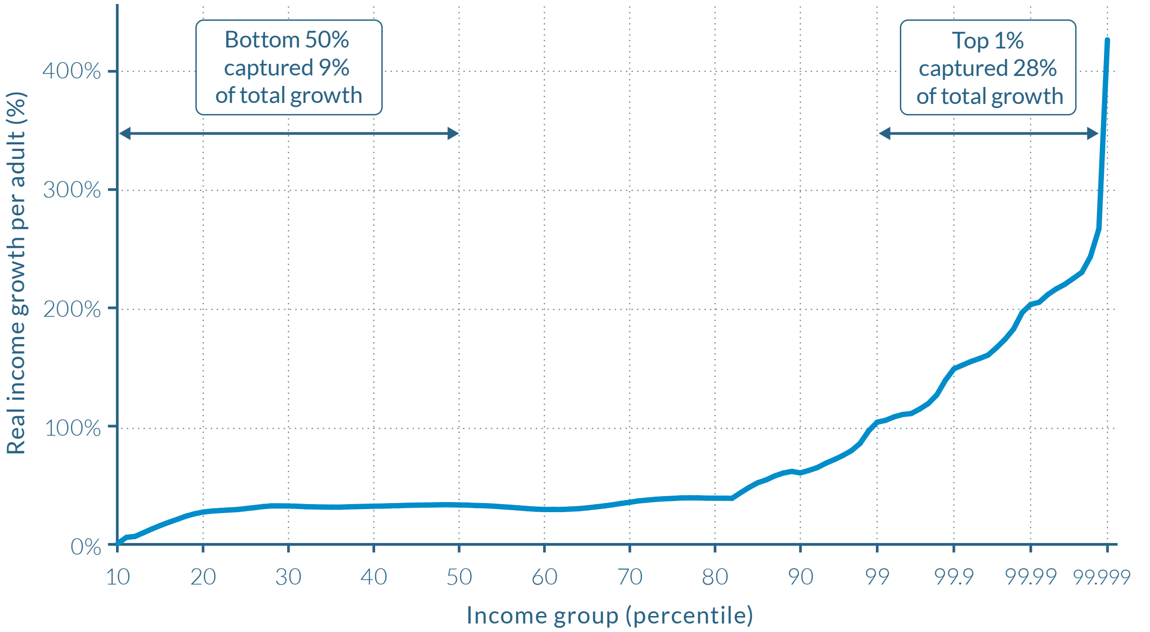
Figure 2.1.2

Total income growth by percentile in US-Canada and Western Europe, 1980–2016



Source: WID.world (2017). See wir2018.wid.world for data series and notes.

On the horizontal axis, the world population is divided into a hundred groups of equal population size and sorted in ascending order from left to right, according to each group's income level. The Top 1% group is divided into ten groups, the richest of these groups is also divided into ten groups, and the very top group is again divided into ten groups of equal population size. The vertical axis shows the total income growth of an average individual in each group between 1980 and 2016. For percentile group p99p99.1 (the poorest 10% among the world's richest 1%) growth was 104% between 1980 and 2016. The Top 1% captured 28% of total growth over this period. Income estimates account for differences in the cost of living between countries. Values are net of inflation.

We start with the distribution of growth in a region regrouping Europe and North America (**Figure 2.1.2**). These two regions have a total of 880 million individuals in 2016 (520 million in Europe and 360 million in North America) and represent most of the population of high-income countries. In Euro-America, cumulative per-adult income growth over the 1980–2016 period was +28%, which is relatively low as compared to the global average (+66%). While the bottom 10% income group saw their income decrease over the period, all individuals between percentile 20 and percentile 80 had a growth rate close to the average growth rate. At the very top of the distribution, incomes grew very rapidly; individuals in the top 1% group saw their incomes rise by more than 100% over the time period and those in the top 0.01% and above grew at more than 200%.

How did this translate into shares of growth captured by different groups? The top 1% of earners captured 28% of total growth—that is, as much growth as the bottom 81% of the population. The bottom 50% earners captured 9% of growth, which is less than the top 0.1%, which captured 14% of total growth over the 1980–2016 period. These values, however, hide large differences in the inequality trajectories followed by Europe and North America. In the former, the top 1% captured as much growth as the bottom 51% of the population, whereas in the latter, the top 1% captured as much growth as the bottom 88% of the population. (See chapter 2.3 for more details.)

The next step is to add the population of India and China to the distribution of Euro-America. The global region now considered represents 3.5 billion individuals in total (including 1.4 billion individuals from China and 1.3 billion from India). Adding India and China remarkably modifies the shape of the global growth curve (**Figure 2.1.3**).

Box 2.1.2

Interpreting inequality graphs in this report

Total growth curves (or "growth incidence curves") shed light on the income growth rate of each income group in a given country or at the world level. The popularization of such graphs is largely due to their use by Christoph Lakner and Branko Milanovic. In this report we are able to provide novel insights on global income dynamics thanks to the new inequality series constructed in WID.world (as detailed in Part 1). In particular, we are able to decompose the top 1% of the global distribution into smaller groups and observe their relative importance in total growth. If anything, our general conclusion is that the "elephant curve" is even more marked than what was initially pointed out by Lakner and Milanovic.

How to interpret these graphs? The horizontal axis sorts global income groups in ascending order from the poorest (left-hand side) to the richest (right-hand side). The first ninety-nine brackets correspond to each of the bottom ninety-nine percentiles of the global population. Each bracket represents 1% of the global population and occupies the same length on the graph. The global top 1% group is not represented on the same scale as the bottom 99%. We split it into twenty-eight smaller groups in the following way. The group is first split into ten groups of equal size (representing each 0.1% of the population). The richest of these groups is then itself split into ten groups of equal size (each representing 0.01% of the global population). The richest of these groups is again split into ten groups of equal size. The richest group represented on the horizontal axis (group 99.999) thus corresponds to the top 0.001% richest individuals in the world. This represents 49 000 individuals in 2016.

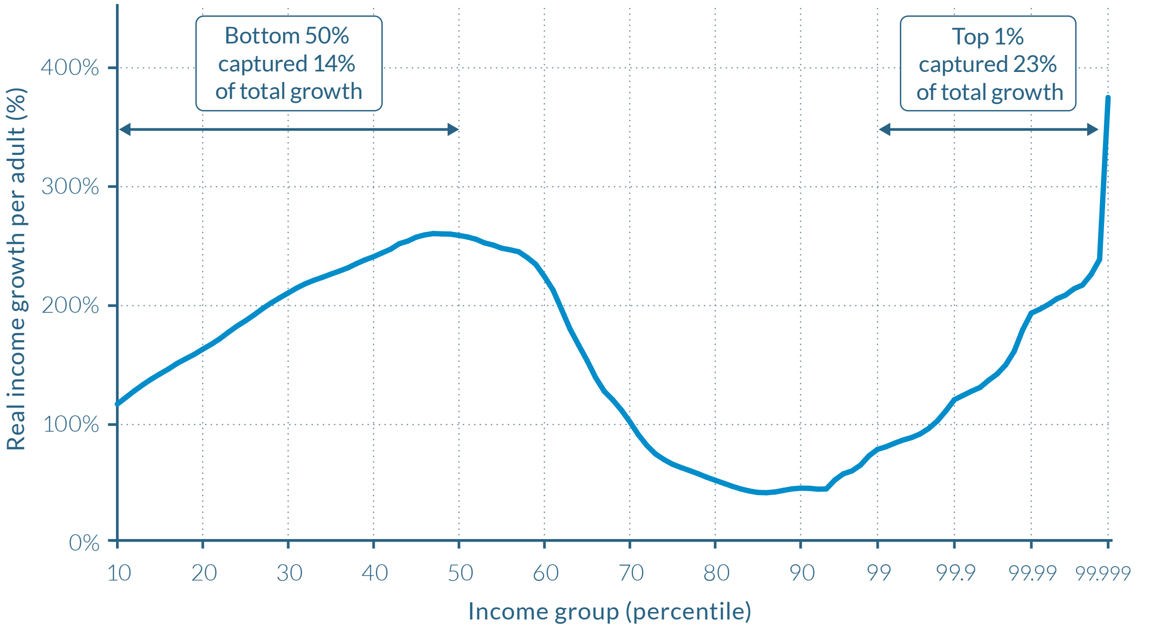
Each of these twenty-eight groups comprising the top 1% earners occupies the same space as percentiles of the bottom 99%. This is a simple way to represent clearly the importance of these groups in total income growth. The global top 1% group captured 27% of total growth from 1980 to 2016—that is, about a quarter of total growth. On the horizontal axis, this group occupies about a quarter of the scale.

There are other ways to scale percentiles on the horizontal axis. Appendices A2.1 and A2.2 show two variants. In the first, each group occupies a space that is proportional to its population size; in effect, the 28 groups decomposing the top 1% are squeezed together. In the other, each group is given a segment that is proportional to its share of total growth captured. In this case, it is the groups at the bottom of the global distribution that are squeezed. Our benchmark representation is a combination of these two variants.

The vertical axis presents the total real pre-tax income growth rate for each of the 127 groups defined above. Real income means that incomes are corrected for inflation. "Pre-tax" refers to incomes before taxes and transfers (but after the operation of the pension system). Note that the values are presented as total growth rates over the period rather than as annualized growth rates, which are perhaps somewhat more common in economic debates. Over long time spans such as the 1980–2016 period analyzed here, it is generally more meaningful to discuss total growth rates than to discuss average annual growth rates. Because of the multiplicative power of growth rates, small differences in annualized growth rates lead to large differences in total growth rates over long time spans. To illustrate this, let us take two income groups whose incomes grow at 4% and 5% over thirty-five years, respectively. The first group does not grow as fast as the second one, but the difference may seem limited. In fact, over thirty-five years, the total income growth is 295% in the first case and 452% in the second, which indeed represents a substantial difference in terms of purchasing power and standards of living.

Figure 2.1.3

Total income growth by percentile in China, India, US-Canada, and Western Europe, 1980–2016



Source: WID.world (2017). See wir2018.wid.world for data series and notes.

On the horizontal axis, the world population is divided into a hundred groups of equal population size and sorted in ascending order from left to right, according to each group's income level. The Top 1% group is divided into ten groups, the richest of these groups is also divided into ten groups, and the very top group is again divided into ten groups of equal population size. The vertical axis shows the total income growth of an average individual in each group between 1980 and 2016. For percentile group p99p99.1 (the poorest 10% among the world's richest 1%), growth was 77% between 1980 and 2016. The Top 1% captured 23% of total growth over this period. Income estimates account for differences in the cost of living between countries. Values are net of inflation.

The first half of the distribution is now marked by a "rising tide" as total income growth rates increase substantially from the bottom of the distribution to the middle. The bottom half of the population records growth rates which go as high as 260%, largely above the global average income growth of 146%. This is due to the fact that Chinese and Indians, who make up the bulk of the bottom half of this global distribution, enjoyed much higher growth rates than their European and North American counterparts. In addition, growth was also very unequally distributed in India and China, as revealed by **Table 2.1.1**.

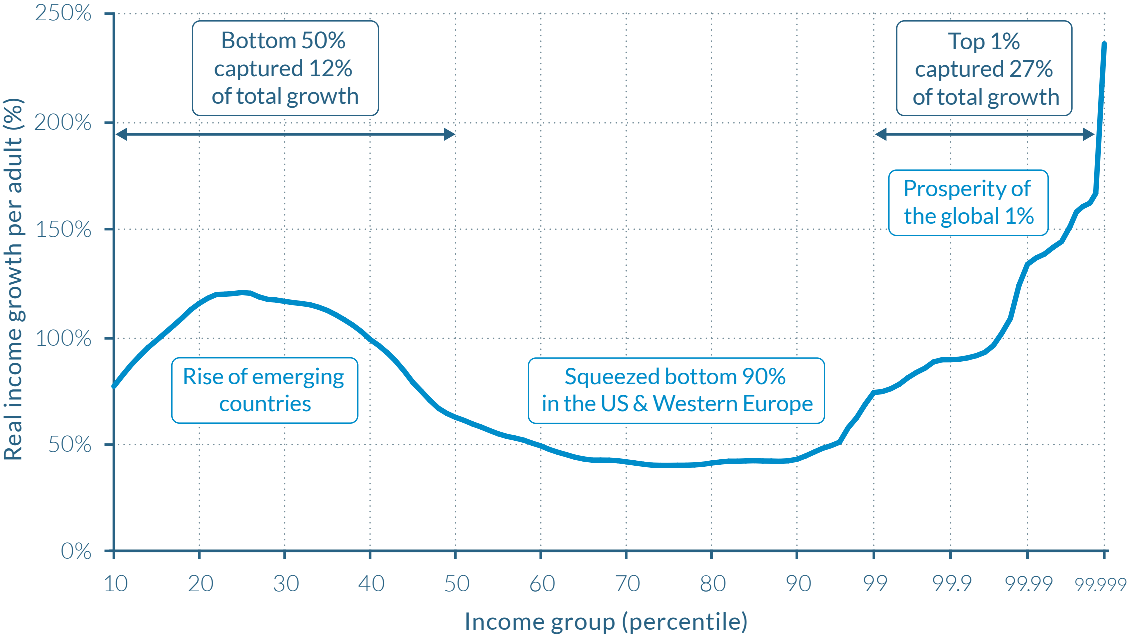
Between percentiles 70 and 99 (individuals above the poorest 70% of the population but below the richest 1%), income growth was substantially lower than the global average, reaching only 40–50%. This corresponds to the lower- and middle-income groups in rich countries which grew at a very low rates. The extreme case of these is the bottom half of the population in the United States, which grew at only 3% over the period considered. (See Chapter 2.4.)

Earlier versions of this graph have been termed "the elephant curve," as the shape of the curve resembles the silhouette of the animal. These new findings confirm and amplify earlier results.[2] In particular they make it possible to measure much more reliably the share of income growth captured at the top of the global income distribution—a figure which couldn't be properly measured before.

At the top of the global distribution, incomes grew extremely rapidly—around 200% for the top 0.01% and above 360% for the top 0.001%. Not only were these growth rates important from the perspective of individuals, they also matter a lot in terms of global

Figure 2.1.4

Total income growth by percentile across all world regions, 1980–2016



Source: WID.world (2017). See wir2018.wid.world for more details.

On the horizontal axis, the world population is divided into a hundred groups of equal population size and sorted in ascending order from left to right, according to each group's income level. The Top 1% group is divided into ten groups, the richest of these groups is also divided into ten groups, and the very top group is again divided into ten groups of equal population size. The vertical axis shows the total income growth of an average individual in each group between 1980 and 2016. For percentile group p99p99.1 (the poorest 10% among the world's richest 1%), growth was 74% between 1980 and 2016. The Top 1% captured 27% of total growth over this period. Income estimates account for differences in the cost of living between countries. Values are net of inflation.

growth. The top 1% captured 23% of total growth over the period—that is, as much as the bottom 61% of the population. Such figures help make sense of the very high growth rates enjoyed by Indians and Chinese sitting at the bottom of the distribution. Whereas growth rates were substantial among the global bottom 50%, this group captured only 14% of total growth, just slightly more than the global top 0.1%—which captured 12% of total growth. Such a small share of total growth captured by the bottom half of the population is partly due to the fact that when individuals are very poor, their incomes can double or triple but still remain relatively small—so that the total increase in their incomes does not necessarily add up at the global level. But this is not the only explanation. Incomes at the very top must also be extraordinarily high to dwarf the growth captured by the bottom half of the world population.

The next step of the exercise consists of adding the populations and incomes of Russia (140 million), Brazil (210 million), and the Middle East (410 million) to the analysis. These additional groups bring the total population now considered to more than 4.3 billion individuals—that is, close to 60% of the world total population and two thirds of the world adult population. The global growth curve presented in Appendix Figure A2.3 is similar to the previous one except that the "body of the elephant" is now shorter. This can be explained by the fact that Russia, the Middle East, and Brazil are three regions which recorded low growth rates over the period considered. Adding the population of the three regions also slightly shifts the "body of the elephant" to the left, since a large share of the population of the countries incorporated in the analysis is neither very poor nor very rich from a global point of view and thus falls in the middle of the distribution. In this synthetic global region, the top 1%

earners captured 26% of total growth over the 1980–2016 period—that is, as much as the bottom 65% of the population. The bottom 50% captured 15% of total growth, more than the top 0.1%, which captured 12% of growth.

The final step consists of including all remaining global regions—namely, Africa (close to 1 billion individuals), the rest of Asia (another billion individuals), and the rest of Latin America (close to half a billion). In order to reconstruct income inequality dynamics in these regions, we take into account between-country inequality, for which information is available, and assume that within countries, growth is distributed in the same way as neighboring countries for which we have specific information (see **Box 2.1.1**). This allows us to distribute the totality of global income growth over the period considered to the global population.

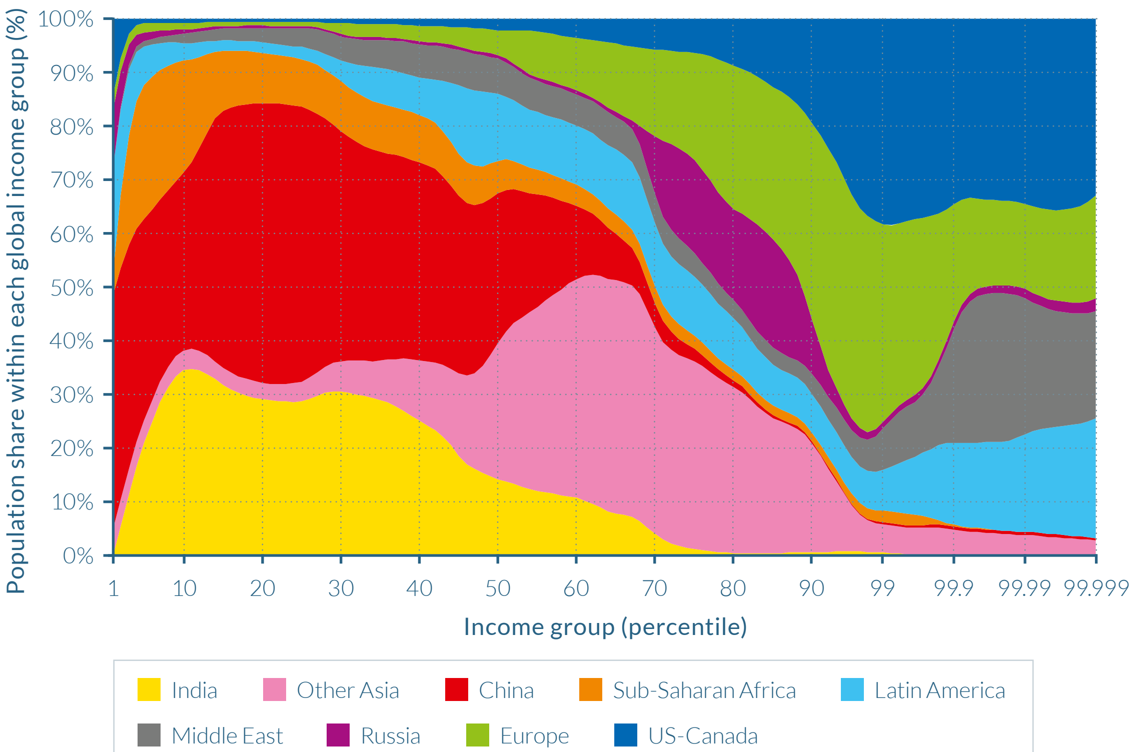
When all countries are taken into account, the shape of the curve is again transformed (**Figure 2.1.4**). Now, average global income growth rates are further reduced because Africa and Latin America had relatively low growth over the period considered. This contributes to increasing global inequality as compared to the two cases presented above. The findings are the same as those presented in the right-hand column of **Table 2.1.2**: the top 1% income earners captured 27% of total growth over the 1980–2016 period, as much as the bottom 70% of the population. The top 0.1% captured 13% of total growth, about as much as the bottom 50%.

The geography of global income inequality was transformed over the past decades

What is the share of African, Asians, Americans, and Europeans in each global income

Figure 2.1.5

Geographic breakdown of global income groups in 1990



Source: WID.world (2017). See wir2018.wid.world for data series and notes.

In 1990, 33% of the population of the world's Top 0.001% income group were residents of the US and Canada.

groups and how has this evolved over time? **Figures 2.1.5 and 2.1.6** answer these questions by showing the geographical composition of each income group in 1990 and in 2016. Between 1980 and 1990, the geographic repartition of global incomes evolved only slightly, and our data allow for more precise geographic repartition in 1990, so it is preferable to focus on this year. In a similar way to how Figures 2.1.2 through 2.1.4 decomposed the data, Figures 2.1.5 and 2.1.6 decompose the top 1% into 28 groups (see **Box 2.1.1**). To be clear, all groups above percentile 99 are the decomposition of the richest 1% of the global population.

In 1990, Asians were almost not represented within top global income groups. Indeed, the bulk of the population of India and China are found in the bottom half of the income distribution. At the other end of the global income ladder, US-Canada is the largest contributor to global top-income earners. Europe is largely represented in the upper half of the global distribution, but less so among the very top groups. The Middle East and Latin American elites are disproportionately represented among the very top global groups, as they both make up about 20% each of the population of the top 0.001% earners. It should be noted that this overrepresentation only holds within the top 1% global earners: in the next richest 1% group (percentile group p98p99), their share falls to 9% and 4%, respectively. This indeed reflects the extreme level of inequality of these regions, as discussed in chapters 2.10 and 2.11. Interestingly, Russia is concentrated between percentile 70 and percentile 90, and Russians did not make it into the very top groups. In 1990, the Soviet system compressed income distribution in Russia.

Figure 2.1.6

Geographic breakdown of global income groups in 2016

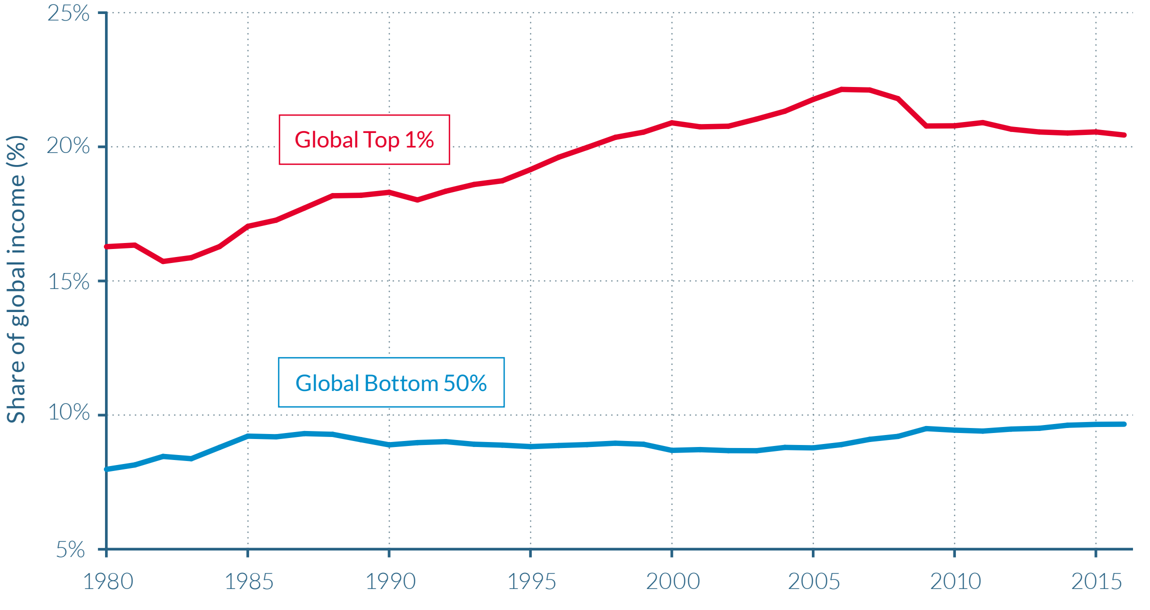
In 2016, 5% of the population of the world's Top 0.001% income group were residents of Russia.

Figure 2.1.7
Global Bottom 50% and Top 1% income shares, 1980–2016



Source: WID.world (2017). See wir2018.wid.world for data series and notes.

In 2016, 22% of global income was received by the Top 1% against 10% for the Bottom 50%. In 1980, 16% of global income was received by the Top 1% against 8% for the Bottom 50%.

In 2016, the situation is notably different. The most striking evolution is perhaps the spread of Chinese income earners, which are now located throughout the entire global distribution. India remains largely represented at the bottom with only very few Indians among the top global earners.

The position of Russian earners was also stretched throughout from the poorest to the richest income groups. This illustrates the impact of the end of communism on the spread of Russian incomes. Africans, who were present throughout the first half of the distribution, are now even more concentrated in the bottom quarter, due to relatively low growth as compared to Asian countries. At the top of the distribution, while the shares of both North America and Europe decreased (leaving room for their Asian counterparts), the share of Europeans was reduced much more. This is because most large European countries followed a more equitable growth trajectory over the past decades than the United States and other countries, as will be discussed in chapter 2.3.

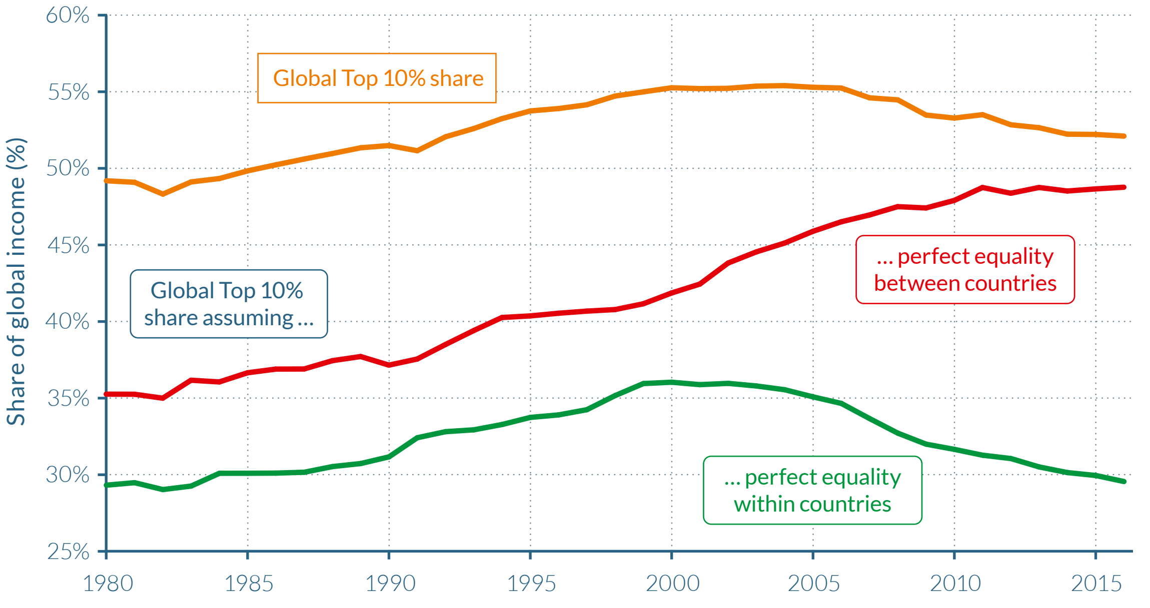
Since 2000, the picture is more nuanced but within-country inequality is on the rise

How did global inequality evolve between 1980 and 2016? **Figure 2.1.7** answers this question by presenting the share of world income held by the global top 1% and the global bottom 50%, measured at purchasing power parity. The global top 1% income share rose from about 16% of global income in 1980 to more than 22% in 2007 at the eve of the global financial crisis. It was then slightly reduced to 20.4% in 2016, but this slight decrease hardly brought back the level of global inequality to its 1980 level. The income share of bottom half of the world population oscillated around 9% with a very slight increase between 1985 and 2016.

The first insight of this graph is the extreme

Figure 2.1.8

Global Top 10% income share, 1980–2016: between versus within country inequality



Source: WID.world (2017). See wir2018.wid.world for data series and notes.

In 2010, 53% of the world's income was received by the Top 10%. Assuming perfect equality in average income between countries, the Top 10% would have received 48% of global income.

level of global inequality sustained throughout the entire period with a top 1% income group capturing two times the total income captured by the bottom 50% of the population—implying a factor 100 difference in average per-adult income levels. Second, it is apparent that high growth in emerging countries since 2000, in particular in China, or the global financial crisis of 2008 was not sufficient to stop the rise in global income inequality.

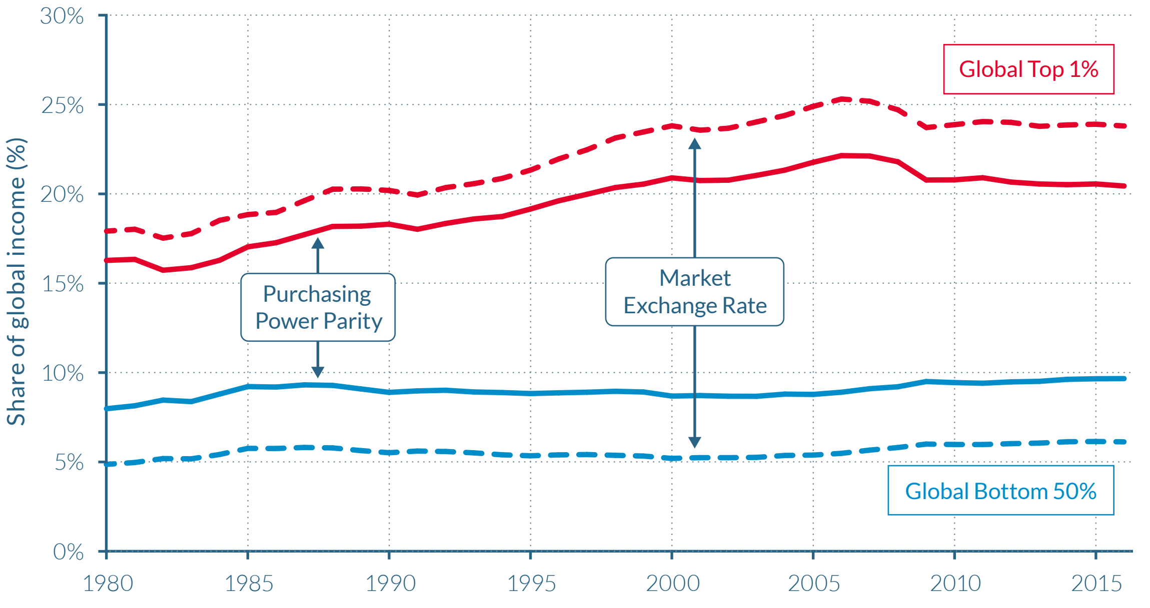
When global inequality is decomposed into a between- and within-country inequality component, it is apparent that within-country inequality continued to rise since 2000 whereas between-country inequality rose up to 2000 and decreased afterwards. **Figure 2.1.8** presents the evolution of the global 10% income share, which reached close to 50% of global income in 1980, rose to 55% in 2000–2007, and decreased to slightly more than 52% in 2016. Two alternative scenarios for the evolution of the global top 10% share are presented. The first one assumes that all countries had exactly the same average income (that is, that there was no between-country inequality), but that income was as unequal within these countries as was actually observed. In this case, the top 10% share would have risen from 35% in 1980 to nearly 50% today. In the second scenario, it is assumed that between-country inequality evolved as observed but it is also assumed that everybody within countries had exactly the same income level (no within-country inequality). In this case, the global top 10% income share would have risen from nearly 30% in 1980 to more than 35% in 2000 before decreasing back to 30%.

Measured at market exchange rate, global inequality is even higher

Prices can be converted from one currency to another using either market exchange rates or purchasing power parities (as we did above). Market exchanges rates are the prices at which people are willing to buy and sell

Figure 2.1.9

Bottom 50% and Top 1% shares of global income, 1980-2016: PPP versus market exchange rates



Source: WID.world (2017). See wir2018.wid.world for data series and notes.

In 2010, the Top 1% received 24% of global income when measured using Market Exchange Rates (MER). When measured using Purchasing Power Parity (PPP), their share was 21%. Thick lines are measured at PPP values, dashed lines at MER values. Income estimates account for differences in the cost of living between countries. Values are net of inflation.

currencies, so at first glance they should reflect people's relative purchasing power. This makes them a natural conversion factor between currencies. The problem is that market exchange rates reflect only the relative purchasing power of money in terms of tradable goods. But non-tradable goods (typically services) are in fact cheaper relative to tradable ones in emerging economies (given the so-called Balassa-Samuelson effect). Therefore, market exchange rates will underestimate the standard of living in the poorer countries. In addition, market exchange rates can vary for all sorts of other reasons—sometimes purely financial and/or political—in a fairly chaotic manner. Purchasing power parity is an alternative conversion factor that addresses these problems (based on observed prices in the various countries). The level of global income inequality is therefore substantially higher when measured using market exchange rates than it is with purchasing power parity. It increases the global top 1% share in 2016 from 20% to 24% and reduces the bottom 50% share from nearly 10% to 6% (**Figure 2.1.9**).

Purchasing power parity definitely gives a more accurate picture of global inequality from the point of view of individuals who do not travel across the world and who essentially spend their incomes in their own countries. Market exchange rates are perhaps better to inform about inequality in a world where individuals can easily spend their incomes where they want, which is the case for top global earners and tourists, and increasingly the case for anyone connected to the internet. It is also the case for migrant workers wishing to send remittances back to their home countries. Both purchasing power parity and market exchange rates are valid measures to track global income inequality, depending on the object of study or which countries are compared to one another.

In this report, we generally use purchasing power parity for international comparisons, but at times, market exchange rates are also used to illustrate other meaningful aspects of international inequality.

Carefully looking at countries' diverse growth trajectories and policy changes is necessary to understand drivers of national and global inequality

The past forty years were marked by a steep rise of global inequality, and growth in emerging countries was not high enough to counterbalance it. Whether future growth in emerging countries might invert the trend or not is a key question, which will be addressed in Part V of this report. Before turning to that question, one should understand better the drivers of the trends observed since 1980.

Given that this period was marked by increasing trade integration between countries, it might seem reasonable to seek explanations in economic trade models. The standard economic models of international trade, however, fail to account for dynamics of inequality observed over the past four decades. Take Heckscher-Ohlin, the most well-known of the two-skill-groups economic trade models. According to it, trade liberalization should increase inequality in rich countries, but reduce it in low-income countries.

How does the model reach this conclusion? The underlying mechanism is fairly simple. It is built around the fact that there are more high-skilled workers (such as aeronautical engineers) in the United States than in China, and more low-skilled workers (such as textile workers) in China than in the United States. Before trade liberalization started between these two countries, aeronautical engineers were relatively scarce in China and thus enjoyed relatively high pay compared to textile workers which were abundant. Conversely, in the United States, low-skilled earners were relatively scarce at the time, and the income differential between engineers and textile workers was limited.

When the United States and China started to trade, each country specialized in the domain for which they had the most workers, in relative terms. China thus specialized in textiles, so that textile workers were in higher demand and saw their wages increase, while aeronautical engineers came to be in lower demand and saw their wages decrease. Conversely, the United States specialized in aircraft building, so the aeronautical engineers saw their wages increase, while the textile workers saw their wages decrease. By virtue of the factor price equalization theorem, the wages of low-skilled workers in China and the United States started to converge, along with the wages of high-skilled workers.

While inequality did rise in the United States, as this model predicts, it also sharply rose in China, as well as in India and Russia, as seen in **Figure 2.1.1a**—contrary to the model's predictions. Regardless of whether the Heckscher-Ohlin is otherwise valid or not, it cannot account for the evolution of global inequality. How can we account for these empirical findings? As **Table 2.1.1** suggests, countries followed very different growth and inequality trajectories over the past decades. It seems necessary to carefully look at these trajectories as well as the institutional and policy shifts which may have occurred in various regions of the world over the past forty years.

Understanding the drivers of global income inequality requires a thorough analysis of the distribution of national income growth within countries. These dynamics are explored in the following chapters.

2.2

TRENDS IN INCOME INEQUALITY BETWEEN COUNTRIES

Information in this chapter is based on "National Accounts Series Methodology," by Thomas Blanchet and Lucas Chancel, 2016. WID.world Working Paper Series (No. 2016/1), and on subsequent WID.world updates.

▷ When focusing on income inequalities between countries, it is more meaningful to compare national incomes than gross domestic product (GDP). National income takes into account depreciation of obsolete machines and other capital assets as well as flows of foreign income.

▷ At the global level, average per-adult national income is €1 340 per month. North Americans enjoy an income three times higher, while Europeans have an income two times higher. Average per-adult income in China is slightly lower than the global average. As a country, however, China represents a higher share of global income than North America or Europe (19%, 17%, and 17%, respectively).

▷ This situation sharply contrasts with that of 1980, when China represented only 3% of total global income. Over this period, strong converging forces were in play which reduced global income inequality between countries. While growth slowed in Western Europe, it skyrocketed in Asia and China in particular, following the modernization of its economy and its opening to global markets.

▷ However, diverging forces were also in play in other parts of the world. From 1980 to now, average incomes in sub-Saharan Africa and South America fell behind the world average.

National income is more meaningful than GDP to compare income inequalities between countries

Public debates generally focus on the growth of gross domestic product (GDP) to compare countries' economic performance. However, this measure is of only limited use in measuring national welfare. GDP measures the value of all goods and services sold in an economy, after having subtracted the costs of materials or services incurred in production processes. As such, it does not properly account for capital depreciation, or for public "bads" such as environmental degradation, rising crime, or illnesses (because these lead to expenditures that contribute to GDP). These limitations have led many statistical agencies, and a growing number of governments, to develop and use complementary indicators of economic performance and well-being.[3]

Beyond the fact that the GDP framework is not meant for the analysis of inequality within countries, it has two other important limitations when the focus is on income inequality between countries. The first one is that gross domestic product, as its name indicates, is a gross measure: it does not take into account expenses required to replace capital that has been deteriorated or that has become obsolete during the course of production of goods and services in an economy. Machines, computers, roads, and electric systems have to be repaired or replaced every year. This has been termed capital depreciation or consumption of fixed capital (CFC). Subtracting it from GDP yields the net domestic product, which is a more accurate measure of true economic output than GDP. Consumption of fixed capital actually varies over time and countries (**Table 2.2.1**). Countries that have an important stock of machines in their overall stock of capital tend to replace higher shares of overall capital. This is generally true for advanced and automatized economies—in particular, for Japan, where consumption of fixed capital is equal to 21% of its GDP (which reduces GDP by close to €8 000 per year and per adult). Consumption of fixed capital is also high in the European Union and the United States (16–17%). On the contrary, economies that possess relatively fewer machines and a higher share of agricultural land in their capital stock tend to have lower CFC values. CFC is equal to 11% of GDP in India, and 12% in Latin America. CFC variations thus modify the levels of global inequality between countries. Such variations tend to reduce global inequality, since the income dedicated to replacing obsolete machines tends to be higher in rich countries than in low-income countries. In the future, we plan to better account for the depreciation of natural capital in these estimates.

GDP figures have another important limitation when the need is to compare income inequality between countries and over time. At the global level, net domestic product is equal to net domestic income: by definition, the market value of global production is equal to global income. At the national level, however, incomes generated by the sale of goods and services in a given country do not necessarily remain in that country. This is the case when factories are owned by foreign individuals, for instance. Taking foreign incomes into account tends to increase global inequality between countries rather than reduce it. Rich countries generally own more assets in other parts of the world than poor countries do. **Table 2.2.1** shows that net foreign income in North America amounts to 0.9% of its GDP (which corresponds to an extra €610 ($670) received by the average North American adult from the rest of the world.[4] Meanwhile, Japan's net foreign income is equal to 3.5% of its GDP (corresponding to €1 460 per year and per adult). Net foreign income within the European Union is slightly negative when measured at PPP values (**Table 2.2.1**) and very slightly positive when measured at market exchange rate values (**Table 2.2.2**). This figure in fact hides strong disparities within the European Union. France and Germany have strongly positive net foreign income (2 to 3% of their GDP), while Ireland and the United Kingdom have negative net foreign incomes (this is

In 2016, Europe represented 20% of world income measured using Purchasing Power Parity. Europe also represented 12% of the world's adult population and 10% of the world's total population. GDP: Gross Domestic Product. CFC: Consumption of Fixed Capital. NFI: Net Foreign Income. PPP: Purchasing Power Parity. All values have been converted into 2016 Purchasing Power Parity (PPP) euros at a rate of €1 = $1.3 = ¥4.4. PPP accounts for differences in the cost of living between countries. Values are net of inflation. Numbers may not add up due to rounding.

largely due to the financial services and foreign companies established there). On the other hand, Latin America annually pays 2.4% of its GDP to the rest of the world. Interestingly, China has a negative net foreign income. It pays close to 0.7% of its GDP to foreign countries, reflecting the fact that the return it receives on its foreign portfolio is lower than the return received by foreign investments in China.

By definition, at the global level, net foreign income should equal zero: what is paid by some countries must be received by others. However, up to now, international statistical institutions have been unable to report flows of net foreign incomes consistently. At the global level, the sum of reported net foreign incomes has not been zero. This has been termed the "missing income" problem: a share of total income vanishes from global economic statistics, implying non-zero net foreign income at the global level.

The *World Inequality Report 2018* relies on a novel methodology which takes income flows from tax havens into account. Our methodology relies on estimations of offshore wealth measured by Gabriel Zucman.[5] It should be noted that, when measured at market exchange rates, net foreign income flows should sum to zero (**Table 2.2.2**), but there is no reason for this to happen when incomes are measured at purchasing power parity (**Table 2.2.1**). Taking into account missing net foreign incomes does not radically change global inequality figures but can make a large difference for particular countries. This constitutes a more realistic representation of income inequality between countries than figures generally discussed.

Asian growth contributed to reduce inequality between countries over the past decades

At the global level, per-adult monthly income in 2016 is €1 340 ($1 740) at purchasing power parity (PPP) and €990 ($1 090) at market exchange rate (MER). As discussed, PPP and MER are different ways to measure incomes and inequality across countries. Whereas MER reflects market prices, PPP aims to take price differences between countries into account.

National income is about three times higher in North America at PPP (€4 220 or $5 490 per adult per month) than the global average and it is two times higher in the European Union at PPP than the global average (€2 630 or $3 420 per adult per month). Using MER values, gaps between rich countries and the global average are reinforced: United States and Canada are five times richer than the world average whereas the EU is close to three times richer.[6] In China, per-adult income is €1 170 or $1 520 at PPP—that is, slightly lower than world average (€1 340 or $1 740). China as a whole represents 19% of today's global income. This figure is higher than North America (17%) and the European Union (17%). Measured at MER, the Chinese average is, however, equal to €700 or $770, notably lower than the world average (€990 or $1 090). The Chinese share of global income is reduced to 15% versus 27% for US-Canada and 23% for the EU.

This marks a sharp contrast with the situation in 1980. Thirty-eight years ago, China represented only 3% of global income versus 20% for US-Canada and 28% for the European Union (at purchasing power parity estimates: see **Table 2.2.3**). Indeed, China's impressive real per-adult national income growth rate over the period (831% from 1980 to 2016, versus 106% from 1950 to 1980: see **Table 2.2.4**) highly contributed to reducing between-country inequalities over the world. Another converging force lies in the reduction of income growth rates in Western Europe, as compared to the previous decades (180% per-adult growth between 1950 and 1980 versus 45% afterwards). This deceleration in growth rates was due to the end of the "golden age" of growth in Western Europe but also due to the Great Recession, which led to a decade of lost growth in Europe. Indeed, per-adult income in Western Europe was in

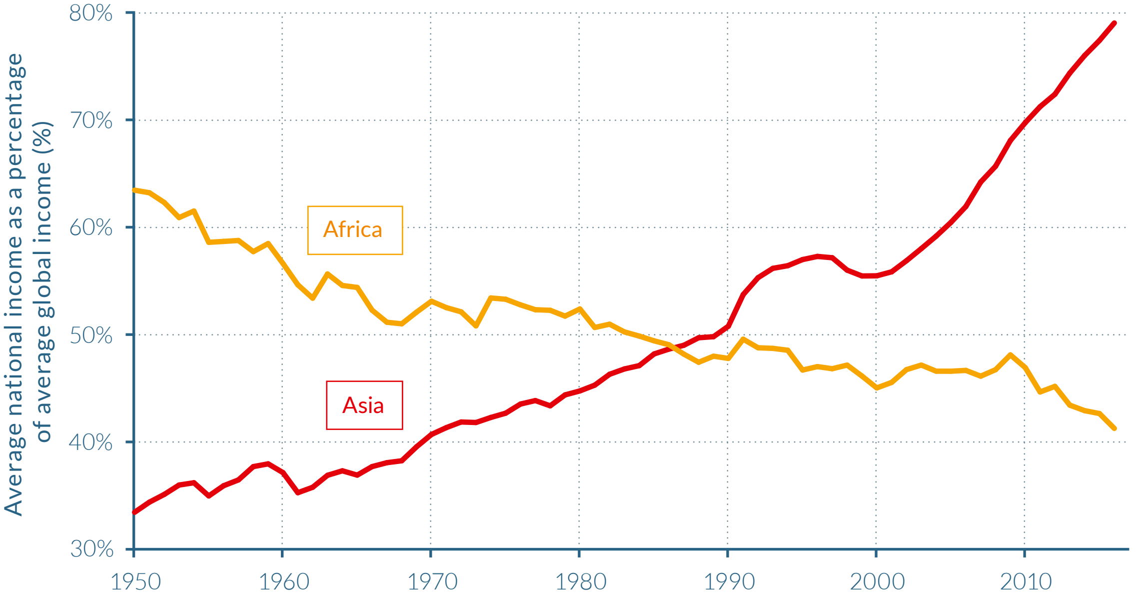
Between 1950 and 1980, Africa's income grew by 258%, whereas income per adult grew by only 85% during the same period. Income estimates account for differences in the cost of living between countries. Values are net of inflation.

Figure 2.2.1

Average income in Africa and Asia relative to the global average, 1950–2016



Source: WID.world (2017). See wir2018.wid.world for data series and notes.

In 1950, average real income per adult in Africa was 63% of the world average income. This figured decreased to 41% in 2016. Income estimates account for differences in the cost of living between countries. Values are net of inflation.

2016 the same as ten years before, before the onset of the financial crisis.

Despite a reduction of inequality between countries, average national income inequalities remain strong among countries. Developing and emerging countries did not all grow at the same rate as China. India's average monthly per-adult income (€580 or $750) is still only 0.4 times the world average measured at PPP, while sub-Saharan Africa is only 0.3 times the world average (€430 or $560) today. Average North Americans earn close to ten times more than average sub-Saharan Africans.

Diverging forces were also at play in certain parts of the world, such as sub-Saharan Africa and Latin America.

Huge inequalities persist among countries but, in some cases, they actually worsened. Certain low- to middle-income regions are relatively worse off today than four decades ago. Between 1980 and 2016, per-adult incomes in Africa grew more slowly (18%) than the world's average per-adult incomes (54%). This growth trend, marked by a combination of political and economic crises and wars, is not limited to the poorest region of the world. In South America, as well, incomes have grown by only 12% since 1980. As a result, these regions' average incomes fell relative to the world average, from 65% to only 40% of the world average in 1950, versus 140% to less than 100% in Latin America (**Figures 2.2.1** and **2.2.2**).

Figure 2.2.2

Average income in China and Latin America relative to the global average, 1950–2016

In 1950, average real income per adult in Latin America was 141% of the world average income. This figure decreased to 92% in 2016. Income estimates account for differences in the cost of living between countries. Values are net of inflation.

2.3

TRENDS IN INCOME INEQUALITY WITHIN COUNTRIES

- After a historical decline in most parts of the world from the 1920s to the 1970s, income inequality is on the rise in nearly all countries. The past four decades, however, display a variety of national pathways, highlighting the importance of political and institutional factors in shaping income dynamics.

- In the industrialized world, Anglo-Saxon countries have experienced a sharp rise in inequality since the 1980s. In the United States, the bottom 50% income share collapsed while the top share boomed. Continental European countries were more successful at containing rising inequality, thanks to a policy and institutional context more favorable to lower- and middle-income groups.

- In China, India, and Russia, three formerly communist or highly regulated economies, inequality surged with opening and liberalization policies. The steepest rise occurred in Russia, where the transition to a market economy was particularly abrupt.

- Inequality is extreme in Brazil, the Middle East, and South Africa, the world's most unequal regions. In these three large emerging markets, inequality currently reaches extreme levels: the top 10% earners capture 55% to 65% of national income.

- Little is known of the long-run dynamics of income inequality in many low-income countries. More information is essential for peaceful democratic debates in these countries, especially given that official estimates are very likely to understate existing levels of inequality.

After a historical decline from the 1920s to the 1970s, income inequality is on the rise in most regions of the world

Income inequality was sharply reduced in the first half of the twentieth century—more precisely, between the 1920s and the 1970s—in most countries of the world, but it has been on the rise almost everywhere since the late 1970s. In Europe and North America, the long-run decline in income inequality was due to the combination of political, social, and economic shocks already discussed. These included the destruction of human and physical capital led by the World Wars, the Great Depression, nationalization policies, and government control over the economy. After the Second World War, a new policy regime was put in place, including the development of social security systems, public education, social and labor policies, and progressive taxation. This combination of factors severely affected very high fortunes, and enabled the rise of a patrimonial middle class and a general decline in inequality in Europe—and to a lesser extent, in North America.[7]

In emerging economies, political and social shocks led to an even more radical reduction of income inequality. The abolition of private property in Russia, land redistribution, massive investments in publication education, and strict government control over the economy via five-year plans effectively spread the benefits of growth from the early 1920s to the 1970s. In India, which did not undergo a communist revolution but implemented socialist policies after gaining its independence, income inequality was also severely reduced over the same period. For most of the global population, the first three-quarters of the twentieth century corresponded to a very strong compression in the distribution of national incomes. The economic elite captured a much smaller share of economic growth in the late 1970s than it did at the beginning of the century.

The trend was then reversed in most countries—even though there are notable exceptions deserving attention. Countries did not all follow the same path. Large emerging countries, as they underwent profound deregulations of their economies, saw inequalities surge as they opened up and liberalized but followed different transition strategies. In rich countries, inequality levels also varied largely according to changes in institutional and policy contexts, with sharp income inequality rises in the Anglo-Saxon world and more moderate increases in continental Europe and Japan. Certain Western European and Northern European countries almost contained the rise in income inequality.

Given the multitude of trends presented in this chapter, it would be imprudent to seek a single story line behind the rise of inequality across countries. Our findings show that national cultural, political, and policy context are key to understanding the dynamics of income inequality. In this chapter, we largely focus on the evolution of top-income shares, as they are now available for a very large set of countries. In the country-by-country chapters that come next, the focus will be more detailed and we will shift the attention to bottom-income groups.

Bottom-income groups were shut off from economic growth in the United States, while top incomes surged in the Anglo-Saxon world

Top 1% income shares have been steadily increasing in Anglo-Saxon countries since the early 1980s, after a historical decline throughout the first part of the twentieth century (see **Figure 2.3.1**). Inequality exploded in the United States: the top percentile income share there was less than 11% in 1980, and it was slightly above 20% in 2014. Britain's top percentile share rose from less than 6% in the late 1970s to nearly 14% in the mid-2010s. Britain had the same level of top 1% income share as Ireland in the late 1970s, but is now nearly on a level with Canada, where the top share increased from less than 9% in 1980 to almost 14%. Australia and New Zealand, with levels of inequality much lower

Figure 2.3.1

Top 1% national income share in Anglophone countries, 1920–2015

In 2014, 20% of national income was received by the Top 1% in the US.

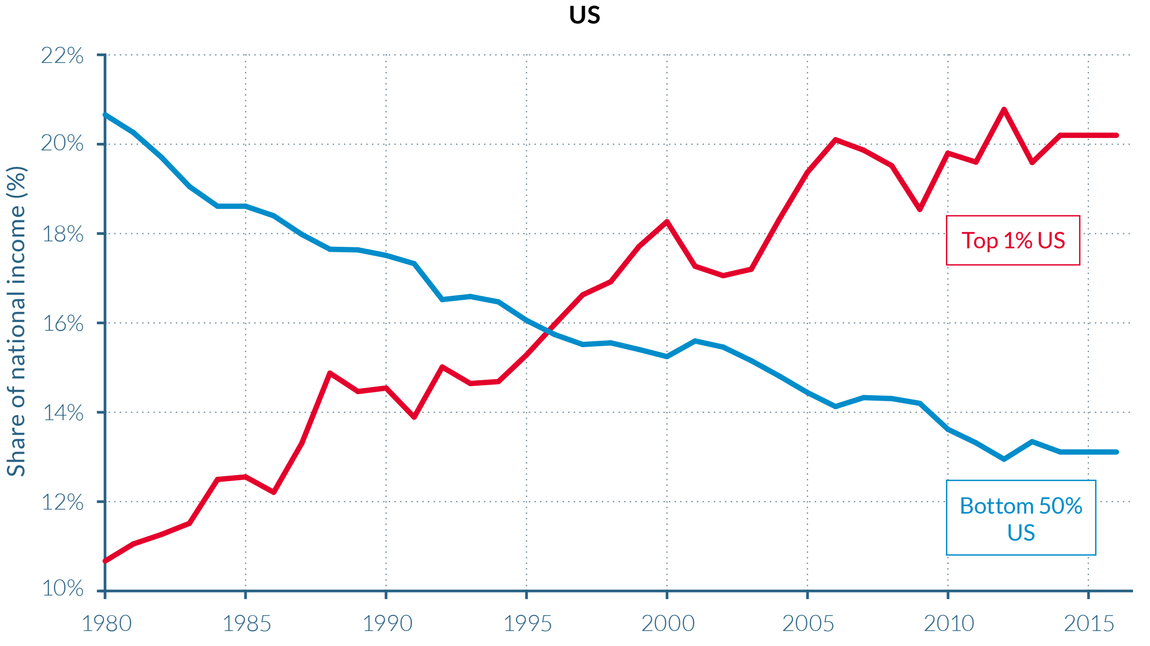
throughout the entire period (around 5% in the early 1980 and rising to less than 10%) also show a broadly similar pattern.[8] The impact of the financial crisis is visible on top-income shares, which exhibit a marked declined after 2007. Novel data suggest that top incomes have either recovered their shares or are progressively recovering them.

The rise in labor income inequality played an important role in the rise of inequality in Anglo-Saxon countries, and particularly in the United States before the turn of the century, as discussed in chapter 2.4. This phenomenon is owing to the "rise of super managers"—that is, the rise in super wages received by CEOs of large financial and nonfinancial firms. This evolution was also accompanied by an increased polarization of income between low-wage and high-wage firms. This contrasted with European countries, where the dynamics at the top of the distribution have been more moderate. New estimates also show that the upsurge in top incomes has mostly been a capital income phenomenon after 2000 in the United States, shedding new light on the process of unequal growth generation.

Our novel estimates also allow a better understanding of the dynamics at the bottom of the distribution—at least for certain countries. In the United States, the bottom 90% of the population benefited from a large share of growth in the three decades following the Second World War. Total per-adult pre-tax income growth for the bottom 50% and for the middle 40% was higher than 100%, while total growth for the top 10% earners was less than 80%. But since the 1980s, the bottom 50% was shut off from national income growth. While average per-adult pre-tax incomes increased by 60%, growth was close to zero for the bottom 50% of the population. The bottom 50% did benefit from a very modest post-tax income growth, thanks to redistribution, but this has been eaten up by rising health spending. Government provided little support to help low-income individuals cope with the situation.

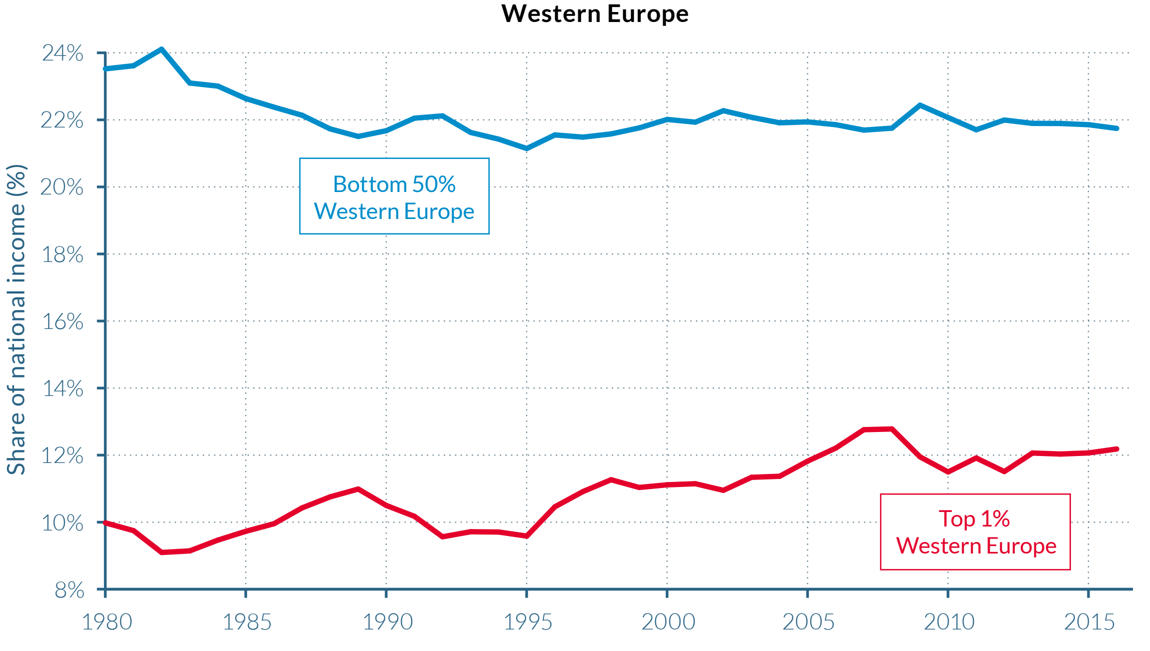
Figure 2.3.2a

Top 1% vs. Bottom 50% national income shares in the US and Western Europe, 1980–2016



Source: WID.world (2017). See wir2018.wid.world for data series and notes.

In 2016, 12% of national income was received by the top 1% in Western Europe, compared to 20% in the United States. In 1980, 10% of national income was received by the top 1% in Western Europe, compared to 11% in the United States.



Source: WID.world (2017). See wir2018.wid.world for data series and notes.

In 2016, 22% of national income was received by the Bottom 50% in Western Europe.

The comparison of inequality trajectories between the United States and Western Europe is particularly striking. The two regions had similar levels of inequality in 1980 (top 1% share at 10–11% and bottom 50% share at 21–23%). However, today, the situations are radically different as the relative positions of the bottom 50% and top 1% group in the United States have been inverted (see **Figure 2.3.2a**).

Inequality in enlarged Europe (with a population of 520 million) is now substantially smaller than in the United States (320 million)

We also compare in **Figures 2.3.2b** through **2.3.2c** the evolution of income inequality between the United States, Western Europe, and enlarged Europe (that is, including Eastern Europe). Enlarged Europe includes ex-communist East European countries with lower average incomes than West European averages, leading to higher inequality levels. However, it is striking to see that inequality levels in enlarged Europe remain much smaller than in United States. In particular, in spite of Europe's bigger size and potential heterogeneity (520 million for enlarged Europe, 320 million for the United States), the bottom 50% income share is substantially larger in Europe: 20–22% of total income at the end of the period versus 12% in the United States.

This conclusion would likely be exacerbated if we were to compare enlarged Europe to enlarged North America (including not only Canada but also Mexico), which we plan to do in the near future as new data become available for Mexico. Another important issue for future research is to better understand which part of Europe's lower inequality level can be attributed to redistributive policies at the regional level (including EU regional development funds), as opposed to national factors (such as the relatively egalitarian legacy of Eastern European countries and the fact that the transition from communism was not as abrupt as in Russia).

Continental European countries were more successful in preventing the rise of incomes at the top and the stagnation of incomes at the bottom

In western continental Europe, inequality has also been on the rise since the late 1970s, though both the levels of inequality and the rise in inequality were less striking than in the United States. The German top 1% income share rose from slightly less than 11% in the early 1980s to 13% today, as described in chapter 2.6. In France, the top 1% pre-tax income share increased from approximately 7% in 1983 to nearly 11% in 2014, as discussed in more detail in chapter 2.5. Spain displays a different picture. The impact of the financial crisis and the bursting of the real estate bubble in 2007–2008, which represented a substantial share of national income, severely hampered incomes at the bottom of the distribution, but also at the top: the top 1% income share decreased from close to 13% in 2006 to less than 9% in 2012, and still shows no sign of recovery. (**Figure 2.3.3**)

For France, new estimates also allow us to track the dynamics of growth at the bottom of the distribution. While growth was higher than average at the bottom 50% and middle 40% during the postwar period and up to the early 1980s, the situation was reversed afterwards. The "thirty glorious years"—as the high-growth 1950–1980 period is commonly referred to in France—continued after the 1980s, but only for the top income earners. This increase in inequality is characterized by rises in both labor and capital income. However, the bottom half of the population was not shut off from growth after the 1980s. This part of the population enjoyed close to average income growth rates—a strikingly different picture than in the United States.

Northern European countries had among the lowest levels of income inequality in the world in the early 1980s. Growth has been more unequal in these countries after 1980 than before, yet income concentration at the top of the distribution remains limited. Top 1%

income earners capture less than 10% of total income in Denmark, Finland, Norway, and Sweden. In Denmark and in the Netherlands, the rise in top percentile share has been small, from about 5% to 6% since the 1980s. As we can see, many European countries have been able to generate relatively high average income growth rates and maintain the rise in income inequality (**Figure 2.3.4**).

In Russia, China, and India, income inequality surged after the 1980s

Income concentration and wealth concentration were particularly high in tsarist Russia before the Soviet revolution of 1917 (see chapter 2.8 on Russia), and in colonial India (see chapter 2.9 on India). In Russia, the communist revolution led to an extreme compression of money incomes. During the entire communist period, the top 1% income share represented around 5% of national income, down to less than 4% in the seventies (see **Figure 2.3.5**). It is worth stressing, however, that this extremely low level of monetary inequality is partly artificial. Soviet inequality took other, non-monetary forms, such as privileged access to particular shops and vacation centers for the political elite, and brutal political repression for large segments of the population.

In India, the top percentile income share decreased from around 20% at the end of the colonial period to 6% in the early 1980s, after four decades of socialist-inspired policies aiming at reducing the economic power of the elite, including nationalizations, government control over prices, and extreme tax rates on top incomes. The implosion of the Soviet block and "shock policies" in Russia, and deregulation and opening policies in India from the 1980s onwards, contributed to strong increases in top percentile income shares. The top 1% share increased to 26% in 1996 in Russia and is now at 20%. In India, the top percentile is now around 22%.

The Chinese opening-up policies established from 1978 (discussed in chapter 2.7 on

Figure 2.3.4

In 2013, 9% of national income was received by the Top 1% in Sweden.

China), which included important privatization plans, had a lesser effect on inequality than reforms had in Russia or India. China shows a substantial rise in inequality (the top share rose from 6.5% to 14% in twenty years). However, as compared to Russia, China's transition to a liberalized, open economy was less abrupt and more gradual. Since 2006, inequality at the top has stagnated. In China and to a lesser extent in India, the rise in inequality occurred in the context of high average income growth, enabling important growth at the bottom of the distribution.

Brazil, South Africa, and the Middle East can be characterized as "extreme inequality" regimes: they have the highest inequality levels observed

In Brazil, South Africa, and the Middle East, income has been historically highly concentrated (see **Figure 2.3.6**). In Brazil, wage inequality has decreased over the past twenty years (in particular due to rising minimum wage) and there have been important and often lauded cash-transfer systems to the poor. However, due to a large concentration of business profits and capital incomes, the top 10% national income share reaches 55% in Brazil today and this value has not changed significantly for the past twenty years as is shown in chapter 2.11. Together with huge regional inequalities, the legacy of racial inequality still plays an important role; Brazil was the last major country to abolish slavery, back in 1887, at a time when slavery made up a very large fraction of the population, up to about 30% of the population in certain regions.

The extreme inequality evident in South Africa can obviously be linked to the historical legacy of the apartheid regime (only fully abolished in 1994), seen today in the country's dualistic economy and society. As discussed in chapter 2.12, the top 10% is largely made up of whites. This group earns more than 60% of national income and enjoys income levels similar to those of Europeans, while the bottom 90% live with incomes comparable to those of low-income African

Figure 2.3.5

In 2015, 14% of national income was received by the Top 1% in China.

countries. But in contrast to Brazil and the Middle East, inequality increased significantly over the past decades in South Africa. The trade and financial liberalization that occurred after the end of apartheid, coupled with the failure to redistribute land equally, can help to explain these dynamics - yet more research will be required to better track and understand recent South African income inequality dynamics.

Despite its much larger racial and ethnocultural homogeneity, levels of inequality in the Middle East are similar to (or possibly even higher than) those in Brazil and South Africa, with a top 10% share above 60%. As discussed in chapter 2.10, regional income and wealth is largely concentrated in in the hands of a small group that is located in the Gulf countries and Saudi Arabia. This is yet another inequality-generating mechanism: the geography of oil property and the frontier system have led to extreme inequality in this region.

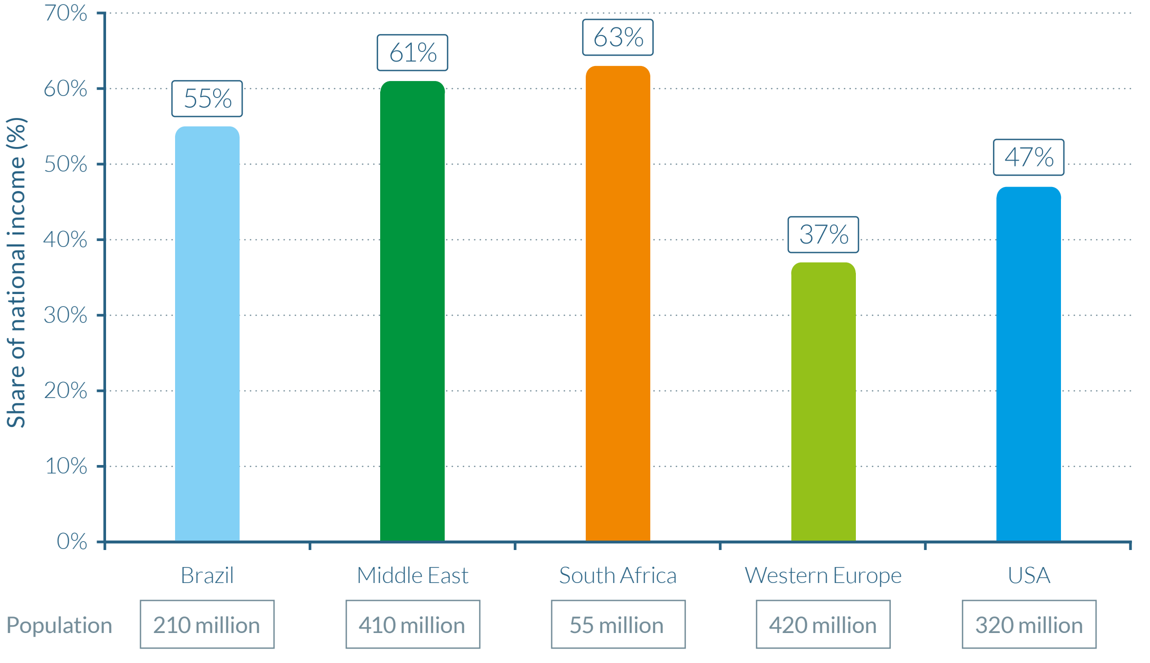
In low-income countries, inequality is likely to be higher than previously thought, but data is scarce

We still know very little about the evolution of income inequality in the rest of the developing and emerging world. The first explanation for this situation is that there is a lack of proper income-tax data, either because governments have not shared it, or because the data simply do not exist anymore, or because the data are still decentralized and not digitized.

In the absence of administrative data, most of what we know is based on survey estimates. As discussed in Part I, survey-based estimates of inequality can have a number of limitations. Surveys are often more sporadic in time, lack consistency with national accounts estimates, and miss top incomes. As demonstrated in this report, for numerous emerging countries, these weaknesses can lead to significant underestimation of inequality levels. (See chapters 2.7 and 2.12.) In Côte d'Ivoire, novel estimates show that the income share of the

Figure 2.3.6

Top 10% national income share in Brazil, the Middle East, South Africa and other countries, 2012–2016



Source: WID.world (2017). See wir2018.wid.world for data series and notes.

In 2016, 61% of national income was received by the Top 10% in the Middle East.

top 1% is approximately 17% of the country's total income, contrary to the 12% previously estimated by surveys. WID.world work also shows that the share of income earned by the top 1% in China was at least twice as great as official estimates previously suggested. We are currently devoting great energies to accessing income tax data in other African countries, following the lead of Côte d'Ivoire, and hope to be able to report more findings in the near future. At this stage, however, we have only limited access to adequate data.

Collectively, these factors mean that we can assess the evolution of income inequality for only a few developing countries in the years before the 1980s, and over a short or interrupted time period. Given that most individuals earned below the first income-tax threshold, our analysis is also restricted to a tiny fraction of the population. Out of the nine sub-Saharan African countries for which we have historical income tax data, the income share earned by the top 1% can only be properly computed in two small countries—Mauritius and the Seychelles—and for only a few years in Zambia and Zimbabwe. For the remaining countries (Ghana, Kenya, Tanzania, Nigeria, and Uganda), the income-tax data encompass less than 1% of the estimated adult population. While this may appear surprising, it is worth remembering that in the early days of the US personal income tax (1913–1915), the proportion of taxpayers was 0.9%.

Nevertheless, some lessons can be drawn from this data. In Africa, from the mid-1940s until the early 1980s, the income share of the top 0.1% decreased in Zimbabwe, Zambia, Malawi, Kenya, Tanzania, and South Africa, following a trend similar to that of most rich countries. But compared to European levels over the same period, income inequality was much higher in these African countries, and even reached the most extreme levels. In 1950, the richest 0.1% of Zambia commanded a bit more than 10% of total national income. Income inequality was, however, seemingly lower in West African countries such as Nigeria and Ghana, where the top 0.1% averaged to 2.5% of total income between 1940 and 1960. Interestingly, this pattern of geographical differences in inequality is still evident in survey data that has been collected in recent decades.

Where it is possible to break down tax data by race or nationality, historical data in African countries demonstrate that most taxpayers were non-African—mainly Europeans, followed by Arabs, then Asians. This dominance is likely to have been mitigated in recent decades, but it is still important in former settlement colonies such as South Africa. Recent research on Côte d'Ivoire for the period 1985–2014 further illustrates how the aforementioned discrepancy between survey data and administrative data can be partly due to the undersampling of non-African individuals.[9]

Available data for Latin American countries show that income inequality in the region is generally higher than the levels seen in European and Asian countries. For example, recent data collected in Latin America indicate that the total income share of the top 1% in Argentina, Colombia, and Brazil is greater than 16%. Interestingly, when only survey data have been used to estimate inequality in the region, the results suggest that income inequality has decreased significantly, while WID.world estimates for Brazil and Colombia show that they have in fact remained stubbornly high.

In conclusion, the scarcity of available data makes it challenging to develop a conclusive picture of inequality levels in lower-income countries. From the data that are available, however, inequality estimations suggest that in most cases the distribution of income is more concentrated than previously thought in low-income countries. While important efforts have been made in the past years to produce and analyze consistent inequality estimates in emerging countries (which are presented for the first time together in this report) the study of the analysis of income inequality based on sound and consistent data in low-income countries is still only in its infancy.

2.4

INCOME INEQUALITY IN THE UNITED STATES

Information in this chapter is based on the article "Distributional National Accounts: Methods and Estimates for the United States," by Thomas Piketty, Emmanuel Saez, and Gabriel Zucman, forthcoming in the *Quarterly Journal of Economics* (2018).

- Income inequality in the United States is among the highest of all rich countries. The share of national income earned by the top 1% of adults in 2014 (20.2%) is much larger than the share earned by the bottom 50% of the adult population (12.5%).
- Average pre-tax real national income per adult has increased 60% since 1980, but it has stagnated for the bottom 50% at around $16 500. While post-tax cash incomes of the bottom 50% have also stagnated, a large part of the modest post-tax income growth of this group has been eaten up by increased health spending.
- Income has boomed at the top. While the upsurge of top incomes was first a labor-income phenomenon in 1980s and 1990s, it has mostly been a capital-income phenomenon since 2000.
- The combination of an increasingly less progressive tax regime and a transfer system that favors the middle class implies that, even after taxes and all transfers, bottom 50% income growth has lagged behind average income growth since 1980.
- Increased female participation in the labor market has been a counterforce to rising inequality, but the glass ceiling remains firmly in place. Men make up 85% of the top 1% of the labor income distribution.

Income inequality in the United States is among the highest of rich countries

In 2014, the distribution of US national income exhibited extremely high inequalities. The average income of an adult in the United States before accounting for taxes and transfers was $66 100, but this figure masks huge differences in the distribution of incomes. The approximately 117 million adults that make up the bottom 50% in the United States earned $16 600 on average per year, representing just one-fourth of the average US income. As illustrated by table 2.4.1, their collective incomes amounted to a 13% share of pre-tax national income. The average pre-tax income of the middle 40%—the group of adults with incomes above the median and below the richest 10%, which can be loosely described as the "middle class"—was roughly similar to the national average, at $66 900, so that their income share (41%) broadly reflected their relative size in the population. The remaining income share for the top 10% was therefore 47%, with average pre-tax earnings of $311 000. This average annual income of the top 10% is almost five times the national average, and nineteen times larger than the average for the bottom 50%. Furthermore, the 1:19 ratio between the incomes of the bottom 50% and the top 10% indicates that pre-tax income inequality between the "lower class" and the "upper class" is more than twice the (1:8 ratio) difference between the average national incomes in the United States and China, using market exchange rates.

Income is very concentrated, even among the top 10%. For example, the share of national income going to the top 1%, a group of approximately 2.3 million adults who earn $1.3 million on average per annum, is over 20%—that is, 1.6 times larger than the share of the entire bottom 50%, a group fifty times more populous. The incomes of those in the top 0.1%, top 0.01%, and top 0.001% average $6 million, $29 million, and $125 million per year, respectively, before personal taxes and transfers.

As shown by **Table 2.4.1**, the distribution of national income in the United States in 2014 was generally made slightly more equitable by the country's taxes and transfer system. Taxes and transfers reduce the share of national income for the top 10% from 47% to 39%, which is split between a one percentage point rise in the post-tax income share of the middle 40% (from 40.5% to 41.6%) and a seven percentage point increase in the post-tax income share of the bottom 50% (from 12.5% to 19.4%). The trend is also of relatively large proportionate losses in income shares as one looks further up the income distribution, indicating that government taxes are slightly progressive for the United States' richest adults.

National income grew by 61% from 1980 to 2014 but the bottom 50% was shut off from it

Income inequality in the United States in 2014 was vastly different from the levels seen at the end of the Second World War. Indeed, changes in inequality since the end of that war can be split into two phases, as illustrated by **Table 2.4.2**. From 1946 to 1980, real national income growth per adult was strong—with average income per adult almost doubling—and moreover, was more than equally distributed as the incomes of the bottom 90% grew faster (102%) than those of the top 10% (79%).[10] However, in the following thirty-four-year period, from 1980 to 2014, total growth slowed from 95% to 61% and became much more skewed.

The pre-tax incomes of the bottom 50% stagnated, increasing by only $200 from $16 400 in 1980 to $16 600 in 2014, a minuscule growth of just 1% over a thirty-four-year period. The total growth of post-tax income for the bottom 50% was substantially larger, at 21% over the full period 1980–2014 (averaging 0.6% a year), but this was still only one-third of the national average. Growth for the middle 40% was weak, with a pre-tax increase in income of 42% since 1980 and a post-tax rise of 49% (an average of 1.4% a year). By

Table 2.4.1

The distribution of national income in the US, 2014

Source: Piketty, Saez and Zucman (2018), available from WID.world

Between 1980 and 2014, the average pre-tax income of the Top 10% grew by 113%. Pre-tax national income is measured after the operation of pension and unemployment insurance systems (which cover the majority of cash transfers), but before direct income and wealth taxes. Post-tax national income is measured after all taxes, transfers, and government spending.

contrast, the average income of the top 10% doubled over this period, and for the top 1% it tripled, even on a post-tax basis. The rates of growth further increase as one moves up the income ladder, culminating in an increase of 636% for the top 0.001% between 1980 and 2014, ten times the national income growth rate for the full population.

The rise of the top 1% mirrors the fall of the bottom 50%

This stagnation of incomes of the bottom 50%, relative to the upsurge in incomes experienced by the top 1% has been perhaps the most striking development in the United States economy over the last four decades. As shown by **Figure 2.4.1a**, the groups have seen their shares of total US income reverse between 1980 and 2014. The incomes of the top 1% collectively made up 11% of national income in 1980, but now constitute above 20% of national income, while the 20% of US national income that was attributable to the bottom 50% in 1980 has fallen to just 12% today. Effectively, eight points of national income have been transferred from the bottom 50% to the top 1%. Therefore, the gains in national income share made by the top 1% have been more than large enough to compensate for the fall in income share of the bottom 50%, a group demographically fifty times larger. **Figure 2.4.1b** shows that while average pre-tax income for the bottom 50% has stagnated at around $16 500 since 1980, the top 1% has experienced 300% growth in their incomes to approximately $1 340 000 in 2014. This has increased the average earnings differential between the top 1% and the bottom 50% from twenty-seven times in 1980 to eighty-one times today.

Excluding health transfers, average post-tax income of the bottom 50% stagnated at $20 500

The stagnation of incomes among the bottom 50% was not the case throughout the postwar period, however. The pre-tax share of income owned by this chapter of the population increased in the 1960s as the wage distribution became more equal, in part as a consequence of the significant rise in the real federal minimum wage in the 1960s, and reached its historical peak in 1969. These improvements were supported by President Johnson's "war on poverty," whose social policy provided the Food Stamp Act of 1964 and the creation of the Medicaid healthcare program in 1965.

However, the share of both pre-tax and post-tax US income accruing to the bottom 50% began to fall notably from the beginning of the 1980s, and the gap between pre-tax and post-tax incomes also diverged significantly from this point onwards. Indeed, the data indicate that virtually all of the meager growth in the real post-tax income of the bottom 50% since the 1970s has come from Medicare and Medicaid. Excluding these two health care transfers, the average post-tax income of the bottom 50% would have stagnated since the late 1970s at just below $20 500 (see **Figure 2.4.2**). The bottom half of the US adult population has therefore been effectively shut off from pre-tax economic growth for over forty years, and the increase in their post-tax income of approximately $5 000 has been almost entirely absorbed by greater healthcare spending, in part as a result of increases in the cost of healthcare provision.[11] Furthermore, it is solely through the in-kind health transfers and collective expenditures that the bottom half of the distribution sees its income rise above its pre-tax level and becomes a net beneficiary of redistribution; up until the government ran large deficits during the 2008 Great Recession, the bottom 50% paid more in taxes than it received in individualized cash transfers.

Among the bottom 50%, the pre-tax income of working-age adults is falling

The stagnation in the incomes of the bottom 50% could in principle reflect demographic changes rather than deeper evolutions in the distribution of lifetime incomes. People's incomes tend to first rise with age—as workers

Figure 2.4.1a

Pre-tax income shares of the Top 1% and Bottom 50% in the US, 1962–2014

In 2014, 13% of national income was received by the Bottom 50% in the US. Pre-tax national income is measured after the operation of pension and unemployment insurance systems (which cover the majority of cash transfers), but before direct income and wealth taxes.

build human capital and acquire experience—and then fall during retirement. Population aging might therefore have pushed the bottom 50% income share down. However, this is not the case for the United States. This can be shown by examining the bottom 50% of income earners within specific age categories such as 20–45 year olds, 45–65 year olds, and 65+ year olds, as in Figure 2.4.3.

Figure 2.4.3a shows that the average pre-tax income of working-age adults in the bottom 50% has collapsed since 1980, falling by 20% for adults aged 20–45 and by 8% for those between aged 45–65. It is only for the elderly (aged 65+) that pre-tax income has been rising, due to increases in social security benefits and private pension distributions. **Figure 2.4.3b** shows that these trends are even more pronounced on a post-tax basis. The average income of bottom 50% income earners among those aged 65+ has grown by 70% since 1980s and now exceeds the average income of bottom 50% income earners among all adults. Indeed, all the growth in the post-tax incomes of the bottom 50% is attributable to this increase in income for the elderly.[12] For the working-age population in the bottom 50%, the increase in post-tax income since 1980 has been essentially nil.

Three key insights can be drawn from the evolution of bottom 50% incomes in the United States. First, as the income of all working-age groups within the bottom 50% has collapsed—including experienced workers above 45 years old—it is unlikely that the cumulative income that someone from the bottom 50% group has earned across their lifetime has grown much since the 1980s. Secondly, the stagnation in the incomes of the bottom 50% is not due to population aging. To the contrary, at the bottom half of the income spectrum, the elderly's incomes are the only ones rising. Thirdly, despite the rise in means-tested benefits, government redistribution has not enhanced income growth

In 2014, the average pre-tax income of the Bottom 50% aged 20 to 45 years old was €13 200. Pre-tax national income is measured after the operation of pension and unemployment insurance systems (which cover the majority of cash transfers), but before direct income and wealth taxes. All values have been converted to 2016 constant US dollars (accounting for inflation). For comparison, $1 = €0.8 = ¥3.3 at Market Exchange Rates, and $1 = €0.9 = ¥6.6 at Purchasing Power Parity. Numbers may not add up due to rounding.

for low- and moderate-income, working-age Americans over the last three decades. This, along with the real level of pre-tax inequality, indicates that there are clear limits to what taxes and transfers can achieve in the face of such massive changes in the pre-tax distribution of income as have occurred in the United States since 1980. This combination of factors supports the view that policy discussions should focus on how to equalize the distribution of primary assets, including human capital, financial capital, and bargaining power, rather than merely focus on ex-post redistribution.

Pre-tax income inequality has risen notably since the 1980s, slightly more than post-tax income inequality

The trends described above should also be put into their longer historical context. An analysis of data going as far back as 1917 indicates that there have been considerable changes in income inequality in the United States over the last century. As shown in **Figure 2.4.4**, the share of national income going to the top 10% has followed a U-shaped curve over the last century. On a pre-tax basis, the top 10% income share today is almost as high as it was at its peak in the late 1920s.

The shares of income attributed to top earners, after accounting for taxes and transfers, have also followed a U-shaped evolution over time, though they exhibit a less marked upward swing in recent decades than do the pre-tax figures. This difference is mainly due to the smaller size of government a century ago, and lower tax rates relative to the present day, which meant the difference between pre- and post-tax incomes was less pronounced in the early 1900s. Pre-tax and post-tax shares of income started diverging after 1933 as President Roosevelt's New Deal impacted the top 1% and policies to raise money for

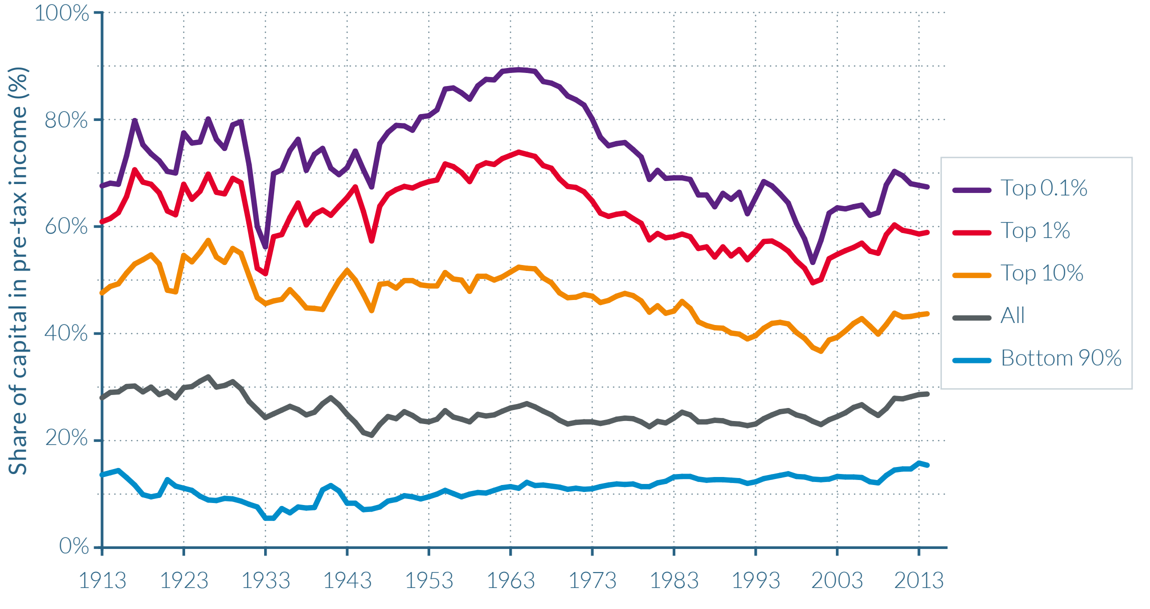
In 2014, 39% of post-tax national income was received by the Top 10%. Pre-tax national income is measured after the operation of pension and unemployment insurance systems (which cover the majority of cash transfers), but before direct income and wealth taxes.

Figure 2.4.5

The share of capital in pre-tax income in the US, 1913–2014



Source: Piketty, Saez and Zucman (2018). See wir2018.wid.world for data series and notes.

In 2014, the share of capital in the pre-tax income of the Top 10% was 44%. Total pre-tax income is the sum of capital income and labor income. Pre-tax national income is measured after the operation of pension and unemployment insurance systems (which cover the majority of cash transfers), but before direct income and wealth taxes.

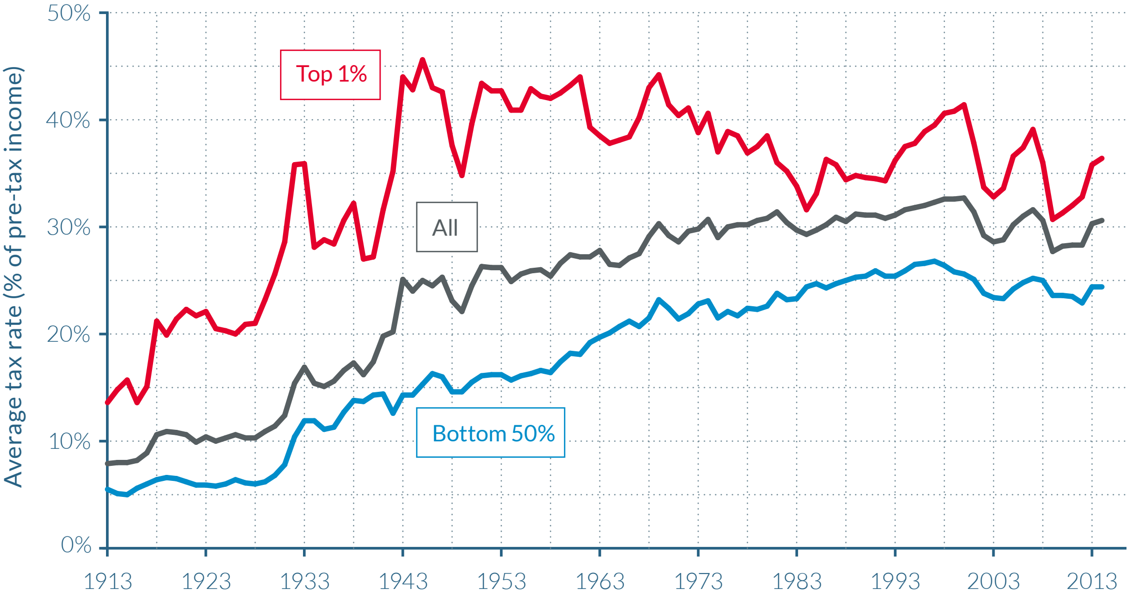
Second World War–related spending led to significant increases in federal income taxation of the top 10%.

Although post-tax inequality has increased significantly since 1980, it has risen at a slower rate than pre-tax inequality. As can be seen in **Figure 2.4.4**, the share of total income attributable to the top 10% rose from 30% to 40% post-tax, and from 35% to 47% pre-tax between 1980 and 2014. Significant tax increases implemented in 2013 for those with the largest incomes may have played a role in the slower growth of post-tax top-income shares relative to pre-tax income shares over the last few years. Overall, redistributive policies have prevented post-tax inequality from returning all the way to pre–New Deal levels (as discussed in more detail below). Further reducing taxes on top earners, as envisioned by the current administration and congress, could sharply increase post-tax income inequality in coming years. (**Box 2.4.1**)

Despite fluctuations, the share of aggregate capital in total pre-tax income has remained relatively stable over the last century. Significantly larger concentrations of earnings continue to be derived from capital, rather than labor, as one moves up the income distribution. The vast majority of Americans have earned little capital income over the last century, with the bottom 90%—which includes both the middle and lower-income classes—rarely receiving more than 10% of their income from capital before the 1970s (see **Figure 2.4.5**). The rise of pension funds (which now account for 36% of all household wealth) has helped to increase the share of capital in the pre-tax income of the bottom 90%, rising to approximately 16% in 2014. While lower than their highs of over 50% in the mid-60s, the top 10% income earners still derive over 40% of their incomes from capital in 2014; this figure was almost 60% for the top 1%, and 70% for the top 0.1% in 2014.

Figure 2.4.6

Average tax rate by pre-tax income group in the US, 1913–2014



Source: Piketty, Saez and Zucman (2018). See wir2018.wid.world for data series and notes.

In 2014, the average tax rate on the incomes of the Top 1% was 36%. Pre-tax national income is measured after the operation of pension and unemployment insurance systems (which cover the majority of cash transfers), but before direct income and wealth taxes. Taxes include all forms of taxes at the federal, state, and local level. Tax rates are expressed as a fraction of pre-tax income.

Fluctuations in the share of income coming from capital have been remarkable for those with the highest incomes. Early in the twentieth century, the top 0.1% derived 70%–80% of its income from capital, but this share collapsed to just over 50% during the Great Depression when corporate profits slumped, before rebounding in the 1950s and 1960s to around 90%. As described in Piketty's *Capital in the Twenty-First Century*, top executive compensation and labor incomes hit an historical low during the postwar decades.[13] They then rose very rapidly from the 1970s through the late 1990s, culminating in 2000 when the capital share of the top 0.1% reached a low point of 49%. Since the turn of the twenty-first century, however, capital has bounced back, with a surge in profits from corporate equities. The share of capital income in national income grew from 22% to 29% between 2000 and 2014, and indeed almost all of the 0.6% average yearly growth of income per adult in the United States over this period was a result of the rise in capital income; labor income per adult grew by 0.1% per year while capital income per adult grew by 2.2% per year. This rise in wealth inequality led to an increase in capital income concentration, which then reinforced wealth inequality itself as top capital incomes were saved at a high rate. Consequently, as the twenty-first century progresses, the working rich of the late twentieth century may increasingly live off their capital income, or could be in the process of being replaced by their offspring who can live off their accumulated inheritance.

Taxes have become less progressive over the last decades

The progressivity of the US tax system has declined significantly over the last few decades, as illustrated in **Figure 2.4.6**. The country's macroeconomic tax rate (that is, the share of total taxes in national income including federal, state, and local taxes) increased from 8% in 1913 to 30% in the late

1960s, and has remained at the latter level since. Effective tax rates have become more compressed, however, across the income distribution. In the 1950s, the top 1% of income earners paid 40%–45% of their pre-tax income in taxes, while the bottom 50% earners paid 15–20%. The gap in 2014 was much smaller. In 2014, top earners paid approximately 30%–35% of their income in taxes, while the bottom 50% of earners paid around 25%. The main factor explaining why the effective tax rates paid by the top 1% have declined over time is the fall in corporate and estate taxes; in the 1960s, the top 1% paid close to 20% of its pre-tax income in corporate and estate taxes, while by 2014, this had fallen to approximately 10%.

The 2013 tax reforms partly reversed the long-run decline in top tax rates. The surtaxes introduced by the Affordable Care Act, and the expiration of the 2001 Bush tax cuts for top earners, together increased marginal tax rates for the richest on their capital income (+9.5 percentage points) and labor income (+6.5 percentage points).[14] These increases were the largest hikes in top tax rates since the 1950s, exceeding those implemented by the Clinton administration in 1993. The effective tax rate paid by top 1% earners has risen by approximately four percentage points between 2011 (32%) and 2013 (36%), and is now back to its level of the early 1980s.[15] Still, it is worth noting that inequality was much lower in the 1980s and

Box 2.4.1

Measuring pre-tax and post-tax income inequality

In this chapter, we present estimates of pre- and post-tax income inequality for the USA, which are two complementary concepts for the analysis of inequality. Comparing pre- and post-tax income inequality allows to better assessing the impact of personal taxes and in-kind transfers on the dynamics of income inequality.

In the WID.world database, pre-tax income refers to incomes measured before personal income and wealth taxes and in-kind transfers (typically health transfers) but after the operation of the pension and employment insurance systems (as well as after Social security and disability transfers in the case of the United States).

In contrast, post-tax income refers to incomes measured after all taxes (in particular, after direct personal and wealth taxes) and after all government transfers (cash and in-kind).

It is important to note that pensions and unemployment insurance represent the vast majority of cash transfers in the United States and more generally in rich countries. Therefore our notion of pre-tax income inequality (which we used in previous chapters to make international comparisons) already includes most cash redistribution.

In practice, other cash transfers tend to be relatively small. For instance, in the case of the United States, pre-tax income is virtually equal to post-tax cash income for the bottom 50%, at around $16 500 in 2014—and this figure has remained more or less the same since 1980. This means that the poor contribute about as much to taxes than they benefit from them in cash transfers (other than pensions and unemployment insurance) and this has not changed in fourty years.

That being said, it is critical to study post-tax inequality and not only pre-tax inequality, first because in-kind transfers (in particular access to free education and health services) play a very important role for bottom groups, and next because post-tax incomes can be substantially smaller than pre-tax incomes at the top of the distribution (at least in countries with highly progressive tax systems).

Unfortunately, the United States is the only country for which complete pre- and post-tax that the long-run declines in corporate-tax and estate-tax revenues continue to exert downward pressure on effective tax rates at the top. Compared to the period between 1940 and 1960, when the level of taxation of the top 1% was consistently above 40%, the average tax rate as a percentage of pre-tax income was more than five percentage points lower in 2014, and ten percentage points lower than before the financial crisis.

In contrast to the overall fall in tax rates for top earners since the 1940s, taxes on the bottom 50% have risen from 15% to 25% between 1940 and 2014. This has been largely due to the rise of payroll taxes paid by the bottom 50%, which have risen from below 5% in the 1960s to more than 10% in 2014. Indeed, payroll taxes are now much more important than any other taxes—federal or state—borne by the bottom 50%. In 2014, payroll taxes amounted to 11% of pre-tax income, significantly above the next largest items: federal and state income taxes, which made up 7% of pre-tax income, and sales taxes, at 5%.[16] Although payroll taxes finance transfers including Social Security and Medicare, which in part go to the bottom 50%, their increase also contributes to the stagnation of the post-tax income of working-age Americans who make up a notable proportion of the bottom 50% of the income distribution.

income inequality estimates are available in this Report. Would focusing on post-tax income inequality in other countries modify the general conclusions of the Report?

Based on the findings of this chapter and on preliminary results for other countries, it seems likely that focusing on post-tax incomes would tend to comfort our main conclusions.

For instance, the magnitude of in-kind education and health transfers tends to be higher in Europe than in the United States, particularly for the bottom 50%, so our conclusion about higher inequality in the US is likely to be magnified when we move from pre-tax to post-tax inequality.

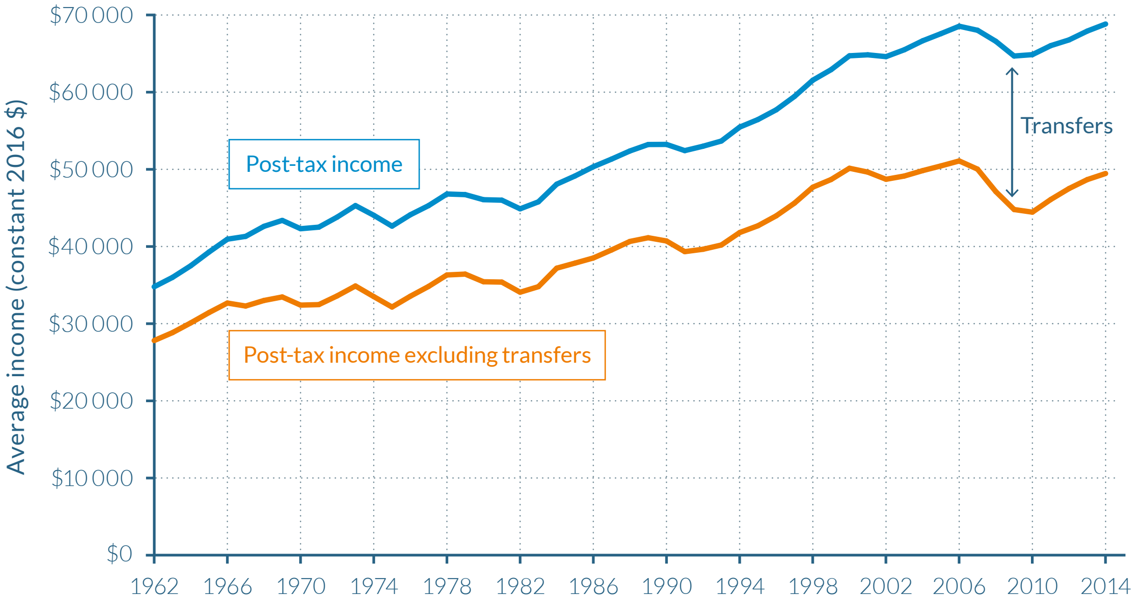
Next, we know that tax progressivity was reduced, rather than increased, in most countries since the 1980s (see chapter 5.2). Taking into account post-tax estimates therefore tends to reinforce the rise in inequality observed in pre-tax series. In France, for instance, effective tax rates are lower for the very rich than for the middle class, and new tax legislations will further decrease these rates for the richest (see chapter 2.5).

In emerging countries, the tax and transfer systems are generally less developed and less progressive than in the United States and Europe (as discussed in chapter 5.2, there are no estate taxes in emerging countries, while the poor pay high taxes on some basic consumption goods such as energy), so the gap between extreme inequality countries and other regions discussed in chapter 2.1 may in fact be reinforced with post-tax estimates.

The exact magnitude of these variations remains unknown at this stage. The WID.world consortium is currently producing novel post-tax income inequality estimates for various parts of the world (in particular for Europe and Latin America), but taking into account consistently all forms of incomes, taxes and transfers of all individuals in a given country over long time periods requires tremendous efforts. This is an exciting agenda for economic research and future editions of this Report will present new results and progresses made along these lines.

Figure 2.4.7

Post-tax income of the Middle 40% in the US, 1962–2014: The role of transfers



Source: Piketty, Saez and Zucman (2018). See wir2018.wid.world for data series and notes.

In 2014, the average post-tax income of the Middle 40% was €68 800. Post-tax national income is measured after all taxes, transfers, and government spending. All values have been converted to 2016 constant US dollars (accounting for inflation). For comparison, $1 = €0.8 = ¥3.3 at market exchange rates, and $1 = €0.9 = ¥6.6 at purchasing power parity.

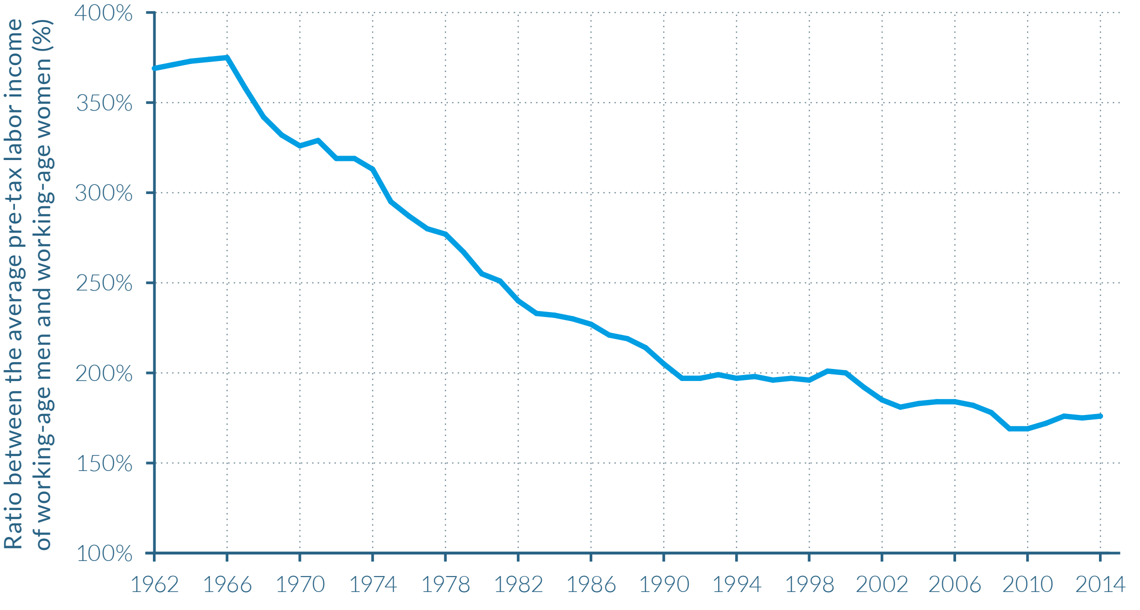
Transfers essentially target the middle class, leaving the bottom 50% with little support in managing the collapse in their pre-tax incomes

While taxes have steadily become less progressive since the 1960s, one major evolution in the US economy over the last fifty years has been the rise of individualized transfers, both monetary and in-kind. Public-goods spending has remained constant, at around 18% of national income, but transfers—other than Social Security, disability, and unemployment insurance, which are already included in calculations of pre-tax income—increased from around 2% of national income in 1960 to 11% in 2014. The two largest transfers were Medicaid and Medicare, representing 4% and 3%, respectively, of national income in 2014. Other important transfers include refundable tax credits (0.8% of national income), veterans' benefits (0.6%), and food stamps (0.5%).

Perhaps surprisingly, individualized transfers tend to target the middle class. Despite Medicaid and other means-tested programs which go entirely to the bottom 50%, the middle 40% received larger transfers in 2014 (totaling 16% of per-adult national income) than the bottom 50% of Americans (10% of per-adult national income). With the top 10% of income earners receiving approximately 8% of per-adult national income in transfers, there is an inverted U-shaped relationship between post-tax income and transfers received (when Social Security benefits are included in transfers). These transfers have been key to enabling middle-class incomes to grow, as without them, average income for the middle 40% would not have grown at all between 1999 in 2014. (See **Figure 2.4.7**) By contrast, transfers have not been sufficient to enable the incomes of the bottom 50% to grow significantly and counterbalance the collapse in their pre-tax income.

Figure 2.4.8

Difference in the pre-tax labor income between working-age men and women in the US, 1962–2014



Source: Piketty, Saez and Zucman (2018). See wir2018.wid.world for data series and notes.

In 2014, the average pre-tax labor income of men aged 20-64 years old was 1.76 times greater (76% higher) than the average pre-tax labor income of women aged 20-64 years old. Pre-tax labor income is composed of wages as well as pensions, social security, and unemployment insurance benefits, minus the corresponding contributions.

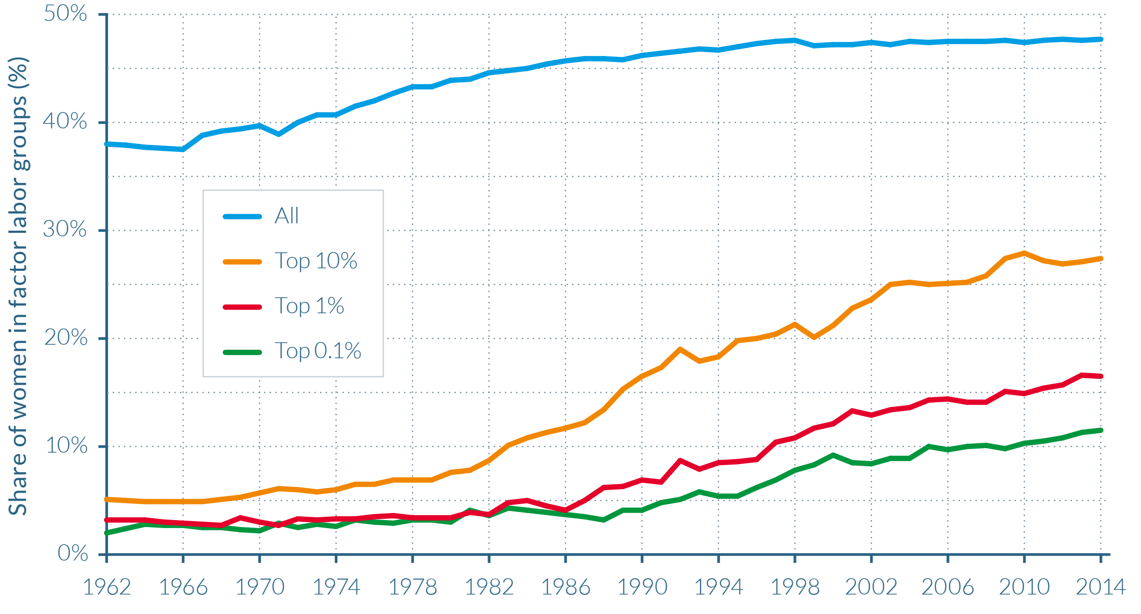
The reduction in the gender wage gap has been an important counterforce to rising US inequality

The reduction in the gender gap has been an important force in mitigating the rise in inequality that has largely taken place after 1980. To examine this process, the data must be analyzed on an individual rather than on a tax-unit basis (such as a couple or a family). The overall gender gap has been almost halved over the last half-century, but it has far from disappeared. The more comprehensive way to measure the gender gap is to compute the ratio of average labor income of working-age men (aged 20–65) to average labor income of working age women (aged 20–65), regardless of whether and how much they work. As illustrated in **Figure 2.4.8**, this income ratio has fallen from highs of 3.7:1 in the 1960s to approximately 1.75:1 in 2014.

Still, considerable gender inequalities persist, particularly at the top of the labor income distribution, as illustrated by **Figure 2.4.9**. In 2014, women accounted for close to 27% of the individuals in the top 10% of the income distribution, up 22 percentage points from 1960. Their representation, however, grows smaller at each higher step along the distribution of income. Women make up only 16% of the top 1% of labor income earners (a 13 percentage point rise from the 1960s), and only 11% of the top 0.1% (an increase of 9 percentage points). There has been only a modest increase in the share of women in top labor income groups since 1999. The glass ceiling is still far from being shattered.

Figure 2.4.9

Share of women in the employed population by labor income group in the US, 1962–2014



Source: Piketty, Saez and Zucman (2018). See wir2018.wid.world for data series and notes.

In 2014, the share of women in the employed population was 48%. Factor labor income excludes pensions, social security, unemployment insurance benefits, and corresponding contributions.

2.5

INCOME INEQUALITY IN FRANCE

Information in this chapter is based on "Income Inequality in France, 1900–2014: Evidence from Distributional National Accounts (DINA)," by Bertrand Garbinti, Jonathan Goupille-Lebret and Thomas Piketty, 2017. WID.world Working Paper Series (No. 2017/4).

- In 2014, the share of total pre-tax income received by the bottom 50% earners was 23%, while the share of the top 10% was 33%. Although income inequality in France was by no means insignificant in 2014, it sharply contrasts with the situation a century ago. In 1900, the top 10% of the income distribution received half of total French national income.
- Income inequality decreased significantly between the start of the First World War and the end of the Second World War due to the fall of top capital incomes resulting from the destruction of physical capital, the damaging impact of inflation, and the effects of nationalizations and rent-control policies.
- The struggle between labor and capital to share the fruits of growth between 1945 and 1983 characterized a turbulent period for income inequality, rising until 1968, when civil unrest pressured the government into reducing wage differentials.
- Austerity measures introduced in 1983, including the end of indexing wages to inflation, started a trend of rising inequality. Wage differentials and returns to capital increased thereafter.
- While gender pay gaps have consistently fallen since the 1970s, women made up just 30% of the top 10% of French earners in 2012, and if current trends continue, women cannot expect to make up a proportion of the top 10% equal to men until 2102.

In 2014, the top 10% French earners captured 33% of national income

In 2014, the average national income per adult in France was €33 400. This average, however, disguises significant variations among groups within the distribution. The bottom 50% earned around €15 000 on average in 2014, notably less than half the national average, and thus their share of total French income was less than a quarter (22.5%). The middle 40% had an annual average income of almost €37 500, and accordingly held a 45% share of national income, while the top 10% received approximately €109 000, more than three times the national average. These relative differences grow ever larger for the richest, with the top 1% having an 11% share in national income, and the top 0.1% and 0.01% having incomes 37 and 129 times the national average, as shown in **Table 2.5.1**.

Income inequality in France has varied significantly since the start of the twentieth century

While income inequality in France is by no means insignificant today, it has fallen notably since 1900. At the beginning of the twentieth century, the top 10% of the income distribution (which can be thought of as the "upper class") received 50% of total national income, while the middle 40% (the so-called "middle class") had around 35%. Meanwhile, the bottom 50% (the "lower class") had less than 15% of national income. The increased shares for the middle (+10 percentage points) and lower class (+8 percentage points) between 1900 and 2014 have thus come at the expense of the richest in roughly equal amounts. This reduction in inequality has taken place, however, in a haphazard and disorderly manner, undergoing numerous evolutions over the last century that are the result of a complex mix of historical events and political decisions.

To better comprehend recent developments in income inequality in France, it is first important to analyze how average income evolved from 1900 to 2014. Per-adult national income has risen approximately sevenfold over the last century in France, from around €5 500 in the year 1900. However, this growth in national income per adult was far from steady. Between 1900 and 1945, per-adult national income declined on average

Table 2.5.1
The distribution of national income in France, 2014

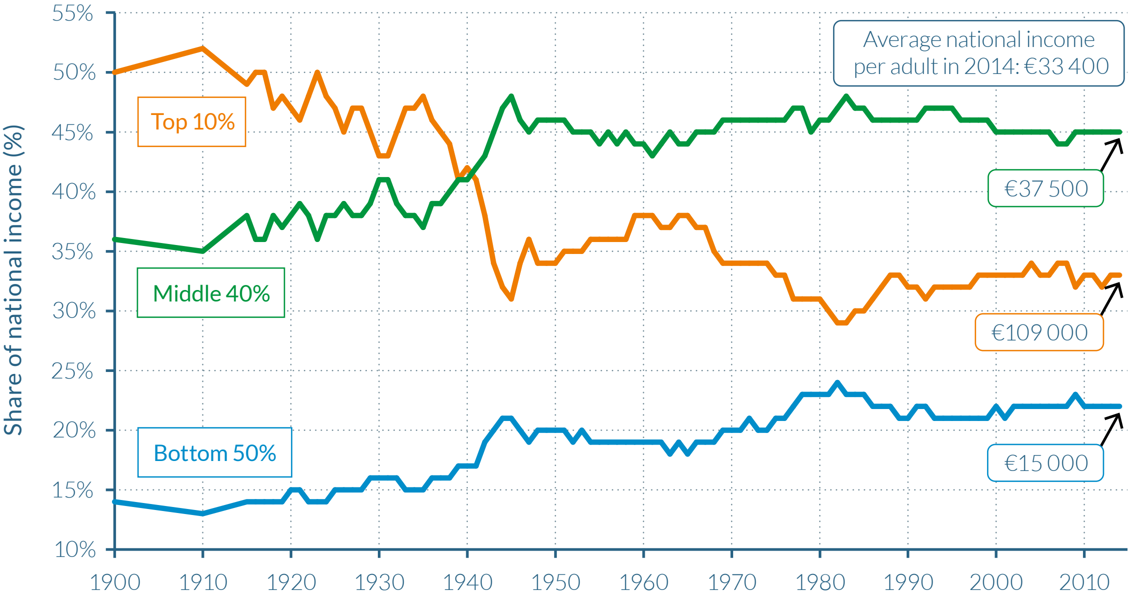
Income group	Number of adults	Income threshold (€)	Average income (€)	Income share
Full Population	51 722 000	–	33 400	100%
Bottom 50%	25 861 000	–	15 000	22.5%
Middle 40%	20 689 000	26 600	37 500	44.9%
Top 10%	5 172 000	56 100	109 000	32.6%
Top 1%	517 000	161 400	360 600	10.8%
Top 0.1%	51 700	544 600	1 234 400	3.7%
Top 0.01%	5 200	2 002 000	4 318 600	1.3%
Top 0.001%	500	6 976 500	13 175 100	0.4%

Source: Garbinti, Goupille-Lebret and Piketty (2017). See wir2018.wid.world for data series and notes.

In 2014, 33% of national income was earned by the Top 10% in France. All values have been converted into 2016 Purchasing Power Parity (PPP) euros at a rate of €1 = $1.3 = ¥4.4. PPP accounts for differences in the cost of living between countries. Values are net of inflation. Numbers may not add up due to rounding.

Figure 2.5.1

Incomes shares in France, 1900–2013: The rise of the lower and middle classes



Source: Garbinti, Goupille-Lebret and Piketty (2017). See wir2018.wid.world for data series and notes.

In 2014, 33% of national income was earned by the Top 10% in France. In the same year, the average income of the Top 10% was €109 000, over three times the national average per adult. All values have been converted into 2016 Purchasing Power Parity (PPP) euros at a rate of €1 = $1.3 = ¥4.4. PPP accounts for differences in the cost of living between countries. Values are net of inflation.

by -0.1% per year, but then increased at an average of 3.7% during the postwar period until 1980; dubbed *les trente glorieuses*. These "thirty glorious years" were followed by a period in which per-adult national incomes grew four times slower than previously, averaging 0.9% per annum from 1980 to 2014. This pattern was not unique to France, however. Similar trends were experienced in most European countries and Japan, and to a lesser extent in the United States and in the UK, where the shocks created by the First and Second World Wars were less damaging than in Continental Europe.

The evolution of income inequality over the last century can be broken down into three broad periods. The first of these periods was from the start of the First World War to the end of the Second World War. As visualized in **Figure 2.5.1**, the share of income of the top 10% of earners fell abruptly during the 1914–1945 period, from more than 50% of total income on the eve of the First World War to slightly above 30% of total income in 1945. This decline was mainly due to the collapse of capital income, which was hit by a number of negative shocks. Capital income generally makes up a significantly higher proportion of income for the richest 10% of the population, and particularly the top 1%, than it does for other groups. Both wars involved the destruction of capital stocks, and bankruptcies were not infrequent. They led to a collapse in gross domestic product (GDP), which lost 50% of its value between 1929 and 1945. Inflation reached record levels (the price index was multiplied by more than a hundred between 1914 and 1950), severely penalizing individuals with bond holdings and, more broadly, with fixed income assets. The control of rents during the period of inflationism led to a tenfold fall in their real value, and additionally, nationalization and the high level of taxation of certain assets in 1945 contributed to a sharp fall in capital income. The result for the top 1%—that is, those earning the most income from capital—was to see their share of national income halved in around thirty years.

The second period, between 1945 and 1983, was characterized by a struggle between labor and capital to share the fruits of growth, which reached very high levels (+3.3% per year on average). From 1945 to 1968, the inequality in wages that had existed before the world wars was rebuilt and the share of capital in the French economy also rose, leading to a period of rising income inequality. As illustrated by **Figure 2.5.1**, the income share of the top 10% had risen from around 30% to 38% during this twenty-three-year period, while the share of the bottom 50% fell from approximately 23% to 17%. Following the events of May 1968, however, this trajectory of rising inequality abruptly stopped.

May 1968 was a volatile period of civil unrest in France, punctuated by demonstrations, general strikes, and protester occupations of universities and factories across the country. The French government, under Charles De Gaulle's presidency, introduced a number of conciliatory policies in the following month in an attempt at appeasement, including a boost in the real minimum wage of approximately 20%. This marked the beginning of a period of steady increases in the minimum wage and of the purchasing power of the poor between 1968 and 1983. The purchasing power of those with lower wages rose substantially more than did GDP, which itself grew by a noteworthy 30%. These factors led to a compression in the distribution of wages and reduced income inequality more generally. In the early 1980s, the top 10% had their lowest share of pre-tax national income recorded, at 30%, while the middle 40% had an historic high of approximately 48%, and the bottom 50% accounted for 23%. However, the rise in unemployment that started during the mid-1970s also marked the beginning of a new period.

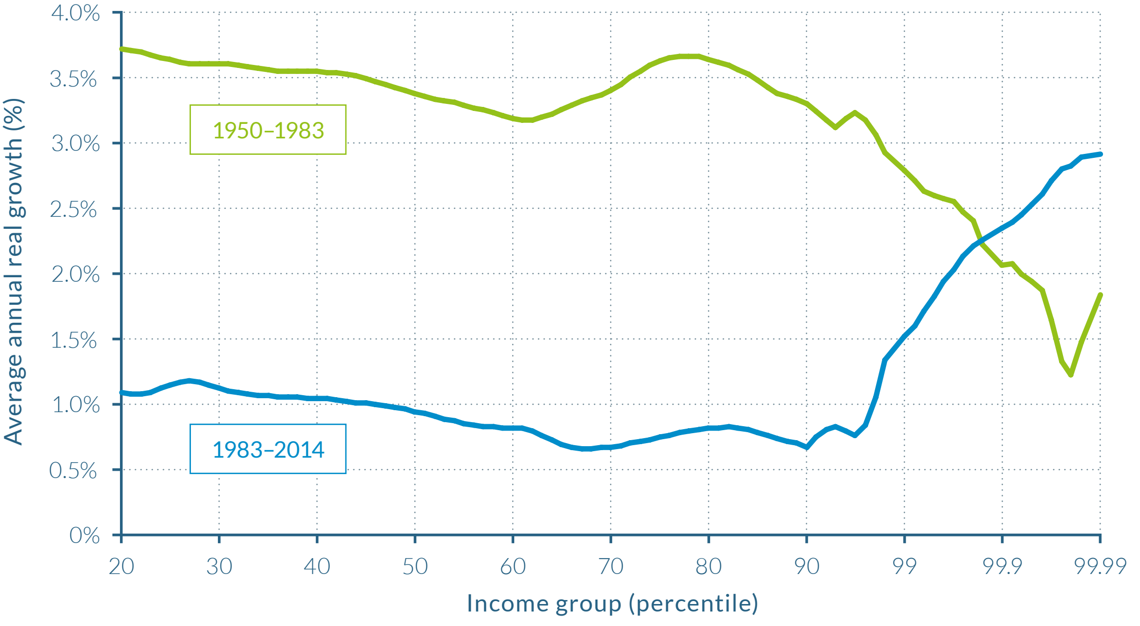
The third period, marked by a substantial reduction in income growth rates (1% per year on average), began in 1982–1983 when successive governments decided to end the policy of indexing wages to prices and therefore reduced the rate of wage increases for the low-paid.[17] This was initially part of an austerity program known as the *tournant de la rigueur* (austerity turn), introduced by President Mitterrand's then newly elected left-wing government. The program was an attempt to combat high inflation rates and rapid deteriorations in the budget and trade deficits between 1981 and 1983 that could have seen France leave the European Monetary System. Taxes were also increased, subsidies to state-owned enterprises were reduced, and social security and unemployment insurance payments were restrained.[18] The overall effect of these policy choices was an increase in the pay gaps between those who earned the lowest wages and others. During this period, inequality was relatively stable except at the top of the distribution. Very top incomes increased substantially.

The end of the "thirty glorious years" for the bottom 95%, but not for those at the top

One way to better understand the magnitude of the turning point that occurred in the 1980s is to look at the total growth curve by income group. That is, we can ask: What was the change in the average income of each group over the different time periods? Between 1983 and 2014, average national income per adult rose by 35% (1% per annum) in real terms in France. However, actual total growth was not the same for all income groups, as illustrated by the impressive upward slope on the right hand of the 1983–2014 growth curve in **Figure 2.5.2**. Total growth between 1983 and 2014 was 31% on average (0.9% per annum) for the bottom 50% of the distribution, 27% for next 40% (0.8% per annum), and 49% for the top 10% (1.3% per annum). Moreover, total growth remained below the economy-wide average until the ninety-ninth percentile, and then rose steeply, up to as much as 98% growth over the thirty-one-year period (2.2% per annum) for the top 0.1% and 144% for the top 0.001% (2.9% per annum).

Figure 2.5.2

Average annual real growth by income group in France, 1950–2014



Source: Garbinti, Goupille-Lebret and Piketty (2017). See wir2018.wid.world for data series and notes.

Between 1950 and 1983, the 50th percentile of the population experienced a 3.4% average annual increase in their real income, while between 1983 and 2014 their real income increased by 0.9% on average per year.

The contrast between 1950–1983 and 1983–2014 in terms of the total growth rates of income groups is particularly stark. As **Table 2.5.2** and **Figure 2.5.2** show, growth rates were very high for the bottom 99% of the population during the "thirty glorious years" between 1950 and 1983, at around 200%, while growth for the top 1% was markedly lower at 109% (2.3% per annum). Growth rates were even lower at the very top, at around 80% (1.8% per annum) for the top 0.1 and 0.01%.

Another way to measure these diverging evolutions is to compare the shares of total economic growth going to the different income groups. Between 1950 and 1983, 25% of total growth went to the bottom 50% of the population, versus only 6% to the top 1%. Between 1983 and 2014, 21% of total growth went to the bottom 50%, as much as the share of growth which went to the top 1%.

Summing up, although the rise of inequality was less pronounced in France (and to a large extent in Europe) than in the United States, the break between the 1950–1983 period, when bottom groups enjoyed larger growth than the top, and the 1983–2014 period, when the exact opposite pattern prevailed, is very visible.

Recent growth at the top is due to higher salaries and returns on capital assets

As a result of the unequal distribution of growth, the share of income attributed to the top 1% has seen a notable increase between 1983 and 2007, rising from less than 8% of total income to over 12% over this period—that is, rising by over 50%. Between 2008 and 2013, the income share of the top 1% fluctuated between 10% and 12%, remaining significantly larger than when income inequality was at its lowest point in the early eighties (see **Figure 2.5.1**). As stated above, this trend of rising inequality among the highest earners is even more pronounced for

Between 1900 and 1950, the share of national income growth captured by the Top 10% was 8%.

the top 0.1% and the top 0.01% (see **Figure 2.5.3**). The difference between the average national income before tax and those of top earners has almost doubled over the preceding thirty years. The top 0.1% average income increased from 21 times above average in 1983 to 37 times in 2014, while the figure increased from 71 times average to 129 times for the top 0.01%.

Why has there been a rise in top incomes over the recent period? In the case of France, top earners have experienced significant increases in their incomes from both labor and capital. Between 1983 and 2013, the labor income of the top 0.01% rose 53%, while their capital income increased by 48%. It is difficult for standard explanations based on technical change and the changing supply and demand of skills to explain rising income concentration at the very top, whether around the world or in France specifically.[19] The rise of labor incomes at the top is more likely to be the result of evolutions in institutional factors governing pay-setting processes for top managerial compensation, including changes in corporate governance and the decline of unions and collective bargaining processes. Evolutions in top marginal tax rates have also likely had an impact on labor income inequality. Reduced top income tax rates can affect wage-setting at the top; as top earners expect less taxes, they may be more inclined to ask for increases in wages.[20] Top income tax rates were above 60% during the *trente glorieuses* and rose to 70% in the early 1980s. They fell to about 50% in the late 2000s. Effective tax rates (total taxes paid on total income) are actually inferior for very top income groups than for the middle class.[21] Recent tax legislation supported by the current government are about to further reduce tax rates at the top, in particular due to reduction in tax rates on capital.

Increases in top labor income inequality have in certain cases been correlated with increases in top capital income inequality. Top managers, for example, have benefitted first from very high labor incomes through

Figure 2.5.3

Rising top inequality in France, 1983–2013

The share of income going to the Top 1% in 2013 grew by 34% relative to its 1983 value, while the share going to the Top 0.1% in 2013 grew by 60%.

large bonuses or stock options (some of which have been largely mediatized) and then from very high capital incomes derived from improvements in the price of the stocks that they have come to own. Top capital incomes have also been rising due to the rising share of macroeconomic capital in a context of declining labor bargaining power and privatization policies.

Gender pay gaps may be falling, but men are still paid approximately 50% more than women

While income inequality has increased since the 1980s, gender gaps have been declining since the 1970s. Still, gender gaps remain very high in France today. In the 1970s (the "age of patriarchy") men earned 3.5 to 5 times the labor income of women, and women's labor force participation rate was around 45%. The share of working women rose dramatically to 80% in 2012 and the women-to-men pay ratio decreased to 1:1.5 on average. There are, however, strong variations in gender income gaps over age groups. As can be seen in **Figure 2.5.4a**, in 2012, men earned 1.25 times more on average than women at the age of 25, and 1.64 times more at age 65.

Gender inequalities are also particularly high among higher paying jobs. Despite moderate improvements since 1994, women still do not have equal access to them. In 2012, the female share of the top 50% of earners was 42%, while women made up just 30% and 12% of the top 10% and top 0.1% earners, respectively. If current trends continue, women can expect to make up the same proportion as men of the top 10% and top 0.1% shares by 2102 and 2144, respectively. (See **Figure 2.5.4b**)

In 2012, the share of women in the total working population of the Top 1% was 16%.

2.6

INCOME INEQUALITY IN GERMANY

Information in this chapter is based on "Top incomes in Germany, 1871–2013," by Charlotte Bartels, 2017. WID.world Working Paper Series (No. 2017/18).

- In 2013, the share of total income received by the bottom half of the population was 17%, while the share of the top decile was 40%. In 1913, the share of the top 10% was also 40%.The top 1% is, however, lower today than in 1913 (18% versus 13%).
- The top 1% increased sharply between the creation of the Reich in 1871 and the establishment of the Weimar Republic in 1918. It then decreased dramatically when social policies were implemented by the Weimar Republic. The Nazi prewar period is associated with economic recovery and favorable policies for large businesses, and saw temporary surges in top incomes. The top 1% share was then reduced to 10–12% during the 1950–1990 period and has been on the rise since reunification.
- Top income earners in Germany have been business owners throughout the twentieth century and up to the present. As most German firms are family owned, with some family members more involved than others, it is difficult to judge how much of top incomes are labor incomes and which part is "pure" capital income (with limited labor input). Starting in the 1980s, however, highly qualified employees have increasingly entered top-income groups.
- In Germany, high income concentration of the industrialization period dropped as soon as the 1920s and fluctuated around this level throughout the postwar period. This contrasts with other rich countries like United States, the United Kingdom, and France, where the Second World War brought strong and lasting reductions in income concentrations at the top.

Investigating the evolution of inequality using German income tax data has a long tradition, as particularly Prussian and Saxon tax data are internationally praised for their accuracy. Simon Kuznets partly drew his famous hypothesis of rising inequality in the early phase of industrialization from Prussian income tax data. The early introduction of modern income taxation in German states at the end of the nineteenth century offers a special opportunity to compute inequality series from the industrialization phase until today.

The series presented in this chapter are based on pre-tax income data from historical German income-tax statistics collected by Charlotte Bartels. One should note, however, that the impressive length of the period covered in Germany comes with a price, in that changing territories are covered by the series. The two world wars of the twentieth century, the division of Germany after the Second World War, and its reunification in 1990 leave the researcher with income tax systems applying across time to quite differently sized territories and populations.

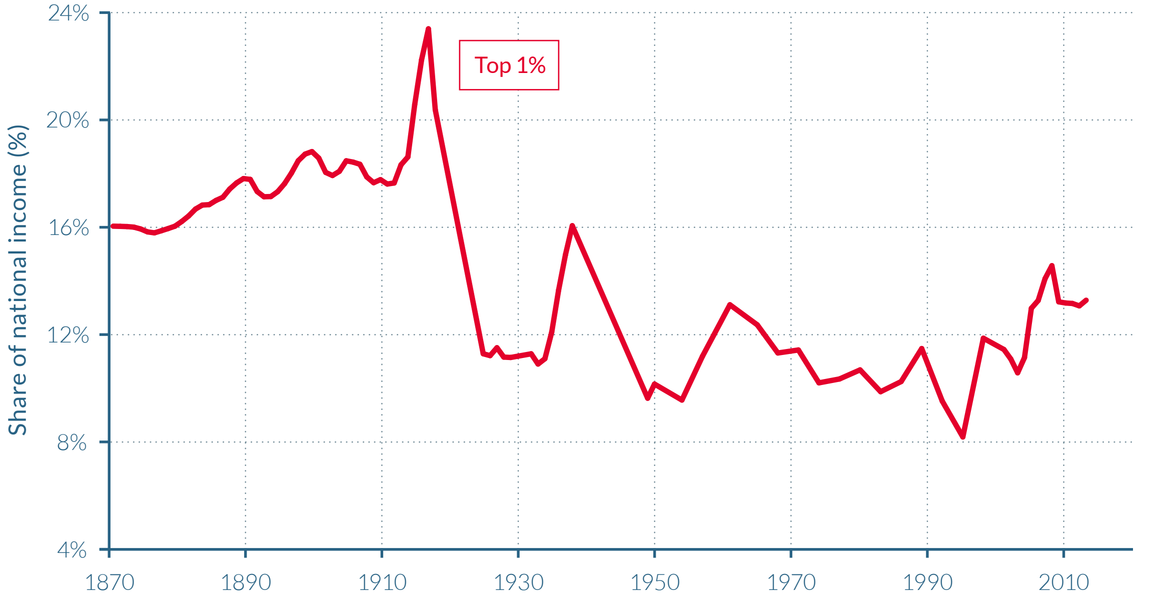
Long-run German income inequality dynamics can be split into five periods

The evolution of income inequality from 1871 to 2013 can be split into five periods. **Figure 2.6.1** shows the evolution of the top 1% income share from 1871 to 2013. The first period starts with the foundation of German Reich in 1871, which unified German states, and ends with the First World War. The top percentile was the greatest beneficiary of this industrialization period. Its income share moderately increased from 16% in 1871 to 18% in 1913 and then rose to 23% during the First World War. The sharp increase observed during that war might have been the result of extraordinarily high profits from military spending. By 1918, authorities managed to restrict those profits, which contributed to bringing the top 1% share back down to 20% of national income.

The second period includes the years of the Weimar Republic (1918–1933), which brought a variety of inequality-reducing policies, including an increase in the top marginal tax rate from 5% to 60% in Prussia, the introduction of unemployment insurance, and employment law including employment protections. Strong unions and the rise of collective bargaining contributed to an increase in wages which resulted in lower labor income inequality. Hyperinflation eroded financial assets and greatly reduced capital incomes during this period. Additionally, industrial firms generated very low profits throughout the 1920s, if any at all, and mostly did not pay out dividends. As a consequence, the top percentile's income share decreased significantly from 20% in 1918 to 11% in 1925 and remained at the latter level until 1933.

The third period starts with the Nazi's seizure of control in 1933 and ends at the eve of the Second World War in 1938. After 1938, the Statistical Office stopped publishing income tax statistics so it is impossible to know how income distribution changed during the Second World War. This prewar Nazi period is marked by an extraordinary increase in the top percentile's income share from 11% in 1934 to 17% in 1938, contrasting with the initial anti-big-business rhetoric of the Nazi party. In contrast, to the top percentile, the P95–P99 group (the top 5% richest, minus the very top 1%) gained only moderately during this period. As in most rich countries, economic recovery after the Great Depression started in 1932 in Germany. Industrial firms saw their profits rise sharply between 1933 and 1939. Ferguson and Voth find evidence that firms with strong ties to the Nazi party disproportionately benefited from the recovery, which probably contributed to further concentration of incomes at the top.[22] The larger firms across all sectors were more likely to form connections with the Nazi government, but this was particularly the case for the rearmament industry.

Figure 2.6.1
Top 1% income share in Germany, 1871–2013



Source: Bartels (2017). See wir2018.wid.world for data series and notes.
In 2013, the Top 1% national income share was 13%.

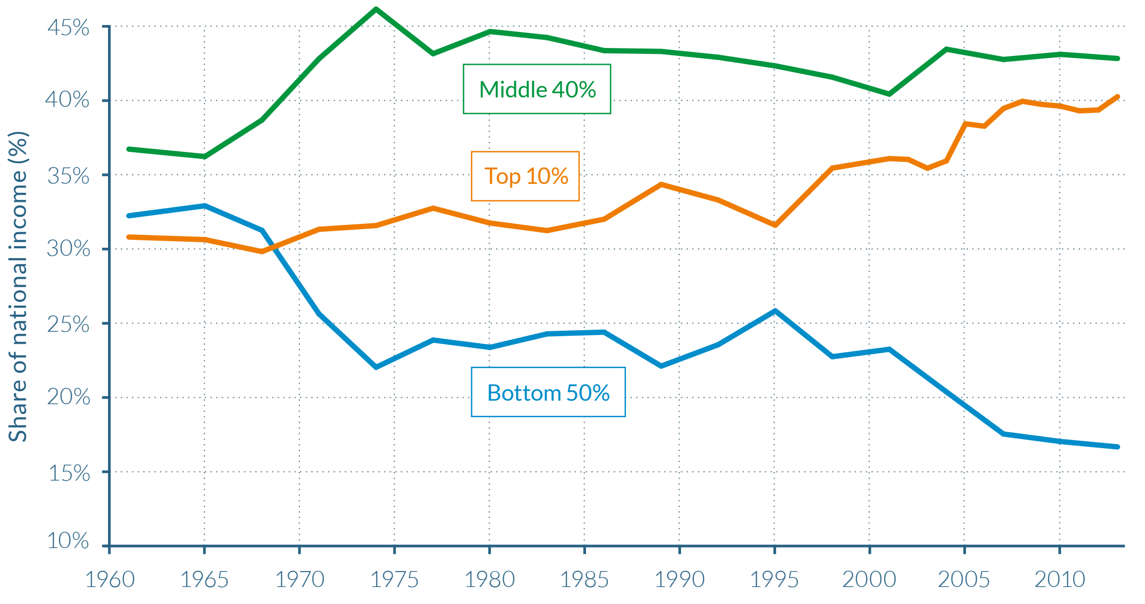
The post-war period is marked by a relatively stable but high top percentile income share

The German postwar period is characterized by a comparably high income concentration at the top, paralleled by a rather compressed wage distribution. From the mid-1950s until the 1980s, the top percentile's share oscillates between 11% and 13%. This is higher than the top percentile's share in postwar United States, United Kingdom, or France in the same period. This finding is particularly striking as the policies (especially nationalizations and rent control) after the Second World War and destructions during the Second World War are generally seen as long-lasting equalizing forces both in Germany and in other war-participating countries. The currency reform in 1948 eradicated capital incomes from financial assets for the second time in the twentieth century, while leaving business assets and real estate untouched. Savings accounts were reduced to about a tenth of their former value. As rents were heavily regulated, top incomes stemmed from business profits. On the other hand, strong labor demand and the high national income growth rates of the German *Wirtschaftswunder* coincided with powerful unions, low unemployment, and a rather compressed wage distribution. The bottom 50% then received a third of total income, as **Figure 2.6.2** shows. It was not until the 1980s that top wage earners increasingly entered top-income groups and the wage distribution became increasingly unequal. With the oil crises and the onset of mass unemployment, the share of the bottom 50% decreased to less than a fifth of national income. The fall of the bottom half was mirrored by an increase of the middle 40%, who received slightly more than 40% of national income beginning in the 1970s.

Income inequality is rising at the top since reunification

The fifth and last period corresponds to reunified Germany. Political unification on October 3, 1990, brought the eastern states

Figure 2.6.2
Income shares in Germany, 1961–2013



Source: Bartels (2017). See wir2018.wid.world for data series and notes.

In 2013, the Top 10% national income share was 40%.

of Berlin, Brandenburg, Mecklenburg–Western Pomerania, Saxony, Saxony-Anhalt, and Thuringia into the Federal Republic of Germany. The first years after reunification were marked by exceptionally high national income growth rates for the reunified German economy. Industrial production quickly collapsed in the East and unemployment rose accordingly. Those keeping their jobs benefitted from an unprecedented jump in real wages, thanks to bargaining by the Eastern German labor unions that aimed to reach parity with West German wage levels in 1994. Taking these effects together, the top percentile's income share fell sharply, whereas the bottom 50% gained in the first years following reunification. The start of the new millennium marked another turning point; the share of the bottom half declined significantly from 22% in 2001 to 17% in 2013, a trend that went hand in hand with the growth of the low-income sector.

The top 10% income group quite steadily increased its income share over the entire postwar period. Highly qualified employees like engineers, lawyers, and doctors have benefitted from high wage growth and have been increasingly present in top-income groups. However, very top incomes are still exclusive to business owners, and profits fluctuate with business cycles. The top percentile's share is volatile, as shown in **Figure 2.6.3**. It suffered large shocks in the German unification crisis in the mid-1990s, the burst of the new economy bubble in the early 2000s, and the Great Recession in 2009. But despite the large drop after the Great Recession, the top percentile's income share still grew by almost 40% between 1983 and 2013, while the bottom 90% share fell by 10%. In 2013, while the average income in Germany was €36 200, the top 10% earned €146 000, the middle 40% earned €39 000, and the bottom 50% earned €12 000.

The share of income going to the Top 1% in 2013 grew by 35% relative to its 1983 value, while the share going to the Bottom 90% in 2013 fell by 13%.

2.7

INCOME INEQUALITY IN CHINA

Information in this chapter is based on "Capital Accumulation, Private Property and Rising Inequality in China, 1978–2015," by Thomas Piketty, Li Yang, and Gabriel Zucman, 2017. WID.world Working Paper Series (No. 2017/6).

▷ China's opening-up policies established from the late 1970s onwards were followed by unprecedented rises in national income, but also significant changes to the country's distribution of income.

▷ While the top 10% and bottom 50% both shared 27% of national income in 1978, they diverged dramatically thereafter, with the former experiencing a substantial increase to 42% by 2015 and the latter a substantial decrease to 15%.

▷ The top 10% of the income distribution enjoyed total growth rates higher than the national average (approximately 1 200% versus 800%), while the bottom 50% and middle 40% experienced slower growth (400% and 700%, respectively).

▷ The urban-rural gap in national income has grown considerably between 1978 and 2015 due to a rise in urban incomes and population. Despite this rising gap, it is mainly inequality within regions that has spurred the growth of inequality at the national level.

Chinese average incomes grew ninefold since 1978

The Communist Party of China, then led by Deng Xiaoping, implemented a series of policies in the People's Republic of China starting in December 1978 to reform and open up the Chinese economy, as the Party sought a new economic model based on the principle of "socialism with Chinese characteristics." The transition away from the communist model of the previous decades ushered in gradual but nevertheless wide-reaching reforms, expanding geographically from special economic zones in coastal cities towards inland provincial regions, and in sectoral waves. During the first stage of reform, market principles were introduced into the agricultural sector through the de-collectivization of production. While foreign investment and entrepreneurship were permitted under state guidance, the vast majority of industry remained state-owned until the mid-1980s. The following decades saw a second stage of deeper reforms implemented. Soviet-style central planning in industry was dismantled through the privatization and contracting out of state-owned enterprises, though the state maintained its control of monopolies in some sectors, including banking and petroleum. Furthermore, liberalization of markets over this period saw the lifting of price controls and the reduction of protectionist policies and regulations, aiding the dramatic growth of the private sector. These changes were particularly evident in the country's housing market. The private housing stock rose from roughly 50% in 1978 to over 95% in 2015. For other forms of domestic capital, the public share declined, though it is still around 50%.

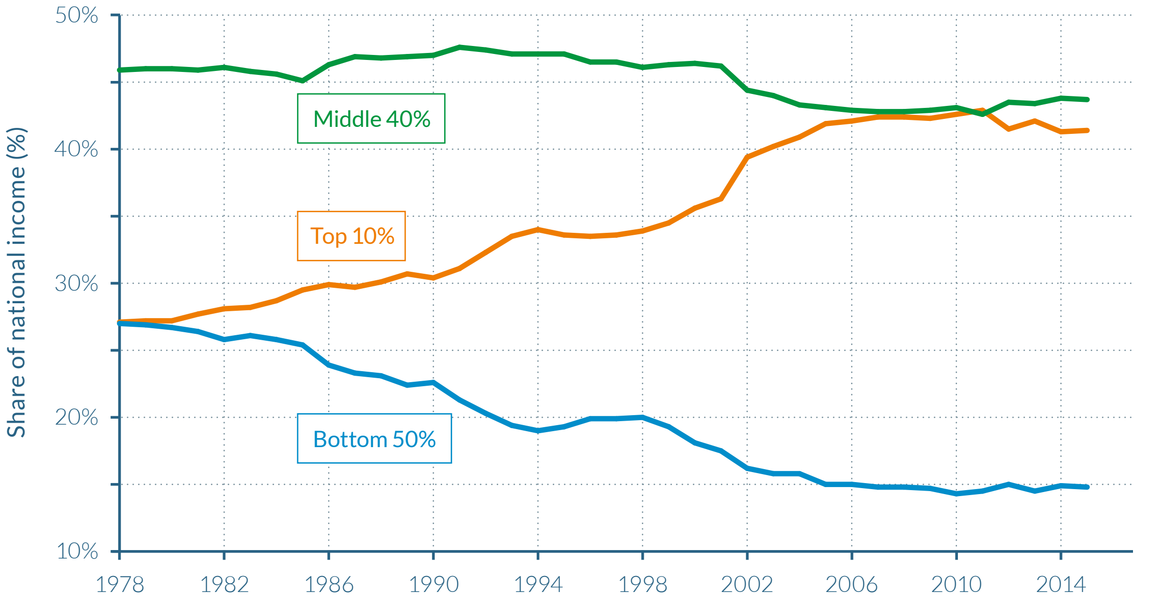
The subsequent impacts of these privatization and opening reforms have been of great interest worldwide, particularly given the significant growth the country has experienced over the last forty years and its accompanying improvements in poverty rates. Indeed, between 1978 and 2015, China moved from a poor, low-income country to the world's leading emerging economy. Despite the decline in its share of world population, China's share of world national income increased from less than 3% in 1978 to 19% in 2015, and real per-adult national income multiplied more than ninefold. Indeed, average national income adult was about €1 400 per year in 1978 (less than 15% of global average), but exceeded €13 100 in 2015 (close to 90% of the global average).

In a recent paper, Thomas Piketty, Li Yang, and Gabriel Zucman analyze how this exceptional growth was distributed across the Chinese population (reported below), and the impact that privatization policies had on the country's capital-income ratios (see chapter 3.3 of the report).[23] To form distributional national accounts, the authors combine survey data, national accounts, and recently released income tax data on high-income taxpayers. They find a significant increase in per-adult pre-tax income inequality from 1978 to 2015.[24] These results largely increase existing official inequality statistics and probably represent a lower bound to inequality, as they remain imperfect.

The shares of the top 10% and bottom 50% diverged after the opening-up reforms

As China began its privatization process (as also discussed in chapter 3.4 on Chinese public and private wealth dynamics), the share of national income going to the top 10% of the population was 27%, equal to the share going to the bottom 50%. Put in another way, these groups captured the same amount of total income, but the former had a population five times smaller than the latter. The average income of the bottom 50% was thus one-fifth of the top 10%. In 1978, the income share of the middle 40% represented just over 46% of national income; their average income was only slightly higher than the national average. The past four decades show a large divergence in the shares of the bottom 50% and the top 10% income earners (see **Figure 2.7.1**).

Figure 2.7.1
Income shares in China, 1978–2015



Source: Piketty, Yang and Zucman (2017). See wir2018.wid.world for data series and notes.
In 2015, the Top 10% national income share was 41%.

The income share of the bottom 50% in 2015 was just below 15%, a twelve-percentage-point fall since 1978. The share of the top 10% had increased to 41%. In 2015, the average income of the bottom 50% (€3 900 or ¥17 000) was approximately 13.5 times smaller than that of the richest 10% in 2015 (€54 500 or ¥238 000). The bottom 50% consequently earned roughly 3.4 times less than the average national income per adult in China of €13 100 or ¥57 000 in 2015, while the top 10% earned around four times more than the average income. The share of national income going to the middle 40% is only marginally different than in 1978 at almost 44%. The average income of this middle class (€14 400 or ¥63 000) was slightly higher than the average Chinese adult's income in 2015. (**Table 2.7.1**)

Income inequality stabilized after 2006

While the incomes of the top 10% and the bottom 50% in China began to diverge in 1978, the greatest divergence took place from 1998 to 2006. This coincided with the eight-year period that saw the Chinese government introduce a new set of policies for the privatization of state-owned enterprises, mainly in the tertiary sector. Part of the resulting effect was a reduction in the bottom 50% share of national income from 20% to 15%, and an increase in the share of the top 10% from around 34% to 43%. Income inequality apparently stabilized thereafter, with the shares of all three of the main income groups in 2015 remaining pretty much similar to their levels in 2006. This stabilization of inequality since 2006 should be regarded with caution as it could partly reflect data limitations, due in particular to the lack of national data made available on high-income taxpayers since 2011.[25] Still, this trend is considered valid by a number of researchers who speculate that a turnaround took place around 2006 as a result of two factors: new policies that reflected changing priorities towards more equitable growth; and the slowdown of structural transformations, such as a shrinking rural labor force, which caused wages to grow more rapidly than output.[26]

Comparing Piketty, Yang, and Zucman's inequality series to the survey-based estimates used by the Chinese government, two remarks are in order. First, the official survey data also show a strong rise in the national income share of the top 10% and a strong decline in the top 50% income share from 1978 to 2015. Second, both the level and the rise of inequality are larger in the aforementioned corrected series than in the official series. The top 10% income share rises 14 percentage points over the observed period (from 27% to 41% of national income)—which is 6 percentage points more than that seen in the official statistics—while the upward correction for the top 1% sees their share of total income for 2015 rise to 14%, versus 6.5% in the raw surveys. Most of the difference between these estimates and the raw surveys comes from the finer level of precision among top income earners enabled by income tax data. In 2015, for example, the raw surveys identify the income share of the top 1% to be 6.5%, but this reaches 11.5% after factoring in data from high-income taxpayers, and 14% following the inclusion of undistributed profits and other tax-exempt income.

Since 1980, Chinese top-income groups benefitted from quadruple-digit growth rates

The new data series constructed by Piketty, Yang, and Zucman on the distribution of national income also allow a decomposition of national income growth by income group. This in turn enables a quantitative assessment of the extent to which various groups of the population have benefitted from the enormous growth China has experienced since 1980. (See **Table 2.7.2** and **Figure 2.7.2**)

Average national income per adult has grown close to ninefold between 1980 and 2015, corresponding to an average annual increase of 6.4% and a total growth rate of 780%. This growth has not been equally shared; the higher the income level, the higher the rate of growth over the time period considered. Growth for the bottom 50% over the period was 390%, while it was 730% for the middle 40%, and 1 230% for the top 10%. Within the top 10%, growth

Between 1980 and 2015, the average pre-tax income of the Bottom 50% in China grew at an average of 4.6% per year, against 0.3% in the US. Values are net of inflation.

was also unequally shared. The top 1% experienced total income growth of 1 800%—a huge figure, but notably less than the increases of over 2 270%, 2 920%, and 3 520% for the top 0.1%, top 0.01%, and top 0.001%, respectively.

By contrast, average national income per adult rose by just 63% and 38% in the United States and France over the same period, respectively—approximately fourteen and twenty-one times less than in China. The difference in income growth across the distribution was also markedly different at the bottom of the distribution; the cumulative national income growth of the bottom 50% was 3% for Americans, while for French citizens, it rose at 33%, i. e. less than the average. However, the same pattern, by which income growth rates rise more quickly the higher up the distribution one goes, was evident for all countries.

The urban-rural gap continues to grow, but it is within-region inequality that spurs overall growth in inequality

What role has the urban-rural gap played in the evolution of Chinese inequality? This question is important as inequality could be driven mainly by growing differences between cities and rural areas and not by inequality among individuals within areas. Policy implications are indeed dependent on which force dominates in the mix. To answer this question, it is first important to identify how the populations of urban and rural areas has changed post 1978, as this will in part determine the urban and rural shares in national income. In the urban areas of China, the adult population rose from 100 million in 1978 to almost 600 million in 2015. During this same period, the adult rural population remained roughly stable, rising from 400 million in 1978 to almost 600 million by the mid-1990s, before declining to less than 500 million in 2015. Secondly, the income gap between urban and rural China has always been large and it has grown over time. Urban households earned twice as much income on average as rural households in 1978, but in 2015 they earned 3.5 times as much. Thus, while the urban share in the adult population has grown from 20% in 1978 to 55% in 2015, the urban share in national income has increased from 30% to 80%.

Despite the increase of inequality both in urban and rural China, the level of income inequality in China as a whole is markedly higher at the national level (where the bottom 50% captures only 15% of total income) than it is within rural China (where the figure is 20%) or urban China (25%) considered alone.[27] As evidenced in the previous sections, the trend for the top 10% largely mirrored that of the bottom 50%, but in the opposite direction, with rising income shares for the top 10%. Combining this data also demonstrates that there has always been more inequality within rural areas than within urban China, and this will remain the case if current trends continue. (**Figure 2.7.3**)

In 2015, the Bottom 50% income share in rural China was 20%.

2.8

INCOME INEQUALITY IN RUSSIA

Information in this chapter is based on “From Soviets to Oligarchs: Inequality and Property in Russia 1905–2016,” by Filip Novokmet, Thomas Piketty, and Gabriel Zucman, 2017. WID.world Working Paper Series (No. 2017/9).

- ▷ Russia’s transition from a communist to a capitalist economic model after 1989 brought about a large divergence in the income shares and growth rates of different income groups.
- ▷ The share of national income attributable to the bottom 50% has fallen from 30% in 1989 to less than 20% today, while the share of the top 1% has rocketed upwards from around 25% to over 45% of national income.
- ▷ Russia’s rapid and chaotic “shock therapy” of privatization, capital flight, and the rise of offshore wealth, along with high inflation and a new market environment, have contributed to the rise of top Russian incomes since 1989.
- ▷ Today’s inequality levels are comparable, and somewhat higher, than those observed during the tsarist period. The Russian Revolution led to a significant redistribution of income, with the top 1% share of national income falling from 18% in 1905 to less than 4% in 1928.
- ▷ The most equitable distribution of income in Russia’s recent history followed the introduction of comparatively liberal de-Stalinization policies from 1958 onwards, with large investments in education and infrastructure.

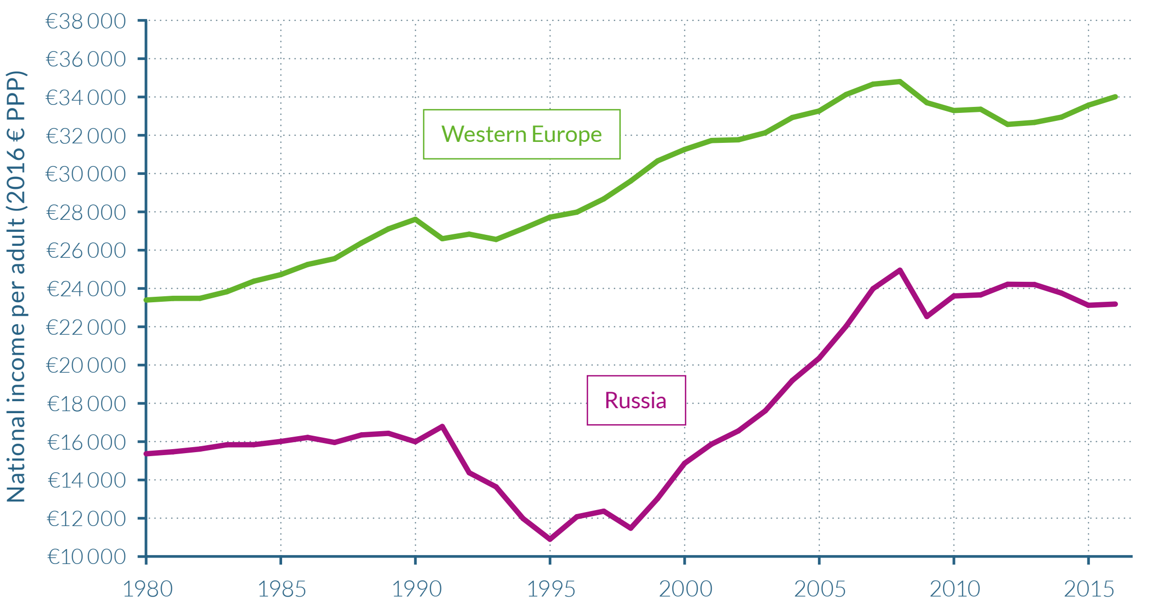
Since the 1990s, Russia's convergence towards Western European levels of GDP has been far from smooth

Since the fall of the Soviet Union in 1990–1991, Russia has experienced dramatic economic and political transformations. National income and gross domestic product fell abruptly from 1992 to 1995, when inflation skyrocketed, but then started to recover during 1998 and 1999, ushering in a decade of robust growth. The world financial crisis and the fall in oil prices interrupted this process in 2008–2009 and, since then, growth has been sluggish. However, there is little doubt that average incomes are significantly higher in Russia today than they were in 1989–1990. Indeed, the gap between Russia's per-adult national income and the West European average narrowed from approximately 60–65% of the West European average in 1989–1990, to around 70–75% in mid-2010.[28] This can be seen in **Figure 2.8.1**.

While average national income per adult in Russia reached almost €23 200 in 2016, this figure hides considerable variations in its distribution. The lowest-earning 50% of the adult population—a group of almost 115 million people—earned just under €7 800 on average in 2016, close to three times less than the national average. The middle 40% also received less income than the national average, earning approximately €21 700. The richest 10% of the population earned considerably more, however, receiving over €105 500 on average in 2016. These differences in income left Russia with a very high concentration of income among the country's richest individuals. The share of national income attributable to the top 10% was 45.5% in 2016, making it considerably larger than that of the bottom 50% (17%) and the middle 40% (37.5%). The top 1% earners capture more than 20% of national income. The average income of the 1.15 million adults in the top 1% was approximately €470 000 in 2016 whereas the top 0.01% and top 0.001% had average

Figure 2.8.1

Average national income per adult in Russia and Western Europe, 1980–2016



Source: Novokmet, Piketty and Zucman (2017). See wir2018.wid.world for data series and notes.

In 2016, the average national income per adult was €23 200 in Russia. All values have been converted into 2016 Purchasing Power Parity (PPP) euros at a rate of €1 = $1.3 = ₽28.3. PPP accounts for differences in the cost of living between countries. Values are net of inflation.

incomes of €12.1 million and €58.6 million, respectively—over 523 times and 2527 times greater than the Russian national average. (See **Table 2.8.1**.)

The best available estimates indicate that Russia's per-adult national income stagnated at around 35–40% of West European levels between 1870 and the First World War, but this ratio rose spectacularly to a high of 65% in the aftermath of Second World War as the Soviet state implemented its modernization strategy of rapid industrialization and mass investment in basic education. As depicted by **Figure 2.8.2**, Russia's relative position plateaued at around 55–65% of West European levels between 1950 and 1990—and while Russian living standards stagnated between the 1950s and 1980s, substantial improvements were experienced in Western Europe and the United States. Together with rising shortages and general frustration among the comparatively highly educated population, the relative sluggishness of living standard improvements arguably contributed to the complex social and political processes that eventually led to the fall of the Soviet Union.[29]

Yet the consequences of these dramatic transformations of the distribution of income and wealth are not well documented or well understood, particularly following the fall of the Soviet Union. There is no doubt that income inequality has increased substantially since 1989–1990—at least in part because monetary inequality was unusually, and to some extent artificially, low under Communism—but there has been little empirical work to measure the exact magnitude of the increase and how this compares to change in other countries. It is to these points and many others that Novokmet, Piketty, and Zucman's recent paper seeks to respond, by creating distributional national accounts for Russia that combine national accounts, survey, and wealth and fiscal data, including recently released tax data on high-income taxpayers, in essentially the way described earlier in this report.

"Shock therapy" transition policies drastically increased the top 10% share of national income

The striking rise in income inequality after the fall of the Soviet Union was dramatic in terms

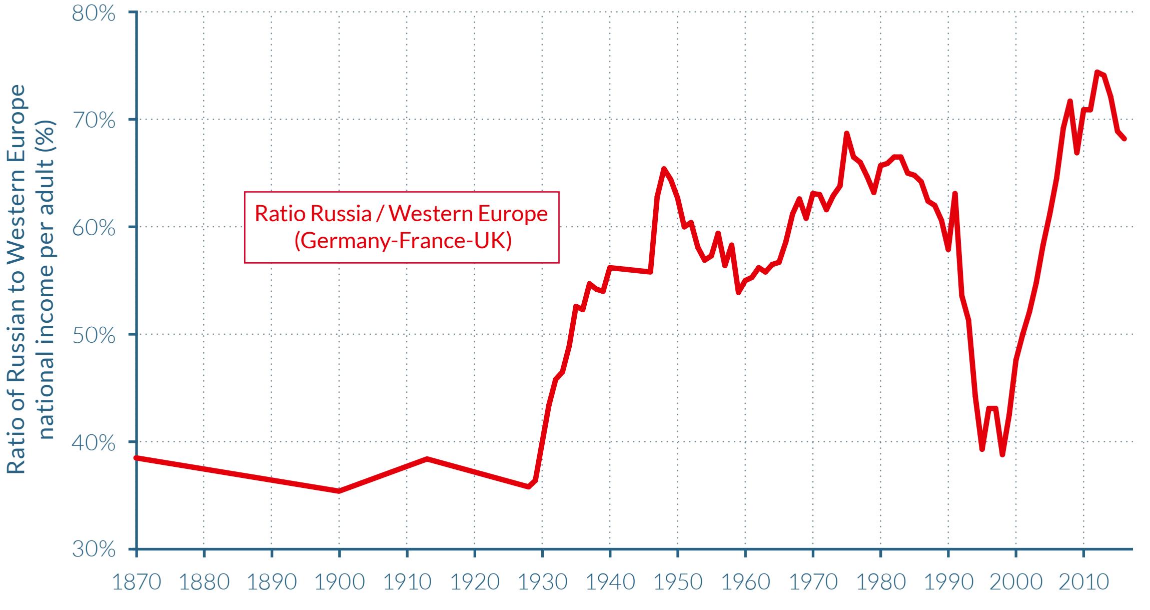
In 2016, the average pre-tax income of the Top 10% was €105 500. All values have been converted into 2016 Purchasing Power Parity (PPP) euros at a rate of €1 = $1.3 = ₽28.3. PPP accounts for differences in the cost of living between countries. Values are net of inflation. Numbers may not add up due to rounding.

Figure 2.8.2

Ratio between national income per adult in Russia and Western Europe, 1870–2016



Source: Novokmet, Piketty and Zucman (2017). See wir2018.wid.world for data series and notes.

In 2016, the national income per adult in Russia was 68% of the national income per adult in Western Europe. All values have been converted into 2016 Purchasing Power Parity (PPP) euros at a rate of €1 = $1.3 = ₽28.3. PPP accounts for differences in the cost of living between countries. Values are net of inflation.

of both speed and quantitative change. This period was shaped by a “shock therapy” and “big-bang” model of transition from the previously planned, state-led economy to one that was to be led by free-market principles.[30] With this came the privatization of the significant wealth of Russia’s state-owned enterprises and the liberalization of prices and capital and labor markets, among many other political and economic changes. According to benchmark estimates provided by Novokmet, Piketty, and Zucman, the income share of the top 10% rose from less than 25% in 1990–1991 to more than 45% in 1996 (see **Figure 2.8.3**), while the income share of the top 10% rose moderately from 39% to 41% in the United States, and remained at around 30%–31% in France.

Privatizations were partly done through a voucher privatization strategy, whereby citizens were given books of free vouchers that represented potential shares in any state-owned company. However, voucher privatization of state-owned enterprises took place very quickly, with the ownership of over fifteen thousand firms transferred from state control between 1992 and 1994.[31] This happened, moreover, within such a chaotic monetary and political context that small groups of individuals were able to buy back large quantities of vouchers at relatively low prices, and also in some cases were able to obtain highly profitable deals with public authorities—for example, via the infamous loans-for-shares agreements.[32] Together with capital flight and the rise of offshore wealth, this process arguably led to much higher level of wealth and income concentration in Russia than in other ex-communist countries.

The transformation of the labor market from state-led to market-led also led to an increase in income inequality through higher inequality of labor income.[33] In communist Russia, unemployment was virtually nonexistent with only small wage differentials used to reward differential inputs and to motivate effort. This

Figure 2.8.3

Top 10% income share in France, Russia and the US, 1905–2015

In 2015, the Top 10% income share in Russia was 46%.

ensured generally egalitarian inequality outcomes as compared to market economies. When the transition toward free markets began, however, a significant amount of unemployment was created as workers moved from the state to the private sector. Both state and private employment fell with the closure of state and private enterprises, while the imposition of hard budgets created intensely unfavorable conditions for investment and hiring, and left very little support for those seeking unemployment benefits—all of which hit the lowest earners the hardest. Given the abundance of excess labor and greater concentration of wealth, the labor market transition and the privatization process favored owners of capital to the detriment of labor.[34]

Price liberalization also saw the consumer price index multiply by nearly five thousand between 1990 and 1996. Inflation was particularly high in 1992 and 1993 (when it hit 1 500% and 900%, respectively) after official price liberalization occurred on January 1, 1992. While these episodes of hyperinflation affected the whole of the Russian economy—national income per adult fell from approximately €17 000 in 1991 to €11 000 in 1995—it was the poorest who were hit the hardest. A large part of the bottom 50% of the income distribution was made up of pensioners and low-wage workers whose nominal incomes were not fully indexed to price inflation, and this resulted in massive redistribution and impoverishment for millions of Russian households, particularly among the retired population. The share of national income accruing to the bottom 50% collapsed, dropping from about 30% of total income in 1990–1991 to less than 10% in 1996.

Concurrent with the rapid collapse in the share of incomes for the poorest 50% of the population, a more gradual and continuous process of rising top 1% income shares can be observed. The income share of the top 1% grew from less than 6% in 1989 to approximately 26% in 1996. This was a huge turnaround in just over seven years; note that the income share of the bottom 50% was five times greater than that of the top 1% in 1989, but by 1996, it was almost two times smaller. Meanwhile, the middle 40% appear to have been relatively unaffected by the initial transition reforms; their share of national income saw only a muted fall over the same period, from approximately 46% to 43%.

Following the 1996 reelection of President Boris Yeltsin, income shares began to stabilize for Russia's poorest 50% of the population. The income share of the bottom 50% rose over five percentage points between 1996 and 1998 as low-end pensions and wages benefited from a gradual recovery process between 1996 and 2015. They never fully returned, however, to their 1990–1991 relative income share. The top 10% share fell from around 48% to 43% between 1996 and 1998, before averaging around 47% until 2015. This latter period saw consistent rises in the income share of the top 10% in the United States, and by 2015, income concentration was higher than in Russia. The top 10% income share also rose in France, but very steadily to a more modest 34% by 2015.

This twelve-year period also saw strong macroeconomic growth, with Russia's per-adult national income more than doubling from around €12 000 in 1996 to approximately €25 000 in 2008.[35] However, it was the top 10% who were to be the main beneficiaries of this growth, as their share of national income rose from 43% to 53% across the ten years leading up to 2008. This upward trend for the top 10% was the opposite of that experienced by the middle 40%, whose share of national income fell from almost 40% in 1998 to 35% in 2008. The world financial crisis and precipitous drop in oil prices interrupted Russian national income growth in 2008–2009, and economic activity remained sluggish after that—only to fall again in 2014–2015, partly due to the international sanctions that followed the Russian military intervention in Ukraine. Average per-adult national income fell by over €2 000 in 2008–2009 before recovering rather lethargically to just over €24 000 in 2013, and then falling back down to €23 000 in 2015–2016. The richest part of the population experienced the largest fall in their share of national income as a result of the crisis, as the top 10% income share lost six percentage points in the two years leading up to 2010. It later settled to just over 45% in 2014–2015. The bottom 50% and middle 40% experienced four-percentage-point rises in their respective shares of national income, to approximately 18% and 39%, respectively.

Considering the period 1989–2016 together, average per-adult national income in Russia increased by 41%—that is, by approximately 1.3% per year. However, as a result of the dynamics described above, the different income groups have enjoyed widely different growth experiences. On average, the bottom earners benefited from very small or negative growth over the twenty-seven-year period (-0.8% per year and -20% over the entire period for the bottom 50%), due principally to the inflation-induced loss of incomes before 1996. The middle 40% had positive but very modest average growth of just 0.5% per year, and thus their incomes grew by 15% over the period. The experience of the top 10%, meanwhile, has been vastly different. Indeed, as **Table 2.8.2** shows, the growth in income these groups saw only increases as one looks further up the income distribution. The average per-adult incomes of the top 10% grew by 3.8% per year between 1989 and 2016, providing the 11.5 million top earners with a cumulative income growth of 171%. Moreover, it is almost solely this top 10% that has benefited from Russia's macroeconomic growth over the period. Their share in the country's growth has been 99%, as opposed to only 1% for the bottom 90%, made up of almost 103.5 million adults.

Figure 2.8.4 shows the annual and total growth rates over the period for different groups of the population. Interestingly, these figures show the same upward-sloping pattern as those constructed by The European Bank for Reconstruction and Development (EBRD).[36] They do, however, differ on two points. First, they show an even stronger tilt toward the top incomes due to a more precise estimation of top Russian incomes.[37] Second, there are meaningful differences in the income concepts employed.[38] The latter difference has a notable impact on the rate of total real growth over the 1989–2016

Table 2.8.2
Income growth and inequality in Russia, 1989–2016

Income group	Average annual real growth rate	Total cumulated real growth	Share in total macro growth
Full Population	1.3%	41%	100%
Bottom 50%	-0.8%	-20%	-15%
Middle 40%	0.5%	15%	16%
Top 10%	3.8%	171%	99%
Top 1%	6.4%	429%	56%
Top 0.1%	9.5%	1 054%	34%
Top 0.01%	12.2%	2 134%	17%
Top 0.001%	14.9%	4 122%	8%

In 2015, the Top 10% share of national income was 46%.

period; the EBRD find this to be 70% rather than the 41% presented above. Such a difference is far from marginal. Consistent with the concepts used in this report and throughout WID.world, Novokmet et al. use national income rather than solely self-reported survey data. In doing so, they recognize the significant challenges of comparing real incomes for the Soviet and post-Soviet periods in a satisfactory manner. For example, if the researchers were to evaluate the welfare costs of shortages and queuing in 1989–1990, then it is possible that their aggregate growth figure might increase from 41% to 70%, or perhaps even more.

Long-run Russian inequality follows a U-shaped pattern

The changes in the distribution of income that took place in the post-communism period of 1989–2016 look very different from those that took place after 1905. In the tsarist Russia of 1905, the share of national income attributable to the top 10% was approximately 47%, while the bottom 50% share was about 17%, and the middle 40% share was 36%. Following the Russian Revolution of 1917, which dismantled the tsarist autocracy and paved the way for the creation of the Union of Soviet Socialist Republics (USSR) in 1922, these shares changed dramatically. By 1929, the top 10% earned just 22% of national income, twenty-five percentage points down from twenty-four years earlier. The loss in the share of national income of the top 10% was subsumed by an approximate thirteen-percentage-point rise in the share of the bottom 50% and middle 40% to almost 30% and 48% of national income, respectively, as seen in **Figure 2.8.5**. The top 1% income share, meanwhile, was somewhat below 20% in 1905 and dropped to as little as 4–5% during the Soviet period. The vast majority of growth up until 1956 (the start of the so-called de-Stalinization policies) was therefore shared by the bottom 90%, with mass investment in publication and the introduction of the five-year plans—plans that brought about the accumulation of capital resources through the buildup of heavy industry, the collectivization of agriculture, and the restricted manufacturing of consumer goods, all under state control.[39]

The death of Joseph Stalin in 1953 and the introduction thereafter of comparatively liberal policies known as de-Stalinization policies, which included the end of mass forced labor in Gulags, saw further changes to income shares that favored those earning lower incomes. The bottom 50% experienced gains in their share of national income from 24% in 1956 to 32% in 1968, while the share of the top 10% fell from 26% to 22% over the same period. Shares of national income then remained fairly constant for these groupings and for the middle 40% until 1989, and growth was thus relatively balanced between them, as illustrated by **Figure 2.8.6** and **Table 2.8.3**.

These figures reiterate the stark difference between living under the communist system and living after its end, in terms of the variance in average annual real growth rates experienced by income groups. Throughout 1905–1956 and 1956–1989, the bottom 50% and middle 40% saw their average annual real incomes increase by at least as much as those of the top 10%, and at considerably higher rates from 1905 to 1956. In this earlier period, growth notably favored both the bottom 50% and middle 40% (with 2.6% and 2.5% annual growth rates, respectively) over the top 10% (0.8%). From 1956 to 1989, the bottom 50% experienced an annual growth rate that was higher than in the preceding periods, but the difference with top groups was remarkably reduced. The top 19% grew at 2.3%—as much as the middle 40%. Interestingly, annual growth rates were increasingly negative within the top 1% income brackets between 1905 and 1956, but were then increasingly positive within these groups from 1956 to 1989. The real contrast, however, is in the post-1989 period, when the divergence in annual growth rates rose to 15.7 percentage points between the top 0.001% (14.9%) and the bottom 50% earners (-0.8%). Such a divergence in growth rates at different ends of the distribution has not been witnessed throughout the twentieth century, even during the socialization of the Russian economy.

More detailed data is required for more precise conclusions to be drawn

As already mentioned, there are a number of limitations in the data sources employed by Novokmet, Piketty, and Zucman, which suggests that while broad orders of magnitude can be considered reliable, small variations in inequality should not be viewed as precisely true. Indeed, their estimates suggest that inequality levels in tsarist and post-Soviet Russia are roughly comparable. But the lack of detailed income tax data—and the general lack of financial transparency—make their estimates for the recent period relatively imprecise, perhaps most importantly because their estimate for 1905 is at least as imprecise.[40] Thus, it seems safer to conclude only that inequality levels in tsarist Russia were very high and are comparable with the possibly even greater levels seen in post-Soviet Russia.

It is also worth stressing that the measures of monetary inequality depicted In **Figure 2.8.1** and **Figure 2.8.5** neglect non-monetary dimensions of inequality, which may bias comparisons of inequality over time and across societies. For example, inequalities in personal status and basic rights, including mobility rights, were pervasive in tsarist Russia, and persisted long after the official abolition of serfdom in 1861. Summarizing such inequalities with a single monetary indicator is clearly an oversimplification of a complex set of power relations and social domination. The same general remark applies to the Soviet period, when monetary inequality was reduced to very low levels under communism. However, the then relatively small difference between the incomes of the top 10% and bottom 50% did not prevent the Soviet elite from having access to superior goods, services, and opportunities. This could take different forms, including access to special shops and vacation facilities, which allowed the Soviet top 1% to enjoy living standards that in some cases might have been substantially higher than their annual incomes of four to five times the national average would have suggested. These factors should be kept in mind when making historical and international comparisons—in Russia or elsewhere.

Between 1989 and 2016, the income of the Top 1% grew at an average rate of 6.4% per year.

2.9

INCOME INEQUALITY IN INDIA

Information in this chapter is based on the working paper “Indian Income Inequality, 1922–2014: From British Raj to Billionaire Raj?,” by Lucas Chancel and Thomas Piketty, 2017. WID.world Working Paper Series (No. 2017/11).

- ▷ Income inequality in India has reached historically high levels. In 2014, the share of national income accruing to India’s top 1% of earners was 22%, while the share of the top 10% was around 56%.
- ▷ Inequality has risen substantially from the 1980s onwards, following profound transformations in the economy that centered on the implementation of deregulation and opening-up reforms.
- ▷ Since the beginning of deregulation policies in the 1980s, the top 0.1% earners have captured more growth than all of those in the bottom 50% combined. The middle 40% have also seen relatively little growth in their incomes.
- ▷ This rising inequality trend is in contrast to the thirty years that followed the country’s independence in 1947, when income inequality was widely reduced and the incomes of the bottom 50% grew at a faster rate than the national average.
- ▷ The temporary end to the publication of tax statistics between 2000–2010 highlights the need for more transparency on income and wealth statistics that track the long-run evolution of inequality. This would allow for a more informed democratic debate on inequality and inclusive growth in India.

India entered the digital age without inequality data

India introduced an individual income tax with the Income Tax Act of 1922, under the British colonial administration. From that date up to the turn of the twentieth century, the Indian Income Tax Department produced income tax tabulations, making it possible to track the long-run evolution of top incomes in a systematic manner. Given the profound evolutions in India's economy since the country's independence, this provides a rich data resource for researchers to access.[41] Research has shown that the incomes of the richest—the "top incomes"—declined significantly from the mid-1950s to the mid-1980, but this trend was reversed thereafter, when pro-business, market deregulation policies were implemented.

Little has been known, however, about the distributional impacts of economic policies in India after 2000, when real income growth was substantially higher than in previous decades. This is largely because the Indian Income Tax Department stopped publishing income tax statistics in 2000, but also because self-reported survey data often do not provide adequate information concerning the top of the distribution. In 2016, the Income Tax Department released tax tabulations for recent years, making it possible to track the evolution of income inequality during the high average income growth years post-2000.

Inequality rose from the mid-1980s after profound transformations of the economy

Over the past four decades, the Indian economy has undergone profound evolutions. In the late seventies, India was recognized as a highly regulated, centralized economy with socialist planning. But from the 1980s onwards, a large set of liberalization and deregulation reforms were implemented. Liberalization and trade openness became recurrent themes among Indian policymakers,

Figure 2.9.1a

Top 10% and Middle 40% income shares in India, 1951–2014

In 2014, the Top 10% national income share was 55%.

epitomized by the Seventh Plan (1985–1990) led by Prime Minister Rajiv Gandhi (1984–1989). That plan promoted the relaxation of market regulation, with increased external borrowing and increased imports. These free-market policy themes were then further embedded in the conditions attached to the International Monetary Fund's assistance to India in its balance of payment crisis in the early 1990s, which pushed further structural reforms for deregulation and liberalization. This period also saw the tax system undergo gradual transformation, with top marginal income tax rates falling from as high as 97.5% in the 1970s to 50% in the mid-1980s.

The structural changes to the economy along with changes in tax regulation, appear to have had significant impact on income inequality in India since the 1980s. In 1983, the share of national income accruing to top earners was the lowest since tax records started in 1922: the top 1% captured approximately 6% of national income, the top 10% earned 30% of national income, the bottom 50% earned approximately 24% of national income and the middle 40% just over 46% (see **Figure 2.9.1a** and **b**). But by 1990, these shares had changed notably with the share of the top 10% growing approximately 4 percentage points to 34% from 1983, while the shares of the middle 40% and bottom 50% both fell by 2 percentage points to around 44% and 22%, respectively.

What came to be known as the first set of economic reforms were implemented from 1991 to 2000 and in practice were the continuation of the mid 1980s policy shift. These reforms placed the promotion of the private sector at the heart of economic policies, via denationalizations, disinvestment of the public sector and deregulation (de-reservation and de-licensing of public companies and industries)[42], weighing the economy substantially in favor of capital above labor. These reforms were implemented both by the Congress government and its Conservative successors. As illustrated by **Figure 2.9.1**, these reforms were concomitant with a dramatic rise in

Figure 2.9.1b

Top 1% and Bottom 50% income shares in India, 1951–2014

In 2014, the Bottom 50% national income share was 15%.

Indian income inequality by 2000. The top 10% had increased its share of national income to 40%, roughly the same as that attributable to the middle 40%, while the share of the bottom 50% had fallen to around 20%.

These pro-market reforms were prolonged after 2000, under the 10th and subsequent five-year plans. The plans ended government fixation of petrol, sugar and fertilizer prices and led to further privatizations, in the agricultural sector in particular. Inequality trends continued on an upward trajectory throughout the 2000s and by 2014 the richest 10% of the adult population shared around 56% of the national income. This left the middle 40% with 32% of total income and the bottom 50%, with around half of that, at just over 16%.

Indian inequality was driven by the rise in very top incomes

Inequality within the top 10% group was also high. The higher up the Indian income distribution one looks, the faster the rise in their share of the national income has been since the early 1980s. As depicted by **Figure 2.9.2**, the income share of India's top 1% rose from approximately 6% in 1982–1983 to above 10% a decade after, then to 15% by 2000, and further still to around 23% by 2014. The latest data thus shows that during the first decade after the millennium, the share of national income attributable to the top 1% grew to be larger than that pertaining to the bottom 50%. By 2014, the national income share of the bottom 50%—a group of approximately 390 million adults—was just two-thirds of the share of the top 1%, who totaled 7.8 million. An even stronger increase in the share of national income was experienced by the top 0.1% and top 0.01%, whose shares grew five-fold and tenfold, respectively, from 2% and 0.5% to almost 10% and 5%, between 1983 and 2014. Income growth rates at the very top were extreme, as shown by **Table 2.9.1**.

These evolutions are consistent with the dynamics of Indian wealth inequality, which

Figure 2.9.2

Between 1980 and 2014, the average income of the Top 10% grew by 394% in India. Values are net of inflation.

exhibit a strong increase in the top 10% wealth share in the recent period, in particular after 2002.[43] Highly unequal income growth at the top mechanically drives wealth inequality across the population, which in returns fuels income concentration.

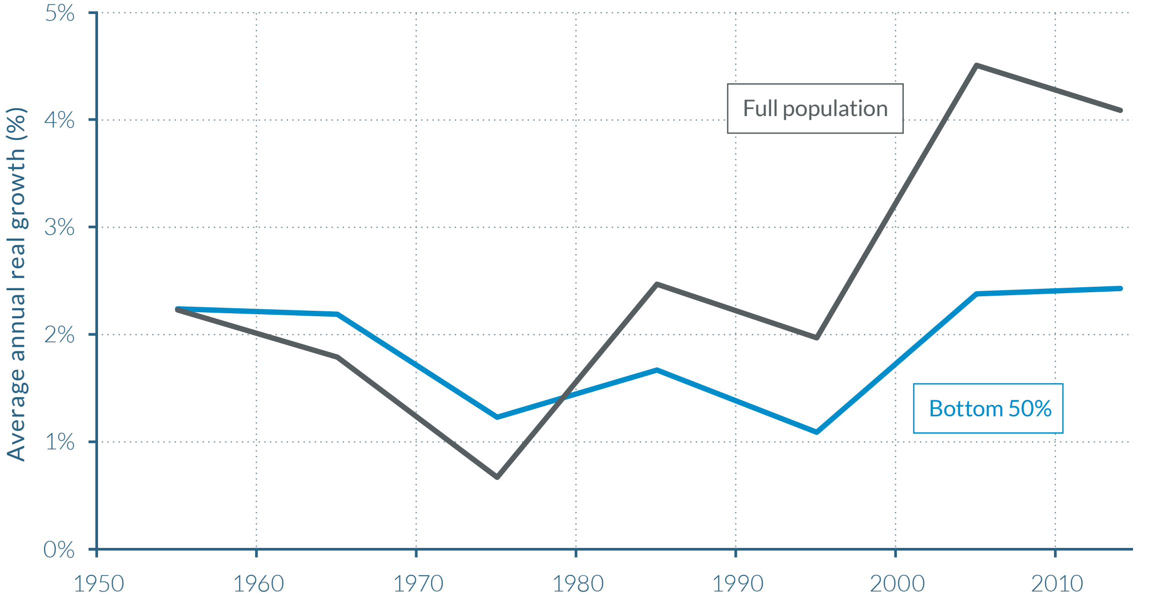
The recent surge in inequality mirrors inequality declines from the 1940s to the 1980s

After independence, Jawaharlal Nehru implemented a set of socialist policies, with strict government control over the economy, with an explicit goal to limit the power of the elite. The policies implemented by himself and his followers, including his daughter Indira Gandhi, up to the late 1970s, included nationalizations, strong market regulation and high tax progressivity. Nationalizations involved the railways and air transport in the early-1950s, oil in the mid-1970s and banking throughout the entire period, to cite but a few. Along with the transfer of private to public wealth and their implicit reduction in capital incomes, nationalizations brought government pay-scale setting with them that compressed wage distributions. In the private sector, incomes were constrained by extremely high tax rates: between 1965 and 1973, top marginal income tax rates rose from 27% to almost 98%. These changes may have discouraged rent-seeking behavior at the top of the distribution, which can be seen as an efficient strategy in the presence of excessive bargaining power and rent-seeking activity. The impact on income inequality was substantial, as the top 1% income share decreased from 21% before the second World War to approximately 10–12% in the 1950s and 1960s and fell further to 6% in the early 1980s.

Revisiting "Shining India's" income growth rates

How do these vast institutional and policy changes translate in terms of income growth rates for different groups of the population? As **Figure 2.9.3** illustrates, the average growth of real incomes has varied notably between the different groups in the income distribution since the 1950s. The annual real incomes of the bottom 50% grew at a faster rate than the countrywide average during the 1960s and 1970s when socialist central planning dominated the Indian economy, and at a notably higher pace than the growth experienced by those in the top 10% and top 1% of earners. However, this dynamic changed dramatically during the 1980s and has remained as such ever since. The 1980s saw a much higher

Figure 2.9.3a
Income growth in India, 1951–2014: Full population vs. Bottom 50%



Source: Chancel & Piketty (2017). See wir2018.wid.world for data series and notes.

In the 2000s, the average income of the full population grew by 4.5% per year on average, while the average income of the Bottom 50% grew by 2.4% per year on average. Values are net of inflation.

Table 2.9.2
Income growth and inequality in India, 1951–1980

Income group	Total real per adult income growth	Share of growth captured by income group
Full Population	65%	100%
Bottom 50%	87%	28%
Middle 40%	74%	49%
Top 10%	42%	24%
Top 1%	5%	1%
Top 0.1%	-26%	-2%
Top 0.01%	-42%	-1%
Top 0.001%	-45%	-0.4%

Source: Chancel & Piketty (2017). See wir2018.wid.world for data series and notes.

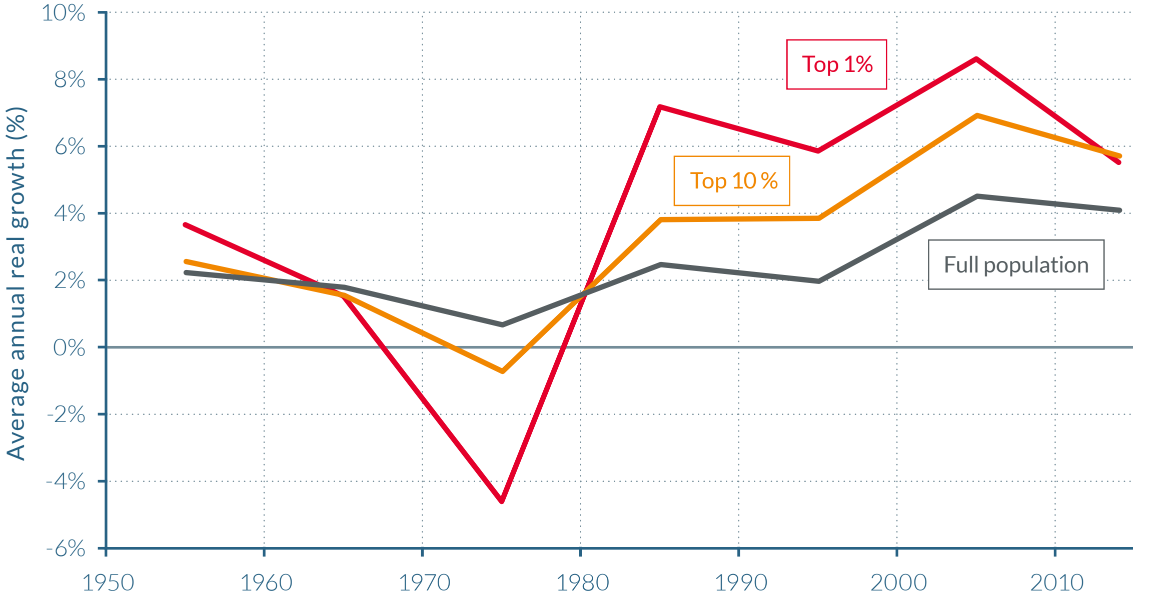
Between 1951 and 1980, the average income of the Top 1% grew by 5%. The Top 1% captured 1% of total growth over this period. Values are net of inflation.

average income growth rates than in the previous decades, but growth was only marginally higher for the bottom 90% of the population. High growth was in fact concentrated among the top 10%. This situation was prolonged throughout the 1980–2000s. During the 2000s, the annual real income growth of the top 1% was close to 8.5%, followed by the top 10% at around 7 % and the bottom 50% at less than 2.5 %. India's countrywide average was 4.5 % over the decade.

Table 2.9.2 shows the growth rate and the percentage of growth captured by different income groups in India between 1951–1980. During this period, the higher the group in the distribution of income, the lower the growth rate they experienced. Real per-adult incomes of the bottom 50% and middle 40% groups grew substantially faster than average income, increasing by 87% and 74% respectively, compared to the 65% growth of average income per adult. Furthermore, the top 0.1%, top 0.01% and top 0.001% income groups

Figure 2.9.3b

Income growth in India, 1951–2014: Full population vs. Top 10% vs. Top 1%



Source: Chancel & Piketty (2017). See wir2018.wid.world for data series and notes.

In the 2000s, the average income of the full population grew by 4.5% per year on average, while the average income of the Top 1% grew by 8.7% per year on average. Values are net of inflation.

experienced a significant reduction in their real incomes, falling -26%, -42% and -45% respectively over the 30-year period. The bottom 50% group captured 28% of total growth between 1951 and 1980, while the middle 40% captured almost half of total growth.

It is particularly interesting to compare the pre-1980 with the post-1980 growth rates. From 1980 to 2014, the bottom 50% and middle 40% grew at 89% and 93%, respectively. Whereas average income growth is substantially higher after 1980, there is very little difference in growth rates for the bottom 50% and middle 40%. Since 1980, it is also striking that the top 0.1% earners captured more of the total growth than the bottom 50% (12% versus 11% of total growth). The top 0.1% of earners represented less than 800 000 individuals in 2014, this is equivalent to a population smaller to Delhi's IT suburb, Gurgaon. It is a sharp contrast with the 389 million individuals that made up the bottom half of the adult population in 2014.

At the opposite end of the distribution, the top 1% of Indian earners captured as much growth as the bottom 84%.

Table 2.9.3 illustrates the income levels and income thresholds for different groups and their corresponding adult population in 2014. The bottom 50% earned significantly less than the average income per adult, receiving less than one-third of the nationwide mean income before tax, while the average income of the middle 40% was around four-fifths the national average. Those in the top 10% earned five times the national average, and when one examines further up the income distribution, the same exponential trend as seen in the growth statistics is evident. The top 1% of earners, for example, received around €134 600 (₹ 3.12 million) per year on average, while the top 0.1% receive approximately €533 700 (₹ 12.4 million), 22 and 86 times the average income for Indian adults, respectively. For the top 0.001%, this ratio is 1871. (**Figure 2.9.4**)

Table 2.9.3

The distribution of national income in India, 2014

Income group	Number of adults	Income threshold (€)	Average income (€)	Comparison to average income (ratio)	Income share
Full Population	794 306 000	–	6 200	1	100%
Bottom 50%	397 153 000	–	1 900	0.3	15.3%
Middle 40%	317 722 000	3 100	4 700	0.8	30.5%
Top 10%	79 431 000	9 200	33 600	5	54.2%
Top 1%	7 943 000	57 600	134 600	22	21.7%
Top 0.1%	794 000	202 000	533 700	86	8.6%
Top 0.01%	79 400	800 100	2 377 000	384	3.8%
Top 0.001%	7 900	3 301 900	11 589 000	1871	1.9%

Between 1980 and 2014, the average income of the Top 0.001% grew by 2726%. Values are net of inflation.

2.10

INCOME INEQUALITY IN THE MIDDLE EAST

Information in this chapter is based on "Measuring Inequality in the Middle East, 1990–2016: The World's Most Unequal Region?" by Facundo Alvaredo, Lydia Assouad, and Thomas Piketty, 2017. WID.world Working Paper Series (No. 2017/16).

- The Middle East appears to be the most unequal region in the world, with the share of income accruing to the top 10 and 1% exceeding 60% and 25% of total regional income 2016. The levels of inequality remained extreme over the 1990–2016 period, with the top 10% income share varying between 60%–66% and a bottom 50% share consistently below 10%. These inequality levels are comparable to or higher than those observed in Brazil and South Africa.

- This high level of income concentration is due to both enormous inequality between countries, particularly between oil-rich and population-rich countries, and is also the result of very large inequality within countries.

- Inequality between countries is largely due to the geography of oil ownership and the transformation of oil revenues into permanent financial endowments. As a result, the income of the oil-rich Gulf countries made up 42% of the total regional income in 2016 despite only representing a small share of the total population (15% in 2016). The gap in per-adult national income between Gulf countries and the other countries is therefore extremely large.

- These new results also show that inequalities within countries are much larger than previously estimated. However, given the lack of data available, these estimations are likely to be substantially underestimated. The problem is particularly acute in the Gulf countries, for which the low official inequality statistics contradict important aspects of their political economy, namely the growing population share of low-paid foreign workers.

The Arab Spring's demands for greater social justice has led researchers to reexamine inequality in the Middle East

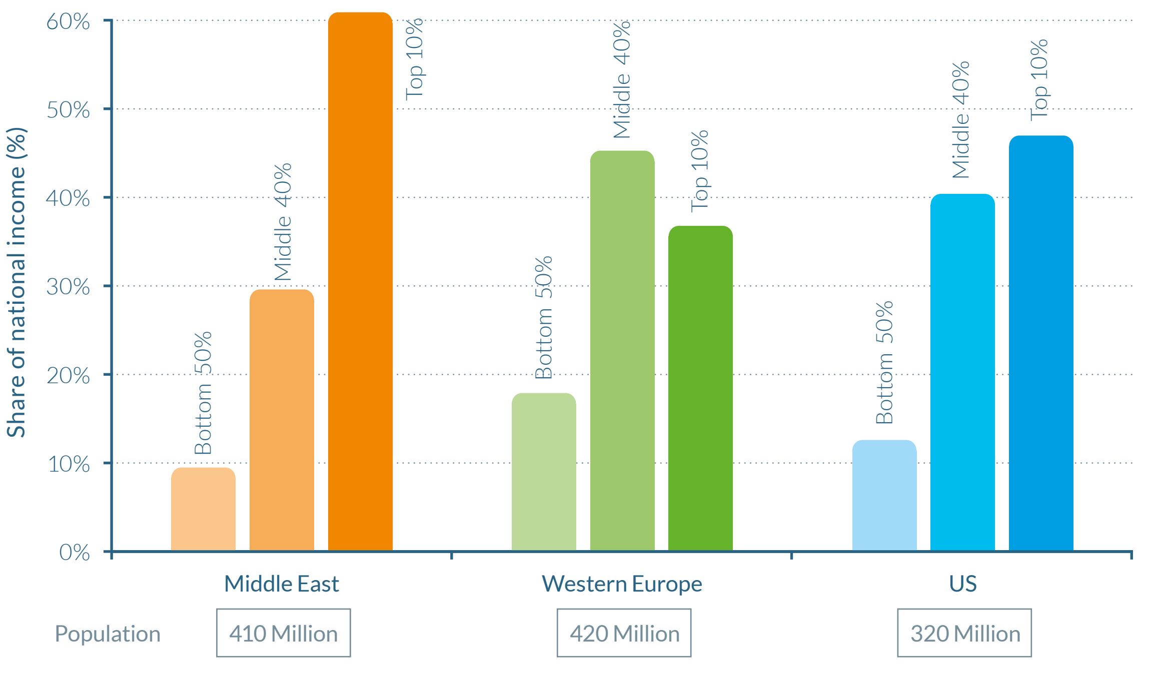
Following the Arab Spring movement, there has been renewed interest in inequality measurement in Middle East countries, as calls for greater social justice were amongst the leading demands of these popular movements. However, existing studies have argued that income inequalities within these countries do not seem to be particularly high by international standards, suggesting that the source of dissatisfaction might lie elsewhere. This somewhat surprising fact, coined "the Enigma of Inequality"[44] or the "Arab Inequality Puzzle"[45], has led to a growth in the literature on inequality in the region.

Among the literature seeking to address this surprising finding is a recent paper by Facundo Alvaredo, Lydia Assouad and Thomas Piketty. They argue that previous results, based on household survey data only, highly underestimate inequality and they offer novel estimates using the only fiscal data available in the region that has been recently released.

Inequality in the Middle East is among the highest of any region worldwide

Income inequality in the Middle East remains extremely high over the 1990–2016 period: the top 10% income share fluctuated at around 60%–66% of total income, while the share of the bottom 50% and middle 40% varied between 8%–10% and 27%–30% of total income, respectively. Regional income has largely been concentrated among the top 1% of the adult population, which receives 27% of total income, that is three times more than the bottom 50%, and approximately the same as the middle 40% of the population. Inequality in the Middle East is therefore among the highest of any region worldwide. (**Figure 2.10.1**)

Figure 2.10.1
Inequality in the Middle East, Western Europe and the US, 2012–2016



Source: Alvaredo, Assouad and Piketty (2017). See wir2018.wid.world for data series and notes.
In 2012-2016 (latest year available), the Top 10% income share in the Middle East was 61%.

Comparing the Middle East performance in terms of inequality with other countries in the World is legitimate and informative—at least as much as the usual inequality comparisons between nation-states. The total population of the region (about 410 million in 2016) is comparable to Western Europe (420 million) and the United States (320 million), and is characterized by a relatively large degree of cultural, linguistic and religious homogeneity. The authors find that the share of total income going to the top 10% income earners in the Middle East, is significantly greater than in the largest rich countries in Western Europe (36%) and the United States (47%) but also than in Brazil (55%), a country that is often described as one of the most unequal in the world. The only country for which higher inequality estimates can be currently found is South Africa, whose top 10% received approximately 65% of national income in 2012. (**Figure 2.10.2**)

While these results contradict the aforementioned studies, they are robust to different estimation techniques. When the income distribution is computed using purchasing power parity figures, which reflect the difference in the living standards of each country, inequality levels decline but not by a significant amount. Changing the geographical definition of the Middle East also has a relatively limited impact on inequality: by excluding Turkey from the analysis, a country whose average income is between those of the poorest countries—Egypt, Iraq, Syria, Yemen, etc.—and the oil-rich Gulf countries, inequalities unsurprisingly increase, but only by a small margin.

The origins of inequality are, however, distinctive amongst these different groups of countries. In the case of the Middle East, they are largely due to the geography of oil ownership and the transformation of oil revenues into permanent financial endowments, as we shall

In 2016, average national income per adult in the Middle East was €22 800 in Purchasing Power Parity, and €10 060 at Market Exchange Rate. All values have been converted into 2016 Purchasing Power Parity (PPP) euros at a rate of €1 = $1.3. PPP accounts for differences in the cost of living between countries. Values are net of inflation.

see below. In contrast, In Brazil, the legacy of racial inequality continues to play an important role together with huge regional inequalities (see chapter 2.11). Extreme inequality in South Africa is intimately related to the legacy of the Apartheid system (see chapter 2.12). It is striking to see that the Middle East, in spite of its much larger racial and ethnocultural homogeneity, has reached inequality levels that are comparable to, and even higher than, those observed in South Africa or Brazil.

Extreme inequality in the Middle East is driven by enormous and persistent between-country inequality

The 1990–2016 period has been a period of rapid population growth in the Middle East: total population rose by about 70%, from less than 240 million in 1990 to almost 410 million in 2016. The rise in average income has been much more modest, however. Using purchasing power parity estimates (expressed in 2016 euros), per-adult national income rose from about €20 000 in 1990 to €23 000 in 2016, that is, by about 15%. Using market exchange rates, per-adult national income rose from less than €9 000 in 1990 to about €10 000 in 2016 (see **Figure 2.10.3**). In Western Europe—a relatively low growth region by world standards—per-adult growth was 22%.

Should Middle East inequality be measured at purchasing power parity (PPP) or at market exchange rates (MER)? Both the PPP and the MER viewpoints express valuable and complementary aspects of international inequality patterns. The PPP viewpoint should of course be preferred if we are interested in the living standards of the inhabitants living, working and spending their incomes in the various countries (which is the case of most inhabitants). However the MER viewpoint is more relevant and meaningful if we are interested in external economic relations: e.g. the ability of tourists and visitors from Europe or from Gulf countries to purchase

Table 2.10.1

Population and income in the Middle-East, 2016

	Population (million)	Adult Population (million)	Adult population (% of ME total)	National Income (Billion 2016 € PPP)	% ME Total Income (PPP)	National Income (Billion 2016 € MER)	% ME Total Income (MER)

Source: Alvaredo, Assouad and Piketty (2017). See wir2018.wid.world for data series and notes.

In 2016, Gulf countries earned €2.4 billion in Purchasing Power Parity. All values have been converted into 2016 Purchasing Power Parity (PPP) euros at a rate of €1 = $1.3, and into 2016 Market Exchange Rate (MER) euros at a rate of €1 = $1.1. PPP accounts for differences in the cost of living between countries. Values are net of inflation. Numbers may not add up due to rounding.

goods and services when they travel to other countries; or the ability of migrants or prospective migrants from Egypt or Syria to send part of their euro wages back home. Here market exchange rates matter a lot, and may also have an important impact on perceptions of inequality. This is why MER are used as benchmark measures of inequality in the Middle East.

It is critical to stress that enormous and persistent between-country inequality exists behind the Middle East average. In order analyze to summarize the changing population and income structure of the Middle East, it is useful to decompose the region into five blocs: Turkey; Iran; Egypt; Iraq-Syria (including other Arab, non–Gulf countries: Jordan, Lebanon, Palestine, Yemen); and Gulf countries (including Saudi Arabia, Oman, Barhain, UAE, Qatar and Kuwait) (see **Table 2.10.1**).

The first four blocs all represent approximately 20–25% of total population of the Middle East, whereas Gulf countries represent 15% of the population. In contrast, Gulf countries represent almost half of the total income of the region in market exchange rates. This reveals the large gap in per-adult national income between Gulf countries and other countries in the region. These marked difference help us understand why albeit novel, regional Middle East inequality estimates are not entirely unexpected.

The evolution of income inequality in the Middle East has been driven by the dynamics of between-country inequality. In 1990, Gulf countries' share in Middle East population was 10%, and their income share was between 44% (PPP) and 48% (MER). The narrowing of per-adult income inequality between Gulf countries and the other four country blocs identified above reduced regional inequality over the 1990–2016 period. However, the income gap between these two groupings remains enormous.

The fall in the income gap between Gulf countries and the rest of the Middle East reflects a number of complex and contradictory forces. It was partly due to the evolution of oil prices and output levels in Gulf countries, as well as to the relative fast output growth in non–Gulf countries including Turkey, but the very large rise of migrant workers also played a significant role, leading to an artificial reduction of national income per adult in Gulf countries. The massive inflow of foreign workers, especially in the construction sector and domestic services sector, quite simply led to a stronger increase in the population denominator than in the income numerator of Gulf countries. This massive rise of migrant workers saw the shares of foreigners in Gulf countries increase from less than 50% in 1990 to almost 60% in 2016.

From this viewpoint, it is also useful to distinguish between two groups of Gulf countries. The first of these groups is made up of Saudi Arabia, Oman and Bahrain, where nationals still make a small majority of the population, with the foreign population share remaining relatively stable at around 40–45% of total adult population between 1990 and 2016. The second group is that of the United Arab Emirates (UAE), Kuwait and Qatar, where the nationals have made up a smaller and smaller minority of the resident population, given that the foreign share rose from 80% to 90% of the total population. This second group made about one quarter of total population of Gulf countries in 1990, but this rose to about one third by 2016.

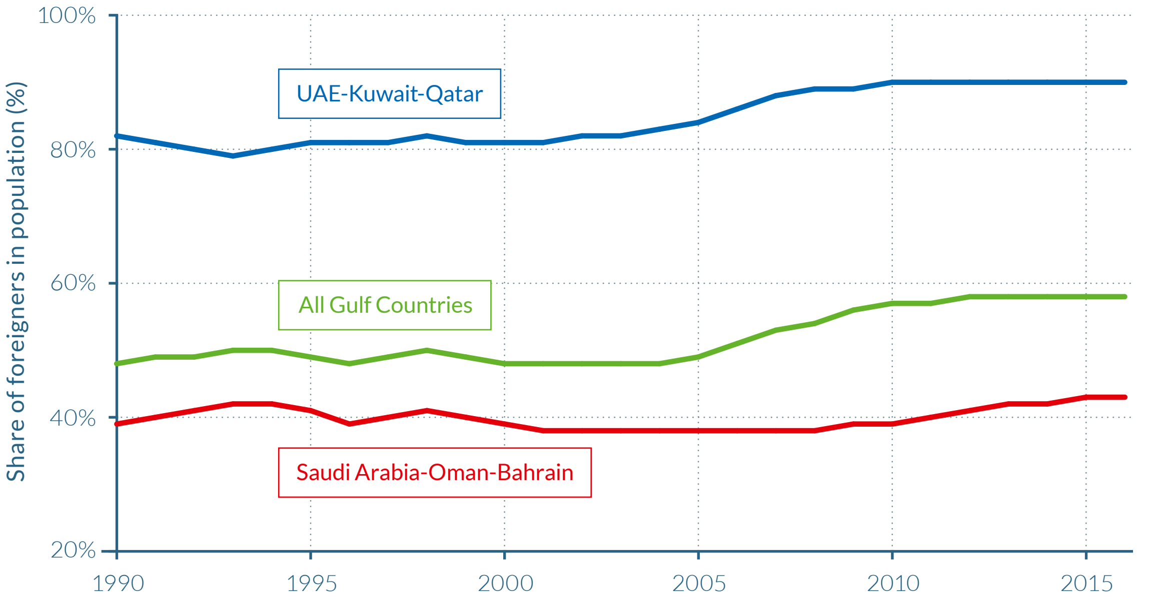
Within-country inequality is likely to be high in Middle East countries

Income tax data is unfortunately extremely limited in the Middle East and therefore prevents a detailed and precise analysis of within-country inequality. It is unfortunate that the only country for which data is currently available is Lebanon, as household surveys in the Middle East appear to underestimate top incomes at least as much as in the rest of the world (and possibly more). The Lebanese data confirms the general finding that top income levels reported in tax data are much higher than in household surveys: top 1% incomes are typically two to three times higher, with large variations across income levels and over years.

The lack of good data is particularly acute in the case of the Gulf countries, where the low official Gini coefficient might indeed hide important aspects of their political economy, namely the growing share of the non-national population, a large majority of which is composed of low-paid workers, living in difficult conditions. The substantial growth of migrant workers in Gulf countries give incentives to nationals within Gulf countries to defend their numerous privileges, beginning by restraining naturalization given that national citizens typically do not pay income tax, benefit from significant social spending, including free healthcare and education, receive subsidies for electricity and fuel, and often receive other benefits such as land grants. Furthermore, some citizens also have expectations that the state provides them with a job and housing, an idea enshrined in some Gulf country constitutions.[46] (**Figure 2.10.4**)

But perhaps the most striking manifestation of the difference between the local and foreign populations is the restrictions imposed on the migrant population through the "sponsorship system," or the "kafala system" as it is known in Arabic.[47] This system requires all unskilled laborers to have an in-country sponsor, usually their employer, who is responsible for their visa and legal status.[48] As a report by the Chatham House think tank describes, this system can lead to the creation of an extremely polarized social structure with two groups which are not legally, socially and economically equals.[49] As far as is known, little research has been conducted to study the two populations to measure income inequality within Gulf societies given the aforementioned data limitations, and therefore our quantitative understanding of these issues is still somewhat limited. Alvaredo, Assouad and Piketty are

Figure 2.10.4
Share of foreigners in Gulf countries, 1990–2015



Source: Alvaredo, Assouad and Piketty (2017). See wir2018.wid.world for data series and notes.
In 2015, the share of foreigners in the total population of the United Arab Emirates, Kuwait and Qatar was 90%.

the first researchers to distinguish systematically between the two populations (and lead to a large upward revisions of inequality estimate in the survey distribution). Unfortunately, there are still important limitations to the empirical understanding of these issues.

Better data on income inequality is crucially needed in the Middle East

Accessing better quality and larger volumes of country-level inequality data for the whole of the 1990–2016 period in Middle East countries might lead to different conclusions than those presented in this paper. In particular, a rise of within-country inequality could possibly counterbalance the reduction of between-country inequality between Gulf countries. Rising within-country inequality trends are found in a large number of very different countries across the world, e.g. in the United States, Europe, India, China, South Africa, Russia, with varying magnitudes as described in other chapters of this report. It is also possible that Middle East countries—along with Brazil—belong to a different category, that is, countries where inequality has always been very large historically and thus has not risen in recent decades. However, given the data sources currently available, it is not possible to draw precise conclusions on this phenomenon with a satisfactory degree of precision.

All in all, it is very difficult to have an informed public debate about inequality trends—and also about a large number of substantial policy issues such as taxation and public spending—without proper access to such data. While the lack of transparency on income and wealth is an important issue in many, if not most, areas of the world, it appears to be particularly extreme in the Middle East, and arguably raises a problem of democratic accountability in itself, independent from the levels of inequality observed.

2.11

INCOME INEQUALITY IN BRAZIL

Information in this chapter is based on “Extreme and Persistent Inequality: New Evidence for Brazil Combining National Accounts, Survey and Fiscal Data,” by Marc Morgan, 2017. WID.world Working Paper Series (No. 2017/12).

- ▷ Novel and more precise inequality data show that the level of inequality is much higher in Brazil than previously estimated.
- ▷ Previous inequality estimates suggested that policies targeting inequality over the past decades had been successful in significantly reducing it, but recent evidence suggests that national income inequality has remained relatively persistent at high levels over the past 15 years. At the time, the fall in labor income inequality, even if more moderate than previously thought, is confirmed by the new estimates.
- ▷ The distribution of income in Brazil has remained stable and extremely unequal over the last 15 years, with the top 10% receiving over 55% of total income in 2015, while the share of the bottom 50% was just above 12% and the middle 40%, approximately 32%. While inequality within the bottom 90% fell, driven by compression of labor incomes, concentration at the top of the distribution grew over the period, reflecting the increasing concentration of capital income.
- ▷ Since the global financial crisis in 2008, the share of total growth in income captured by the top 10% of earners has been the same than in the years of strong growth leading up to the crisis.
- ▷ The bottom 50% captured a very limited share of total growth between 2001–2015. So far, cash transfers had only a limited impact on the reduction of national income inequality.

Brazil's inequality is higher than previously estimated and relatively stable over the past two decades

Brazil has consistently been ranked among the most unequal countries in the world since data became widely available in the 1980s. However, from the mid-1990s, household surveys began to show that inequality was falling, due to a combination of strong labor market performance, declines in the skill wage premium due to educational expansion, systematic increases in the minimum wage (indexed to social benefits), and the growing coverage of social assistance programs.[50] This household data provided evidence that government policies had been effective in reducing inequality. Indeed, this apparent decline in Brazilian income inequality drew significant attention worldwide, as examples of large economies that could reduce inequality while growing solidly are relatively rare.[51]

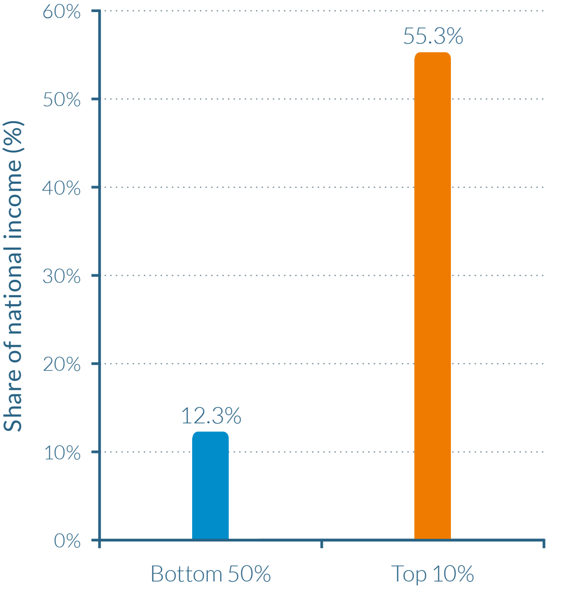
However, as described earlier in this report, household surveys only tell part of the story. Recent releases of income tax data by the Federal tax office have painted a different picture, showing that inequality in Brazil was higher than previously thought.[52] Marc Morgan has generated a series of distributional national accounts for Brazil, which combine annual and household survey data with detailed information on income tax declarations and national accounts. By ensuring the consistency of the surveys and tax declarations with macroeconomic totals, he is able to provide the most representative income inequality statistics to date that show a sharp upward revision of the official estimates of inequality in Brazil. The novel data also suggests that, if contrary to other emerging countries such as Russia, India or China, pre-tax inequality has remained relatively stable in Brazil since the turn of the new century, it has not declined as much as many commentators have argued.

Total income inequality has remained at very high levels in Brazil despite the fall in labor income inequality

The findings highlight the large extent of income concentration in Brazil. The richest 10% of Brazilian adults—around 14 million people—received over half (55%) of all national income in 2015, while the bottom half of the population, a group five times larger, earned between four and five times less, at just 12%. The middle 40% of the distribution receives just less than one third of total income (32%), a figure which is low by international standards. This clearly reveals that inequality in Brazil is principally affected by the extreme concentration at the top of the distribution. This concentration becomes less extreme when we look at the labour income distribution. The top 10% highest earners received 44% of all national labour income in 2015, with the middle 40% taking home almost 40% and the bottom 50% in this distribution receiving about 15%. (**Figure 2.11.1**)

Since 2000, total income inequality has remained relatively stable. Small gains were made by the bottom 50%, who increased

Figure 2.11.1
Bottom 50% and Top 10% income shares in Brazil, 2015



Source: Morgan (2017). See wir2018.wid.world for data series and notes.
In 2015, the Top 10% received 55% of national income.

Table 2.11.1
The distribution of national income in Brazil, 2015

Income group	Number of adults	Income threshold (€)	Average income (€)	Income share
Full Population	142 521 000	–	13 900	100%
Bottom 50%	71 260 000	–	3 400	12.3%
Middle 40%	57 008 000	6 600	11 300	32.4%
Top 10%	14 252 000	22 500	76 900	55.3%
Top 1%	1 425 000	111 400	387 000	27.8%
Top 0.1%	142 500	572 500	2 003 500	14.4%
Top 0.01%	14 300	2 970 000	10 397 600	7.5%
Top 0.001%	1 430	15 400 000	53 986 200	3.9%

Source: Morgan (2017). See wir2018.wid.world for data series and notes.

In 2015, the average income of the Top 10% was €76 900. All values have been converted into 2016 Purchasing Power Parity (PPP) euros at a rate of €1 = $1.3 = R$2.7. PPP accounts for differences in the cost of living between countries. Values are net of inflation. Numbers may not add up due to rounding.

their share of national income from 11% to 12% from 2001 to 2015, while the top 10% income share evolved from 54% to just over 55% over the period. Both of these gains were at the expense of a continuous squeeze on the middle 40%, whose share of national income fell from 34% to just above 32%. The stability in the total income inequality should not mask the registered decline in the inequality of labour incomes. The bottom 50% of earners made greater gains in this distribution, increasing their share from 12% to 15% from 2001 to 2015, while the top 10% labor income share fell from 47% to 44%. The middle 40% share increased from 37% to almost 40%, which confirms the overall compression in the labour income distribution and conveys the importance of capital income in the total income distribution. This is even more apparent the higher up in the hierarchy the comparison is made. For instance, while the top 1% of labour earners received 14% of national labour income in 2015, the same group in the national total income distribution received double this share (28%).

These extreme levels of inequality manifested themselves in large differences between the average incomes of the aforementioned groups, as represented by **Table 2.11.1**. In 2015, the average income of an adult living in Brazil was around €13 900 (R$37 100), but for those amongst the bottom 50% of earners, the average income was less than €3 400 (R$9 200, around a quarter of the national average). Moving up the income distribution, the average annual income of adults in the middle 40% was approximately €11 300 (R$30 500), meaning that a significant percentage of 90% of Brazil's adult population earned less than the national average, which highlights the extent of income skewness in Brazil and the lack of a broad "middle class." Consequently, the average income of the top 10% was over five times greater than the national average at €76 900 (R$207 600). The magnitudes increase substantially as one moves towards the upper echelons of the income distribution, with the average income of the richest 1% being around €387 000 (R$1 044 900).

Table 2.11.2 presents refined shares at the top of the income distribution for 2015, to show more precisely how national income is shared across the adult population and also compares how inequality estimates differ between the DINA series and survey data.

Using only the survey data, the top 1% (about 1.4 million adults) received 12% of national income in 2015. However, when income from fiscal data and undistributed income from national accounts are included, the share of this top 1% increases dramatically, to 28%. The large share of national income captured by the top 1% therefore seems to be gradually reducing the share of the middle 40% over time.

Higher up the distribution, the trend is similar, with the elites capturing a disproportionate share of Brazilian income. **Figure 2.11.2** compares the income share of the bottom 50% (70 million adults), with that of the top 0.1% (140 000 adults) over the fifteen-year time period. Having started at similar levels of national income in 2001—around 11% each—the two groups quickly experienced diverging fortunes, with the top 0.1% share growing to just under 15% of national income by 2004 and the share of the bottom 50% remaining virtually unchanged. By 2015 the gap between the groups' respective shares had grown to 4 percentage points, such that the collective incomes of the top 0.1% were significantly larger than those of the bottom 50% despite the top 0.1% being 500 times smaller in population size.

Table 2.11.2
Survey income and national income series in Brazil, 2015: Comparing income shares

Income group	Survey income series *(survey data)*	WID.world series *(survey + tax + national accounts data)*
Bottom 50%	16.0%	12.3%
Middle 40%	43.6%	32.4%
Top 10%	40.4%	55.3%
Top 1%	10.7%	27.8%
Top 0.1%	2.2%	14.4%
Top 0.01%	0.4%	7.5%
Top 0.001%	0.1%	3.9%
Total (% national income)	57.1%	100%

Source: Morgan (2017). See wir2018.wid.world for data series and notes.
In 2015, the share of survey income attributable to the Top 10% was 40%, while the share of national income attributable to the Top 10% was 55%.

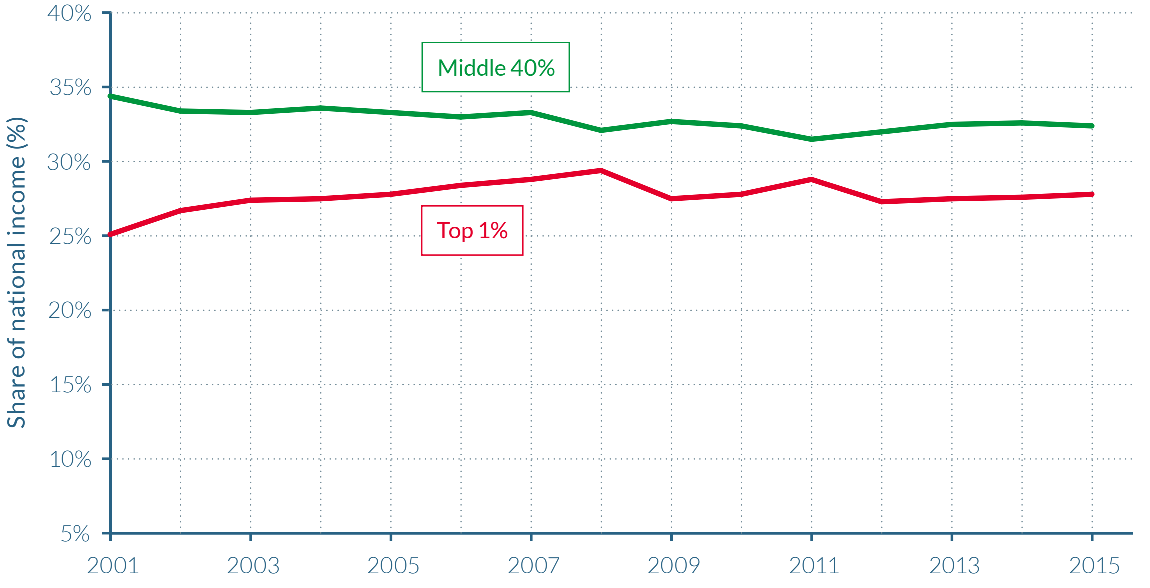
Morgan in the same work also compares the raw estimates from the surveys with his benchmark national income series (combining national accounts, surveys and fiscal data). There are clear, large discrepancies in the level and change in inequality that grow increasing larger the higher up the distribution one looks. These discrepancies thus highlight why relying exclusively on surveys and ignoring undistributed income in national accounts flowing to corporations can distort understanding of how income inequality has developed in Brazil. For example, household surveys indicate that income inequality fell between 2001 and 2015, with the top 10% share of national income falling from 47% to just above 40% and the bottom 50% share rising from just over 12% to 16%. These are in stark contrast with the trends and levels presented above, with a top 10% share oscillating around 55% (**Figure 2.11.3**). The general trend is therefore one of an increase in the concentration of national income shares at the top of the income distribution, small increases at the bottom and an ever-smaller share for the middle.

Brazilian income inequality rises as the richest experience higher growth in incomes

Distributional National Accounts also enable us to examine how growth at the macroeconomic level in Brazil has affected the income shares of the country's population. Between 2001 and 2015, cumulative real growth of national income per adult in Brazil totaled 18%. (See **Table 2.11.3**.) The question that arises from this evolution is how the income growth of different groups of the income distribution compares to these numbers. The real growth of average incomes in the bottom 50% was strong, increasing approximately by 29% over the fifteen-year period.

Figure 2.11.2a

Income shares of the Middle 40% and Top 1% in Brazil, 2001–2015



Source: Morgan (2017). See wir2018.wid.world for data series and notes.

In 2015, the Top 1% received 28% of national income.

This was comparatively higher than the growth in incomes of the middle 40% (12%) and the top 10% (21%). However, growth was strongest among the top percentiles. The income of the top 1% grew by almost double the national average, at 31%, while the incomes of the top 0.1% grew at almost 55%, 3 times the national average. Growth was strongest at the very summit of the distribution, with the incomes of the top 0.01% and the 0.001% growing by 85% and 122%, respectively.

Despite the growth of incomes in the bottom half of the income distribution, the top of the distribution captured a disproportionately large part of the total income growth between 2001 and 2015. For example, the top 10% captured 61% of total growth, while the top 1% captured 43%. Even with the strongest growth performance over the period of three major income groupings, the low average incomes of the bottom 50% meant that the fraction of total growth they were able to capture was relatively small, at 18%. Subsequently, the change in the bottom 50% share of total national income was also small. The figures relating to the middle 40% help to reinforce the importance of the size of incomes in analyzing how group shares in national income have changed: despite their total cumulative growth rate being smaller than the bottom 50%, the fraction of total growth captured by the middle 40% was higher than that of the poorest half of the population, at 22%.

Table 2.11.3 also subdivides the incidence of growth by two roughly equal time periods, relating to that before the global financial crisis, and that during and after it. During the first period (2001–2007), all groups experienced strong increases in their average incomes as the economy grew solidly, with only the middle 40% growing at a slower pace than the national average. Nevertheless, the overwhelming gains went to the top decile, with the top 1% capturing over 65% of total growth. Growth in the years between 2007 and 2015 was slightly weaker, with average

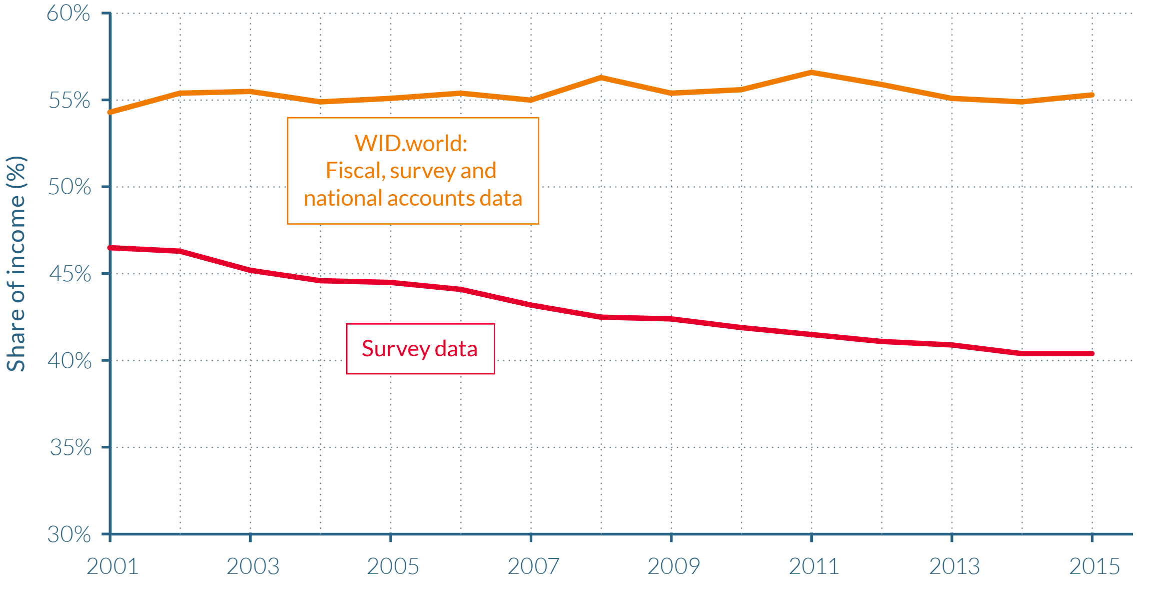
Figure 2.11.3

Top 10% income share in Brazil, 2001–2015: National income series vs. survey income series



Source: Morgan (2017). See wir2018.wid.world for data series and notes.

In 2015, the Top 10% earners captured around 40% of national income according to household surveys. However, corrected estimates using fiscal, survey and national accounts show that their share is 55%.

incomes expanding by 7% as compared to 10% in the previous period, but growth was equally concentrated in the top decile after the financial crisis. The impact of the crisis was notably felt by the highest groups, as the average incomes of groups above the top 0.1% had not yet recovered to their 2007 levels by 2015.

Table 2.11.3

Income growth and inequality in Brazil, 2001–2015

	2001–2015		2001–2007		2007–2015	
Income group	**Total cumulated growth**	**Fraction of total growth captured**	**Total cumulated growth**	**Fraction of total growth captured**	**Total cumulated growth**	**Fraction of total growth captured**
Full Population	56%	100%	27%	100%	23%	100%
Bottom 50%	70%	14%	32%	14%	28%	14%

Between 2001 and 2015, the Top 10% captured 57% of total growth.

2.12

INCOME INEQUALITY IN SOUTH AFRICA

Information in this chapter is based on "Colonial rule, apartheid and natural resources: Top incomes in South Africa, 1903–2007," by Facundo Alvaredo and Anthony B. Atkinson (Centre for Economic Policy Research Discussion Paper, 2010, No. 8155), as well as on WID.world updates.

- South Africa stands out as one of the most unequal countries in the world. In 2014, the top 10% received 2/3 of national income, while the top 1% received 20% of national income.

- During the twentieth century, the top 1% income share was halved between 1914 and 1993, falling from 20% to 10%. Even if these numbers must be qualified, as they are surrounded by a number of uncertainties, the trajectory is similar to that of other former dominions of the British Empire, and is partly explained by the country's economic and political instability during the 1970s and 1980s.

- During the early 1970s the previously constant racial shares of income started to change in favor of the blacks, at the expense of the whites, in a context of declining per capita incomes. But while interracial inequality fell throughout the eighties and nineties, inequality within race groups increased.

- Rising black per capita incomes over the past three decades have narrowed the interracial income gap, although increasing inequality within the black and Asian/Indian population seems to have prevented any decline in total inequality.

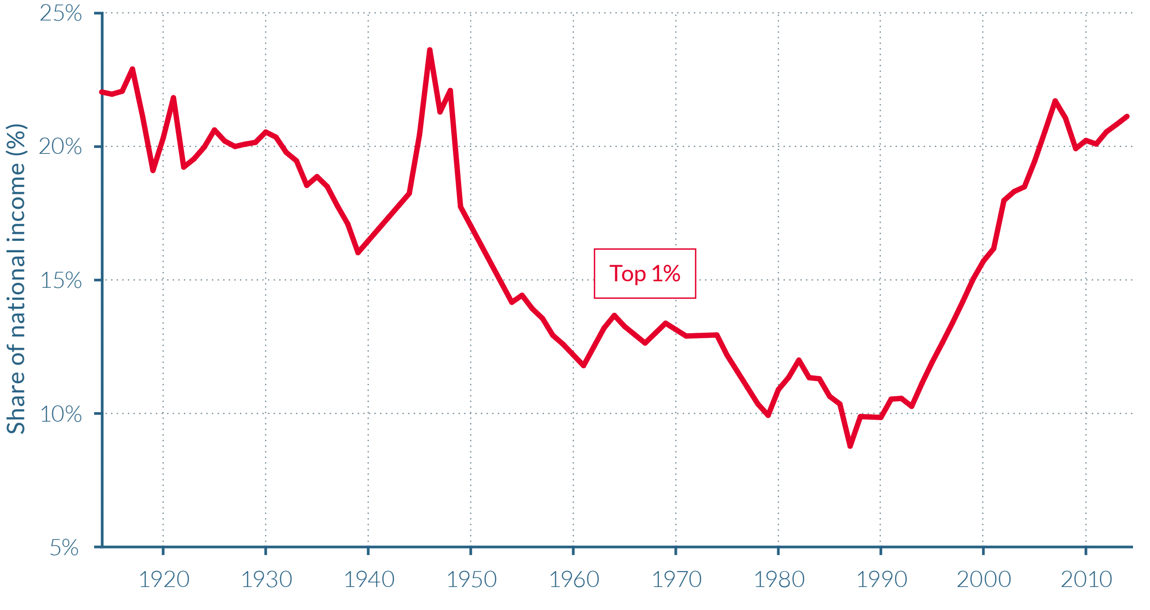
- Since the end of the Apartheid in 1994, top-income shares have increased considerably. In spite of several reforms targeting the poorest and fighting the segregationist heritage, race is still a key determinant of differences in income levels, educational attainment, job opportunities and wealth.

South Africa's dual economy is among the most unequal in the world

South Africa is one of the most unequal countries in the world. In 2014, the top 10% of earners captured two thirds of total income. This contrasts with other high-income inequality countries such as Brazil, the United States and India where the top 10% is closer to 50–55% of national income. However, unlike other highly unequal countries, the divide between the top 1% and the following 9% in South Africa is much less pronounced than the gap between the top 10% and the bottom 90%. Otherwise said, in terms of top income shares, South Africa ranks with the most unequal Anglo-Saxon countries, but, at the same time, there is less concentration within the upper income groups, mostly composed by the white population. The average income among the top 1% was about four times greater than that of the following 9% in 2014 (for comparative purposes, the top 1% in the United States earn seven times more than the following 9%), while average income among the top 10% was more than seventeen times greater than the average income of the bottom 90% (it is eight times more in the United States). It is then only logical that the income share of the top 1% is high, capturing 20% of national income, though this is not the largest share in the world.

The South African "dual economy" can be further illustrated by comparing South African income levels to that of European countries. In 2014, the average national income per adult among the richest 10% was €94 600, at purchasing power parity, that is, comparable to the average for the same group in France, Spain or Italy. But average national income of the bottom 90% in South Africa is close to the average national income of the bottom 16% in France. In light of these statistics, the recently debated emergence of a so-called middle class is still very elusive. Rather, two societies seem to coexist in South Africa, one enjoying living standards close to the rich or upper middle class in advanced economies, the other left behind. (**Figure 2.12.1**)

Figure 2.12.1
Top 1% income share in South Africa, 1914–2014



Source: Alvaredo & Atkinson (2010). See wir2018.wid.world for data series and notes.
In 2014, the Top 1% share of national income was 21%.

Inequality has decreased from the unification of South Africa to the end of apartheid

South Africa is an exception in terms of data availability in comparison with other African countries. The period for which fiscal data are available starts in 1903 for the Cape Colony, seven years before the Union of South Africa was established as a dominion of the British Empire, and ends in 2014, with some years sporadically missing, and noticeably an eight-year interruption following the end of apartheid in 1994. As is often the case with historical tax data series, only a very small share of the total adult population was eligible to pay tax in the first half of the twentieth century. Therefore, the fiscal data from which we can estimate top-income shares allows us to track the top 1% income share since 1913, but only cover the top 10% of the population from 1963 (with a long interruption between 1971 and 2008).

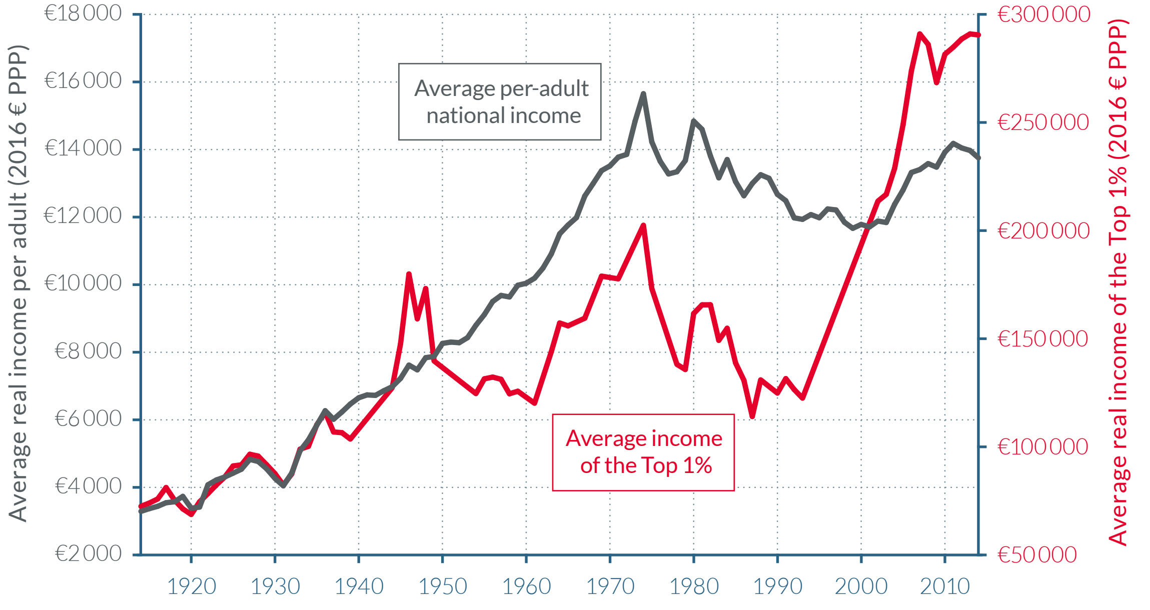
With important short run variations, the evolution of income concentration over the 1913–1993 period seems to follow a very clear long-term trend. The income share of the richest 1% was more than halved between 1913 and 1993, falling from 22% to approximately 10%. Not only did the income share attributable to the top 1% decrease, but inequality within this upper group was also reduced. Indeed, the share of the top 0.5% fell more quickly than the share of the next 0.5% (from percentile 99 to percentile 99.5). Consequently, while the top 0.5% represented about 75% of the top 1% in 1914, by the end of the 1980s, their representative proportion fell to 60%.

Despite the extreme social implications of the first segregationist measures that were implemented in the early 1910s, these policies did not lead to large increases in income concentration among the top 1%. This was also a time in which South Africa progressively developed its industrial and manufacturing sector, enjoying notable accelerations in the 1930s that were to the benefit of the large majority of the population. Aside from a brief fall during the Great Depression, average real income per adult then increased steadily. Following a trend similar to other former Dominions of the British Empire (Australia, Canada and New Zealand) inequality decreased significantly in South Africa from 1914 to the beginning of the the Second World War, despite some short-run variations in the late 1910s: the income share of the top 1% fell from 22% to 16%.

During the Second World War, national average continued to follow its previous trend, but the average real income of the richest 1% took off. As a consequence of the demand shock during the war, the agricultural export prices boomed, the manufacturing sector more than doubled its output between 1939 and 1945, and profits for the foundry and engineering industries increased by more than 400%.[53] However, the wage differential between skilled/white and unskilled/black workers remained extremely large. As C.H. Feinstein described, "black workers [were] denied any share of the growing income in the new economy they were creating."[54] The fact that the peak in the income share of the top 1%—as high as 23% in 1946—was concomitant with the war effort thus seems essentially due to a brief enrichment of the upper class.

In contrast, income growth in the 1950s was more inclusive, as average real income per adult increased by 29% between 1949 and 1961, while the average real income of the top 1% slightly decreased. By 1961 the income share of the top 1% had fallen to around 14%. In the 1960s, both averages grew approximately at the same rate such that inequality remained relatively constant. Following 60 years of successive increases, national average income was almost four times greater by the early 1970s than in 1913. Inequality resumed its downward sloping trend from 1973, but this also marked a period of overall income growth stagnation in South Africa until 1990 that culminated in a three-year recession.

Figure 2.12.2
Average income per adult and average income of the Top 1% in South Africa, 1914–2014



Source: Alvaredo & Atkinson (2010). See wir2018.wid.world for data series and notes.

In 2014, the average income per adult in South Africa was €13 750 (R107 300), while the average income of the Top 1% was €290 500 (R2 266 000). All values have been converted into 2016 Purchasing Power Parity (PPP) euros at a rate of €1 = $1.3 = R7.8. PPP accounts for differences in the cost of living between countries. Values are net of inflation.

For the first time in the previous 90 years, gold output started falling. Richer seams were exhausted and extraction costs increased rapidly. The industry that was once the engine of the economy started to weaken. Increases in oil prices and other commodities accelerated inflation dramatically, averaging about 14% per year between 1975 and 1992. In the 1980s, international sanctions and boycotts were placed on South African trade as a response to the apartheid regime, adding further pressure to that created by domestic protests and revolts, and contributed to the destabilization of the regime in place. White dominance was challenged on both economic and political grounds, to which the ruling government progressively made concessions, recognizing trade unions and the right to bargain for wages and conditions; this could partly explain why the average real income per adult of the top 1% decreased faster than the national average. (**Figure 2.12.2**)

The progressive policies implemented after the apartheid were not sufficient to counter a profoundly unequal socio-economic structure

There are no fiscal data to estimate top-income shares for the eight years that followed 1993. However, joining up the data points to the next available figure in 2002 suggests that income inequality has increased sharply between the end of apartheid and the present, even if the magnitude of the increase must be taken with caution, as the estimates in these two periods may not be totally comparable. The income share of the top 1% increased by 11 percentage points from 1993 to 2014. Part of the increase from 1993 to 2002 should come from changes in the tax code. In particular, before 2002, capital gains were totally excluded, which is very likely to downward bias the share of top-income groups. Also, the tax collection capabilities seem to have increased substantially in the last years. That being said, using household survey data for the years 1993, 2000 and 2008 research has demonstrated that inequality increased significantly during the period for which we have no fiscal data.[55]

At first, it might seem puzzling that the abolishment of a segregationist regime was followed by an aggravation of economic inequality. The establishment of a multi-racial democracy, with a new constitution and a president of the same ethnic origin as the majority of the population, did not automatically transform the inherited socio-economic structure of a profoundly unequal country. Interracial inequality did fall throughout the eighties and nineties, but inequality within race groups increased: rising black per capita incomes over the past three decades have narrowed the black-white income gap, although increasing inequality within the black and Asian/Indian population seems to have prevented any decline in aggregate inequality. In explaining these changes scholars agree in that the labor market played a dominant role, where a rise in the number of blacks employed in skilled jobs (including civil service and other high-paying government positions) coupled with increasing mean wages for this group of workers.

Since 1994, several redistributive social policies have been implemented and/or extended, among which important unconditional cash transfers targeting the most exposed groups (children, disabled and the elderly). At the same time, top marginal tax rates on personal income were kept relatively high and recently increased to 45%. However, in spite of these redistributive policy efforts, surveys consistently show that top-income groups are still overwhelmingly white. Other studies further demonstrate that such dualism is itself salient along other key dimensions such as unemployment and education. Furthermore wealth, and in particular land, is still very unequally distributed. In 1913, the South African parliament passed the Natives Land Act which restricted land ownership for Africans to specified area, amounting to only 8% of the country's total land area, and by the early 1990s, less than 70 000 white farmers owned about 85% of agriculture land.[56] Some land reforms have been implemented, but with seemingly poor results,[57] and it is likely that the situation has not improved much since, although precise data about the recent distribution of land still needs to be collected.

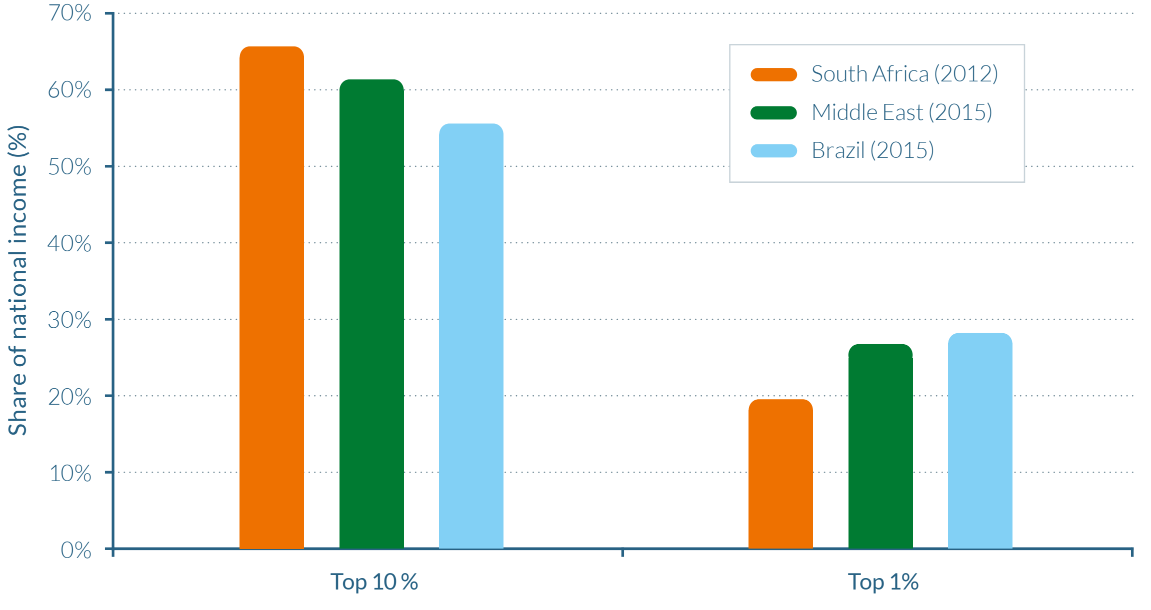
Given this socio-economic structure, the interruption of the international boycotts in 1993 might have more directly favored a minority of high skilled and/or richer individuals who were able to benefit from the international markets, which therefore contributed to increase inequality. This hypothesis would also explain the fact that income inequality in South Africa did not increase in the 1980s, while boycotts were put in place, contrary to other former Dominions (New Zealand, Canada and Australia) despite the country having so far followed a similar trend. Furthermore, the implementation of the Growth, Employment and Redistribution (GEAR) program in 1996, which consisted of removing trade barriers, liberalizing capital flows and reducing fiscal deficit might also have contributed, at least in the short run, to enrich the most well off while exposing the most vulnerable, in part by increasing returns to capital over labor and to skilled workers over unskilled workers.

The rapid growth experienced from the early 2000s until the mid-2010s was essentially driven by the rise in commodity prices and was not accompanied with significant job creation as the government hoped it would. The income share of the top 1% grew from just less than 18% in 2002 to over 21% in 2007, then decreased by about 1.5 percentage points and increased again in 2012–2013 as prices reached a second peak. The fact that these variations closely mirror the fluctuation in commodity prices suggest that a minority benefiting from resource rents could have granted themselves a more than proportional share of growth.

Lastly, it should be stressed that the top 1% only represents a small part of the broader top 10% elite which is mostly white. While the share of income held by the top 1% is relatively low as compared to other high inequality regions such as Brazil or the Middle East, the income share of the top 10% group is extreme in South Africa (**Figure 2.12.3**). The historical trajectory of the top 10% group may be different to that of the top 1%—potentially with less ups and downs throughout the 20th century. Unfortunately at this stage, historical data on the top 10% group does not go as far back in time as for the top 1% group."

Figure 2.12.3

South Africa: the world's highest top 10% income share, but not the highest top 1% share



Source: Alvaredo & Atkinson (2010), WID.world (2017). See wir2018.wid.world for data series and notes.

In 2012, the Top 10% share of national income was 65% in South Africa, while it was 55% in Brazil in 2014. Income shares correspond to the latest year available (2012 for South Africa, 2015 for the Middle East, 2015 for Brazil).

9 L. Czajka, "Income Inequality in Côte d'Ivoire: 1985–2014," WID.world Working Paper no. 2017/8, July 2017, http://wid.world/document/income-inequality-cote-divoire-1985–2014-wid-world-working-paper-201708/.

10 Very top incomes, however, grew more in post-tax terms than in pre-tax terms between 1946 and 1980 (194%), because the tax system was more progressive at the very top in 1946.

11 The growth in Medicare and Medicaid transfers reflects an increase in the generosity of the benefits, but also the rise in the price of health services provided by Medicare and Medicaid—possibly above what people would be willing to pay on a private market. See, for example, A. Finkelstein, N. Hendren, and E. F. P. Luttmer, "The Value of Medicaid: Interpreting Results from the Oregon Health Care Experiment," NBER Working Paper no. 21308, National Bureau of Economic Research, June 2015, http://www.nber.org/papers/w21308.pdf—and perhaps an increase in the economic surplus of health providers in the medical and pharmaceutical sector.

12 In turn, most of the growth of the post-tax income of the elderly Americans in the *bottom 50%* has been due to the rise of health benefits. Without Medicare and Medicaid (which cover nursing home costs for poor elderly Americans) average post-tax income for the bottom 50% seniors would have stagnated at $21 000 since the early 2000s, and would have increased only modestly since the early 1980s when it was around $15 500.

15 The US Congressional Budget Office also finds an increase by about 4–5 points in the federal tax rate of the top 1% from 2011 to 2013. US Congressional Budget Office, "The Distribution of Household Income and Federal Taxes, 2013," US CBO Report, June 2016, Congress of the United States, Washington DC, https://www.cbo.gov/sites/default/files/114th-congress-2015–2016/reports/51361-householdincomefedtaxes.pdf.

16 In keeping with the national accounts conventions, the nonrefundable portion of tax credits and tax deductions are treated as negative taxes, while the refundable portion of tax credits are seen as transfers. Subsequently, nobody can have negative income taxes.

17 This general periodization is relatively well known and has been studied elsewhere (see in particular. See T. Piketty, "Income Inequality in France, 1901–1998," *Journal of Political Economy* 111, no. 5 (2003): 1004–1042; and Piketty, *Capital in the Twenty-First Century.*

18 See Piketty, "Income Inequality in France, 1901–1998," and Piketty, *Capital in the Twenty-First Century.*

19 See Piketty, *Capital in the Twenty-First Century*, ch. 9 in particular.

20 T. Piketty, E. Saez, and S. Stantcheva, "Optimal Taxation of Top Labor Incomes: A Tale of Three Elasticities," *American Economic Journal: Economic Policy* 6, no. 1 (2014): 230–271.

21 A. Bozio, R. Dauvergne, B. Fabre, J. Goupille, and O. Meslin. "Fiscalité et redistribution en France, 1997–2012", Rapport IPP, 2012. See in particular p.28 for tax rates on primary incomes (before pensions and unemployment insurance) and p.30 for tax rates on secondary incomes (including pensions and unemployment insurance). In the former case, tax rates at the top are lower than for any other income group. In the latter case, tax rates are lower for the bottom 50% than for the richest, but the middle class has a higher total tax rate than the top 0.1%.

22 T. Ferguson and H.-J. Voth, "Betting on Hitler: The Value of Political Connections in Nazi Germany," *Quarterly Journal of Economics* 123, no. 1 (2008): 101–137.

23 T. Piketty, L. Yang, and G. Zucman, "Capital Accumulation, Private Property and Rising Inequality in China, 1978–2015," NBER Working Paper no. 23368, National Bureau of Economic Research, June 2017, http://www.nber.org/papers/w23368.pdf.

24 Comparing the paper's inequality series to the official survey-based estimates highlights that although the trends are similar in both calculation methods, the data used in Piketty, Yang, and Zucman, "Capital Accumulation," shows both a much larger level and rise in inequality over the period. Most of the difference between these estimates comes from the use of high-income tax data.

25 In particular, the lack of national data on high-income taxpayers since 2011 forces the authors to apply the 2006–2010 average correction factors to years 2011–2015 (in effect making it impossible to detect a possible rebound of inequality since 2011).

26 See R. Kanbur, Y. Wang, and X. Zhang, "The Great Chinese Inequality Turnaround," ECINEQ WP 2017-433, Society for the Study of Economic Inequality (ECINEQ), April 2017, http://www.ecineq.org/milano/WP/ECINEQ2017-433.pdf; and R. Garnaut, L. Song, C. Fang, and L. Johnston, "Domestic Transformation in the Global Context," in *China's Domestic Transformation in a Global Context*, ed. L. Song, R. Garnaut, C. Fang, and L. Johnston, 1–16 (Acton, Australia: Australian National University Press, 2015).

27 As a result, the middle 40% income share is now similar in China to urban China: the top 10% income share is higher in China than in urban China, while the bottom 50% income share is lower, leaving the share of the middle 40% at about 43%–44% in both cases in recent years.

28 The Western European average referred to is the simple arithmetic average of per-adult income in Germany, France, and Britain. Note that using the Western European average income as a reference point is clearly an oversimplification and does not do justice to the complexity of country-specific trajectories. For example, Germany, France, and Britain have quasi-identical average incomes in 2016, but Britain lagged behind Germany and France in 1980 (only slightly above Russian level), and was well ahead in 1870–1914.

29 The best indicator of the mediocre Soviet economic and social performance in the postwar decades is perhaps the stagnation of life expectancy. See, for example, E. Todd, *The Final Fall: An Essay on the Decomposition of the Soviet Sphere*, trans. J. Waggoner (New York: Karz, 1979).

30 See, for example, B. Milanovic, *Income, Inequality, and Poverty during the Transition from Planned to Market Economy* (Washington, DC: World Bank, 1998).

31 See J. Nellis, "Time to Rethink Privatization in Transition Economies?" *Finance and Development* 36, no. 2 (1999): 16–19.

32 In 1995, the government of Boris Yeltsin adopted a "loans-for-shares" scheme, whereby some of the largest state industrial assets were leased through auctions for money lent by commercial banks to the government. The auctions were thought by many to have been rigged and lacked competition, being largely controlled by favored insiders with political connections or used for the benefit of the commercial banks themselves. Since neither the loans nor the leased enterprises were returned in time, this effectively became a form of selling, or privatizing, state assets at very low prices. See I. W. Lieberman and D. J. Kopf, eds., *Privatization in Transition Economies: The Ongoing Story* (Amsterdam: Elsevier JAI, 2008).

33 See J. Flemming and J. Micklewright, "Income Distribution, Economic Systems and Transition," in *Handbook of Income Distribution*, ed. A. B. Atkinson and F. Bourguignon,843–918 (Amsterdam: Elsevier, 2000).

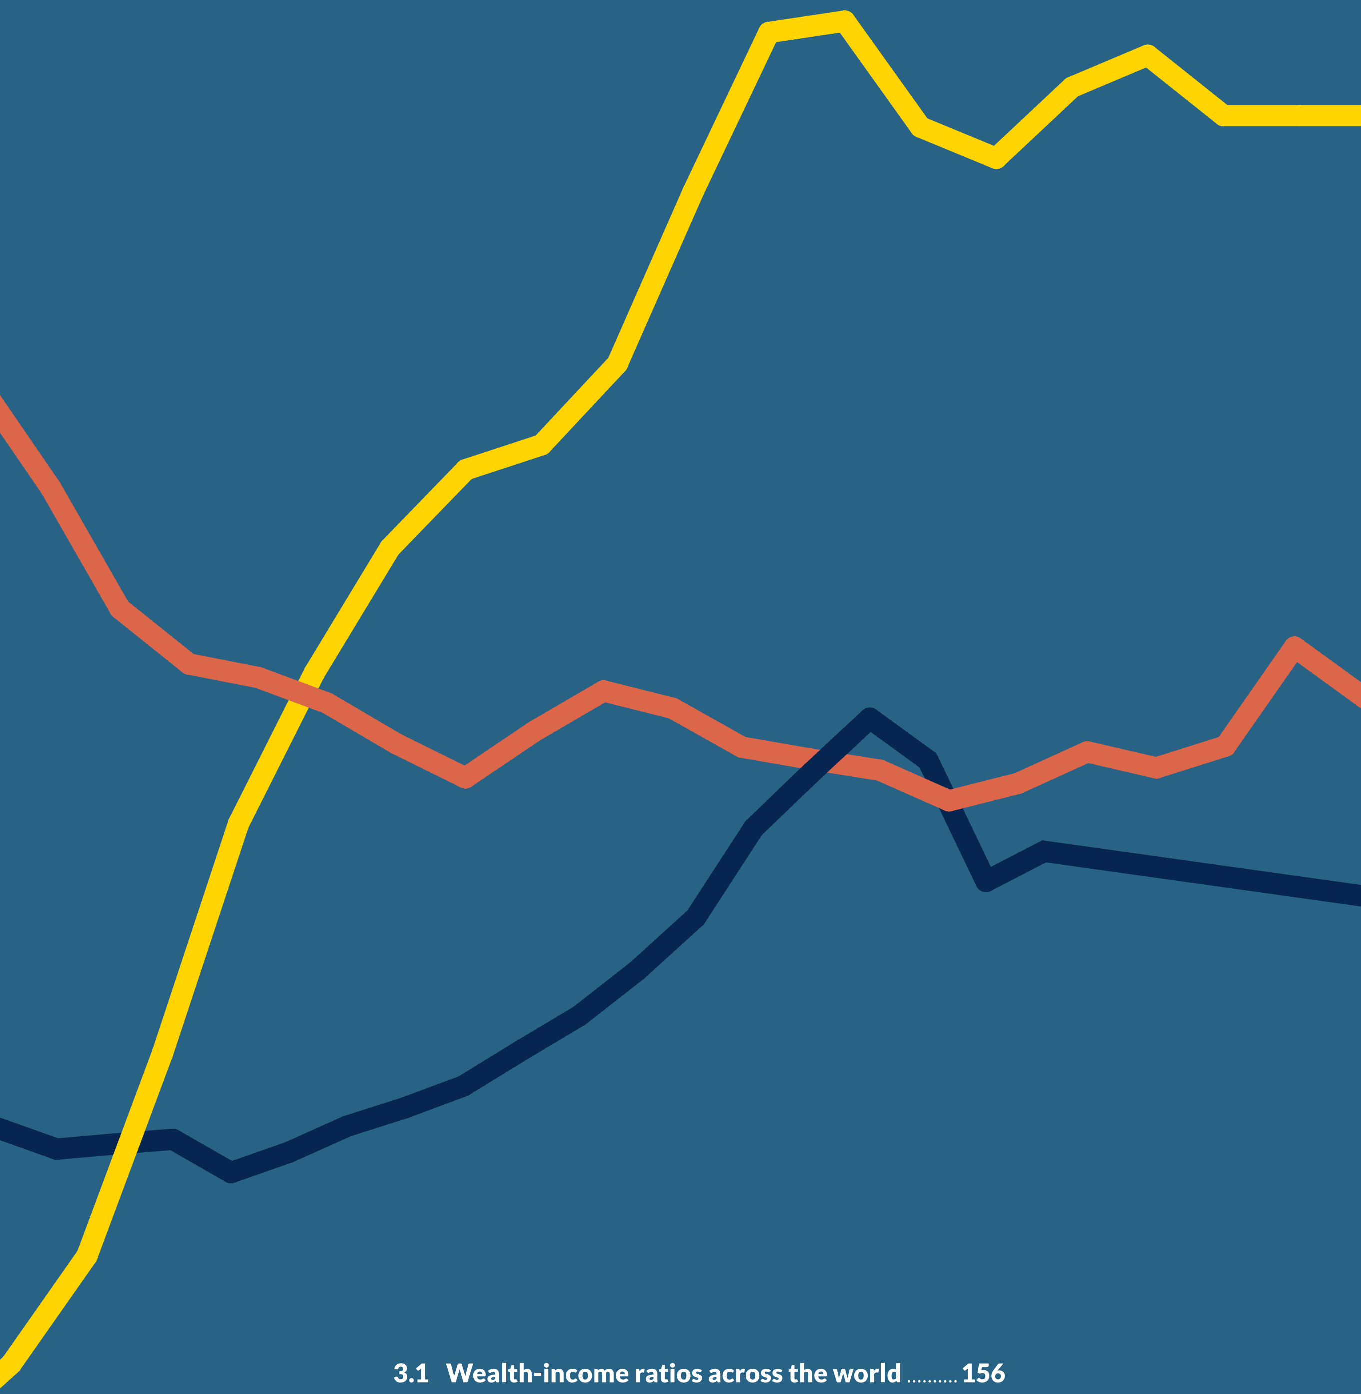
PART III

PUBLIC VERSUS PRIVATE CAPITAL DYNAMICS



3.1

WEALTH-INCOME RATIOS ACROSS THE WORLD

- Analyzing the composition of an economy's national wealth, between assets that are privately and publicly owned, is a prelude to understanding the dynamics of wealth inequality among individuals. New data have allowed us to better comprehend the evolution of countries' wealth-income ratios and can help answer crucial policy questions.
- A general rise in the ratio between net private wealth and national income has been observed in nearly all countries in recent decades. It is striking to see that this long-run finding has largely been unaffected by the 2008 financial crisis, or by asset price bubbles in countries such as Japan and Spain.
- There have been unusually large increases in the ratios for China and Russia, which have quadrupled and tripled, respectively, following their transition from a communist- to a capitalist-oriented economy. Private wealth-income ratios in these countries are approaching levels observed in France, the UK, and the United States.
- Public wealth has declined in most countries since the 1980s. Net public wealth (public assets minus public debts) has even become negative in recent years in the United States and the UK, and is only slightly positive in Japan, Germany, and France. This arguably limits government ability to regulate the economy, redistribute income and mitigate rising inequality.
- In China, public property largely declined but remains at a high level today: net public wealth has stabilized at about 30% of national wealth since 2008 (as compared to 15%–25% in the West during the mixed-economy 1950–1980 period).
- The only exceptions to the general decline in public property seen in the data are oil-rich countries with large public sovereign funds, such as Norway.
- The structural rise of private wealth-income ratios in recent decades is due to a combination of factors including high saving rates and growth slowdowns (volume factors), the increase of real estate and stock prices (relative asset price factors), and the transfer of public wealth to private wealth (institutional factors), described in the next chapters.

New data have allowed us to better understand the relationship between wealth and inequality

Understanding how the level and structure of national wealth have evolved in the long run is one of the most fundamental economic questions. National income is a "flow" concept: it is defined as the sum of all income flows produced and distributed in a given country during a given year; it can also be broken down between the remuneration of labor and capital. National wealth, on the other hand, is a "stock" concept: it is defined as the sum of all assets—in particular housing, business, and financial assets, net of debt—that were accumulated in the past. The relationship between national wealth and national income can inform us about a number of key economic, social, and political evolutions, including the relative importance of capital in an economy and the structure of ownership.

Before we look at distribution of private wealth (that is, what share of private wealth is owned by the bottom 50% of the population, the top 10%, and so on), it is critical to better understand the evolution of total private wealth, and how it compares to public wealth and to total national wealth—which by definition is equal to the sum of private and public wealth. It is also important to keep in mind that the very notions of private property and public property can have very different meanings depending on the country or the period considered. For instance, private property in land or housing can take very different forms, depending on the extent of tenant rights, the length of their tenures, the ability of landlords to change their rents or expel them unilaterally, and so forth. In a similar way, corporate property may not have the same meaning when workers' representatives hold substantial voting rights in corporate boards (such as in Nordic countries or Germany) as in countries where shareholders control all voting rights.

Also, public property in China today is a different reality from public property in this country forty years earlier, or in the context of Norway's public sovereign fund today, and so on. Understanding the details of the legal, political, and governance system is important to understanding the interplay between property structure and power relations between social groups. The study of private and public wealth cannot be limited to the analysis of trends and levels; it must be grounded in a deeper understanding of the countries' institutions and how these affect political and social inequality, as well.

Studying the evolution of national wealth-national income ratios can also help improve our knowledge on the structure of wealth, savings, and investment and thus can be used to study fundamental macroeconomic questions. These questions include: What are the long-run dynamics and prospects regarding the evolution of public debt? And what are the patterns of net foreign asset positions? In order to properly analyze these issues, it is critical to look at the entire national balance sheet—that is, the overall structure of who owns what. Public debt or foreign assets are not owned by the planet Mars; by definition, they belong to private or public property owners. Monitoring the evolution of capital accumulation and the composition of private assets, for example, can also help identify potential signs of instability in an economy. Indeed, in the cases of Japan and Spain, wealth-income ratios reached historical highs in 1990 and 2008, respectively, as both countries experienced asset market bubbles.

Until recently it was difficult to fully get to grips with such dynamics because of a lack of data. Thomas Piketty and Gabriel Zucman have recently presented harmonized annual series of wealth-income ratios for the eight largest rich economies in the world from 1700 onwards.[1] These series have also been discussed in *Capital in the Twenty-First Century* and in the ensuing debates on the return to a patrimonial society.[2]

Their work has been extended by other researchers. The WID.world database now contains data on more than twenty countries, which we discuss in this report. In particular, we currently have series on the structure of private and public wealth in a number of emerging and ex-communist economies, which are able to provide new insights on crucial public policy issues.

We should stress, however, that this is an area where we still need to make a lot of progress. In particular, we still know far too little about the structure of public, private, and foreign ownerships in many areas of the developing and emerging world, particularly in Africa, Latin America, and Asia.

Private wealth-income ratios have risen remarkably since the 1970s

In 1970, private wealth-national income ratios ranged from around 200%–350% in most developed countries (see **Figure 3.1.1** and **Figure 3.1.2**). The past four decades saw a sharp rise in these ratios in all countries. By 2007, the year in which the global financial crisis began, private wealth-national income ratios in the countries observed averaged 550%, peaking at 800% in the extreme case of Spain. Despite the fall in these ratios in some of the countries following the financial crisis and the decline in housing prices, the multi-decade trend seems to have been largely unaltered. By 2016, the market value aggregate private wealth—measured in years of national income—is typically twice as large in 2016 as in 1970.

There have, however, been interesting cross-country variations in magnitudes and levels. Within Europe, country trajectories have been roughly similar as net private wealth rose from 250–400% of net national income in 1970 to 450–750% by 2016. Italy showed the most spectacular rise in its private wealth-to-income ratio, which approximately tripled from 250% in 1970 to over 700% in 2015, followed by the UK where the private wealth-national income ratio more than doubled, from approximately 300% to 650%, over the same forty-five years. France (from approximately 300% to more than 550%) followed a similar trajectory, though at a slightly lower order of magnitude, while this trend was also followed by Germany (from approximately 250% to 450%) and Spain (from about 400% to 650%) over the same period.

Outside of Europe, Australia and Canada demonstrated comparable evolutions in their private wealth-national income ratios to France, Italy, and the UK. Canada's private wealth more than doubled between 1970 and 2016, from around 250% of net national income to more than 550%, while Australia's rise was still significant but less striking, increasing from slightly less than 350% of national income to over 550%. In the United States, private wealth—relative to national income—rose by a half over the same time period, from less than 350% of national income to around 500%.

In Japan, the private wealth-income ratio also almost doubled over the time period (300% to almost 600%) and, like Spain, experienced enormous fluctuations as a result of its asset price bubble in the years leading up to 1990. In Japan, real estate and stock market prices rose dramatically from around 1986 as overly optimistic expectations regarding future economic fundamentals increased the value of the country's capital assets and sent its private wealth-national income ratio soaring to as much as 700% by 1990. But soon after the Nikkei stock market index had plummeted and the price of assets followed suit, leading to what was dubbed the "lost decade" and a 150-percentage-point fall in the wealth-income ratio by 2000. However, despite further falls, the wealth-income ratio remained one of the highest among the rich countries. As explained in detail in chapter 4.6, Spain has followed a similar trend since the bursting of the country's asset price bubble, with its wealth-to-income ratio falling by around 150 percentage points from its peak in 2007 to approximately 650% in 2014.

Thanks to recent research that has been completed on some of the world's largest emerging economies, it is now also possible

Figure 3.1.1

Net private wealth to net national income ratio in rich countries, 1970–2016

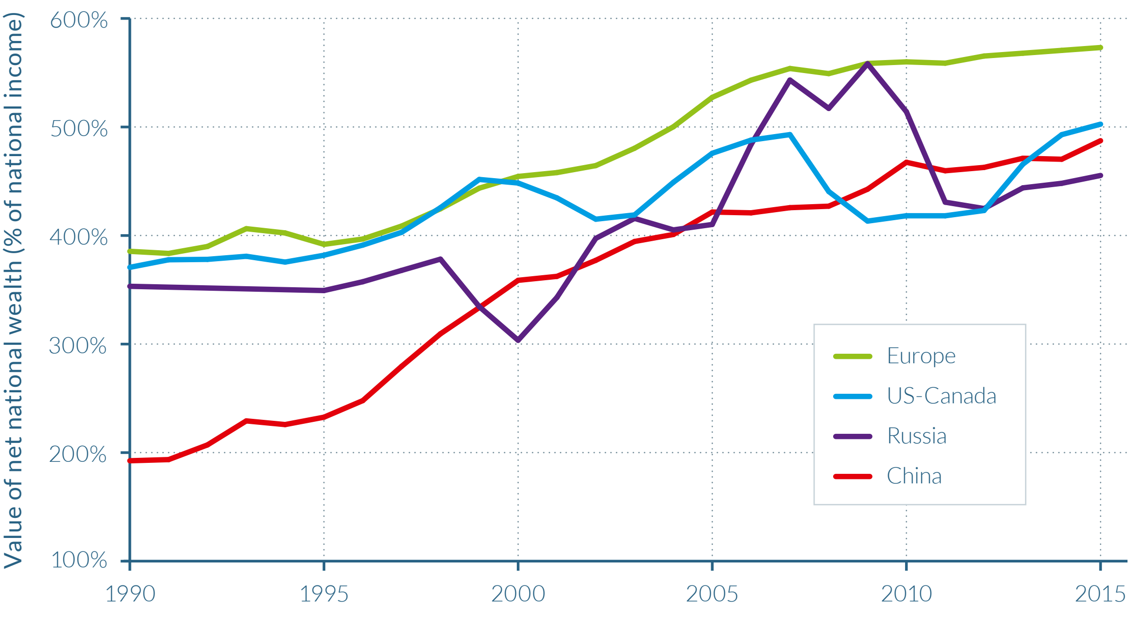
In 2015, the value of net private wealth in the UK was 629% of net national income, i.e. it was worth 6.3 years of national income. Net private wealth is equal to private assets minus private debt. Net national wealth is equal to net private wealth plus net public wealth.

Figure 3.1.2

Net national wealth to net national income ratio in emerging and rich countries, 1990–2015



Source: WID.world (2017). See wir2018.wid.world for data series and notes.

In 2015, the value of net national wealth in China was 487% of net national income, i.e. it was worth 4.9 years of national income. Net national wealth is equal to net private wealth plus net public wealth. Net private wealth is equal to new private assets minus net private debt.

to compare how these countries' wealth-income ratios have evolved. This is particularly interesting given the changes in political and economic regimes experienced in the emerging world over the period considered. As depicted in **Figure 3.1.2**, China and Russia both experienced large rises in their private wealth-income ratios after their transitions away from communism. While to some extent these increases are to be expected (as a large proportion of public wealth is transferred to the private sector), the scale of change experienced is particularly striking in China. The comparison with the trajectories observed in developed countries is also of particular interest (about which more will be said below).

At the time of the "opening-up" policy reforms in 1978, private wealth in China amounted to just over 110% of national income, but by 2015, this figure had reached 490%, following almost unrelenting rises. Russia's transition began twelve years later in 1990, but the change since has been no less spectacular. Over this shorter period of time, Russia's private wealth-income ratio more than tripled from around 120% to 370%. It is interesting to compare these changes with those in Europe and North America, described above, as China's ratio is only just below that of the United States, and Russia is not a long way behind, either. Furthermore, the speed and scale of the change in these emerging economies far surpasses that seen in rich countries. By way of comparison, the only time the UK or the United States experienced a similar magnitude of change in wealth-income ratios followed their huge falls at the beginning of the twentieth century.

Rising national wealth-to-income ratios in recent decades come exclusively from the rise of private wealth

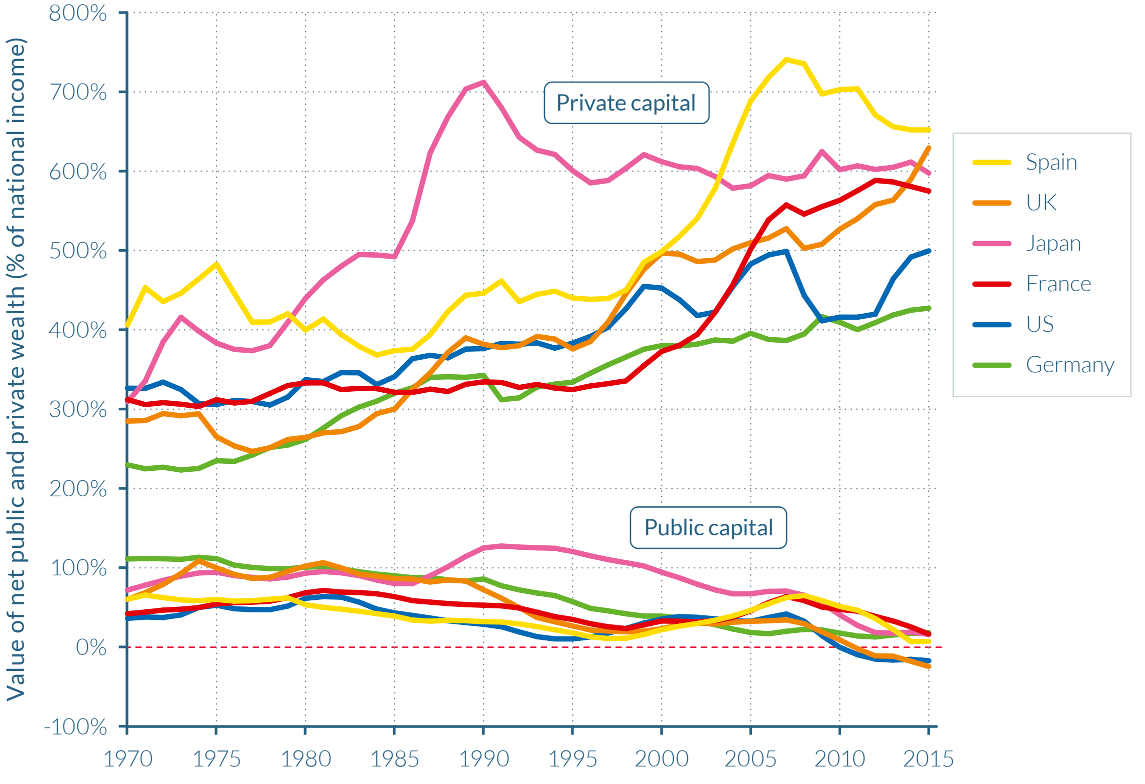
From **Figure 3.1.3** it quickly becomes clear that the recent upward trend in national wealth-to-income ratios has exclusively been the result of private wealth accumulation. Indeed, in the UK and the United States, national wealth consists entirely of private wealth, as net public wealth has become negative (that is, public assets are now below public debt). France, Japan, and Germany have also experienced a significant decline in public wealth, which is now worth just about 10–20% of national income according to official estimates—that is, a very tiny fraction of total national wealth. The domination of private wealth in national wealth represents a marked change from the situation which prevailed in the 1970s, when net public wealth was typically between 50% and 100% of national income in most developed countries (and over 100% in Germany). Today, with either small or negative net public wealth, the governments of developed countries are arguably limited in their ability to intervene in the economy, redistribute income, and mitigate rising inequality. (More on this will be said below.)

In practice, the decline in net public wealth in recent decades is mostly due to the rise of public debt, while the ratios of public assets to national income have remained relatively stable in most countries (see **Figures 3.1.4a** and **3.1.4b**). The relative stability of public assets—relative to national income—can be viewed as the consequence of two conflicting effects: on the one hand, a significant fraction of public assets were privatized (particularly shares in public or semi-public companies, which used to be relatively important in a number of developed countries between the 1950s and the 1970s); on the other hand, the market value of the remaining public assets—typically public buildings hosting administrations, schools, universities, hospitals, and other public services—has increased over this time period.

China and Russia provide two contrasting examples of how private-wealth-to-national-income ratios have evolved, relative to the aforementioned countries, for which the privatization strategies chosen by the two countries play an integral role. (This is further analyzed in chapters 3.2 through 3.4.) The gradual process of privatization of public

Figure 3.1.3

Net private wealth and net public wealth to national income ratios in rich countries, 1970–2015



Source: WID.world (2017). See wir2018.wid.world for data series and notes.

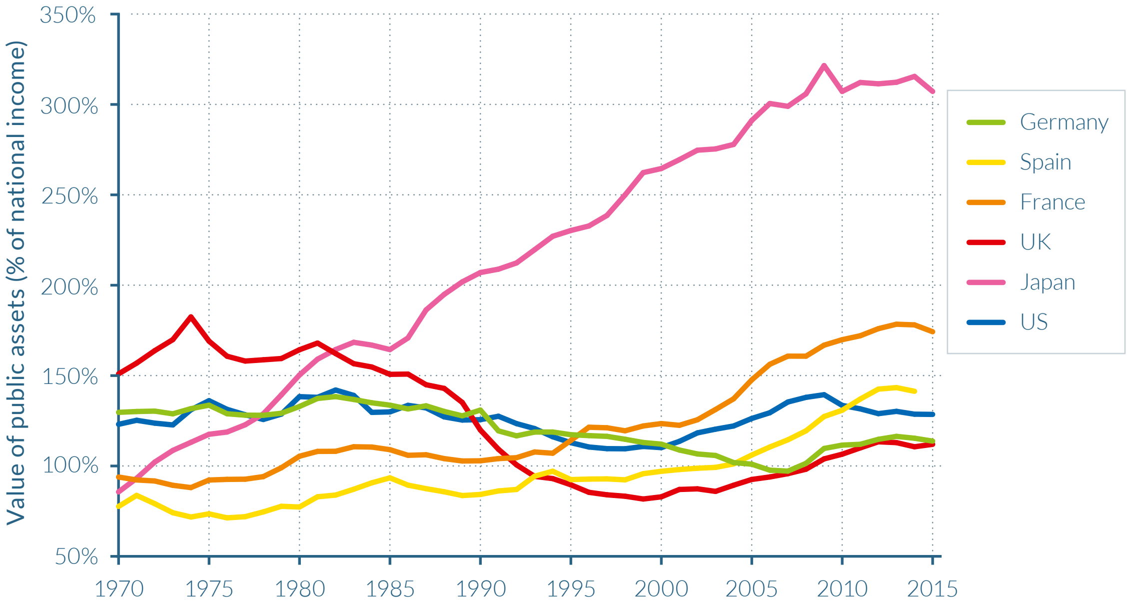
In 2015, the value of net public wealth (or public capital) in the US was negative (-17% of net national income) while the value of net private wealth (or private capital) was 500% of national income. In 1970, net public wealth amounted to 36% of national income while the figure was 326% for net private wealth. Net private wealth is equal to new private assets minus net private debt. Net public wealth is equal to public assets minus public debt.

wealth in China led to a slight over-fall in the value of public wealth as a proportion of national income, from just over 250% of national income in 1978 to approximately 230% in 2015, in a context of rapidly rising asset prices. In Russia, the voucher privatization strategy chosen aimed to transfer public assets into the private sector as quickly as possible, and subsequently had the effect of reducing the net public wealth to national income ratio enormously, from over 230% of national income in 1990 to around 90% in 2015.

The dominance of private wealth over public wealth within countries is further highlighted by their relative shares in national wealth. As depicted by **Figure 3.1.5**, all observed countries (with the exception of Norway) have seen a decline in the value of public property relative to private property. In the late 1970s, the share of net public wealth in net national wealth was positive and substantial in all developed countries: it was as large as 25% in countries including Germany and Britain, and 15% in Japan, France, and the United States. By 2016, the share of public wealth has become negative in Britain and the United States, and is only marginally positive in Japan, Germany and France. In China, the share of public wealth was as large as 70% in 1978, and seems to have stabilized around 30% since 2008—a level that is somewhat larger (but not incomparable) to that observed in Western countries during the mixed-economy period of the 1950s–1970s.

Figure 3.1.4a

Public assets to net national income ratio in rich countries, 1970–2015



Source: WID.world (2017). See wir2018.wid.world for data series and notes.

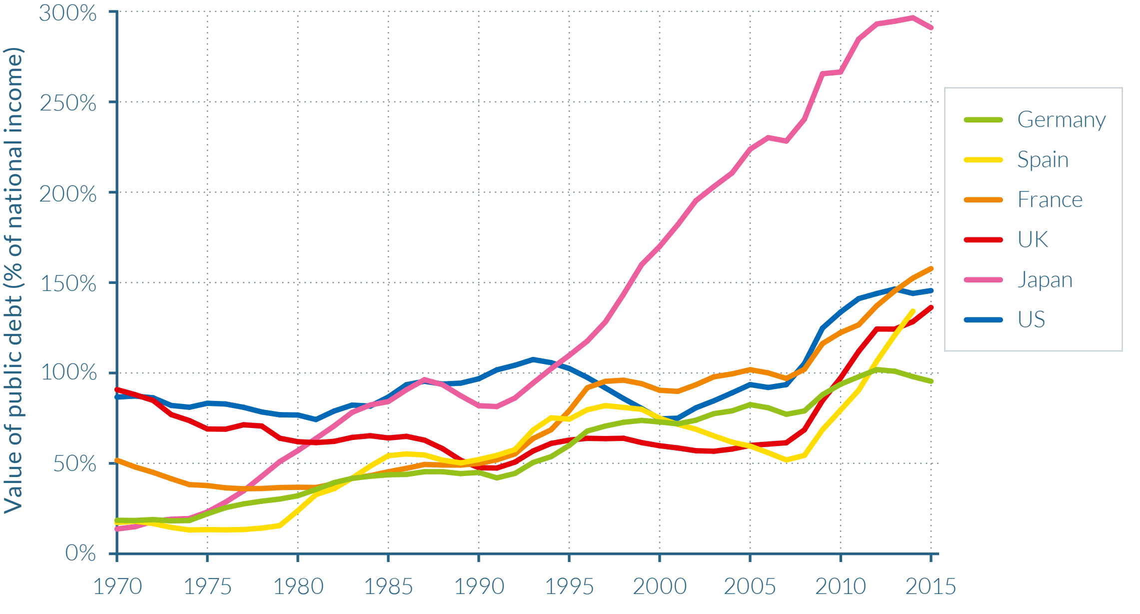
In 2015, the value of public assets in Germany was 114% of net national income, i.e. it was worth 1.1 years of national income.

Norway, along with some other resource-rich countries, is unique in this sense, using its large sovereign investment fund to invest in projects that can increase the wealth of the state. Following oil and gas discoveries in 1969, the Norwegian government established a Global Pension Fund in the 1990s to invest a proportion of the revenue earned from these nonrenewable energy sources and ensure that the benefits from North Sea oil production accrued not just to the current generation, but also to future generations. This is seen as an important instrument of economic policy in Norway to support government saving, finance public expenditure, and wealth accumulation. As a result, the share of public wealth within total national wealth rose from around 30% in 1978 to almost 60% by 2015 as the value of public wealth rose to roughly 300% of national income (considerably greater than in China's in relative terms).

There are two interesting comparisons to be made here that illustrate the importance of political institutions and ideologies in determining national wealth-to-income ratios. To summarize, it's not only a question of oil—it depends on what the government decides to do with public wealth and with the economy. The first comparison is with Russia. Despite accumulating similar trade surpluses in relative terms to Norway—equal to around 200% of national income—according to official statistics, Russia has been unable to accumulate large foreign assets, and instead a significant proportion of these surpluses are estimated to be held in offshore assets and thus cannot be taxed or used for government expenditure (unlike in Norway). The second comparison is with the UK, given that it also was able to benefit from North Sea oil. In his book *Inequality, What Can Be Done?*, Anthony Atkinson poses a thoughtful question.[3] "It is an interesting piece of conjectural history," he writes, "to ask what would have happened if the UK had created such a fund in 1968 and had spent only the real return" in a similar way to Norway.[4] Atkinson goes on to show that

Figure 3.1.4b

Public debt to net national income ratio in rich countries, 1970–2015

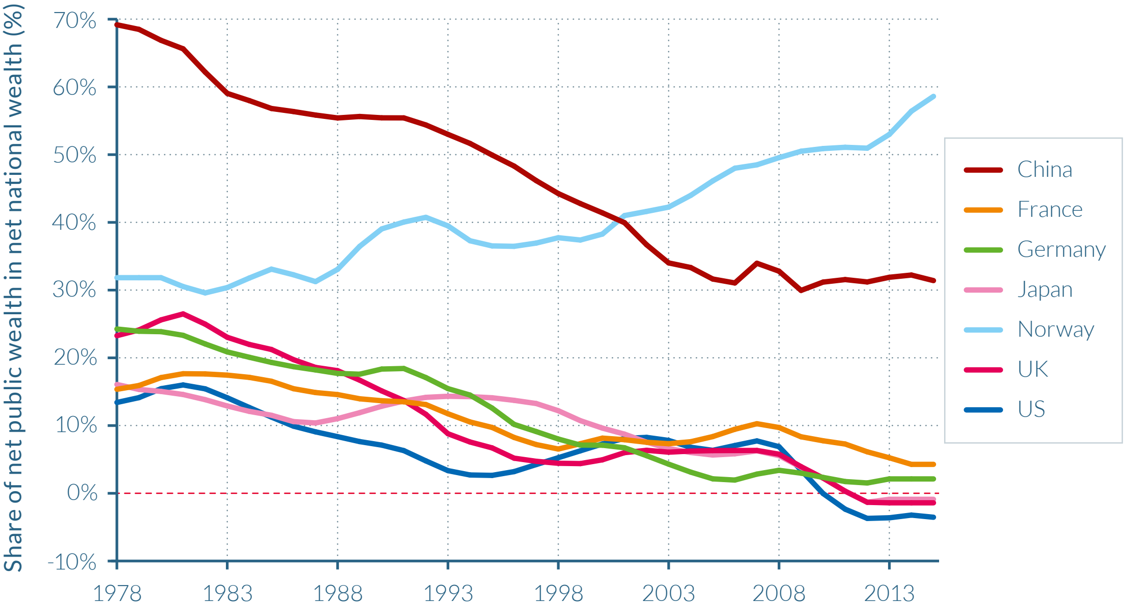


Source: WID.world (2017). See wir2018.wid.world for data series and notes.

In 2015, the value of public debt in the US was 146% of net national income, i.e. it was worth 1.5 years of national income.

Figure 3.1.5

The share of public wealth in national wealth in rich countries, 1978–2015



Source: Piketty, Yang and Zucman (2017). See wir2018.wid.world for data series and notes.

In 2015, the share of public wealth in national wealth in France was 3% against 17% in 1980. Net public wealth is equal to public assets minus net public debt. Net national wealth is equal to net private wealth plus net public wealth.

the accumulated fund for the UK would have been very considerable (some £350 billion), or about 60% of the Norwegian fund. As the UK is a larger country, the fund would have represented a smaller percentage of national income, but nevertheless, the fiscal cushion would have enabled the UK's net worth to be positive in rather than negative today.

Recent evolutions in wealth-income ratios are likely the result of economic policy decisions and country-specific contexts

The following chapters provide a more detailed analysis of why wealth-income ratios developed as described above in developed countries since the 1970s (chapter 3.2), and in China and Russia since their respective transitions away from communist-dominated economic and political models (chapter 3.3).

In summary, the structural rise of private wealth-income ratios in recent decades has been due to a combination of factors. High saving rates and growth slowdowns (volume factors) were responsible for approximately 60% of the increase in national wealth-income ratios in the rich countries observed, while rises in real estate and stock prices (relative asset price factors) represented the remaining 40%. The transfer of public wealth to private wealth (institutional factors) is critical to understanding the evolution of private wealth-income ratios in China and Russia, but also in developed countries that underwent large privatization exercises (generally in the mid-1980s), though on a much smaller scale.

Since the financial crisis, trends in wealth-income ratios have varied between countries, underlining the importance of institutional and country-specific contexts. Wealth-income ratios dipped in all of the observed countries following the crisis, suggesting short-term capital losses were experienced as a result of falling asset prices, as evidenced by lower house prices and stock market indices across countries from 2008. The size, speed, and timing of the fall and subsequent recovery in ratios—which occurred to some extent in all but two countries for which data are available (Japan and Spain)—vary significantly, again highlighting how individual country circumstances can substantially affect the wealth-income ratio. For example, the fall in ratios in Spain (down 150%), and the United States (down 140%) are likely to have been larger than in other countries due to overinflated prices for stocks and property assets that helped to create the emergence of these bubbles in the first place (see chapter 4.5 in particular).

3.2

THE EVOLUTION OF AGGREGATE WEALTH-INCOME RATIOS IN DEVELOPED COUNTRIES

- National savings and economic growth and asset prices are key to understanding how national wealth has evolved in the long run. National savings and growth account for about 60% of the rise in national wealth in rich countries, while asset prices account for the remaining 40%.
- The rise in housing largely drove domestic capital accumulation since the late 1970s, with significant variations across countries.
- External wealth has played an important role in the general evolution of wealth-income ratios.
- Today's private wealth-national income ratios in rich countries appear to be returning to the high values observed in the late 19th century, which were as high as 600%–700%

National savings, economic growth, and asset prices are key to understanding how national wealth-income ratios have evolved in the long run

In order to properly analyze the evolution of national wealth-national income ratios and the structure of property, we need to combine a large number of complex explanatory factors and processes.

First, for a given level of national wealth, the division between private and public wealth is largely a consequence of government policies. If the government in Russia or China decides to privatize public assets—typically below market prices—then the share of private wealth will mechanically increase. More generally, if a government decides to run fiscal surpluses in order to accumulate public assets (and/or nationalize private assets, sometimes below or sometimes above market prices, depending on the historical and ideological context), then other things being equal, the share of public wealth will rise. If a government runs fiscal deficits and finances its deficits by issuing public debt or privatizing public assets, then the share of public wealth will decline.

In the case of developed countries, the combination of public policies (fiscal deficits, privatization of public assets, and expansion of public debt) followed since the 1970s led to a reduction of the share of public wealth from around 20% of national wealth in the 1970s (between 15% and 25%, depending on the specific country) to about 0% (or slightly negative levels) by 2016 (see **Figure 3.1.5**). If different fiscal and regulation policies had been followed, and if the public share in national wealth had remained at the same level as in the 1970s, then by definition the level of private wealth would be about 20% lower in 2016 than what it actually was (other things equal, that is, for a given level of national wealth). In that sense, the decline in public wealth explains a very large fraction of the overall rise in private wealth–national income ratios.

The other issue is to understand the evolution of national wealth–national income ratios. Here one needs to consider the interplay between the level of national savings (the sum of public and private saving), the level of economic growth (itself determined by population and productivity growth), and the evolution of relative asset prices. More precisely, following the work by Piketty and Zucman (2014), one can decompose the evolution of national wealth-national income ratios into two components: volume effects and price effects.

Volume effects are largely determined by the evolution of national savings: the higher the level of national savings, the larger the accumulation of national assets and hence national wealth. They also depend on the level of growth: for given savings, a lower population and/or productivity growth will tend to raise the ratio of national wealth to national income (simply because national income is lower). In sum, countries with high savings and low growth (for example, because of demographic stagnation, as in Japan and large parts of Europe) naturally tend to accumulate high national wealth–national income ratios.[5]

Price effects are determined by the evolution of asset prices—in particular, housing and equity prices—relative to consumer prices. This in turn depends on a number of institutional and policy factors—for example, the gradual lift of rent control contributed to the large increase in housing prices over the period—as well as on the patterns of saving and investment strategies. For example, if the aging households in Japan or Europe choose to invest a large proportion of their savings in domestic assets including real estate (and do not, or cannot, diversify their portfolio internationally as much as would have been possible) then it is perhaps not too surprising that high upward pressure is generated on housing prices.

By combining systematic data series on the patterns of saving, investment, and economic growth in developed countries since 1970, one can show that both volume and price effects have played a significant role. For example, looking at the eight largest developed economies, one finds that about 60% of national wealth accumulation between 1970 and 2010 can be attributed on average to volume effects, versus about 40% to price effects. It is worth noting, however, that there are very large cross-country variations. For instance, volume effects explain 72% of the accumulation of national wealth in the United States between 1970 and 2010, while residual capital gains explain 28%. Similar to the United States, new savings also appear to explain around 70–80% of national wealth accumulation in Japan, France, and Canada between 1970 and 2010, while residual capital gains accounted for the remaining 20–30%. Capital gains were larger, however, in Australia, Italy, and the UK, where they accounted for more than 40%–60% of the increase in wealth. In the UK, more than half of the country's growth in wealth (58%) over the period was attributable to improvements in asset prices. On the contrary, asset prices were reduced over the period in Germany so savings accounted for all the rise in in national wealth—while capital gains actually moderated this rise.[6]

Our new extended series confirm these general findings. In particular, following the 2008 financial crisis, we observe very different patterns of asset price adjustments. For example, housing prices fell substantially in the United States and Spain (more on this below), and much more moderately in the UK and France. The general conclusion, however, is that the decline in asset prices observed in some countries in recent years is relatively small as compared to the long-run rise in relative asset prices observed since 1970.

What explains these important long-run capital gains in most countries identified in the data? To some extent, the capital gains made in the housing and stock markets since the 1970s–1980s can be understood as the outcome of a long-run asset price recovery. Asset prices fell substantially during the 1910–1950 period mainly due to low savings rates and negative valuation effects (including losses on foreign portfolios) and have been rising regularly ever since 1950. There might, however, have been some overshooting in the recovery process, particularly in housing prices. This could be explained by the kind of home portfolio bias described above.

Germany was the one interesting exception to the general pattern of positive capital gains. Given the country's relatively large saving flows, one would expect to observe a higher national wealth-income ratio than the 430% recorded in 2015. According to estimates that include research and development expenditure in saving flows, "missing wealth" in Germany is of the order of 50%–100% of national income, suggesting that German statisticians may have either overestimated saving and investment flows, or underestimated the current stock of private wealth, or both. However, another possibility is that Germany had not experienced a long-run asset price recovery of the same magnitude as other countries because of the importance the German legal system places on the rights to control private assets by stakeholders other than private property owners. Rent controls, for example, may have prevented the market value of real estate from increasing as much as in other countries. Similarly, voting rights granted to employee representatives on corporate boards may reduce the market value of corporations. Germans may also not have the same preferences for expensive capital goods, especially housing, than the British, French, and Italians, perhaps the result of historical and cultural reasons that mean they favor living in a more polycentric country rather than one with a large centralized capital city.

Lastly, it is worth noting that when an average of wealth accumulation is computed for European countries as whole, capital gains and losses become less important as a factor in understanding gains in wealth-income ratios.[7] Europe overall experienced lower residual capital gains than in France, Italy, and the UK due to the impact of Germany. Had regional balance sheets for the United States been available, it is possible that decomposing wealth accumulations would reveal that regional asset price variations within the United States would not be too different from those found in Europe. Therefore, it is possible that substantial relative asset price movements can become permanent within relatively small national or regional economic units, but these effects tend to correct themselves at a larger scale.[8]

The rise in housing wealth largely drove domestic capital accumulation

The accumulation of housing wealth has played a large role in the total accumulation of domestic capital, but with significant variations between countries. In France, Italy, and the UK, the rise in domestic capital-national income ratios is almost entirely due to the rise of housing (**Table 3.2.1**). In Japan, housing represents less than half of the total rise of domestic capital—and an even smaller proportion of the total rise of national wealth, given the large accumulation of net foreign assets.

In most countries, other domestic capital goods have also contributed to the rise of national wealth, in particular because their market value has tended to increase. In particular, we can look at Tobin's Q ratios—a definition of the gap between the market and the book value of corporations.[9] These were much below 1 in the 1970s, meaning that the market value of wealth assets (that is, their price on the stock market) was considerably below their book value (that is, the value of assets based on the company's balance sheet account; their assets minus liabilities) and were closer to 1 (and at times above 1) in the 1990s–2000s. But there are again interesting cross-country variations. Tobin's Q was very low in Germany, remaining well below 1 (and typically around 0.5), contrary to values in the UK and the United States. One interpretation is the "stakeholder effect" described briefly above. Shareholders of German companies do not have full control of company assets—they share their voting rights with workers' representatives and sometimes regional governments—which might push a company's stock market value below its book value.[10] However, another possibility is that some of the variations in Tobin's Q reflect data limitations. Quite puzzlingly, indeed, in most countries Tobin's Q appears to be structurally below 1, although intangible capital is imperfectly accounted for, which in principle should push values above 1. Part of the explanation may be that the book value of corporations tend to be overestimated in national accounts.

External wealth has played an important role in the general evolution of wealth-income ratios

The above analysis of how wealth has been accumulated in rich countries does not differentiate whether wealth was accumulated domestically or abroad. National wealth can be viewed as the sum of domestic wealth and net foreign wealth—that is, foreign assets (assets owned by domestic residents in other countries) minus its gross foreign liabilities (domestic assets owned by residents from other countries). Reviewing the data on national and net foreign wealth for the 1970–2016 period indicates that net foreign wealth—whether positive or negative—has been a relatively small part of national wealth in rich countries throughout the 1970–2016 period (see **Figure 3.2.1**).

Despite net foreign assets representing a relatively small fraction of national wealth, external wealth has played an important role in the general evolution of wealth-income ratios. First, Japan and Germany accumulated sizable positive net foreign positions in the 1990s and 2000s, as these export-orientated economies generated large trade surpluses, and by 2015, the countries owned the equivalent of about 50% and 70% of national income in net foreign assets, respectively. Although Japan's and Germany's net foreign positions are still substantially smaller than the positions reached by France and the UK

Source: Piketty & Zucman (2014) and Estevez-Bauluz (2017). See wir2018.wid.world for data series and notes.

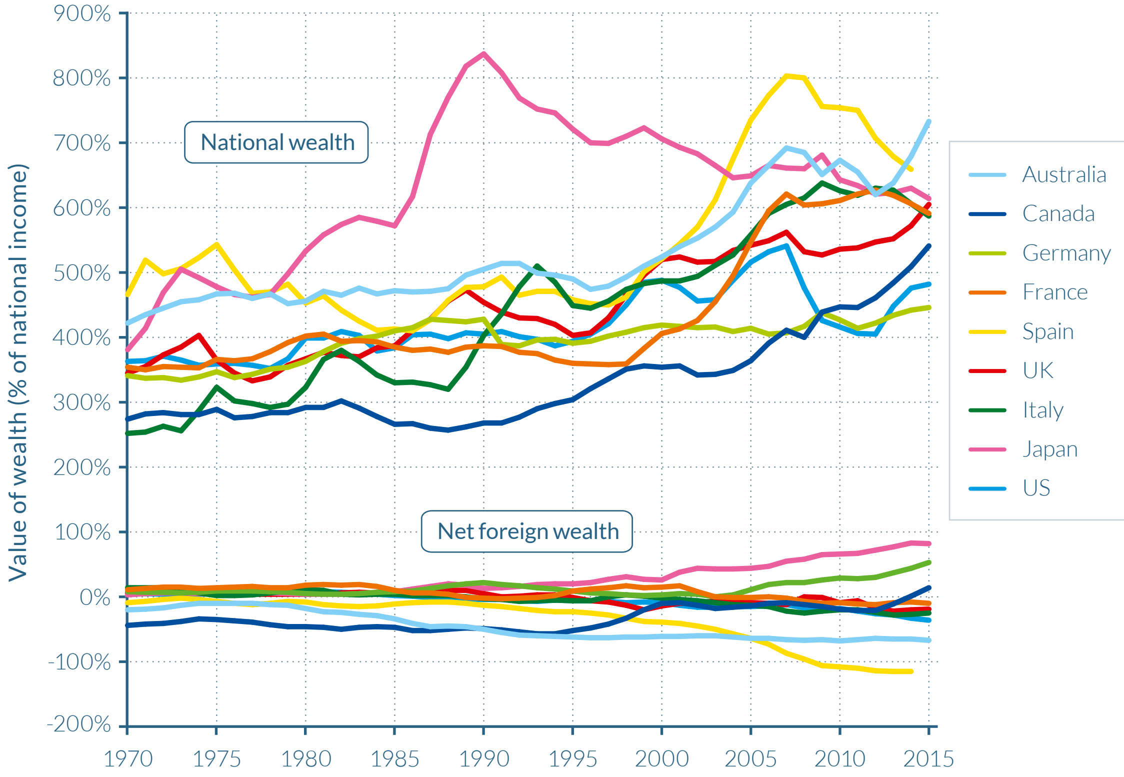
In 2015, the value of domestic capital in Italy was 612% of net national income, i.e. it was worth 6.1 years of national income. Domestic capital is the market-value of national wealth minus net foreign assets.

before the First World War, they have nonetheless grown to be substantial. As a result, the rise in net foreign assets represents more than a quarter of the total rise of the national wealth-national income ratios in the two countries. By contrast, most of the other rich nations exhibit net foreign positions which are negative—typically between -10% and -30% of national income—and which have generally declined over the period. One caveat to these official net foreign asset positions is that they do not include the sizable assets held by a number of developed country residents in tax havens. In all likelihood, including these assets would turn the rich world's total net foreign asset position from negative to positive, and this improvement would probably be particularly large for Continental Europe where 15% of the region's GDP is estimated to be held in offshore tax havens.[11] Chapter 3.4 and chapter 4.5 also provide estimations of offshore wealth in Russia and Spain, respectively.

Second, there has been a huge rise in the total amount of foreign assets owned by

Figure 3.2.1

Net national and net foreign wealth in rich countries, 1970–2015



Source: WID.world (2017). See wir2018.wid.world for data series and notes.

In 2015, the value of net national wealth in France was 591% of net national income (i.e. it was worth 5.9 years of national income), while the value of net foreign wealth was -10% of net national income. Net national wealth is equal to net private wealth plus net public wealth. Net foreign wealth is equal to all foreign assets held by national citizens minus all national assets held by foreign citizens.

countries since the 1970s, such that a significant share of each rich country's domestic capital is now owned by other countries. The rise in cross-border positions is significant everywhere, being spectacularly large in Europe, and a bit less so in the larger economies of Japan and the United States. One implication is that capital gains and losses on foreign portfolios can be large and volatile over time and across countries, and indeed foreign portfolios have generated large capital gains in the United States (but also in Australia and the UK) and significant capital losses in some other countries (Japan, Germany, France). Strikingly, in Germany, virtually all capital losses at the national level can be attributed to foreign assets. In the United States, net capital gains on cross-border portfolios represent one-third of total capital gains at the national level, and the equivalent of the total rise in the US national wealth-national income ratio since 1970.

Returning to the gilded age?

It is almost impossible to properly understand the rise of wealth-income ratios in developed countries in recent decades without putting the recent period into a longer historical perspective. As outlined above, a significant part of the rise of wealth-income ratio since 1970 is due to capital gains: about 40% on average, with large differences between countries. But the key question is: Were these capital gains due to a structural, long-run rise in the relative price of assets (caused, for example, by uneven technical progress), or was this a recovery effect that could have compensated for capital losses observed during earlier parts of the twentieth century?

Analyzing the evolution of wealth-income ratios over a further one hundred years reveals that capital gains experienced since 1970 were due to recovery effects. Because of historical data limitations, this long-term analysis is restricted to four countries—namely, France, Germany, the UK, and the United States. However, these countries indicate two clear patterns. For the three European countries, similar U-shaped patterns are evident, such that today's private wealth-national income ratios appear to be returning to the high values observed over the period 1870–1910, which were as high as 600%–700%.

In addition, European public wealth-national income ratios have followed an inverted U-curve over the past century. However, the magnitude of the pattern of public wealth accumulation is very limited compared to the U-shaped evolution of private wealth, meaning that European national wealth-income ratios are strongly U-shaped, too (see **Figure 3.2.2**). It can also be observed that at around the start of the twentieth century, European countries held a very large positive net foreign asset position, averaging around 100% of national income. Interestingly, the net foreign position of Europe has again turned (slightly) positive in 2000–2010, when the national wealth-income ratio again exceeded that of the United States.

Starting from this set of descriptive facts, and using the best historical estimates of saving and growth rates, it is also possible to estimate the relative contribution of savings and capital gains since 1870. This exercise shows that total accumulation of national wealth over this 140-year-long period appears to be well accounted for by saving flows. But in order to fully reconcile differences in private wealth-income ratios, small residual capital gains are required for France, the UK, and the United States, and a small residual capital loss for Germany. In all cases, however, saving flows account for the bulk of wealth accumulation: capital gains seem to wash out in the long run.

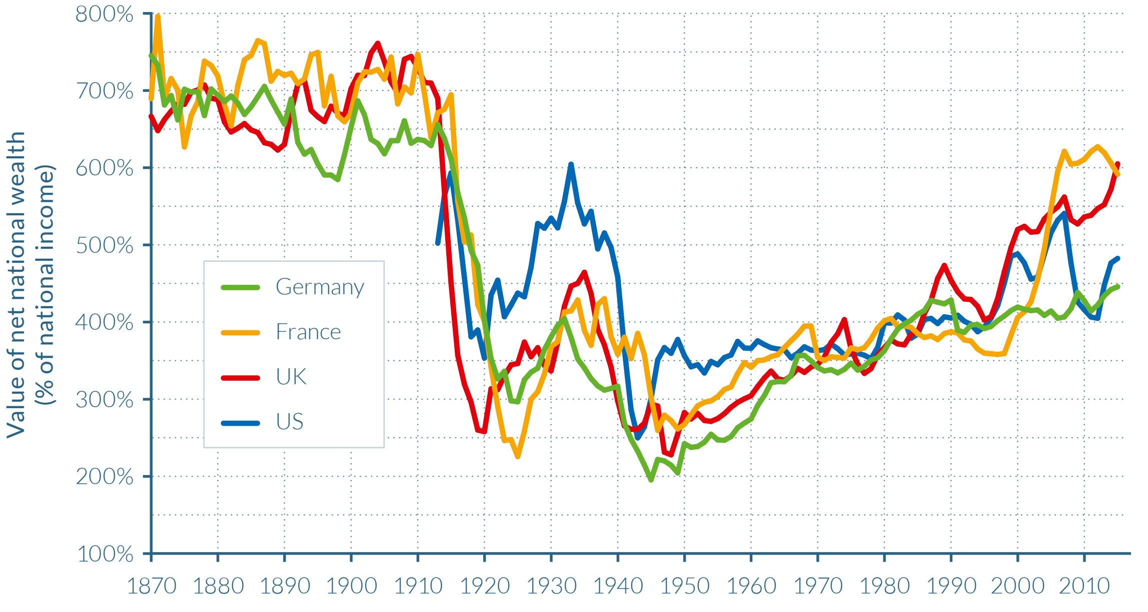
Dividing the analysis by sub-periods, it becomes clear that in every European country a strong U-shaped relative capital price effect was experienced. In the UK, for example, negative rates of real capital losses near -2% per year were experienced between 1910 and 1950, followed by real gains of approximately +1% per year between 1950 and 1980 and around 2.5% between 1980 and 2010.[12] France also exhibits similar patterns, and collectively the data for these two countries seem to illustrate a slight overshooting in the recovery process so that the total relative asset price effect over the 1910–2010 period appears to be somewhat positive. In Germany, by contrast, the recovery seems like it is yet to emerge, as the total relative asset price effect averaged close to -1% between 1910 and 2010.

This sub-period analysis allows for the huge decline in wealth-income ratios that occurred in Europe between 1910 and 1950 to be decomposed.[13] In the UK, war destructions played a negligible role, accounting for an estimated 4% of the total decline in the wealth-income ratio. Instead, low national savings during this period accounted for 46% of the fall in the wealth-income ratio and negative valuation effects (including losses on foreign portfolios) for the remaining 50%. These negative valuation effects were in part due to the numerous anti-capital policies were then put into place after the First World War—before which, capital markets largely ran unfettered. These policies were gradually lifted from the 1980s on, contributing to an asset price recovery.

In France and Germany, cumulated physical war destructions account for about one-quarter of the fall in wealth-income ratios. Low national saving and real capital losses each explain about half of the remaining three-quarters. Interestingly, the private

Figure 3.2.2

Long-run trends in the national wealth of rich countries, 1870–2015



Source: WID.world (2017). See wir2018.wid.world for data series and notes.

In 1870, the value of net national wealth in Germany was 745% of net national income, i.e. it was worth 7.5 years of national income. Net national wealth is equal to net private wealth plus net public wealth.

wealth-national income ratio declined less in the UK than in France and Germany between 1910 and 1950, but the reverse holds for the national wealth-income ratio, due to the large quantity of public debt held by the UK around 1950. The US case is again fairly different from that of Europe, however, as the fall in the country's wealth-income ratio during the 1910–1950 period was more modest, and so was the recovery since 1950. Regarding capital gains, every sub-period in the United States shows small but positive relative price effects. The capital gain effect grew larger in the recent decades and largely derived from United States' growing foreign portfolio, as it seems too large to be accounted for by under-estimated saving and investment flows.

These results show that over a few years and even a few decades, valuation effects and war destructions are of paramount importance in determining wealth-to-income ratios. But in the main rich economies, today's wealth levels are reasonably well explained by saving and income growth rates across the period since 1870.

These findings have a number of implications for the future and for policy making. First, the low wealth-income ratios of the mid-twentieth century were due to very special circumstances. The world wars and anti-capital policies destroyed a large fraction of the world capital stock and reduced the market value of private wealth, which is unlikely to happen again with free markets. By contrast, the determinants of the wealth-income ratio—saving and growth rates—will in all likelihood matter a great deal in the foreseeable future. As long as countries keep saving sizable amounts (due to a mixture of bequest, life-cycle, and precautionary reasons), countries with low growth rates are bound to have high wealth-income ratios. For the time being, this effect is stronger in Europe and Japan, but to the extent that growth will ultimately slow everywhere, wealth-income ratios may well ultimately rise across the whole world.

The return of high wealth-income ratios is certainly not bad in itself, but it raises new issues about capital taxation and regulation. Because wealth is always very concentrated (due in particular to the cumulative and multiplicative processes governing wealth inequality dynamics—see Part IV for more detail on this), high wealth-income ratios imply that the inequality of wealth, and potentially the inequality of inherited wealth, is likely to play a bigger role for the overall structure of inequality in the twenty-first century than it did in the postwar period. This evolution might reinforce the need for progressive capital and inheritance taxation.[14] If international tax competition prevents this policy change from happening, one cannot exclude the development of a new wave of anti-globalization and anti-capital policies.

Furthermore, because saving and growth rates are largely determined by different forces, wealth-income ratios can vary a great deal between countries. This fact has important implications for financial regulation. With perfect capital markets, large variations in wealth-income ratios potentially imply large net foreign asset positions, which can create political tensions between countries. With imperfect capital markets and home portfolios bias, structurally high wealth-income ratios can contribute to domestic asset price bubbles such as those seen in Japan and Spain. Housing and financial bubbles are potentially more devastating when the total stock of wealth amounts to six to eight years of national income rather than only two to three years. The fact that the Japanese and Spanish bubbles are easily identifiable in the dataset also suggests that monitoring wealth-income ratios may help designing appropriate financial and monetary policy. In Japan and Spain, most observers had noticed that asset price indexes were rising fast, but in the absence of well-defined reference points, it is always difficult for policy makers to determine when such evolutions have gone too far and whether they should act. Wealth-income ratios and wealth accumulation decompositions can provide useful, if imperfect, reference points here.

3.3

COMPARING THE EXPERIENCES OF FORMER COMMUNIST STATES

Information in this chapter is based on two sources. The first is "From Soviets to Oligarchs: Inequality and Property in Russia 1905–2016," by Filip Novokmet, Thomas Piketty, and Gabriel Zucman, 2017. WID.world Working Paper Series (No. 2017/9). The second is "Capital Accumulation, Private Property and Rising Inequality in China, 1978–2015," by Thomas Piketty, Li Yang, and Gabriel Zucman, 2017. WID.world Working Paper Series (No. 2017/6).

- The evolution of public and private wealth in China and Russia since their transitions away from communism can be viewed as extreme cases of the general rise of private wealth relative to national income in rich countries since the 1970s–1980s.
- Their experiences are largely explained by institutional differences, particularly their respective privatization strategies for public assets. Privatization occurred at a much faster rate, in a more chaotic manner and at a larger extent in Russia than in China due to its "shock therapy" liberalization policies and voucher privatization schemes for state owned enterprises.
- Despite being at roughly equal levels in 1980, private wealth reached approximately 500% of national income in China by 2015—roughly equal to levels seen in the US and just below those of France and the UK (550–600%), while this figure was notably smaller for Russia, on the order of 350–400%.
- Public wealth remained at around 200–250% in China between 1980 and 2015, but decreased tremendously from 300% to less than 100% in Russia, again reflecting differences in the countries' privatization strategies.
- Differences in savings and investment incentives saw a significant proportion of Russian wealth leave the country to be held in offshore assets, while the overwhelming majority of Chinese wealth stayed within the country's boundaries to be invested in domestic assets.

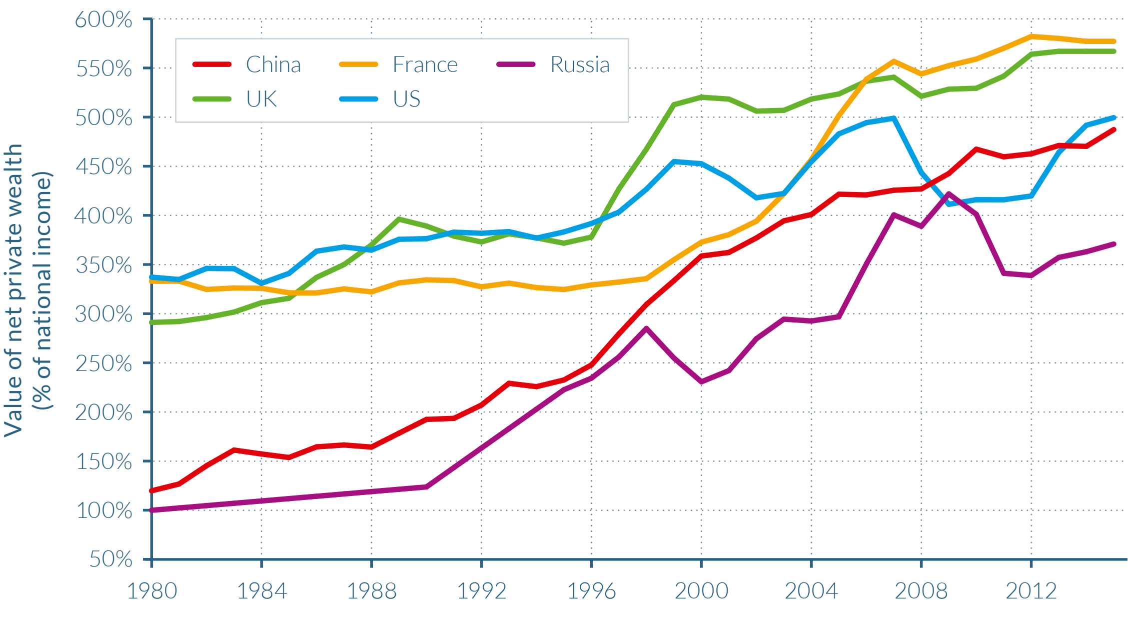
Privatization strategies were key in determining wealth accumulation differences between China and Russia

The transition away from communism in both China and Russia had profound effects on aggregate wealth in both countries. However, there were also considerable differences between the two countries, which are first evident in the evolution of their respective private wealth–national income ratios. As examined in detail in chapter 3.2, the general rise of private wealth relative to national income in rich countries since the 1970s–1980s can be attributed to a combination of factors including the combination of growth slowdowns and relatively high saving rates and general rises in asset prices. The case of Russia together with that of China and other ex-communist countries can be viewed as an extreme case of this general evolution, but the liberalization and public asset privatization strategies chosen by the two countries also had crucial impacts on the development of these countries' wealth to national income ratios.

In Russia as in China, private wealth was very limited back in 1980, at slightly more than 100% of national income in both countries. But by 2015, private wealth reached approximately 500% of national income in China, roughly equal to levels seen in the US, and rapidly approaching the levels observed in countries such as France and the UK (550–600%). Private wealth in Russia has also increased enormously relative to national income, but the ratio was comparatively only of the order of 350–400% in 2015—that is, at a markedly lower level than in China and in Western countries as illustrated by **Figure 3.3.1**. This gap would have been larger if estimates of offshore wealth were not included in Russia's private wealth (more to come on this in chapter 3.5). This is an important source of wealth to include in estimates for Russia as it represents approx-

Figure 3.3.1

Net private wealth to net national income ratios in China, Russia and rich countries, 1980–2015: The rise of private wealth



Source: Novokmet, Piketty & Zucman (2017). See wir2018.wid.world for data series and notes.

In 2015, the value of private wealth in the US was 500% of national income, i.e. it was worth 5 years of national income. Net private wealth is equal to net private assets minus net private debt.

imately 70% of national income, while the global average offshore wealth is estimated to be in the region of 10% of national income.[15]

The rise of national wealth in Russia has been almost exclusively driven by increases in private wealth, which have themselves come at the expense of public wealth. National wealth increased only weakly relative to national income during the last quarter of a century, rising from 400% in 1990 to 450% by 2015, with public wealth falling from around 300% of national income to below 90%. In contrast, China's public wealth remained relatively constant from 1978 to 2015, staying above 230% of national income. Given the large rise in private wealth described above, national wealth has thus doubled from around 350% to 700% of national income over the period (see **Figure 3.3.2**). Interestingly, national wealth fell notably following the end of communism in Russia, dropping from around 425% of national income in 1990 to 300% in 2000. This was largely due to the speed at which the so-called shock therapy and voucher privatization strategy was implemented to transfer public wealth to the private sector (particularly that of state-owned enterprises). However, while public wealth-income ratios in China fluctuated during the first decade that followed the "reform and opening up" policies of 1978, they have risen almost constantly since. The speed of privatization of both state-owned enterprises and housing stock was much slower in China than in Russia, allowing for a more gradual and consistent transfer of wealth from the public to the private sector. The larger variations seen in Russian wealth as compared to Chinese wealth that occurred between 1998 and 2002, and between 2006 and 2010, can in large part be explained by the stock market fluctuations experienced in Russia during these periods of time.

Understanding the differences in wealth accumulation between China and Russia

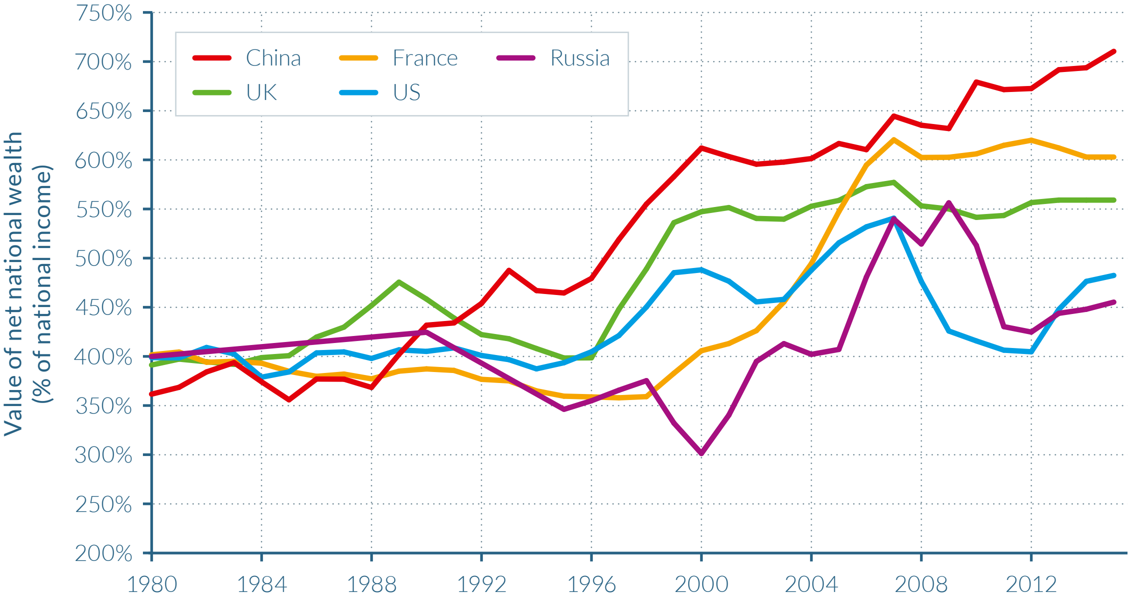
The widely divergent patterns of national wealth accumulation observed in Russia and China can be accounted for by a number of factors. First, saving rates (net of depreciation) have been markedly higher in China, typically as large as 30–35%, as compared to 15–20% at most in Russia. If a country saves more, it is natural that it will accumulate more wealth. Second, these Chinese savings were used for the most part to finance domestic investment and hence domestic capital accumulation in China. In contrast, a very large fraction—typically about half—of Russia's national savings were used to finance foreign investment, via very large trade surpluses and current account surpluses, rather than domestic investment. This is not necessarily disadvantageous in itself, but these large flows of foreign savings resulted in little wealth accumulation as a result of the general mismanagement of the surpluses, including bad portfolio investment, capital flight, and offshore leakages.

Again, the gap between Russia and China would be even larger if offshore wealth were not included in Russian national wealth calculations. Its inclusion is undoubtedly illuminating in helping readers to understand the evolution of wealth trends in Russia, but given that offshore wealth is largely out of the reach of the national government, its presence in Russian wealth calculations could also be argued to overestimate its tangible value for the country. In contrast, if the full value of cumulated trade surpluses in Russia's national wealth were considered in estimations, then Russia's national wealth-income ratio would have been at the same level as China's by 2015, at around 700% of national income. The magnitude of change when including and excluding these factors illustrates the macroeconomic significance of this issue.

Finally, China's national wealth-income ratios are higher than in Russia because relative asset prices have increased more in the former than the latter. In particular, Tobin's Q ratios are much closer to one in China than in Russia.[16] This means that the market value of wealth assets in China (that is, their price on the stock market) is much closer to their book value (that is, the value of assets based on the company's balance sheet account; their assets minus liabilities) than in Russia, where these values were

Figure 3.3.2

Net national wealth to net national income ratios in China, Russia and rich countries, 1980–2015: National wealth accumulation



Source: Novokmet, Piketty & Zucman (2017). See wir2018.wid.world for data series and notes.

In 2015, the value of national wealth in China was 710% of national income, i.e. it was worth 7.1 years of national income. Net national wealth is equal to net private wealth plus net public wealth.

consistently very low. The interpretation of this finding may reflect a number different factors.

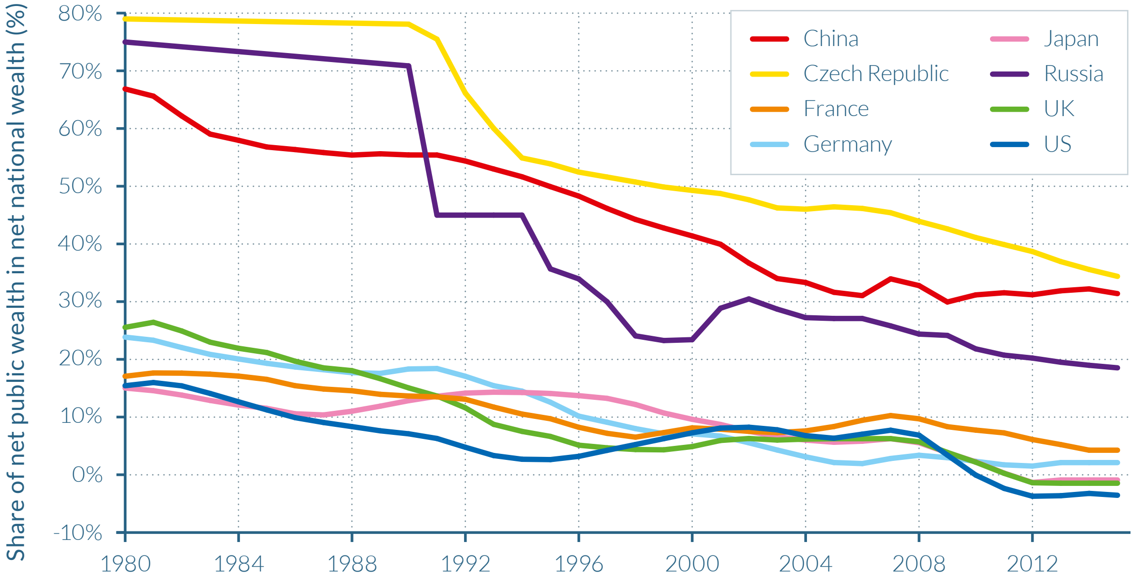
On the Chinese side, the key factor influencing Tobin's Q ratio nearing one is the country's restricted capital markets which limit the number of Chinese companies listed on the stock exchange.[17] On the Russian side, there are a larger number of factors. One interpretation is that company stakeholder models have various actors other than shareholders—including worker representatives and sometimes regional government, share corporate decision-making power— which may reduce the market value of equity shares, but not necessarily the social value of companies. A less optimistic interpretation of low Q ratios, which may better fit the Russian case, is that there were ill-defined property rights and low protection of shareholder stakes in companies, not because of the benefit of other well-defined and potentially efficiency-enhancing stakeholders, but simply because the legal system is not working well. In addition, it could also be that this low market valuation reflects the importance of offshore assets and legal outsourcing in the management and control of Russian corporations. That is, Russian corporations are embedded into a complex nexus of contracts and offshore legal entities, of which the system of official shares ruled by the Russian legal system and traded on Moscow stock market is only the visible part.[18]

Understanding the evolution of public wealth in China and Russia

The ex-communist countries of China and Russia have followed the same general patterns of a declining overall share of public property in total wealth as rich countries in recent years, though starting from a much higher level of public wealth. In the ex-communist countries of China and Russia, the share of net public wealth fell from around 70% in 1980 to 35% and 20%, respectively, in 2015—a veritable turnaround

Figure 3.3.3

The share of public wealth in national wealth in former communist and rich countries, 1980–2015: The decline of public property



Source: Novokmet, Piketty & Zucman (2017). See wir2018.wid.world for data series and notes.

In 2015, the share of public wealth in national wealth in Russia was 19%. Net public wealth is equal to public assets minus net public debt. Net national wealth is equal to net private wealth plus net public wealth.

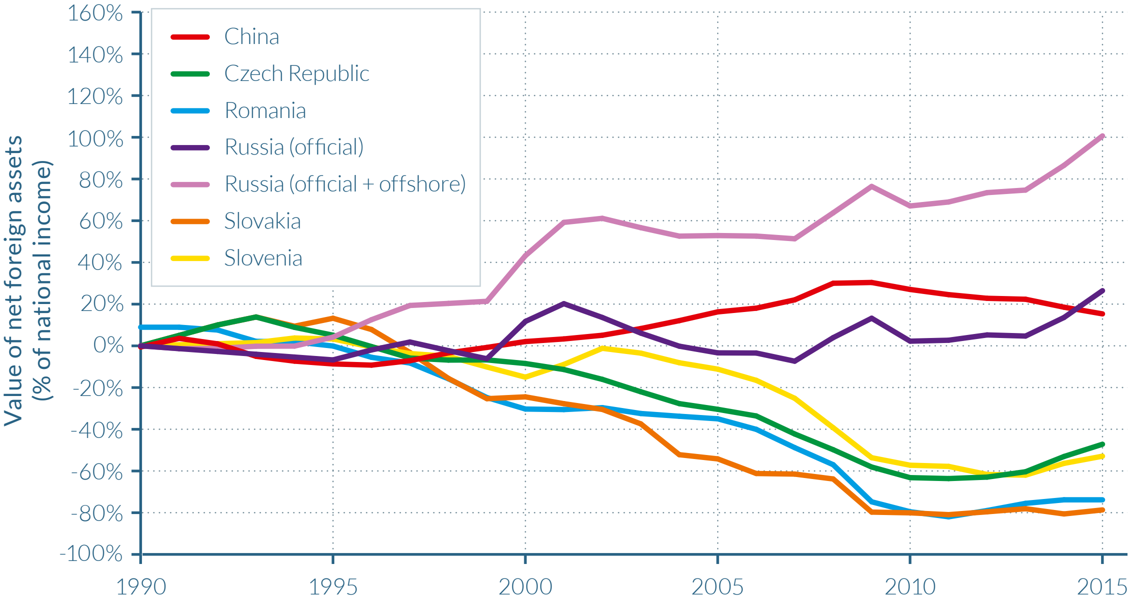
in their public-private wealth ratios. As depicted by **Figure 3.3.2**, the share of net public wealth in net national wealth reversed in both China, from around 70%–30% in 1978 to 30%–70% in 2015, and in Russia, from 70%–30% to 20%–80% between 1990 and 2015. These recent figures for the countries' public-private wealth ratios are not incomparable to those observed in the so-called "capitalist" countries during the mixed-economy period that followed the Second World War (1950–1980). But while these countries have ceased to be communist, in the sense that public ownership has ceased to be the dominant form of property, they still have much more significant public wealth than other capitalist countries. This is due both to low public debt and significant public assets—for instance, Russia's energy sector. (**Figure 3.3.3**)

However, there are also strong differences between China's and Russia's experiences. The larger magnitude of the reversal in public-private wealth ratio in Russia, and its occurrence over a shorter time period, serves to underline the greater speed and depth of privatization in Russia relative to China. Indeed, this process is still continuing in China, and the public-private divide could even be stabilized at the current level if the Chinese authorities choose to do so. In contrast, Russia's "shock therapy" approach to privatization was markedly different from that followed in China and other ex-communist countries. This contrast is evident in the period immediately after Russia's transition toward a market economy commenced, from 1990 to 1995, when the fall in the share of net public wealth in net national wealth in Russia (70% to 35%) was five times larger than that in China (55% to 50%). Its implications for income inequality and wealth inequality are discussed in more detail in Part II and Part IV, respectively.

In contrast, the importance of foreign assets within China and Russia has been fairly similar since their transitions away from communist models, but have occurred for vastly different reasons. As illustrated by **Figure 3.3.4**, both countries have positive net foreign assets,

Figure 3.3.4

Net foreign assets in former communist countries, 1990–2015



Source: Novokmet, Piketty & Zucman (2017). See wir2018.wid.world for data series and notes.

In 2015, the share of net foreign assets as a fraction of national income in Russia (including offshore assets) was 101%. Net foreign assets are all assets held by national citizens in foreign countries minus all assets held by citizens from foreign countries in the national country.

meaning that the assets they own in the rest of the world are more valuable than those owned by foreigners in China and Russia, respectively. In Russia, this has largely been due to the country's economic and natural endowments, given its large, but not necessarily permanent, natural resources, and has allowed the country to accumulate trade surpluses and foreign reserves for the future, as can also be observed in most oil-rich countries in the Middle East and elsewhere.

The accumulation of net foreign assets in China that are similar in magnitude to those of Russia should be viewed as much more striking, however, and indicate significant differences between the two countries. Chinese net foreign assets were accumulated in the absence of any significant natural resource endowment, and with much smaller trade surpluses of less than 3% of national income on average over the 1990–2015 period. In comparison, Russia's trade surpluses averaged 10% of national income for the same period. This reflects more efficient management of trade surpluses and foreign reserves, which are viewed as critical for China's economic and financial sovereignty by its Communist Party, and also the political choice of limiting foreign investors' rights in China.

Differences in political institutions and ideologies seem to have played an even bigger role than purely economic factors in the evolution of wealth-national income ratios in China and Russia, and the share of the public and private sector within national wealth. As has already been stressed, the speed and depth of Russia's privatization strategy was vastly different from the much slower and more gradual transition plan implemented by China, particularly the fire sale of Russian state-owned enterprises through the country's voucher privatization scheme. Furthermore, differences in savings and investment incentives saw a significant proportion of Russian wealth leave the country to be held in offshore assets, while the overwhelming majority of Chinese wealth stayed within the country's boundaries.

3.4

CAPITAL ACCUMULATION, PRIVATE PROPERTY, AND RISING INEQUALITY IN CHINA

Information in this chapter is based on “Capital Accumulation, Private Property and Rising Inequality in China, 1978–2015,” by Thomas Piketty, Li Yang, and Gabriel Zucman, 2017. WID.world Working Paper Series (No. 2017/6).

- While Chinese national wealth doubled in recent decades, from 350% to 700% of national income, its composition also changed dramatically. The share of agricultural wealth fell from close to half of total capital in the late-1970s to less than a tenth by the mid-2010s. By contrast, the privatization of the housing sector and the liberalization of capital markets saw the shares of housing and domestic capital dominate the make-up of China’s national wealth.
- Perhaps the most spectacular evolution has been in the division of national wealth between public and private wealth. Private wealth rose from around 100% of national income in 1978 to over 450% of national income in 2014, largely due to the privatization of housing stock, reaching a level close to those seen in France, the United States, and the UK.
- The balance of public and private wealth changed from a 70–30 proportional split of public-private assets in 1978 to a 35–65 split by 2015, but public wealth remained important as a share of national income, at around 250%. This level is high when compared to rich countries.
- High Chinese savings rates were an important driver of the rise in wealth accumulation, but according to simulations, they accounted for only 50% to 60% of the rise. The rest can be accounted for by increases in relative asset prices.
- China’s wealth accumulation was primarily driven by domestic capital accumulation. Chinese net foreign position, despite substantial growth since 2000, remains relatively modest compared to Japan or Germany. On the other hand, China remains more suspicious regarding foreign ownership of companies than Europe and North America.

China's transition to a mixed economy led to a surge in national wealth and a radical change in its composition

The Chinese wealth-national income ratio has increased substantially in recent decades. In 1978, national wealth as a percentage of national income was approximately 350%, but by 1993 this figure had reached 500% and grew to over 700% by 2015, as the composition of national wealth changed dramatically. The share of agricultural land used to make up almost half of total capital in 1978, but dropped sharply to less than a tenth of the total in 2015, as illustrated by **Figure 3.4.1**. In contrast, housing and other domestic capital wealth (buildings, equipment, machinery, patents, assets used by corporations, public administrations and households) increased enormously, in volume and in their share of the total: housing wealth increased from around 50% of national income in 1978 to approximately 200% in 2015, while other domestic capital grew to be the largest wealth component, rising from around 100% to over 350% between 1978 and 2015. Net foreign assets have also become a notable addition to China's national wealth since the turn of the twenty-first century, amounting to approximately 25% of national income.

But perhaps the most spectacular evolution since the late 1970s has been the division of national wealth into private and public wealth (see **Figure 3.4.2**). Private wealth was relatively small in 1978, at around 100% of national income, but grew to represent over 450% of national income in 2014, while public wealth remained roughly stable, between 200% and 250% of national income over the period (first increasing slightly until 1993–1994 and then declining back to its initial level). As a result, the balance of public and private wealth in national wealth has altered enormously, with the 70–30 proportional split of public-private assets in 1978 reversed to a 35–65 split by 2015, as the country transitioned away from a communism-based economic model towards a mixed-form economy.

The extent of national wealth privatization in the Chinese economy differed, however, depending on the type of wealth asset, as can be seen in **Figure 3.4.3**. In the housing sector privatization was particularly comprehensive, with the private housing stock rising from roughly 50% to over 95% between 1978 and 2015, while for other forms of domestic capital the public share has declined but is still around 50%. Domestic equities (traded and non-traded), for example, were almost entirely owned by the state (95%) in 1978, but private ownership rose to around 30% by 2015, such that the government continues to own around a 60% share and foreign ownership accounts for the remaining 10%. Interestingly, the fraction of Chinese equities that are publicly owned dropped substantially until 2006, but seems to have stabilized—or even increased somewhat—since 2007.

Public assets remain substantial in China, unlike in most Western countries

The private wealth-national income ratio in China is now in the range of 450–500%, much closer to levels seen in most OECD countries. In the United States and the UK, the ratio is closer to 500% and 550–600%, respectively, but in China, public assets remain substantial unlike in these western countries where public wealth has become very small, or even negative, with public debt exceeding public assets. Indeed, the share of public property in China today is somewhat larger than, but by no means incomparable to, what it was in the West from the 1950s to the 1980s, and has recently appeared to have strengthened further: since the 2008 financial and economic crisis the public share in China's mixed economy has seemingly increased and thus domestic capital accumulation has been one of the primary drivers of wealth growth in China.

The size and structure of China's publicly-held wealth assets has large implications for economic development. The size of public property has important consequences for the state's ability to conduct industrial and

Figure 3.4.1

The asset composition of national wealth in China, 1978–2015

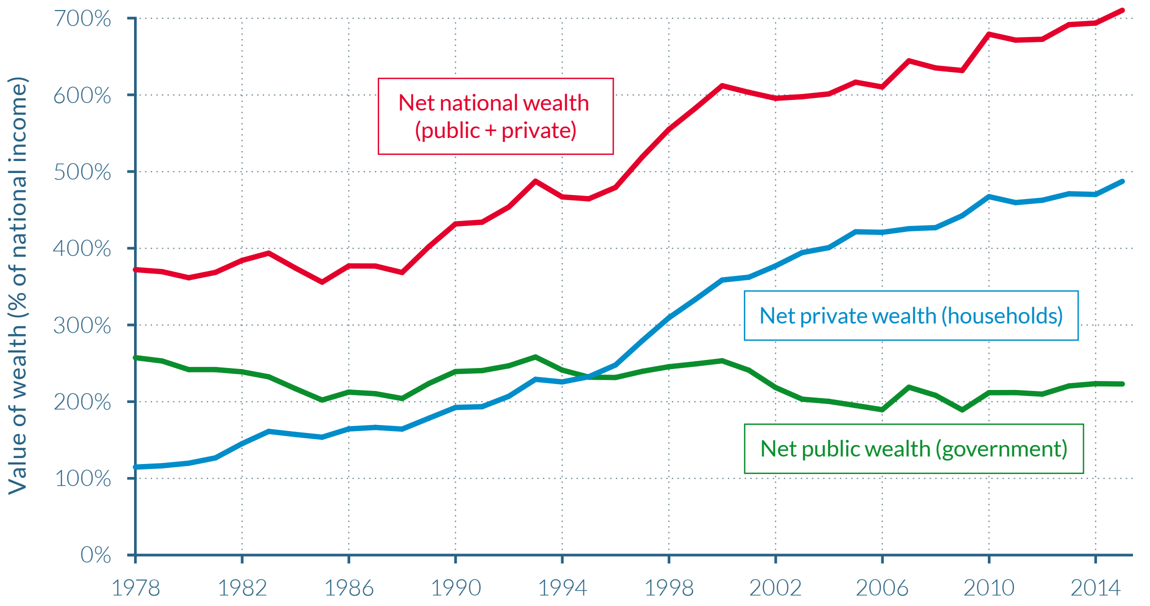
In 2015, the value of national wealth was equivalent to 710% of national income, i.e. it was worth 7.1 years of national income. The value of total housing wealth was 246% of national income.

Figure 3.4.2

The structure of national wealth in China, 1978–2015

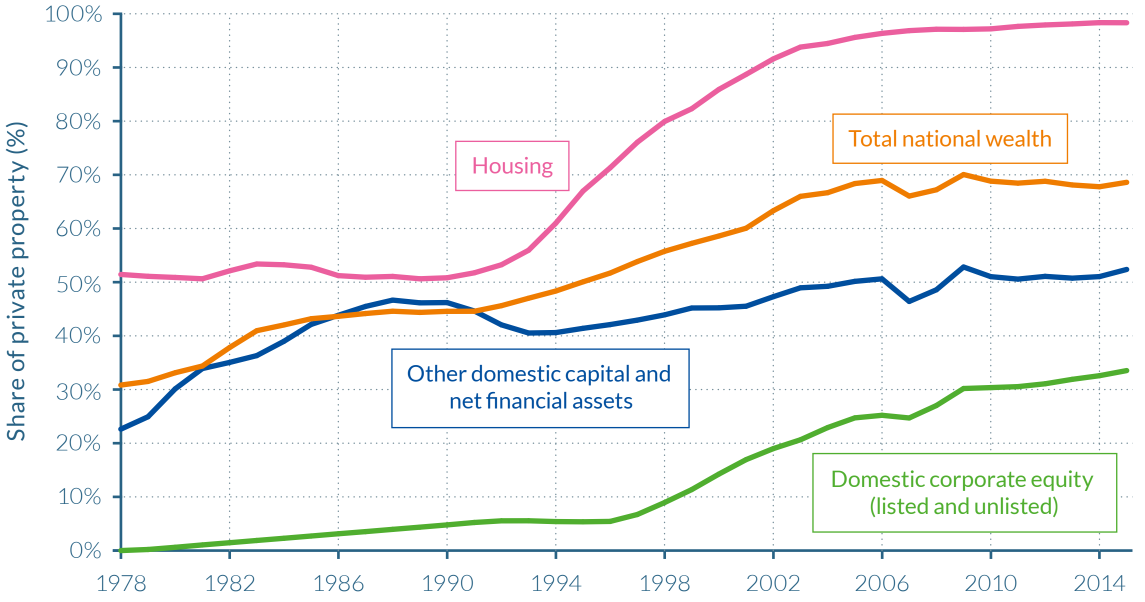


Source: Piketty, Yang and Zucman (2017). See wir2018.wid.world for data series and notes.

In 2015, the value of net private wealth was equivalent to 487% of net national income, i.e. it was worth 4.5 years of national income. Chinese public wealth was equal to 223% of national income. Net national wealth is equal to net private wealth plus net public wealth. Net private wealth is equal to private assets minus private debts. Net public wealth is equal to public assets minus public debts.

Figure 3.4.3

The share of private property by type of asset in China, 1978–2015: The rise of private property



Source: Piketty, Yang and Zucman (2017). See wir2018.wid.world for data series and notes.

In 2015, the share of private property in total national wealth was 69%. The share of private property in housing was 98%.

regional development policies; sometimes more efficiently and sometimes less so. It also has potentially considerable fiscal consequences, as governments with negative net public wealth typically have to pay large interest payments before they can finance public spending and welfare transfers, while those with large positive net public wealth can benefit from substantial capital incomes, enabling them to finance more public spending than would be possible through tax collection.

It is interesting to compare the evolution of the public share in national wealth in China and a resource-rich country with a large sovereign wealth fund such as Norway. These two countries have essentially switched positions: the public share in Chinese national declined from 70% to 30% between 1978 and 2015, while it rose from 30% to 60% in Norway over the same period (see **Figure 3.4.4**). A key difference between public wealth in Norway and China is that most of Norway's public wealth is invested abroad. Norway's large positive net public wealth generates capital income that is mostly used to finance further foreign capital accumulation, which in the long-run can be used to reduce taxes and to finance more public spending. In that sense, it is a very different form of public property than in China. Norwegian public property has therefore largely been accumulated for fiscal and financial purposes, rather than for industrial development and retaining a measure of control over the economy as seen in China. Norway's sovereign fund has, however, also been used at times to promote certain policies, for example, regarding social and environmental objectives.

High savings rates and increases in relative asset prices drove wealth accumulation

High savings and investment rates over the period have been important drivers of Chinese wealth accumulation, but they are insufficient to account for the total increase in the country's wealth—as it has also been the case for several rich countries. The other important element in understanding Chinese wealth accumulation is the rise of relative asset prices, in particular housing and equity prices that grew considerably more than the rise in consumer prices. As per the estimates of Thomas Piketty, Li Yang and Gabriel Zucman, savings explain 50% to 60% of the rise in the wealth-income ratio since 1978, while the increase in relative asset prices accounts for the remaining 40% to 50%.

Just as in rich countries, the rise in relative asset prices has been the result of a series of factors. First in this series of factors is the high taste preferences and demand for housing assets by Chinese households, which itself may be partly due to limited access to alternative savings and investment vehicles—Chinese citizens could not invest overseas, for example, and capital markets took time to develop—and also to insufficient awareness of expansions in the public pension system. A second important explanation involves changes in the legal system that reinforced private property rights including the lifting of rent controls, increases in the relative power of landlords over tenants and changes in the relative power of shareholder and workers within enterprises.

Decomposing wealth accumulation by sectors (private and public) and assets (financial and nonfinancial) in China over the period 1996–2015 provides interesting insights. When analyzing private wealth, there are clear differences between the returns on assets: strong, positive capital gains have been made by nonfinancial assets (231%), which centered around residential housing assets (163%), while there were only negligible capital gains for net financial wealth (1%). Conversely, there were strong capital gains for public financial assets (68%) and smaller gains for public nonfinancial wealth (19%). The majority of these large capital gains on public financial assets came from government-owned equities, and can be linked to the reform of state-owned enterprises that began in 2003 and the unprecedented wave of initial public offerings of state-owned enterprises that started in 2006. China also made notable capital losses on its net foreign assets, in part due to the appreciation of the yuan after 2004, explaining why despite its large current account surpluses, its net foreign asset position has increased only moderately (from -9% of national income in 2000 to 15% in 2015).

China, like Japan, seems more suspicious vis à vis foreign ownership than Europe or North America

Domestic financial intermediation has also played a key role in the development of wealth in China over the last four decades. The ratio between total domestic financial liabilities—that is, total debt and equity issued by households, the government, and the corporate sector combined—and total domestic capital has risen from 60% in 1978 to 140% in 2015. This is a substantial rise given the limited financial development seen in China in the late 1970s. However, despite this financial development, the level of financial intermediation remains much lower in China than in many Western countries, where financial intermediation ratio roses from between 100–140% in 1978 to 200–300% in 2015, as depicted by **Figure 3.4.5**.

Foreign ownership of Chinese companies has not played a strong role in the rise of wealth, however. The fraction of domestic financial liabilities owned by the rest of the world reached only 5% in China in 2015, and has not past 7% across the whole observed period, as seen in **Figure 3.4.6**. Japan has the next smallest percentage of foreign ownership at 10% of domestic financial liabilities, followed by 15% in the United States and 25–30% in Germany and France. These differences partly reflect size effects: European countries are smaller, and if ownership were to be consolidated at the European level, the rest of the world would own only about 15% of European wealth (as in the United States). Even so, there does appear to be a tendency that some Asian countries—Japan and even more so China—are less open to foreign ownership than European and North American countries.

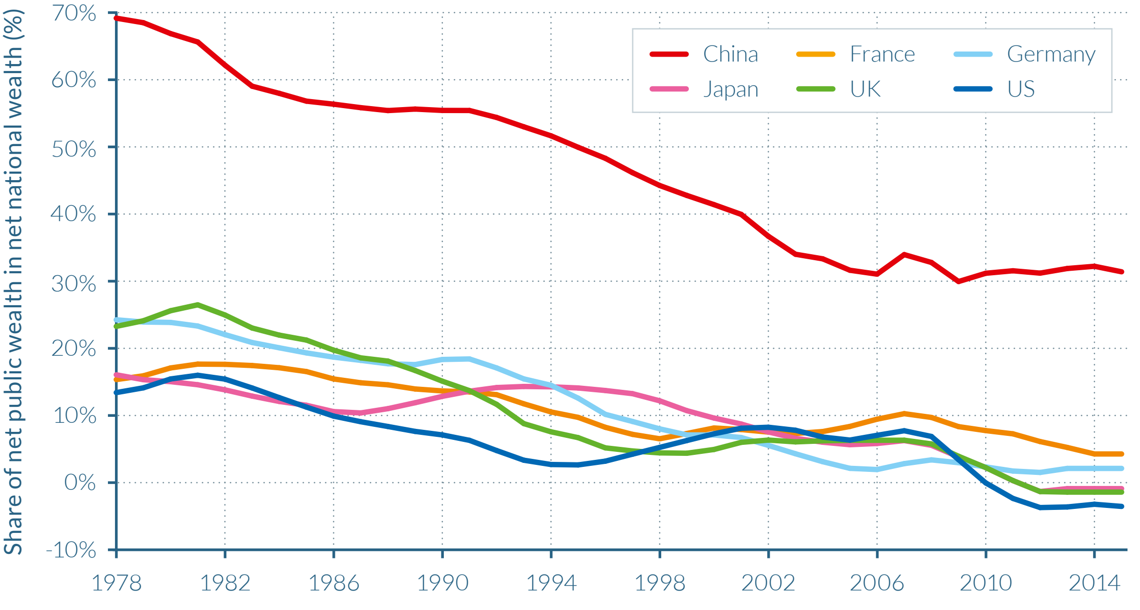
The changing shares of public property in China and rich countries, 1978–2015

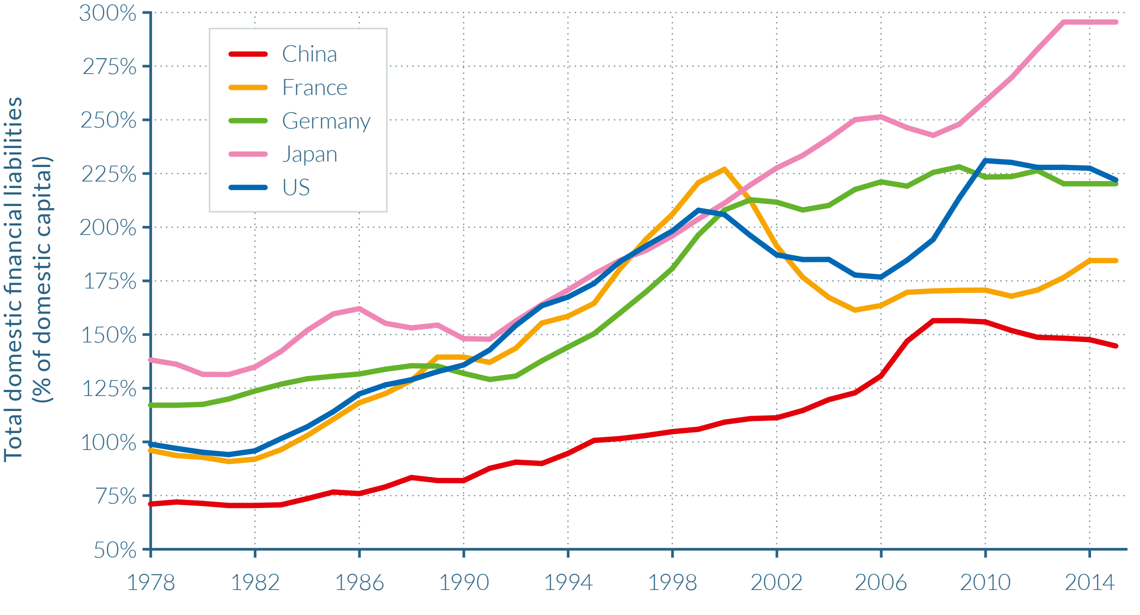


Source: Piketty, Yang and Zucman (2017). See wir2018.wid.world for data series and notes.

In 2015, the share of public property within total national wealth in China was 31%, while in the US it was -4%. Net national wealth is equal to net private wealth plus net public wealth. Net public wealth is equal to public assets minus public debts.

Figure 3.4.5

Domestic financial liabilities in China and rich countries, 1978–2015: The rise of financial intermediation

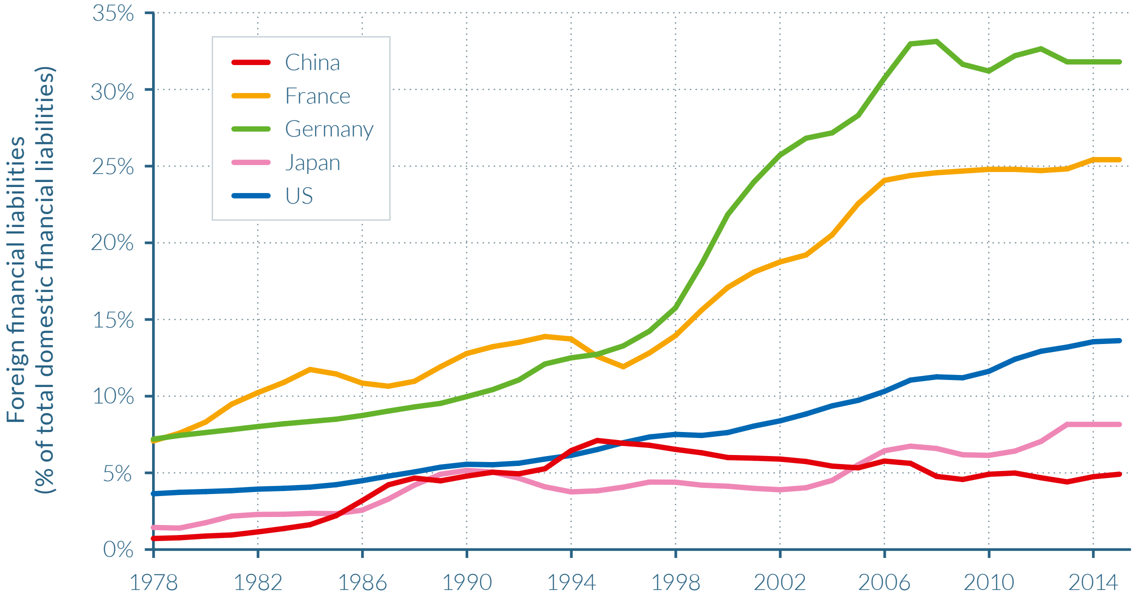


Source: Piketty, Yang and Zucman (2017). See wir2018.wid.world for data series and notes.

In 2015, the value of domestic financial liabilities in China was equal to 145% of domestic capital, while in Germany it was 220%.

Figure 3.4.6

Foreign financial liabilities in China and rich countries, 1978–2015: The rise of foreign ownership



Source: Piketty, Yang and Zucman (2017). See wir2018.wid.world for data series and notes.

In 2015, the value of foreign financial liabilities in China equated to 5% of total domestic financial liabilities, while in France it was 25%. Foreign financial liabilities are comprised of portfolio equity held by foreigners, foreign direct investment, foreign debt and financial derivatives.

3.5

THE RISE OF PRIVATE PROPERTY IN RUSSIA

Information in this chapter is based on "From Soviets to Oligarchs: Inequality and Property in Russia 1905–2016," by Filip Novokmet, Thomas Piketty, and Gabriel Zucman, 2017. WID.world Working Paper Series (No. 2017/10).

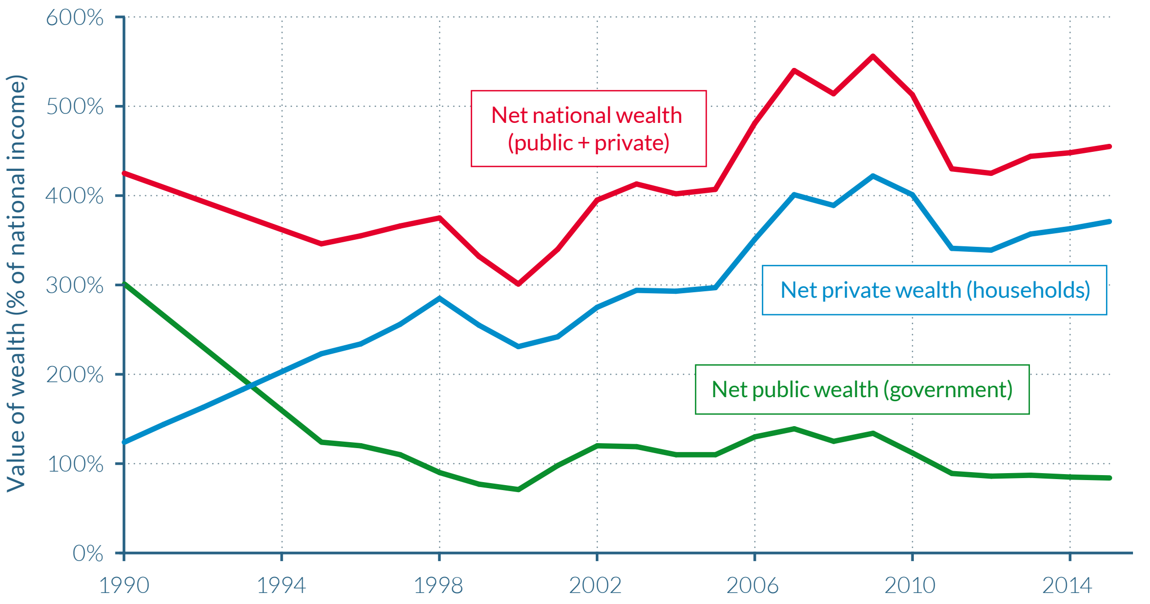
- ▷ Russia's net national wealth-income rose moderately since the country's transition from a communist to a capitalist economic model, increasing from around 400% in 1990 to 450% in 2015. At the same time, there have been significant fluctuations in the country's wealth breakdown, as the shock therapy and voucher privatization strategy transferred enormous wealth at a very fast rate from the public to the private sector. Public wealth amounted to 300% of national income in 1990, but was just 100% in 2015.
- ▷ Private housing wealth represented by far the largest component of Russian private wealth in 2015. The gradual rise of housing can be accounted for by real-estate price movements and a privatization of the housing sector that was more gradual than the voucher privatization method used for companies.
- ▷ The very low level of official financial assets owned by Russian households—around 70–80% of national income throughout the 1990–2015 period—is particularly striking. This suggests that the privatization of Russian companies did not lead to any significant long-run rise in the value of household financial assets.
- ▷ However, discrepancies in Russia's balance of payments allow researchers to estimate that a small number of Russian citizens had offshore wealth assets that amounted to 70% of national income in 2015, doubling the official value of financial assets. This is suspected to be the result of capital flight, made possible through weaknesses in Russia's legal and statistical system.

Russia's transition from public to private property

The evolution of aggregate private and public wealth in Russia has changed dramatically since the fall of the Soviet Union. As the country transitioned from a communist to capitalist model after 1990, public property was transferred to the private sector. Net national wealth amounted to slightly more than 400% of national income in 1990, roughly three-quarters of which was owned by the state and one-quarter by private individuals. But by 2015, these proportions reversed, as illustrated by **Figure 3.5.1**. Net private wealth amounted to 350% of national income, while net public wealth represented less than 100%; the overall national wealth to national income ratio had increased by just 12% over 25 years. Furthermore, this dramatic fall in Russia's net public wealth occurred over just a few years, between 1990 and 1995, as the country implemented its so-called shock therapy transition strategies, which included the privatization of state-owned enterprises through vouchers.[19] (More on this will be addressed in Part IV of the report.)

It is noteworthy that aggregate national wealth fell relative to national income in the initial stages of Russia's transition. As can be seen on Figure 3.5.1, net national wealth decreased between 1990 and 1999, from over 400% of national income to about 300%, such that aggregate national wealth fell even more than national income over this period, which almost halved itself. National wealth rose then considerably between 1999 and 2009, reaching about 550% of national income. This peak corresponded to a very large rise of Russian stock market prices and housing prices during this decade, but as asset prices then fell in the aftermath of the financial crisis, aggregate national wealth fell back to around 450% of national income in 2015, only just above its value 25 years previously. As a consequence, the major transformation

Figure 3.5.1
The structure of national wealth in Russia, 1990–2015

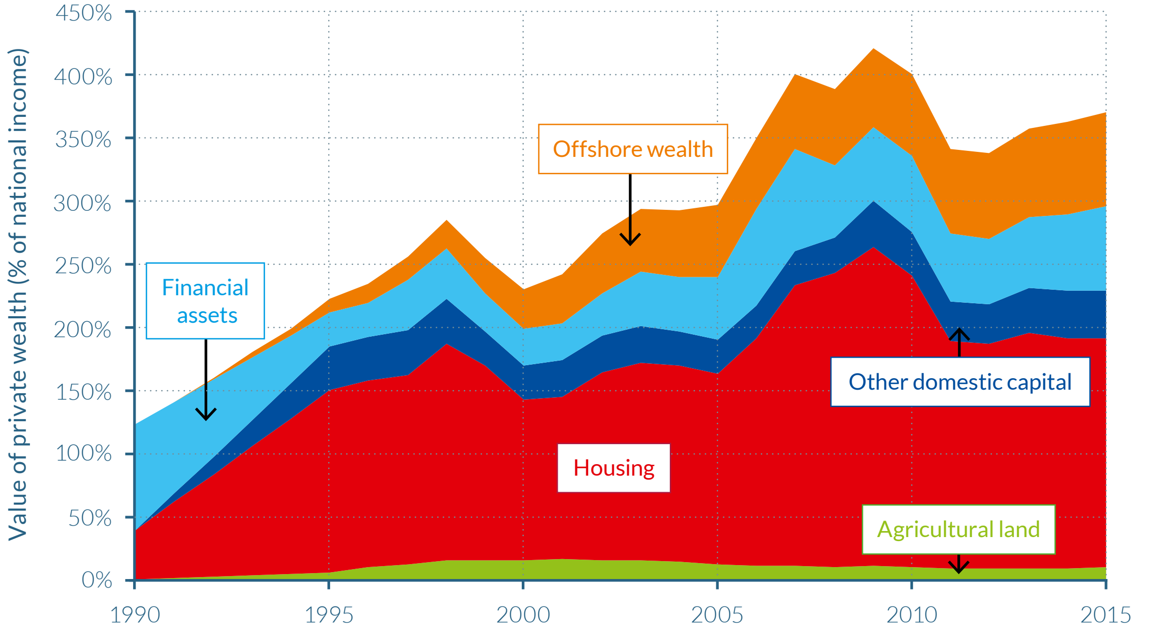


Source: Novokmet, Piketty and Zucman (2017). See wir2018.wid.world for data series and notes.

In 2015, the value of net national wealth was equal to 455% of national income, i.e. it was worth 4.6 years of national income. Net public wealth was equal to 84% of national income. Net national wealth is equal to net private wealth plus net public wealth. Net private wealth is equal to private assets minus private debts. Net public wealth is equal to public assets minus public debts.

Figure 3.5.2

The asset composition of private wealth in Russia, 1990–2015



Source: Novokmet, Piketty and Zucman (2017). See wir2018.wid.world for data series and notes.

In 2015, the value of housing assets was equal to 182% of national income, i.e. it was worth 1.8 years of national income. The value of financial assets was 67% of national income.

during the 1990–2015 period was the shift from public to private property, rather than any significant and sustained increase in the aggregate value of national wealth.

Private housing has risen to dominate private wealth in Russia

In order to better understand which factors influenced the evolution of national wealth-income ratios in Russia and the composition of the country's wealth, it is critical to look separately at the different asset categories. As seen in **Figure 3.5.2**, there was a significant rise in private wealth since 1990.[20] Housing played a critical role here as property prices more than doubled between the year 2000 and the peak of the housing bubble in 2008–2009, increasing the value of housing wealth from less than 50% of national income in 1990 to 250% at its peak, before easing to approximately 200% by 2015. Comparatively, other domestic capital (mostly consisting of unincorporated businesses owned directly by households) and agricultural land (which was also largely privatized during the 1990s) increased over time, but these assets played a relatively limited role as compared to the rise of private housing.

In addition to real estate price movements, the gradual rise of private housing wealth between 1990 and 2015 can be accounted for by the more continuous manner in which housing privatization occurred, relative to the voucher privatization method used for companies. Tenants were typically given the right to purchase their housing unit at a relatively low price, but they did not need to exercise this right immediately. Due to various economic, political and psychological factors, many Russian households waited until the late 1990s and even the 2000s to exercise this right. Indeed, some were concerned about the possible maintenance costs associated to private ownership as under public housing ownership maintenance work was taken care of by public authorities, while others were more concerned about a possible political downturn, particularly following the presidential election of 1996 when Boris Yeltsin won with a relatively small margin against communist party leader Gennady Zyuganov.

Official household financial assets are particularly low in Russia, due largely to the voucher method chosen to privatize former state-owned enterprises

What is also particularly striking is the very low level of official financial assets owned by Russian households attained in official Rosbank financial balance sheets and other official sources. Household financial assets have always been less than 70–80% of national income throughout the 1990–2015 period, and they have often been less than 50% of national income; in the late 1990s and early 2000s, they were as little as 20–30% of national income. Thus, it is as if the privatization of Russian companies did not lead to any significant long-run rise in the value of household financial assets, in spite of the fact that it had become possible for individuals to own financial shares in Russian firms. This appears particularly paradoxical.

The initial decline in financial assets was perhaps predictable. Back in 1990, household financial assets—which at the time mostly consisted of saving accounts—amounted to about 70–80% of national income. But as prices were liberalized in the early 1990s, these Soviet-era savings were all but eradicated by hyperinflation. The consumer price index was multiplied by nearly 5000 between 1990 and 1996, with annual inflation rates consistently above 150% and as high as 1 500% in 1992 and 900% in 1993. Following the introduction of the new ruble—worth 1 000 old rubles—in 1998, the inflation rate stabilized at around 20–30% per year on average up to 2006.

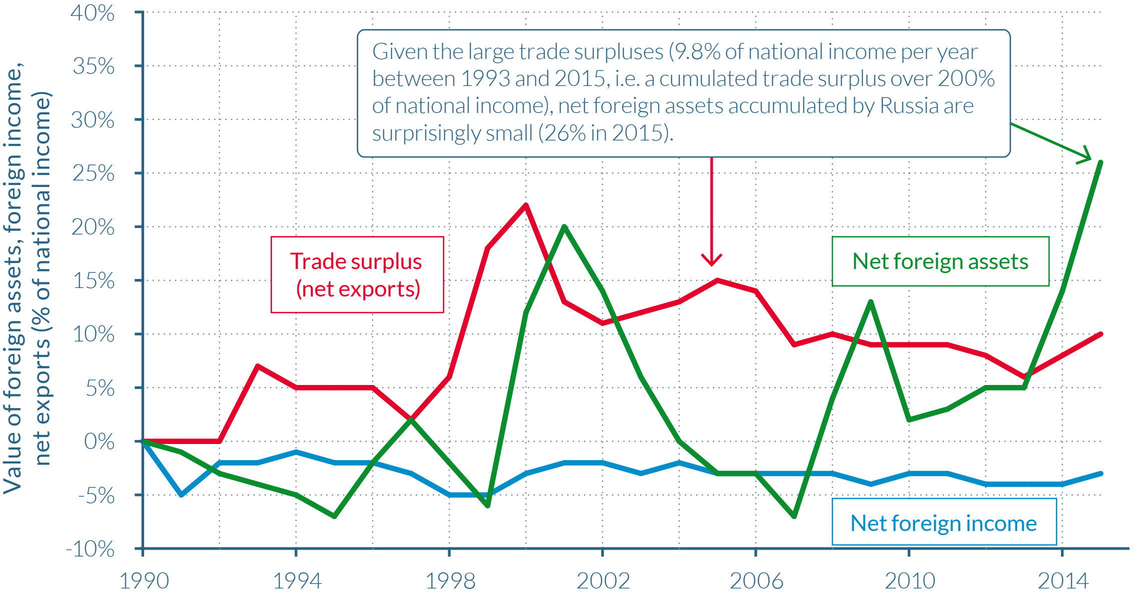
What is more surprising is why the new financial assets that were accumulated by Russian households during the 1990s—in particular through voucher privatization—did not compensate for this loss in savings. Of course, when vouchers were first introduced in 1992–1993, it was very difficult for Russian households to know what to do with these new financial instruments and how to put a price on them. More generally, it could be argued that in the chaotic monetary and political context of the 1990s it is not too surprising that the market value of household financial assets remained relatively low until the somewhat more stable mid- to late-1990s. What is more difficult to understand, however, is why such extremely low valuations persisted well after this period. In particular, in spite of the spectacular Russian stock market boom that occurred between 1998 and 2008, it is conspicuous that total financial assets officially owned by Russian households amounted to little more than 70% of national income in 2008—that is, less than the level observed in 1990.

Taking into account offshore wealth doubles Russia's total official financial assets

In the view of Filip Novokmet, Thomas Piketty, and Gabriel Zucman, the main explanation for this paradox is the existence of a small subset of Russian households that own very substantial offshore wealth—that is, nonofficial financial assets in offshore tax havens. According to their benchmark estimates, offshore wealth has gradually increased between 1990 and 2015, representing approximately 75% of national income at the end of the period. As depicted by **Figure 3.5.2**, offshore wealth was thus roughly as large as official financial assets owned by Russian households. By definition, offshore assets are difficult to estimate, and the benchmark estimates presented in this section are neither precise nor fully satisfactory, but these orders of magnitude seem to be reasonable, and if anything may be somewhat underestimated given the way in which they are constructed, as explained below.

In order to estimate the rise and magnitude of offshore wealth held by Russian house-

Figure 3.5.3
Trade surplus and missing foreign assets in Russia, 1990–2015



Source: Novokmet, Piketty and Zucman (2017). See wir2018.wid.world for data series and notes.
In 2015, the value of Russia's trade surplus (exports - imports) was equal to 10% of national income.

holds, it is natural to start by looking at the evolution of Russia's trade balance and its balance of payments. Examining these two balances together, there is a clear contrast between the very large trade surpluses recorded in Russia and the country's relatively modest foreign assets, as illustrated by **Figure 3.5.3**.

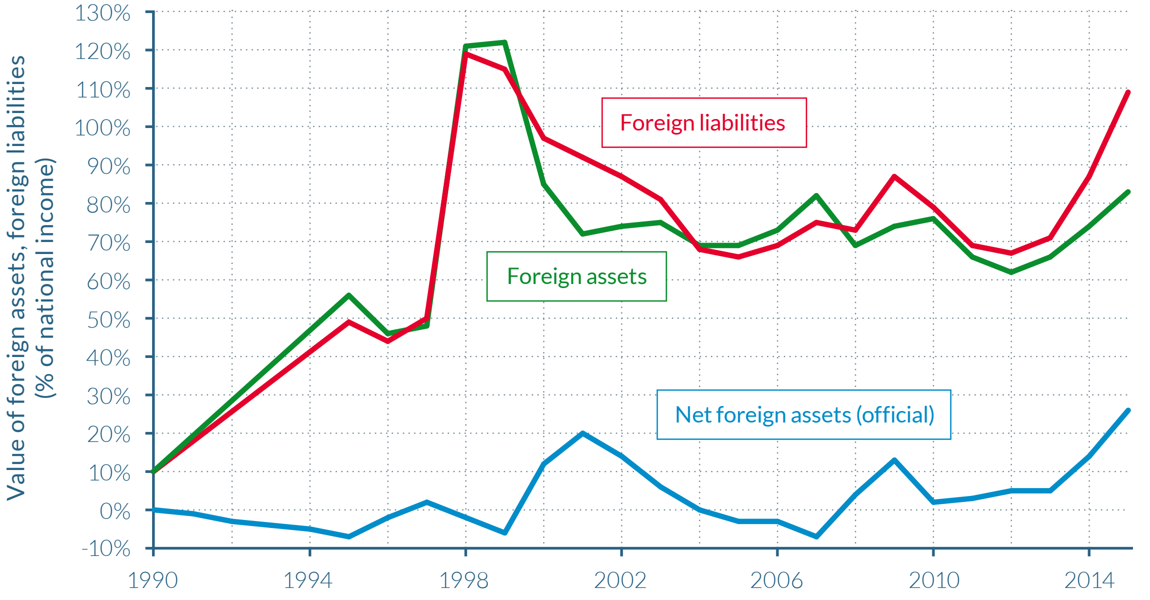
Russia has had strong trade surpluses each single year since the early 1990s. These trade surpluses—mostly driven by exports in oil and gas—averaged almost 10% of national income between 1993 and 2015, having been at around 5% between 1993 and 1998, and as much as 20% in 1999–2000. Thus, in each of the last 20 years, the Russian economy has exported the equivalent of around 10% of its annual income in excess of what the country has imported. Given that Russia's initial financial position when beginning its transition was close to zero, with very few foreign assets or foreign debt, these sustained surpluses should have led to a massive accumulation of foreign assets held by Russian citizens in the rest of the world. However, the paradox is that net foreign assets accumulated by Russia are surprisingly small at about 25% of national income in 2015.

Investigating Russia's balance sheet reveals further inconsistent information regarding the ownership of financial assets. Both foreign assets (that is, assets owned by Russian residents in the rest of the world) and foreign liabilities (that is, assets owned by rest-of-the-world residents in Russia) have increased significantly since the fall of the Soviet Union. Both were extremely small in 1990, at around 10% of national income, reflecting low levels of financial integration with the rest of the world and strong capital controls. But by 2015, foreign assets had reached almost 110% of national income, and foreign liabilities were close to 85% of national income, hence a net foreign asset position of about 25% of national income.

How can such a low level of net foreign wealth accumulation be accounted for? An obvious

Figure 3.5.4

Official foreign assets and liabilities in Russia, 1990–2015



Source: Novokmet, Piketty and Zucman (2017). See wir2018.wid.world for data series and notes.

In 2015, official net foreign assets were 26% of national income. Net foreign assets are foreign assets minus foreign liabilities. Foreign assets are assets owned by Russian residents in the rest of the world. Foreign liabilities are assets owned by rest-of-the-world residents in Russia.

explanation is capital flight: some Russian individuals, and/or some Russian corporations acting on behalf of individuals, and/or some Russian government officials acting on behalf of individuals, were able to appropriate some of Russia's trade surpluses to accumulate offshore wealth—that is, foreign assets that are not properly recorded as such in Russia's official financial statistics. Given the weaknesses of Russia's legal and statistical system, and the widespread use of offshore entities to organize business and financial transactions in Russia over this period, it is maybe not too surprising that such leakages might have occurred.[21]

Discrepancies in Russia's balance of payments can aid estimations of the country's offshore wealth

How large these capital flight leakages are, and the associated accumulation of offshore wealth is, are challenging to measure. Simple calculations of trade surpluses (230%) minus official net foreign assets (30%) over the 1990–2015 period, would suggest that cumulated capital flight is on the order of 200% of national income. But this does not include the cumulated capital income flow on these foreign assets, which could have been significant if rates of return on these assets were high. Indeed, it appears that returns on foreign assets were lower than the returns on foreign liabilities over the 1990–2015 period, as illustrated by the small negative net foreign income flows in **Figure 3.5.3**. This net capital income outflow hence absorbed approximately a quarter to a third of Russia's annual trade surplus.

Furthermore, the capital gains and losses realized on the portfolio of foreign assets and liabilities needs to be accounted for. These portfolio effects can be substantial if there are large differences between annual surpluses and the observed evolution of net foreign assets. This is partly what happened in Russia as foreign investors bought Russian assets in the 1990s when stock market prices were extremely low and benefited from the country's booming stock market of the 2000s, providing part of the explanation as to why foreign liabilities rose as much as **Figure 3.5.4** shows. These portfolio effects therefore imply that a substantial part of Russia's trade surpluses was translated into assets held by citizens from elsewhere in the world. But the magnitude of the aforementioned differentials in rates of return and portfolio effects were not large enough to fully explain the missing wealth paradox.

Filip Novokmet, Thomas Piketty, and Gabriel Zucman therefore look to exploit inconsistencies in Russia's balance of payments to estimate the size of offshore wealth—that is, Russia's missing foreign assets. Their relatively conservative estimations indicate that offshore wealth reached approximately 75% of national income by 2015, suggesting that Russians own approximately as much offshore wealth as their official financial asset holdings (about 70–80% of national income in both cases). That is, they own about 50% of their total financial wealth offshore. These results are similar to estimates obtained by Gabriel Zucman's earlier research that used a different methodological approach.[22] Thus they can be viewed as somewhat reassuring. But while these magnitudes are believed to be broadly accurate, these estimations lack absolute precision given the general lack of international financial transparency—and the difficulties of identifying by whom these missing assets are owned and what form they take potentially pose even greater challenges.

Even more uncertain is the location of the assets held offshore by Russian citizens. Some of this offshore wealth might be invested back in Russian corporations, while it is also discussed that some Russians own significant property assets in cities such as London and in the countryside of nations such as French, and/or have large shares in companies and in sports teams in countries such as Germany, the UK, and the United States. Inspecting the list of Russian billionaires released by *Forbes* illustrates that these individuals collectively own more than $400 billion in assets—that is, the equivalent of about half of the estimated $800 billion in Russian offshore wealth. Comparing the corresponding wealth portfolios published by *Forbes* and other magazines, one could be tempted to conclude that most of the offshore wealth is held in Russian companies, in particular in the energy and financial sectors. On this basis, interpretations of the available data indicate that a large fraction of Russia's official foreign liabilities—over 80% of national income in 2015—is actually held by Russian residents via offshore accounts. But given that the *Forbes* list does not provide any information regarding the fraction of reported billionaire wealth held offshore—likely a very large proportion—it is difficult to provide more conclusive explanations.

PART IV

TRENDS IN GLOBAL WEALTH INEQUALITY

4.1

GLOBAL WEALTH INEQUALITY: TRENDS AND PROJECTIONS

- Data on global wealth inequality is sparser than data on income inequality, so estimates should be interpreted with care. It is not possible to construct at this stage a consistent global wealth distribution. However, available research on key regions—in particular, China, Europe, and the United States—provide valuable insights into global wealth dynamics.

- Evidence points towards a rise in global wealth inequality over the past decades. At the global level—represented by China, Europe, and the United States—the top 1% share of wealth increased from 28% in 1980 to 33% today, while the bottom 75% share hovered around 10%.

- Wealth is substantially more concentrated than income. The top 10% owns more than 70% of the total wealth in China, Europe, and the United States, the bottom 50% owns less than 2%, and the middle 40% ("the global wealth middle class") owns less than 30%.

- If established trends in wealth inequality were to continue, the top 0.1% alone will own more wealth than the global middle class by 2050.

Global wealth inequality estimates are scarcer than for global income inequality and subject to caution

The available data on wealth inequality is much sparser than for income inequality, especially at the global level. It is therefore more difficult to provide a complete picture of how global wealth inequality has evolved over the past few decades.

We want to be very clear about this: available data sources make it impossible at this stage to properly estimate the level and evolution of the global distribution of wealth. We can to some extent estimate the global distribution of income and its evolution, as we have tried to cautiously show in Part II of this report. The situation is different for wealth. As we have shown in Part III of this report, there are very large areas of the world—particularly in Africa, Latin America, and Asia—where we are not even able to properly measure the aggregate level of national wealth and its decomposition into private and public property, foreign wealth, and natural capital. We first need to make more progress on the measurement of total wealth and its changing structure before we can construct estimates of distribution of private wealth among individuals.

A number of magazines (most notably, *Forbes*) do publish global rankings of billionaires, and some financial institutions (for instance, Credit Suisse) have combined billionaire data with other data sources to estimate global distributions of wealth. Typically these studies find that top wealth holders have been rising at very high speed in recent decades—substantially faster than the size of the world economy—and below we will agree with this general conclusion. However the methodologies used by *Forbes* and by these institutions often lack transparency; in particular, they do not release their raw data sources and detailed computer codes. It is impossible therefore to reconstruct their statistical results. This is not merely a technical question; methodological choices can indeed have a large impact on the measured evolution of wealth inequality, and transparency of methods and sources is critical if we want to reach some agreement about inequality facts.

In the context of the WID.world project, we choose to proceed in a gradual manner and to release wealth inequality series solely for the countries for which raw sources allow us to do so in a satisfactory manner. Ideally, one needs to combine household wealth surveys together with wealth rankings and administrative fiscal data (coming from both the income tax, using the capitalization method, and the inheritance tax, using the estate multiplier method) to be able to properly estimate the distribution of wealth and to confront sources in a transparent way. At this stage, these conditions are satisfied only for a handful of countries—most notably, the United States, a number of countries in Europe (in particular, France, the UK, and Spain), and to a lesser extent China (where we have access to household wealth surveys and wealth rankings, but where access to fiscal data is extremely limited). We have also produced estimates of wealth inequality for Russia and the Middle East, but they are more fragile, and we do not use them to produce global wealth estimates in this report.

Our global wealth inequality estimates since 1980 therefore combine data from three large regions: the United States, China, and Europe. Europe itself is represented by three countries (France, Spain, and the United Kingdom), which on the basis of other countries for which we have wealth inequality data (in particular, Sweden and Germany) appear to be broadly representative. Starting from 1987, we can also compare our results with the *Forbes* billionaire rankings, which provide a better coverage of countries, though only for a tiny, extremely wealthy part of the population, and with little knowledge of how this information was collected.

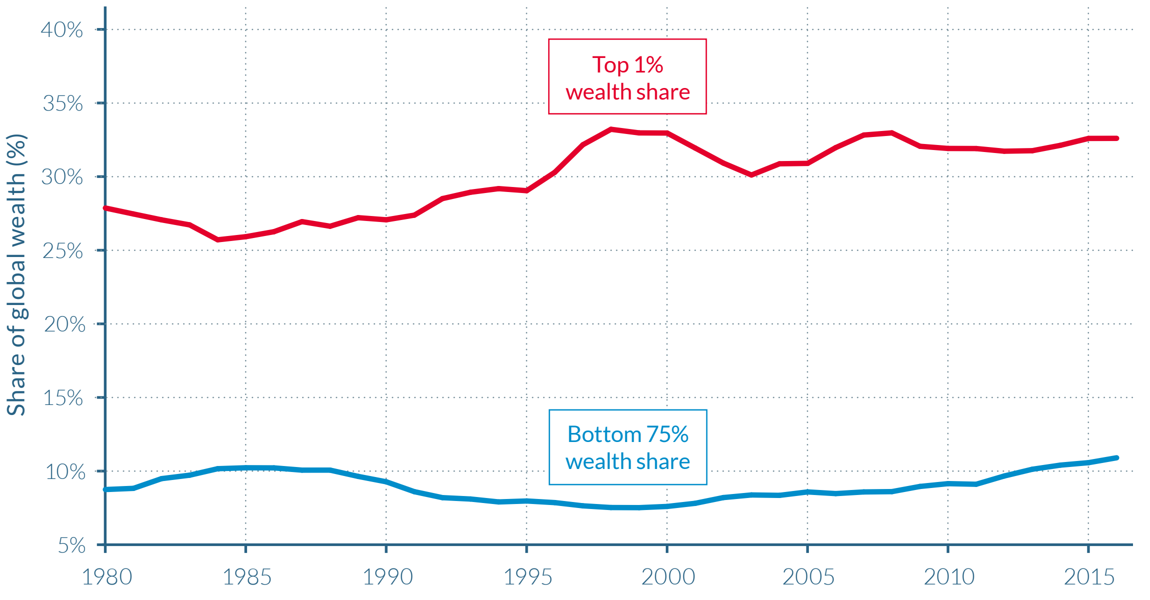
Available data show that global wealth inequality is extreme and on the rise

At the global level (represented by China, Europe, and the United States), wealth is substantially more concentrated than income: the top 10% owns more than 70% of the total wealth.[1] The top 1% wealthiest individuals alone own 33% of total wealth in 2017. This figure is up from 28% in 1980. The bottom 50% of the population, on the other hand, owns almost no wealth over the entire period (less than 2%). Focusing on a somewhat larger group, we see that the bottom 75% saw its share oscillate around 10%. Wealth concentration levels would probably be even higher if Latin America, Africa, and the rest of Asia were included in the analysis, as most people in these regions would be in the poorer parts of the distribution. We leave this to future editions of the *World Inequality Report*. (**Figure 4.1.1**)

We compare in **Table 4.1.1** the growth rates of the different wealth groups between 1980 and 2017 (all growth rates are expressed in real terms—that is, after deduction of inflation). A number of striking findings emerge. First, one can see that average wealth has grown faster since the 1980s than average income, reflecting the general tendency of wealth/income ratios to rise in most countries, as documented in Part II of this report. Between 1987 and 2017, per-adult average income has increased at 1.3% per year at the world level, while per-adult wealth has increased at 1.9% per year.

Next, if we now look at the top of world wealth distribution—as measured by the *Forbes* billionaire rankings—we find that the top wealth holders' share has increased a lot faster than average wealth holders: 5.3% since 1987 for the top 1/20 million, and 6.4% for the top 1/100 million (see **Table 4.1.1**). By definition, this is an evolution that cannot continue forever: if top wealth holders were to grow on a permanent basis at a speed that is three to four times faster than average wealth in the world, then billionaires would ultimately come to own 100% of the world's wealth.

Figure 4.1.1
Top 1% and Bottom 75% shares of global wealth, 1980–2017: China, Europe and the US



Source: WID.world (2017). See wir2018.wid.world for data series and notes.

In 2016, 33% of global wealth was owned by the Top 1%. The evolution of global wealth groups from 1980 to 2017 is represented by China, Europe and the US.

Table 4.1.1

Global wealth growth and inequality, 1980–2017

	China + Europe + US		World
	1980–2017	1987–2017	1987–2017
Top 1/100 million (Forbes)	–	7.8%	6.4%
Top 1/20 million (Forbes)	–	7.0%	5.3%
Top 0.01% (WID.world)	5.5%	5.7%	4.7%
Top 0.1% (WID.world)	4.4%	4.5%	3.5%
Top 1% (WID.world)	3.4%	3.5%	2.6%
Average wealth per adult	2.9%	2.8%	1.9%
Average income per adult	1.3%	1.4%	1.3%

Source: WID.world (2017). See wir2018.wid.world for data series and notes.

Between 1987 and 2017, the wealth of the global Top 1% grew by 2.6%. The wealth threshold for an individual to be part of the Top 1% wealthiest in China + Europe + US in 2017 is €1 125 000, the Top 0.1% threshold is €5 209 000, the Top 0.01% threshold is €25 812 000.

The problem with this billionaire data is twofold: first, as was noted above, it is not entirely clear how it was estimated; next, and most importantly, it is not clear at all whether this pattern of very fast growth holds only for billionaires, or whether it can be extended to multimillionaires. This is crucial because there are many more individuals who own $5 million, $20 million, or $100 million than there are billionaires, and the former command a potentially much larger fraction of world wealth than the latter.

We unfortunately do not know the full answer to this question, but at least our estimates for the US, Europe, and China distribution of wealth provide some interesting insights. We find that the top 1% average wealth in the US, Europe, and China has risen at 3.5% per year between 1987 and 2017 (versus 2.8% for per-adult average wealth and 1.9% for average income). The higher we go in the distribution, the faster the growth: the top 0.1% average wealth has increased by 4.4% per year, and the top 0.01% average wealth has increased by 5.6% per year.

These findings, which were obtained by combining a number of independent data sources (household wealth surveys, income tax data using the income capitalization method, and inheritance tax data using the estate multiplier method, when available), appear to be consistent with the *Forbes* billionaire data. But they also suggest that one needs to go really very high in the distribution of wealth to see growth rates on the order of 5%–6% per year. If one considers only the top 1% wealth holders as a whole (that is, all individuals with net wealth higher than about €1.1 million in China, Europe, and the United States in 2016), then the growth rate between 1987 and 2017 has been 3.5% per year. This is faster than average wealth growth (2.8% per year), but the gap is not as huge as for billionaires. This suggests at current speed that rising inequality and the divergence of the wealth distribution will take a couple of decades before it takes really extreme proportions. (See below for a discussion of future prospects.) That being said, the direction in which the distribution is going definitely suggests rising concentration of wealth, and there is no evidence that the financial crisis of 2008 had any impact—other than temporary—on this long-run structural trend.

Our results also show that a large share of the growth of global wealth accrued to the top

1% and even narrower wealth groups. As **Table 4.1.2** shows, the top 1% captured 37% of per capita wealth growth, more than half of which went to the top 0.1%.

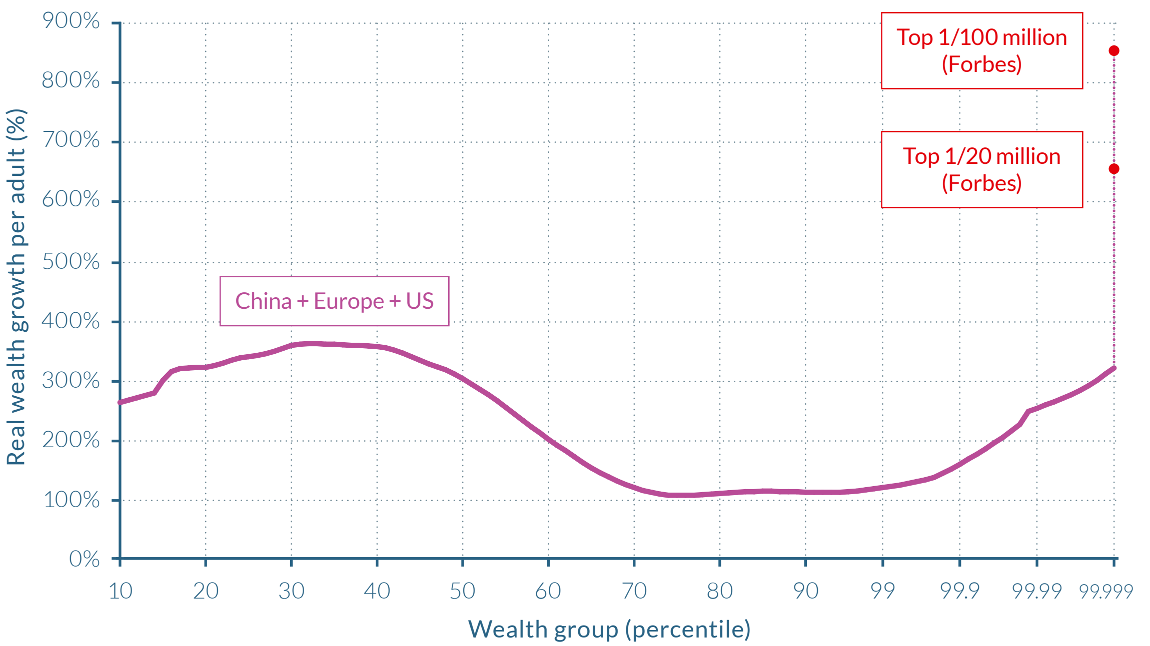
All of this implies growing inequality at the top end of the distribution. Note that the bottom of the distribution has also experienced a significant increase of its wealth, driven by rapid growth in China, as shown by **Figure 4.1.2**. This pattern is reminiscent of the "elephant curve" of global income growth, showing that the global wealth distribution seems to have evolved in ways qualitatively similar to income. The bottom three-quarters of the distribution saw its wealth increase by a sizeable amount, though less than the world's billionaires according to *Forbes*. Between those two groups, wealth growth was at its lowest for the middle class in developed countries. The trends in the wealth growth of different groups have been fairly stable over the last three decades, with narrower wealth top groups experiencing higher growth.

Under a business-as-usual scenario, the top 1% wealth share will increase at 1 percentage point every five years

What will happen to the global distribution of wealth if these trends were to continue for the next few decades? **Figure 4.1.3** seeks to answer that question. The top 0.1% wealth owners would progressively catch up with the global wealth middle class, which we define as wealth holders below the top 10% and above the median—that is, 40% of the world population. In 2050, both groups would own the same share of global wealth—that is, 25%. The global wealth middle class comprises 40% of the world population meaning that the top 0.1% wealthiest would be on average four hundred times wealthier than the global middle class. This evolution would take a couple of decades.

The top 1/20 million and 1/100 million of individuals, which comprise about 250 and 50 adults, could respectively own 1.5% and 0.75% of total wealth as soon as 2030, up from 0.5%

Figure 4.1.2
Global wealth growth by percentile, 1987–2017: China, Europe and the US



Source: WID.world (2017). See wir2018.wid.world for data series and notes.

Between 1987 and 2017, the average wealth of the 50th global wealth percentile grew by 300%. Average global wealth growth per adult was 129%. The evolution of and 0.25% in the early 1990s. The share of the top 1% would keep on increasing by one percentage point every five years. The shares of the top 0.1% and 0.01% would also grow by one percentage point every five years, meaning that the increase in wealth inequality is in fact driven by these small groups. These groups are much broader than billionaires, but nevertheless quite narrow. (To belong to the top 0.1% or top 0.01% of Europe, the United States, and China in 2016, one needs to own more than €5.2 million or €25.8 million, respectively.)

Table 4.1.2

Share of global wealth growth captured by wealth group, 1980–2017

Wealth group	Share of real growth per capita
Bottom 99%	62.9%
Top 1%	37.1%
Top 0.1%	21.6%
Top 00.1%	12.4%

Source: WID.world (2017). See wir2018.wid.world for data series and notes.

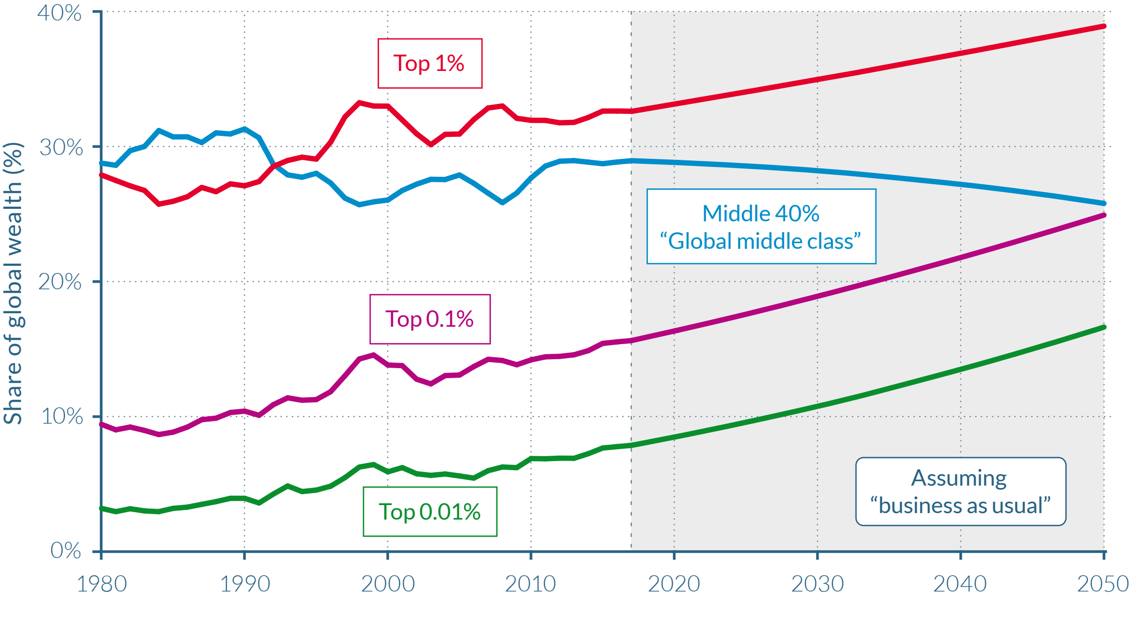
Between 1980 and 2017, the global Top 1% captured 37% of total wealth growth in China, Europe and the US. The wealth threshold for an individual to be part of the Top 1% wealthiest in China + Europe + US in 2017 is €1 125 000, the Top 0.1% threshold is €5 209 000, the Top 0.01% threshold is €25 812 000.

Global wealth inequality is driven by a large number of forces

As discussed in Part II, global income dynamics are driven by both between- and within-country forces. The rise of private wealth has been faster in large emerging economies than in rich countries, a trend driven by high economic growth and large-scale privatization in transition economies. This tends to reduce global wealth inequality. This effect was more than offset at the top, however, by the rise in wealth inequality within countries. Rising wealth inequality within countries is itself due to a number of factors, including rising income inequality amplified by inequality of savings rates and of rates of return. Other factors, such as the progressivity of taxation, can in

Figure 4.1.3

Global wealth inequality, 1980–2050: China, Europe and the US



Source: WID.world (2017). See wir2018.wid.world for data series and notes.

In 2016, in a world represented by China, Europe and the US, the global wealth share of the Top 1% was 33%. Under "Business as usual", the Top 1% global wealth share would reach 39% by 2050, while the Top 0.1% wealth owners would own nearly as much wealth (26%) as the middle class (27%). The evolution of global wealth groups from 1987 to 2017 is represented by China, Europe and the US. Values are net of inflation.

turn mitigate or worsen these dynamics. Hence, future global wealth inequality will depend on both catchup growth in emerging economies, and within-country determinants of inequality. We study them at the country level as further described in the next chapters.

We should stress at the onset that there was nothing inevitable about the fact that the very top of the global wealth distribution would rise so much faster than average world wealth beginning in the 1980s. One of the global factors that might have played a role is the larger transfer from public to private wealth that took place in many countries. (See Part II.) To the extent that privatization disproportionately benefited small groups of the population—for example, Russian oligarchs—this can help explain why top wealth holders' shares rose so fast. It is difficult, however, with the data at our disposal to estimate the global impact of this factor. In particular, there are also some cases where privatization has benefitted mostly the middle class (for example for housing, as we discuss below for the case of the UK, France and Spain). Whether this channel is likely to be important for the future (one might be tempted to conclude that large privatization waves are now behind us) is another important and uncertain issue.

Box 4.1.1

Methodological note: How our projections work

We partition the distribution of wealth into several groups:

- the bottom 99%
- the top 1%, excluding the top 0.1%
- the top 0.1%, excluding the top 0.01%
- the top 0.01%, excluding the top 1/20 million
- the top 1/20 million, excluding the top 1/100 million
- the top 1/100 million

We calculate the average growth rate of wealth of these groups since 1987 (start of the *Forbes* ranking), and extrapolate the average wealth of each of these groups based on these growth rates. We obtain top wealth shares based on these averages.

Because narrower top groups have experienced higher growth in the past, this method forecasts an increase of wealth inequality. Of course, this trend cannot be extended indefinitely into the future, because with the current parameters it will eventually lead to the top group's owning nearly all of the wealth. However, this problem only arises at very long horizons, so the method is still useful for projections over a few decades.

Another potentially important global factors behind booming top wealth is the fact that financial deregulation and innovation might have increased the inequality in rates of return that are accessible to different sizes of financial portfolio. Some of the most convincing evidence for this channel comes from the observed real rates of return on university endowments, which varied from 4–5% per year for the smallest endowments to as much as 8–10% per year for largest ones (after deduction of inflation and management costs) in the United States between 1980 and 2010.[2]

Again one might wonder whether this corresponds to a specific financial period or whether this will continue in the future (available data suggests that large endowments were still getting very good returns in recent years). Also the governance of personal family wealth involves many other issues than that of large academic capital endowments, so one cannot directly apply these findings. Unfortunately there is too little data available to make similar computations for the highest family wealth.

As we shall see below, however, our country studies do show that differential rates of return—together with differential saving rates—can potentially be an important driving force behind rising wealth concentration. (**Box 4.1.1**.)

4.2

COMPARING TRENDS IN PERSONAL WEALTH INEQUALITY ACROSS THE WORLD

- Available data on personal wealth inequality shows that it has been on the rise in most countries since the early or late eighties. Increasing income inequality and the large transfers of public to private wealth which occurred over the past forty years drive these dynamics.
- Large rises in top wealth shares have been experienced in China and Russia following their transition from communism towards a capitalist economy, though the different inequality dynamics experienced between these two countries highlights different economic and political transition strategies.
- In the United States, wealth inequality has increased dramatically over the last 30 years and was mostly driven by the rise of the top 0.1% wealth owners. Growing inequality of income and saving rates created a snowballing effect of rising wealth concentration.
- The increase in top wealth shares in France and the UK was more moderate over the past forty years, in part due to the dampening effect of the rising housing wealth of the middle class and lower income inequality relative to the United States. As a result, while wealth concentration has been historically lower in the United States than in Europe, the situation reversed after the 1970s.
- Property prices also played an important tempering role for wealth inequality in Spain as wealth concentration remained roughly unchanged over the observed period with only short-lived fluctuations.
- In the long run, the differential between rates of return to capital and growth rates, as well as the dynamics of savings rate among wealth groups, drive wealth inequality. When rates of returns available to high-wealth portfolios are higher than average economic growth, wealth inequality increases. The same is true when savings inequality is high.

Wealth inequality within countries fell dramatically from the beginning of the twentieth century in some of the world's largest economies, but since the 1980s there have been widespread increases in wealth concentration. The combination of economic, political and social shocks that led to the long-run decline in wealth inequality experienced throughout Europe and North America from the start of the First World War to the mid-1980s was described in the *Capital in the Twenty-First Century*.[3] These shocks included the Great Depression, the destruction of human and physical capital led by the World Wars, restrictions on capital flows, nationalization of industries and goods provision, and greater government control over the economy. Given the close relationship between wealth and income, the story of the former is similar to that of the latter: collectively, these factors severely impacted the fortunes of the wealthiest and supported the growth of middle class wealth in Europe and the United States.

Unfortunately relatively little is been known about the recent evolution of wealth inequality at a global level. Wealth inequality data discussed in public debates up to now essentially relied on sources which do not allow for a sound analysis of wealth dynamics. It is also difficult to track how wealth inequality statistics are constructed since the methodologies are not always made transparent. This is not merely a technical question: methodological choices can indeed have a large impact on the evolution of measured wealth inequality.

The publicly available information discussed in this report and published on WID.world on the distribution of wealth and cross-border assets is still imperfect. But we see it as a fist systematic attempt at generating data on wealth inequality over the globe. It combines in a consistent manner tax data, wealth surveys and data on cross-border assets. The construction of estimates presented in this report was carried out for China, France, Russia, Spain, the United Kingdom and the United States which are presented in this chapter and the subsequent ones.

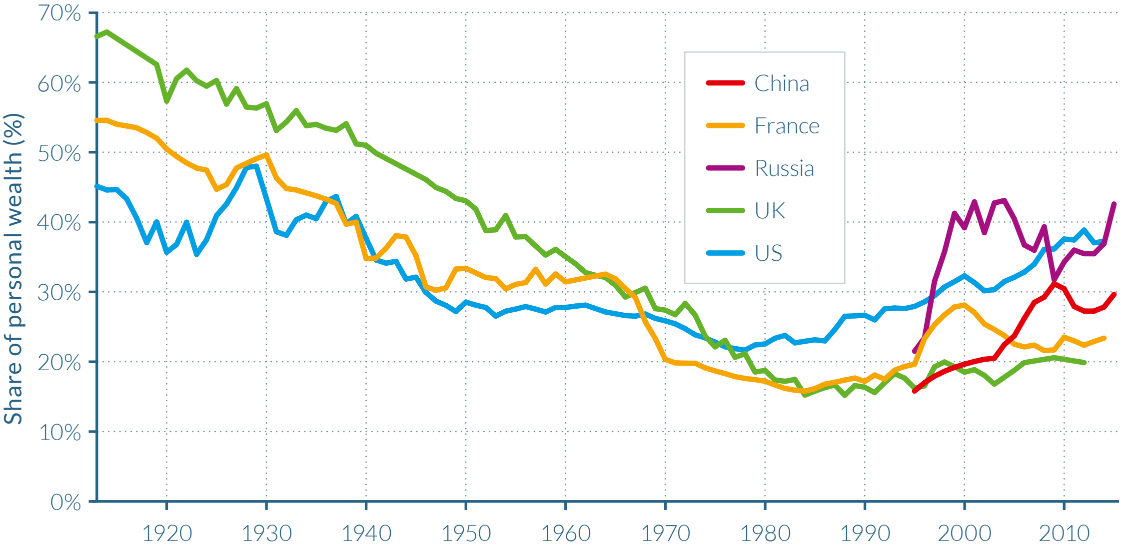
Contrasting transition strategies have generated divergent inequality dynamics in China and Russia

Wealth inequality data for China and Russia is only available from 1995–2015, but even in these last two decades the series confirm huge increases in wealth inequality. Wealth concentration amongst the top 1% in both countries practically doubled, as their share in China's total wealth rose from just over 15% in 1995 to 30% in 2015, and in Russia's from below 22% to approximately 43%. Interestingly, the share of the top 10% in total wealth in 2015 is much closer between the two countries, at 67% in China and 71% in Russia as illustrated by **Figure 4.2.2**, indicating that Russia's transition strategy favored its most wealthy citizens more than China's. As seen in **Figure 4.2.1**, by 2015 Russia had a higher concentration of wealth than the United States, while China's wealth inequality was roughly in between that of France and the United States.

The variations in inequality increases between the two former communist countries were in part due to differences in their strategies for privatizing housing and state-owned enterprises. In Russia, previously state-owned businesses were transferred to the private sector through a voucher privatization process that can be compared to a fire sale of assets given the extremely fast pace at which it was executed. By contrast, the enormous transfer of public capital into private capital with the sale of state-owned enterprises in China occurred more slowly. Its scale, though, was considerable: close to 100 000 firms with ¥11.4 trillion worth of assets were privatized between 1995 and 2005.[4]

The method by which property wealth was privatized was different, however. Chinese citizens experienced huge reductions in welfare housing allocations and the almost complete privatization of the housing

Figure 4.2.1
Top 1% personal wealth share in emerging and rich countries, 1913–2015



Source: WID.world (2017). See wir2018.wid.world for data series and notes.
In 2015, the Top 1% wealth share was 43% in Russia against 22% in 1995.

market, and by 2002, 85% of urban housing was privately-owned. This property privatization process was very unequal as access to quoted and unquoted housing assets often depended on how wealthy and politically connected the household was, with the wealthiest end of the distribution able to access privatized public wealth more easily through official markets. In contrast, Russians took a more gradual approach to property privatization. Tenants were typically given the right to purchase their housing unit at a relatively low price and did not need to exercise this right immediately, while uncertainty surrounding the macroeconomic and political environment also meant many Russian households waited until the late 1990s and even the 2000s to exercise this right. Consequently, the property privatization process had a small dampening effect on the rise of wealth inequality. The shares of the middle 40% defined as the top 50% excluding the top 10% fell in both countries across the period. Interestingly, the group's share fell in similar proportions in China and in Russia, from 43% in 1995 to 26% in 2015 in China and from 39% to 25% over the same period in Russia. While the fall was more pronounced in China, it was initially more abrupt in Russia than in China, however, due to the aftereffects of hyperinflation that followed price liberalization in 1992 and wiped out savings.

The growing inequality of income and savings rates have caused rapid wealth concentration in the United States

The rise of wealth inequality in the United States was less abrupt, but no less spectacular in historical terms, than the increases experienced in the former communist countries. Wealth inequality in the United States fell considerably from the high levels of the Gilded Age by the 1930s and 1940s, due to drastic policy changes that were part of the New Deal. The development of very progressive income and estate taxation made it much more difficult to accumulate and pass on large fortunes. Financial regulation sharply limited the role of finance and the ability to concentrate wealth as in the Gilded

Figure 4.2.2

In 2015, the Top 10% wealth share was 67% in China.

age model of the financier-industrialist. But since the mid-1980s, top wealth shares have risen sharply. The key driver of this rapid increase in wealth concentration has been an upsurge of incomes at the top of the distribution and the stagnation of incomes at the bottom. These dynamics follow the reversal of the policies implemented during the previous period, with financial deregulation and lower top tax rates among others. The differentials between the saving rates of the richest and those of the middle- and lower-class also increased wealth inequality. This had a reinforcing, "snowballing" effect as the purchase of financial assets by the wealthy using the savings from their large incomes has led to a rise in capital income concentration, providing greater incomes for the purchase of more assets and hence larger top wealth shares.

In the United States, the share of wealth owned by the top 1% adults grew from a historic low of below 22% in 1978, to almost 39% in 2014, as depicted in **Figure 4.2.1**. This represented a trend reversal from historical patterns as the top 1% wealth share in the United States was almost double that of France and the UK in 2014. These changes enabled the wealthy to purchase more wealth assets with high returns, setting a snowballing effect in motion for those at the top of the distribution, while wealth of the middle class stagnated. Consequently, the wealth share of the middle 40% fell from a historic high of almost 37% of total wealth in 1986, to around 28% in 2014. Pensions and home ownership rates of the middle 40% increased over the preceding period, but after the mid-1980s this trend reversed due to a surge in household debt that included mortgages, student loans, credit card and other debts. These debts increased from 75% of national income in the mid-1980s to 135% in 2009 and, despite some deleveraging in the wake of the Great Recession, still amounted to close to 110% of national income in 2012; this trend can be seen in the negative share of total wealth owned by the bottom 90% between 2008 and 2013.

The rising housing wealth of the middle-class dampened wealth inequality increases in France and the UK

Between the start of the First World War and the early 1980s, France and the UK experienced dramatic falls in wealth inequality. Large wealth shocks between 1914 and 1945 included the great depression, inflation and the destruction of productive capital and housing during the World Wars, and were followed by policies designed to reduce wealth inequality such as nationalizations, rent control and tax policies. These factors collectively led to the creation of a patrimonial middle class, which did not exist in Europe before WWI, contrary to the United States where wealth inequality was relatively lower at the time. Since the mid-1980s wealth inequality has risen in both the UK and France, though to a much lesser extent than in the United States, such that the United States is now more unequal in terms of wealth than Europe. In France and in the UK, strong returns on the financial assets held in proportionately larger quantities by the wealthiest fueled wealth inequality. This factor was, however, moderated by the general rise in house prices that have largely benefited the patrimonial middle-class, which owns relatively more housing than top wealth groups.

The beginning of the twentieth century saw the start of dramatic falls in the wealth share of the top 10% and top 1% in both France and the UK, as depicted in **Figure 4.2.1** and **Figure 4.2.2**. The share of wealth owned by the top 1% in the UK reached almost 75% in the early 1900s, and represented almost 60% of the total in France. But by the early 1980s, a combination of factors including the destruction of capital during the World Wars and greater state control of economic activity and redistribution thereafter saw the top 1% share fall to 16% in 1985 in both countries and that of the top 10% fell to 47% in the UK and 50% in France, near historic lows (they had previously been as high as 93% and 86%, respectively).

But in the midst of then French President Mitterrand's austerity turn and Prime Minister Margaret Thatcher's premiership, wealth inequality began to rise. Greater wealth concentration was the result of a number of factors including: greater earnings disparities between the top and bottom of the distribution, a fall in tax progressivity, higher returns on financial assets disproportionately owned by the wealthy and the privatization of large parts of formerly state-run industry.

In France, there were strong short-run fluctuations around 2000, with a substantial rise in top 10% wealth share (up to 57% in 2000) followed by a decline (53% in 2004). This was entirely due to large movements in relative asset prices. Indeed, stock prices were very high in France during the "dotcom bubble" in 2000, as compared to housing prices, which favored the upper class relative to the middle class.

However, despite these fluctuations, the longer-term trend was unchanged. In 2014, the share of total wealth held by the top 10% had increased to 55% in France and the figure was 52% in the UK in 2012, while the shares of the wealthiest 1% reached 23% and 20%, respectively. The rise in wealth inequality in the 2000s was moderate as the rise in general house prices experienced before and over this period improved the value of property wealth—assets held in greater proportion by the middle 40%—thus comforting the share of the patrimonial middle class.

We should note, however, that high housing prices have ambiguous and contradictory effects on wealth inequality. On the one hand, high housing prices can mitigate rising inequality between the middle and the top, in the sense that property owning middle classes—who typically own most of their assets in housing—benefit from an increase in the value of their wealth that is stronger than the upper groups—who mostly own financial assets. But on the other hand high housing prices make it for difficult for the poorer groups to access real estate property to begin with, and this can lead to rising inequality between the poor and the middle. High property prices also create new forms of inequality, for instance between those who bought real estate at the right time and those who did not, or between young wage-earners who can benefit from parental wealth and inter vivos gifts to become home owners and those who remain tenants forever. These are new forms of inequality which have become increasingly important for the generations born in the 1970s–1980s and after, and which were much less important for the earlier cohorts (in particular for those generations born in the 1940s–1950s, who could purchase housing assets at relatively low price with their labor income only).[5]

Property prices also played an important equalizing role for wealth inequality in Spain

The housing market has also played an important role among other European countries. Spain experienced fluctuations in its wealth concentration across the last decades, but inequality has remained broadly stable as a result of housing market evolutions. Asset price movements were key in determining short-run wealth inequality levels. In particular, the country's housing boom saw property prices triple between 1984 and 1990, and triple again between 1996 and 2008, led to volatility in wealth concentration trends throughout the period between 1984 and 2013. As the wealthiest individuals in Spain bought deeper into the property market through multiple property purchases, the bursting of this bubble in 2008 thus had larger impact on top 10% and top 1%, neutralizing their previously made gains. A similar story is also evident in the midst of the dot-com boom and bust as the wealth share of the top 1% peaks at around 28% in 2000.

Policies and institutions drive long-run wealth inequality through their impact on returns on capital and savings rates.

In the long-run, it is the inequality of savings rates between individuals and the differential between rates of return and growth that determine wealth concentration.[6] Earlier work has shown that wealth inequality within the top wealth groups increases in line with the difference between the rate of return and the rate of growth (r–g).[7] Intuitively, the higher the gap between growth and the rate of return on capital (r > g), the more wealth inequality is amplified as capital is concentrated in the hands of the wealthy. It implies that past wealth is capitalized at a faster pace, and that it is less likely to be overtaken by the general growth of the economy. As was already mentioned above, this effect can be strongly reinforced by the fact that rates of returns tend to increase with the level of wealth: the rates of return available for large financial portfolios usually have little do with those open to small deposits.

Small changes in savings rates can also have a very large impact on wealth inequality, though it may take several decades and even generations for their impacts to play out. These forces have been evident in France, the UK, and the United States, which all exhibit large differences between the savings rates of the wealthiest individuals and the rest of the distribution. In France, the top 10% of wealth holders generally saved between 20%–30% of their annual incomes between 1970 and 2012, but this fraction was much smaller and fell notably over the period for the middle 40%, from 15% of annual income in 1970 to less than 5% by 2012, while savings rates among the bottom 50% fell from 8% to approximately 0%. In the United States, the savings rate of the bottom 90% of families fell sharply since the 1970s, while it has remained roughly stable for the top 1%. The annual saving rate of the bottom 90% fell from around 5–10% in the late 1970s and early 1980s to around -5% in the mid-2000s, before bouncing back to about 0% after the Great Recession. These falls in saving rates amongst the bottom 90% have been largely the consequence of increases in household debt, particularly from mortgages.

Assuming the same inequality of saving rates that were observed in France over the 1984–

2014 period—namely 24.5% for the top 10% and 2.5% for the bottom 90%—will persist, together with the same inequality of rates of return and the same inequality of labor income, the share of total wealth owned by the top 10% in France will gradually increase to the levels that were observed in the nineteenth and early twentieth centuries, that is, approximately 85% of total wealth. If, however, the 1970–1984 trends had persisted after 1984 and continued during the upcoming decades, the top 10% would have owned only slightly more than 45% of total wealth today and this figure would further decrease throughout the twenty-first century.

4.3

WEALTH INEQUALITY IN THE UNITED STATES

Information in this chapter is based on the article "Wealth Inequality in the United States Since 1913: Evidence from Capitalized Income Tax Data," by Emmanuel Saez and Gabriel Zucman, 2016. *Quarterly Journal of Economics*, 131(2), 519–578.

- Top wealth shares have been risen since the mid-1980s to 2012, with the top 0.1% driving wealth concentration at the top; their wealth share grew threefold from 7% in 1978 to 22% in 2012, a level comparable to that of the early twentieth century.
- United States wealth inequality had previously fallen considerably from the 1930s and 1940s, due to drastic policy changes that were part of the New Deal. These policies included the introduction of progressive income and estate taxation, and greater financial regulation.
- The key driver of this rapid increase in wealth concentration since the 1980s has been an upsurge of top incomes combined with an increase in saving rate inequality across wealth groups. This has had a reinforcing, "snowballing" effect as the accumulation of financial assets by the wealthy has led to a rise in capital income concentrations, allowing for more wealth accumulation at the top.
- The declining wealth share of the bottom 90% of the distribution is the result of plummeting middle-class savings, as their mortgage, consumer credit, and student debt has greatly increased.

Wealth inequality in the United States has risen rapidly and consistently since the mid-1980s

To fix notions of wealth inequality in the United States, it is perhaps best to first consider the distribution of the country's wealth in 2012 that is outlined in **Table 4.3.1**. The average net wealth per family was over $384 000, but this average masks a large heterogeneity. The bottom 90%—a group of almost 145 million families who possess approximately $94 000 on average—collectively own about as much of the total household wealth (22%) as the 161 000 families who are included in the top 0.1%; their average wealth was approximately $82 million, 845 times larger than the bottom 90%. Wealth is much more concentrated than income in the United States, as the top 0.1% wealth share is about as large as the income share of the top 1%.

Rising wealth inequality since the 1980s is almost entirely due to the top 0.1%

Wealth is becoming significantly more concentrated in the United States, but this trend is not the result of tens of millions of Americans seeing a rise in their fortunes. It is rather the spectacular dynamics of a tiny group of the population owning more than $4.4 million—the entry price of the top 1%.

Top wealth shares have risen sharply since the mid-1980s. Indeed, the share of wealth held by the top 10% in 1985 was approximately 63%, the lowest value it had reached since 1917. But by 2012, the wealth share of the top 10% had reached over 77%, an additional 13 percentage points. More than three quarters of all wealth in America was owned by just ten percent of its population.

Table 4.3.1
The distribution of household wealth in the US, 2012

Wealth group	Number of families	Wealth threshold ($)	Average wealth ($)	Wealth share
A. Top Wealth groups				
Full Population	160 700 000	–	384 000	100%
Top 10%	16 070 000	740 000	2 871 000	77.2%
Top 1%	1 607 000	4 442 000	15 526 000	41.8%
Top 0.1%	160 700	23 110 000	81 671 000	22.0%
Top 0.01%	16 070	124 525 000	416 205 000	11.2%
B. Intermediate Wealth groups				
Bottom 90%	144 600 000	–	94 000	22.8%
Top 10–1%	14 463 000	740 000	1 470 000	35.4%
Top 1–0.1%	1 446 300	4 442 000	8 178 000	19.8%
Top 0.1–0.01%	144 600	23 110 000	44 537 000	10.8%
Top 0.01%	16 070	124 525 000	416 205 000	11.2%

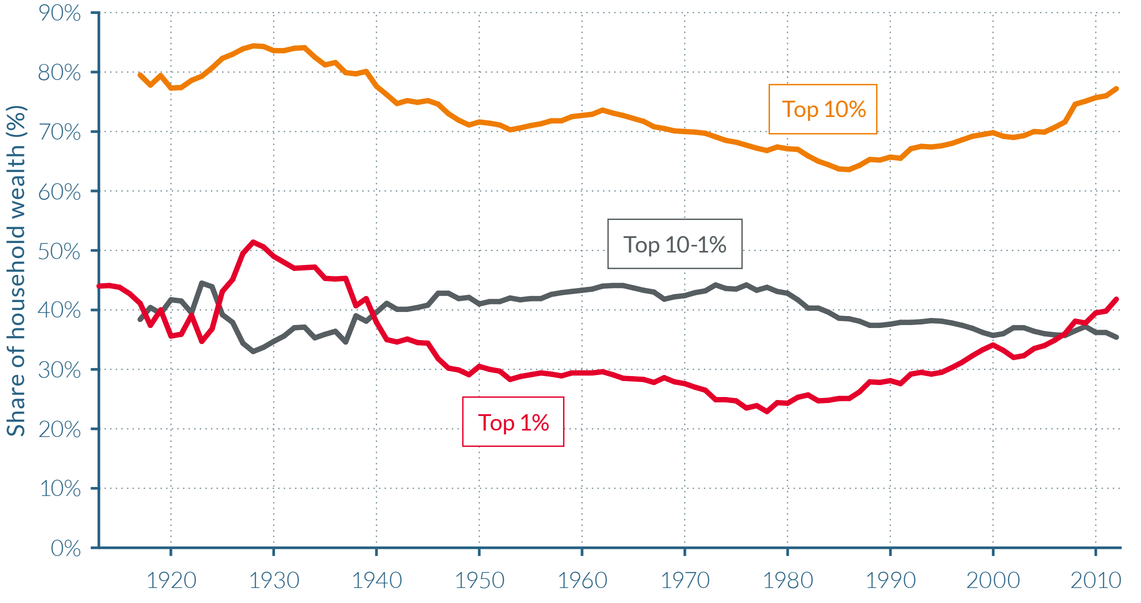
In 2012, the average wealth of the Top 10% in the US was $2 871 000. All values have been converted to 2016 constant US dollars (accounting for inflation). For comparison, $1 = €0.9 = ¥6.6 at market exchange rates. Numbers may not add up due to rounding.

Figure 4.3.1a

Wealth shares of the Top 10%, Top 10-1% and Top 1% in the US, 1913–2012



Source: Saez & Zucman (2016). See wir2018.wid.world for data series and notes.

In 2012, the share of household wealth owned by the Top 10% in the US was 77%.

However, since the mid-1980s, the wealth share of families belonging to the top 10% but not to the top 1% has decreased. In fact, the share of total wealth owned by the top 1% increased at a faster pace (up by around 17 percentage points) than the top 10% between 1986 and 2012 (see **Figure 4.3.1a**). The rise in the wealth share of the top 1% itself owes almost all of its increase to the growth of the top 0.1% share which rose from 7% to 22% (15 percentage points). The wealth share of the top 0.1% was thus larger than the share of the top 1–0.1% (that is the top 1% minus the top 0.1%) in 2012, having tripled since 1978. Almost all of the top 1% and top 10% increase over the past four decades has been due to the top 0.1% alone.

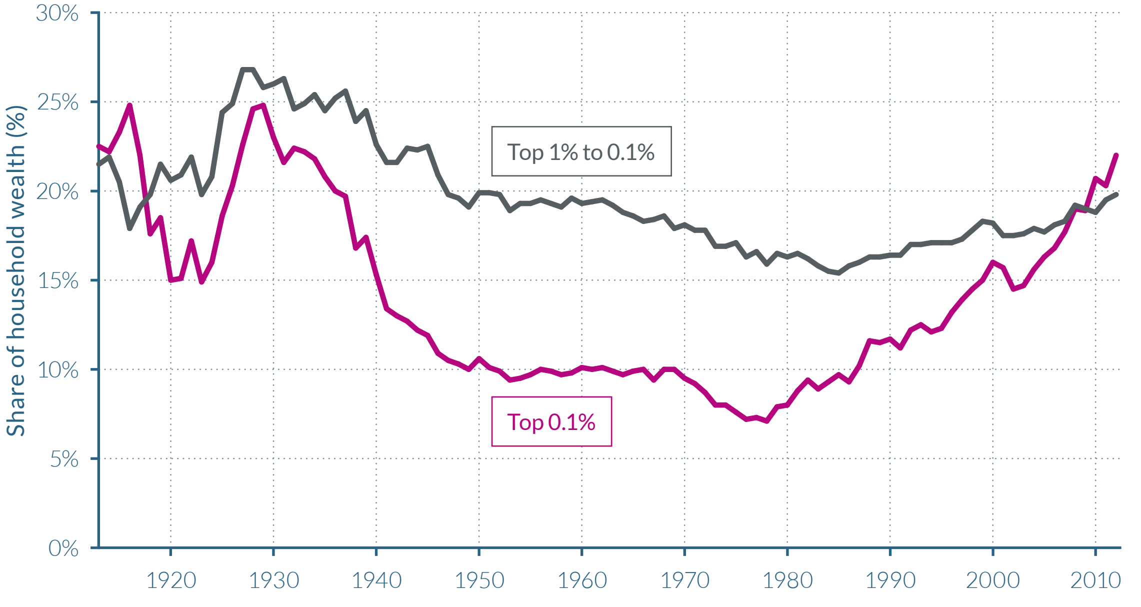
The recent rises in wealth concentration contrasts with continual reductions over the previous half-century

The significant increase in the wealth shares of America's wealthiest since the mid-1980s is in direct contrast to the trend that followed the Great Depression. The Roaring Twenties saw a huge rise in wealth concentration, as the top 1% accumulated a significantly larger share of total wealth over the decade, rising from 35% in 1923 to almost 52% by 1928, and the top 10% wealth share peaked at 84%. But the impact of the Great Depression, and the New Deal policies implemented under Franklin Roosevelt's Presidency, quickly saw this trend reverse.

Wealth inequality fell at a tremendous pace from 1929 until around the end of the Second World War. The loss in the value of financial assets from the collapse of the stock market and the introduction of financial regulation during the New Deal reduced the role of finance and the ability to concentrate wealth relative to the Gilded Age model of the financier-industrialist, while the development of progressive income and estate taxation made it difficult to accumulate and pass on large fortunes. Correspondingly, the share of the top 1% fell from 52% of total wealth to 29%

Figure 4.3.1b

Wealth shares of the Top 1-0.1% and Top 0.1% in the US, 1913–2012



Source: Saez & Zucman (2016). See wir2018.wid.world for data series and notes.
In 2012, the share of household wealth owned by the Top 0.1% in the US was 22%.

by 1949. Their falling shares were not just accumulated by the top 10–1% either, as illustrated by **Figure 4.3.1b**, as the share of total wealth rose from 33% to 42%, leaving the bottom 90% with a 29% share, equal to that of the top 1%.

Following the Second World War, wealth inequality rose moderately, before falling again from the early 1960s onwards. The wealth share of the top 10% grew from around 70% to 74% in 1962, before falling in almost every year until the mid-1980s, by which point their share had dipped below 65% of total wealth. As previously described, the Reagan era of deregulation and reduced tax progressivity formed a turning point in wealth inequalities in America. The top personal income tax rate from 50% in 1986 to 28% in 1988, well below the corporate tax rate of 35%.

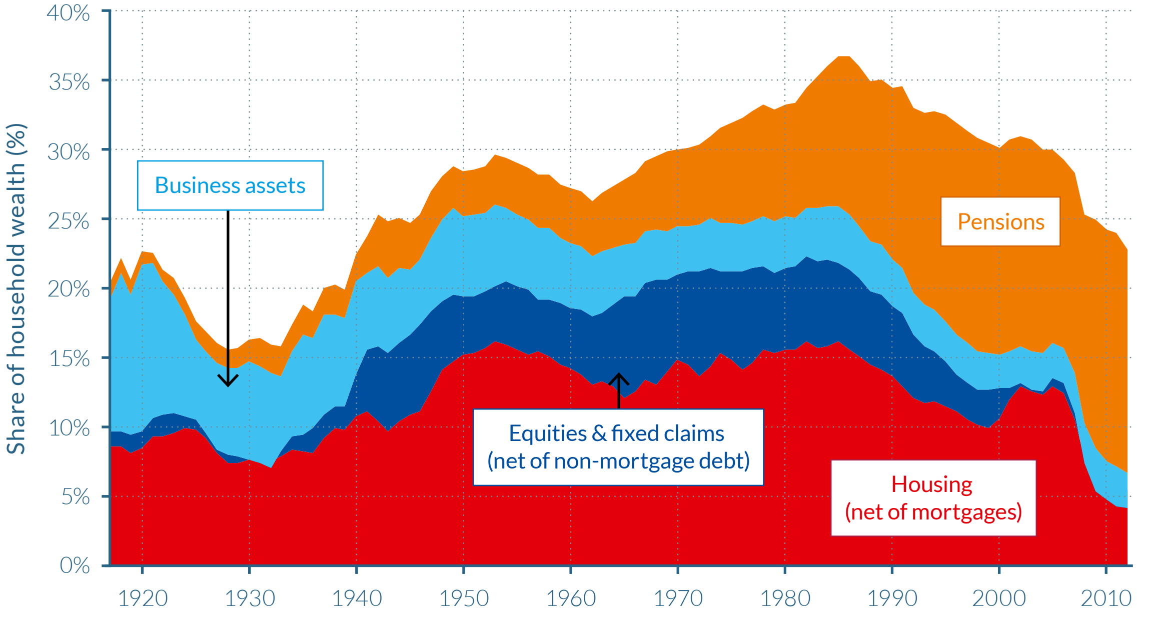
The rise and fall of middle-class wealth

The second key result of the analysis involves the dynamics of the wealth share of the bottom 90%. Since the bottom half of the distribution always owns close to zero net wealth, that is, when including negative wealth such as credit card and housing debt, the wealth share of the bottom 90% is therefore equal to the share of wealth owned by the middle 40% group, above the bottom 50% but below the top 10%. Within this "middle class", the share of total wealth owned in 2012 was the same as it was 70 years earlier, despite a rise in the value of their pensions and an increase in their home ownership rates.

The share of wealth owned by the middle class began to increase from the early 1930s, and peaked in the mid-1980s. It has subsequently undergone a continuous decline, as illustrated by **Figure 4.3.2**. The large rise in the wealth share of the bottom 90%, from 16% in the early 1930s to 35% in the mid-1980s, was driven by the group's accumulation of housing wealth, and to a greater extent by pensions. Pensions were almost nonexistent at the beginning of the

Figure 4.3.2

Composition of the wealth share of the Bottom 90% in the US, 1917–2012



Source: Saez & Zucman (2016). See wir2018.wid.world for data series and notes.

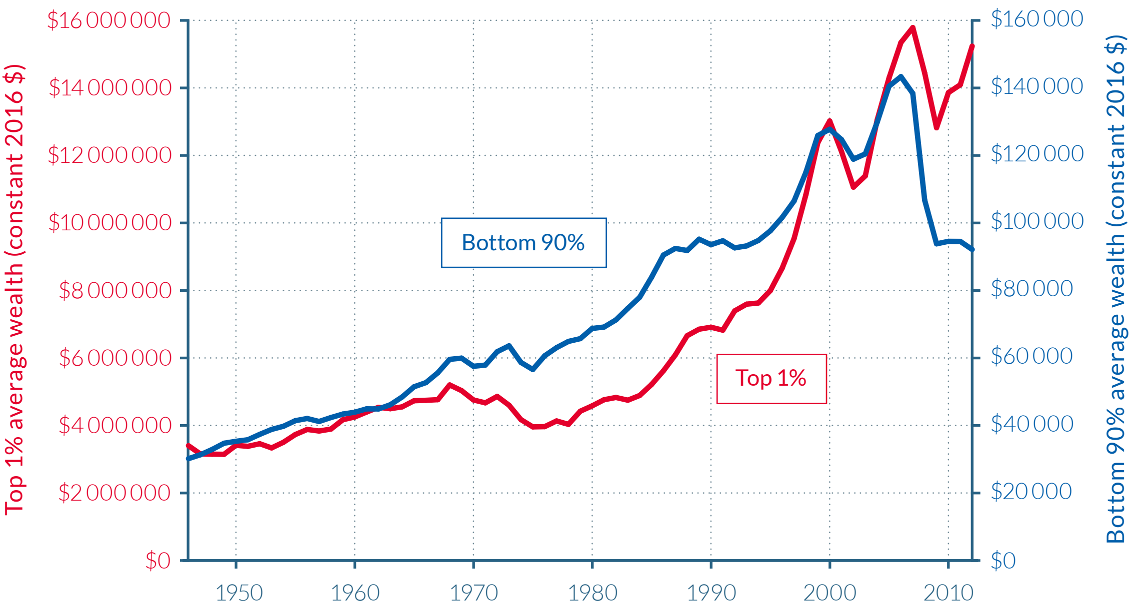
In 2012, the share of household wealth held by the Bottom 90% in the US was 23%. Pensions made up 16 percentage points of the group's household wealth share.

twentieth century, but developed in the form of defined benefits plans, and then from the 1980s in the form of defined contribution plans such as Individual Retirement Accounts and the so called 401(k)s (the latter referring to a section of the United States tax code).

The declining share in the wealth share of the bottom 90% that occurred from the mid-1980s was due to a fall in two components of middle class wealth, namely the housing component (net of mortgage debt) and the fixed income component (net of non-mortgage debt). This fall was mostly the consequence of an upsurge in debt, as aggregate household debt, including mortgages, student loans, credit cards, and other debts, increased from 75% of national income in the mid-1980s to 135% in 2009. The financial crisis of 2007–2009 and the Great Recession then hit the middle class hard. The share of wealth owned by the bottom 90% collapsed between mid-2007 and mid-2008 because of the crash in housing prices, and the subsequent recovery was uneven: over 2009–2012, real wealth per family declined 0.6% per year for the bottom 90%, while it rose 7.9% per year for the top 0.1%.

Despite a reduction in debt levels in the wake of the Great Recession as the middle class sold a proportion of their assets, their debt still amounted to close to 110% of national income in 2012. This upsurge in the debt of the middle class has had a dramatic effect on middle-class wealth as approximately 90% of (non-mortgage) debt belongs to the bottom 90% of the wealth distribution, being sufficiently large to more than offset the rise in the value of their pensions. Strikingly, the average real wealth of the bottom 90% of families was no higher in 2012 than in 1986. Real average wealth of the bottom 90% rose considerably during the late 1990s tech-boom and the mid-2000s housing bubble, peaking at \$143 000 in 2006, but then collapsed to about \$93 800 in 2009 (at constant 2016 \$), as depicted in **Figure 4.3.3**.

Figure 4.3.3
Average wealth of the Bottom 90% and Top 1% in the US, 1946–2012



Source: Saez & Zucman (2016). See wir2018.wid.world for data series and notes.

In 2012, the average real wealth of the Bottom 90% households was $92 100, while the average real wealth of the Top 1% was $15 237 000. All values have been converted to 2016 constant US dollars (accounting for inflation). For comparison, $1 = €0.9 = ¥6.6 at market exchange rates.

The dynamics of savings rates explains much of the evolution of wealth inequality

Inequalities in income shares and savings rates have been shown to have an impact on wealth dynamics in the long run.[8] There has been a significant difference in the savings rates of the different US wealth groups between 1917 and 2012. The bottom 90% of wealth holders saved approximately 3% of their income on average over the period, while the 10–1% grouping saved about 15% of their income and the top 1%, around 20–25%. The main exception was during the Great Depression (1929–1939), during which the savings rate of the top 1% was substantially negative, because corporations had zero or even negative profits, but still paid out dividends. This period of negative saving at the top greatly contributed to the fall in top wealth shares during the 1930s described above.

Savings rate inequality has also increased in recent decades. The saving rate of bottom 90% families has fallen sharply since the 1970s, while it has remained roughly stable for the top 1%. The annual saving rate of the bottom 90% fell from around 5–10% in the late 1970s and early 1980s to around -5% in the mid-2000s, before bouncing back to about 0% after the Great Recession (from around 2008–2011). From 1998 to 2008, the bottom 90% dis-saved (spent on credit) each year due to massive increases in debt, in particular mortgages, fueled by an unprecedented rise in housing prices.[9] Concurrently, the top 1% continued to save at a high rate, and so the relative savings rate of the bottom 90% and the top 10–1% collapsed.

While the fall in the savings of the middle class explains much of the decline in the wealth share of the bottom 90%, rising income inequality has nonetheless had several noteworthy impacts on the dynamics of wealth inequality in the United States. Firstly, the fall in the savings rate of the bottom 90% saving rate might itself be a consequence of the increase in income inequality and the lackluster growth of middle-class income, further accentuating wealth inequality.[10] Secondly, simulations indicate that if the bottom 90% had maintained a constant share of national income, as well as saving at 3% per year then its wealth share would have declined little since the mid-1980s and would be equal to about 33% in 2012 (rather than its actual level of 23%). And finally, rising income inequality at the top has had a significant impact on the wealth shares of the groups at the top of the wealth distribution. For example, the share of income earned by families in the top 1% of the wealth distribution doubled since the late 1970s, to about 16% in recent years. This increase is relatively larger than the increase in the wealth share of the top 1%, suggesting that the main driver of the growth in the wealth share of the top 1% is the upsurge of their income.

4.4

WEALTH INEQUALITY IN FRANCE

Information in this chapter is based on "Accounting for Wealth Inequality Dynamics: Methods, Estimates and Simulations for France (1800–2014)," by Bertrand Garbinti, Jonathan Goupille-Lebret and Thomas Piketty, 2016. WID.world Working Paper Series (No. 2016/5).

- ▷ Wealth inequality rose moderately in France since the mid-1980s. In 2014, the top 10% owned 55% of total French wealth, up from 50% in 1984, its lowest level ever recorded.
- ▷ Wealth inequality has fallen dramatically between 1914 and 1984. In the early 1900s, the wealth share of the top 1% amounted to 55% of total wealth. Large shocks between 1914 and 1945 (depression, inflation, wars) followed by nationalizations, rent control and tax policies reduced the share of the wealthiest 1% to around 16% by the early 1980s.
- ▷ The 1980–1984 period saw the rising prosperity of the middle class as significant increases in the group's absolute wealth levels were experienced. This was in part due to the rise of their saving rates during this high-growth period.
- ▷ The rise in housing prices also played a crucial role in moderating the increase in wealth inequality after 1984, as these assets form a large part of the portfolio of the middle class.
- ▷ The long-run dynamics of wealth inequality are largely governed by the inequality of savings rates, themselves driven by habit formation, income inequality and tax and regulatory policies.
- ▷ Small variations in savings rates and rates of return can have substantial, long term impacts on wealth inequality. If the recent trends are prolonged, wealth inequality could return to its 1900 level by the end of the century.

The top 10% richest French own 55% of total wealth, while the middle 40% owns 38%.

If France's total wealth was equally shared amongst the French adult population in 2014, each adult would own approximately €201 000 in net wealth. However, as **Table 4.4.1** indicates, this was far from the case. The least wealthy half of the adult population have around €25 500 in assets, equal to one-eighth of the national average and which amounted collectively to 6% of the country's total wealth. The average wealth of the middle 40% is almost equal to that of the national average at €193 000, and hence their share of total wealth, at 38%, almost represents what it would have been if French wealth was shared equally. French adults need to own assets totaling over €402 000 to be counted in the top 10%, a group whose average wealth was close to €1.1 million, five-and-a-half times the national average and 43 times the average wealth of the bottom 50%.

Wealth in France is even more highly concentrated among the top 10%. This is immediately obvious when analyzing the wealth share of the top 1%: at 23.4% of total wealth and average net assets of over €4.7 million, their share is almost as large as the wealthiest 10% of the population excluding the top 1%, that is, the 10%–1%. To be amongst the top 0.1%, French adults must have wealth totaling nearly €7.6 million, with the average for the group closer to €16.5 million. The total wealth of this group of 52 000 adults is thus a third larger than that of the 26 million adults in the bottom 50%. At almost €184 million, the average wealth of the 520 adults in the top 0.001% is 914 times the national average and almost 180 times the average of their peers in the top 10% group.

Wealth inequality has fallen dramatically since the early twentieth Century leading to the creation of a patrimonial middle class

Current levels of wealth inequality are far from their early twentieth century levels. During the nineteenth and early twentieth century, wealth concentration remained stable at an extremely elevated rate. As noted in *Capital in the Twenty-First Century*,[11] while the French Revolution is likely to have reduced wealth concentration in France with the end of fiscal privileges new taxes on

Table 4.4.1
The distribution of personal wealth in France, 2014

Wealth group	Number of families	Wealth threshold (€)	Average wealth (€)	Wealth share
Full Population	51 720 000	–	201 000	100%
Bottom 50%	25 860 000	–	25 500	6.3%
Middle 40%	20 690 000	99 000	193 000	38.4%
Top 10%	5 172 000	402 000	1 097 000	54.5%
Top 1%	517 000	2 024 000	4 703 000	23.4%
Top 0.1%	51 700	7 612 000	16 506 000	8.2%
Top 0.01%	5 170	26 668 000	55 724 000	2.8%

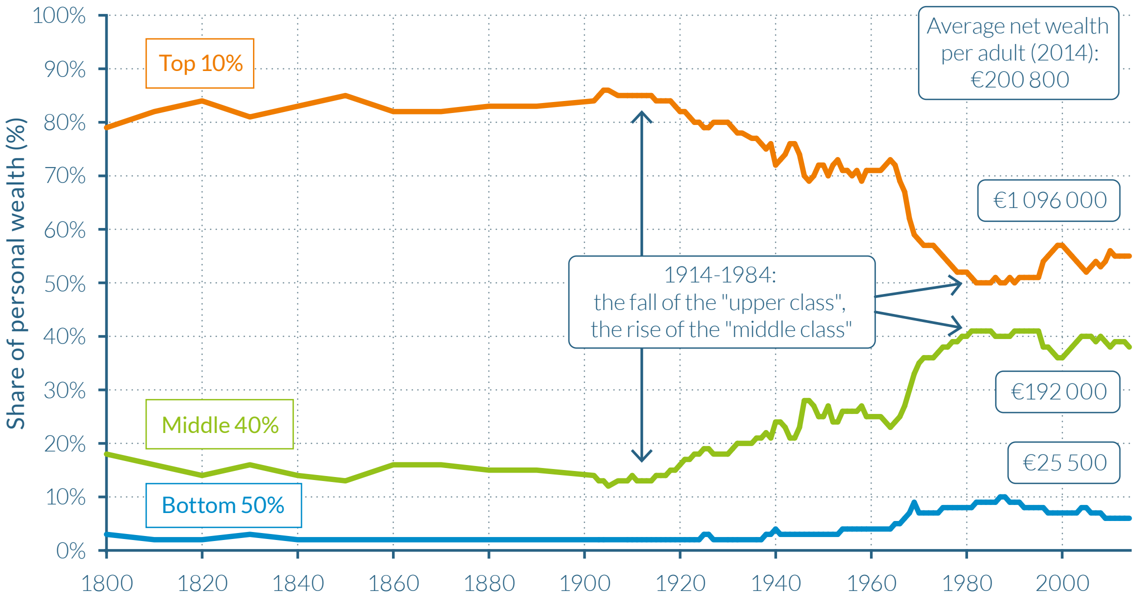
In 2014, the average wealth of the Top 10% in France was €1 097 000. All values have been converted to 2016 constant euros (accounting for inflation). For comparison, €1 = $1.1 = ¥7.3 at market exchange rates. Numbers may not add up due to rounding.

Figure 4.4.1
Wealth shares in France, 1800–2014



Source: Garbinti, Goupille-Lebret and Piketty (2017). See wir2018.wid.world for data series and notes.

In 2014, the share of personal wealth held by the Top 10% in France was 55%. All values have been converted to 2016 constant euros (accounting for inflation). For comparison, €1 = $1.1 = ¥7.3 at market exchange rates.

wealth, it is interesting to note that wealth remained highly concentrated in 1800 and throughout the nineteenth Century. During the French Third Republic (1870–1940), which brought forward ideals of republican meritocracy, wealth concentration increased rather than decreased. On the eve of the First World War, the share of the top 10% was around 85% of total wealth, while the middle 40% owned a little less than 15% of French wealth, leaving the bottom 50% with almost no wealth. In a sense, there was no "middle class": the middle 40% was almost as propertyless as the bottom 50%. As can be observed in **Figure 4.4.1**, the wealth held by the top 10% between 1800 and 1914 was dominated by that of the top 1%, who held almost double the wealth of the top 10–1% at the beginning of the 1900s.

The top 10% wealth share started to fall following the 1914–1945 capital shocks. The First and Second World Wars caused huge losses in the aggregate wealth-income ratio—from around 700% to less than 200%—as significant stocks of total wealth were destroyed. This had a profound impact on wealth inequality in France. The share of total wealth held by the top 1% almost halved between the start of the First and the end of the Second World War, falling from around 55% to 30% to the benefit of the middle class.

The rise of the middle 40% during the 1914–1945 period is not due to the fact that the middle class accumulated a lot of wealth during this period: this simply corresponds to the fact they lost less wealth—in proportion to their initial wealth level-than the top 10%. In contrast, during the postwar decades, the rise of the middle class corresponds to a significant rise of their absolute wealth levels partly due to the rise of their savings rates during the high-growth period.

This fall in wealth inequality continued until the early 1980s, and fell to its lowest level recorded in 1983–1984. The share of total

Figure 4.4.2

In 2014, the share of personal wealth held by the Top 1% was 24%. All values have been converted to 2016 constant euros (accounting for inflation). For comparison, €1 = $1.1 = ¥7.3 at market exchange rates.

wealth held by the top 1% and the top 10–1% fluctuated during the mid-1940s to mid-1960s, between 30%–35% and around 35%–40%, respectively, while the middle 40% share of total wealth rose from around 20% to 25%. Top 1% shares dropped from around 33% in 1945 to just over 15% by 1984, while the middle 40%, rose from 25% to over 40%. (See **Figure 4.4.1** and **Figure 4.4.2**.)

Wealth has increased moderately since 1984

Wealth inequality increased moderately since the early 1980s. In 1984, French wealth was the least concentrated it had been since data collection began at the beginning of the nineteenth century. But as the 1980s progressed, wealth inequality began to increase notably. The introduction of more laissez-faire economic policies, including the privatizations of large state-owned enterprises and the development of financial markets, that followed then President Mitterrand's austerity turn in 1982–1983 (see Chapter 2.2 for more detail) saw the wealth share of the top 10% wealthiest French adults increase to around 53% by 1990 and 56% by 1995. This came at the expense of the wealth shares of the both the middle-class and the lower class, whose shares fell to around 49% and 6%, respectively, by the mid-1990s.

Wealth concentration then rose at a significant rate in the years of the dot-com boom. By 2000, the wealth share of the top 10% passed 60%, leaving the middle 40% with less than 35% and the bottom 50% with around 6%. The year 2000 did, however, appear to be somewhat of a turning point, illustrating the strong short-run fluctuations in wealth concentration experienced over the last three decades. The shares of the middle 40% then began to rise and those of the top 10% fall as stock prices crashed in the wake of the bursting of the dot-com bubble in 2000, and house prices increased at a solid rate. These

Figure 4.4.3

In 2014, the value of personal wealth was equal to 571% of national income.

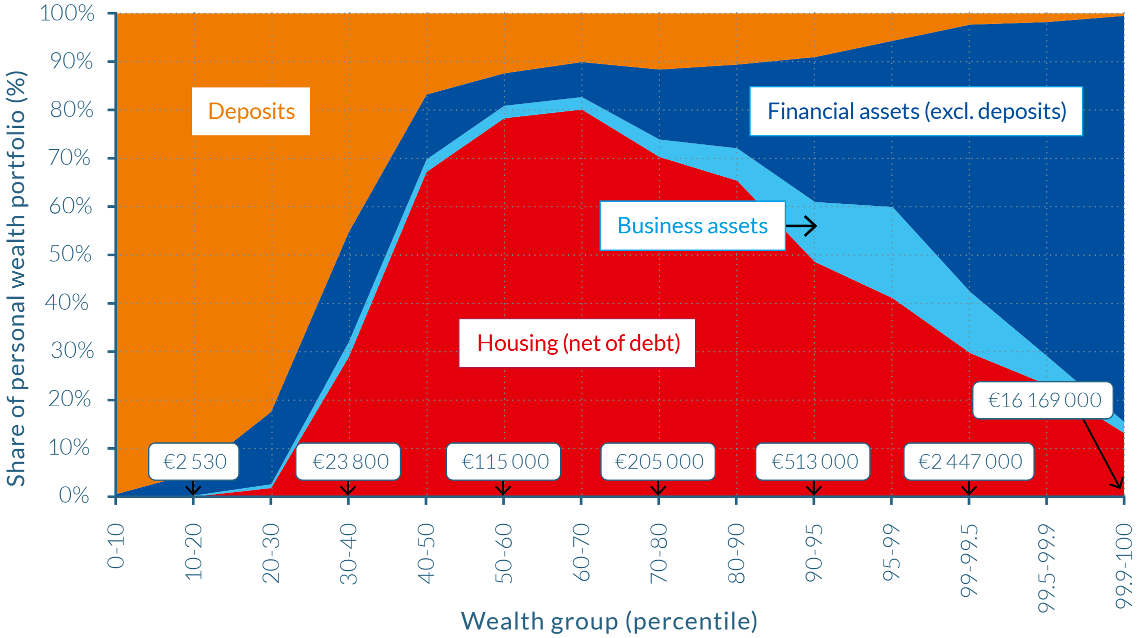
relative movements in asset prices (discussed in more detail below) left the top 10% with approximately 56% of total wealth in 2005, the middle 40% with around 38% and the bottom 50% with the remaining 6%. The share of the bottom 50% thus remained unchanged during the first five years of the new millennium, despite the substantial changes for the other half of France's adult population.

The following years leading up-to and following the global financial crisis of 2008–2009 had a rather muted impact on wealth inequality in France. The share of total wealth held by the top 10% increased to around 59% in 2010, while those of the middle 40% remained almost unaffected. It was the bottom 50% who suffered instead, seeing their share of total wealth fall to just 5%. The following two years show slight falls in the wealth share of the top 10% and a small increase for the bottom 50%, again changes in the shares of the middle 40% were negligible.

Differences in asset portfolios among wealth groups are key in determining wealth inequality dynamics over the recent period

Before we move on to analyzing wealth inequality within asset categories, it is important to recall that the composition and level of aggregate wealth changed substantially in France over the 1970–2014 period, as depicted by **Figure 4.4.3**. Observing this figure, it is clear to see that the shares of housing assets and financial assets have increased substantially, while the share of business assets has declined markedly, the latter largely due to the fall in self-employment. Financial assets, other than deposits, increased strongly after the privatization of the late 1980s and the 1990s and reached a high point in 2000 as the stock market boomed in the run-up to the dot-com crash. In contrast, housing prices declined in the early 1990s, but then rose strongly during the 2000s, while stock prices were falling.

Figure 4.4.4
Asset composition by wealth group in France, 2012



Source: Garbinti, Goupille-Lebret and Piketty (2017). See wir2018.wid.world for data series and notes.

In 2012, 67% of the personal wealth of the 5th decile (p50-p60) was composed of housing assets (net of debt). All values have been converted to 2016 constant euros (accounting for inflation). For comparison, €1 = $1.1 = ¥7.3 at market exchange rates.

These contradictory movements in relative asset prices have an important impact on the evolution of wealth inequality in France, as different wealth groups own very different asset portfolios. As depicted by **Figure 4.4.4**, the bottom 30% of the distribution own mostly deposits in 2012, while housing assets are the main form of wealth for the middle of the distribution. However, as one move towards the top 10% and the top 1% of the distribution, financial assets—other than deposits—gradually become the dominant form of wealth, largely because of their large equity portfolios. These general patterns of asset portfolio construction remain relatively constant throughout the 1970–2014 period, except that business assets played a more important role during the 1970s and early 1980s, particularly among middle-high-wealth holders.

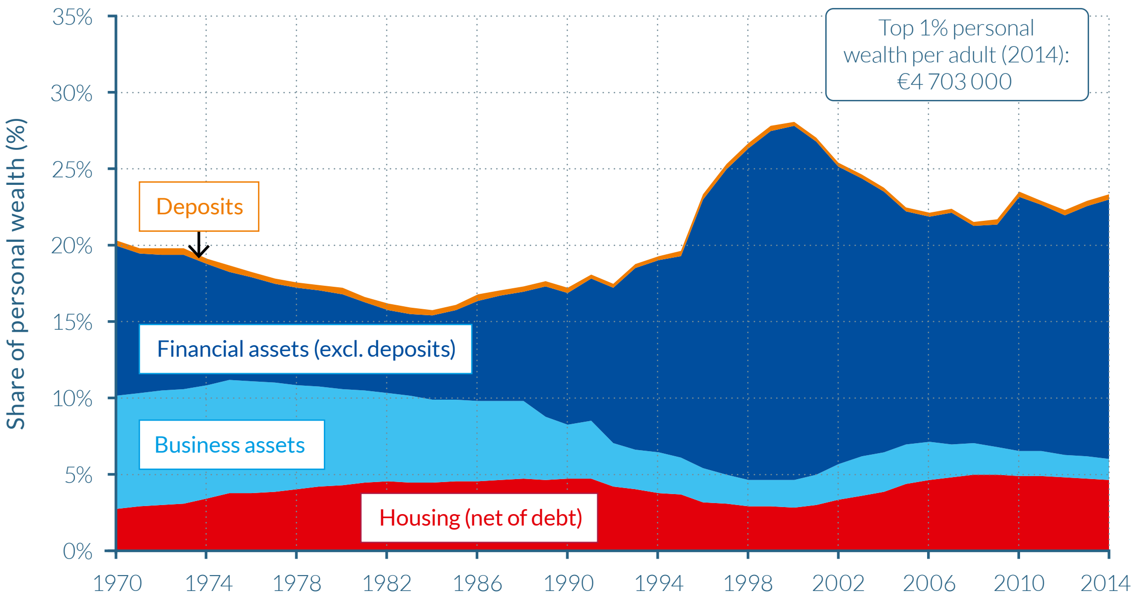
If one now decomposes the evolution of wealth shares going to the bottom 50%, middle 40%, top 10%, and top 1% by asset categories, the impact of asset price movements on inequality is significant. In particular, **Figure 4.4.5**, indicates the significant impact the stock market boom of the 2000s and its slide thereafter had on top wealth shares in particular. It also shows the effect of the general increase in housing prices on the wealth shares of the middle 40% during the 2000s, further discussed below.

Rising housing prices moderated wealth concentration since the 1980s

Changes to house prices played a notable role in reducing wealth inequality in France between 1970 and 2014. Similar to trends in a number of other rich nations, house prices in France increased at a faster pace than consumer price inflation (2.4% faster per year) and thus the total return to French adults owning property was significant, growing at an annual rate of over 6% during

Figure 4.4.5a

Composition of the wealth share of the Top 1% in France, 1970–2014

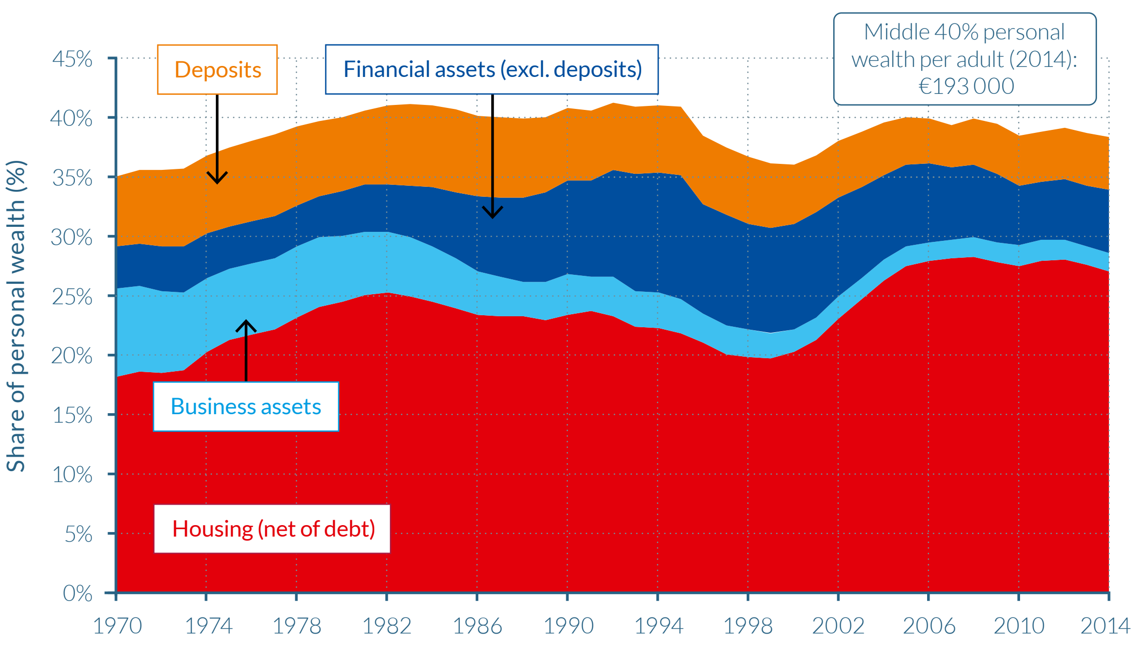


Source: Garbinti, Goupille-Lebret and Piketty (2017). See wir2018.wid.world for data series and notes.

In 2014, the Top 1% owned 17% of personal wealth in financial assets, excluding deposits. All values have been converted to 2016 constant euros (accounting for inflation). For comparison, €1 = $1.1 = ¥7.3 at market exchange rates.

Figure 4.4.5b

Composition of the wealth share of the Middle 40% in France, 1970–2014



Source: Garbinti, Goupille-Lebret and Piketty (2017). See wir2018.wid.world for data series and notes.

In 2014, the Middle 40% owned 27% of personal wealth in housing (net of debt). All values have been converted to 2016 constant euros (accounting for inflation). For comparison, €1 = $1.1 = ¥7.3 at market exchange rates.

the observed period. However, this structural increase in house prices has been far from steady, rising particularly strongly between 2000 and 2008, and therefore generated large short-run, rather than long-run, fluctuations in wealth inequality.

The explanation for the short-term fluctuation in wealth concentration experienced as financial asset prices increased up to the beginning of the twenty-first century also follows the same line of reasoning. During the stock market boom, wealth inequality in France increased substantially due to the bias towards financial asset holdings amongst the wealthiest. However, the reasoning also follows that these increases in asset prices can be discounted as an explanation for the long-run increase in inequality over the period, alongside the changes in house prices.

Once variations in asset prices are corrected for, the data indicates that structural factors have caused a rise in the concentration of wealth between 1970 and 2014. The housing boom of the 2000s did, however, play an important role as a mitigating force to limit the rise of inequality, as the structural increase in the wealth shares of the top 10% and top 1% over the 1984–2014 period would have been substantially larger had housing prices not increased so fast during these years relative to other asset prices.

France is also a clear illustration of the fact that housing prices have an ambiguous and contradictory impact on inequality. They raised the market value of the wealth of the middle class—those who were able to access real estate—and thereby raised the wealth share of the middle 40% relative to the top 10%, whose asset portfolios are more diversified and contain relatively less real estate. But, rising housing prices also made it more difficult for people in the lower and working classes (the bottom 50%), and also members of the middle class with no family wealth, to access real estate.

Higher savings rates and returns on assets for the wealthy increased wealth concentration since the 1980s

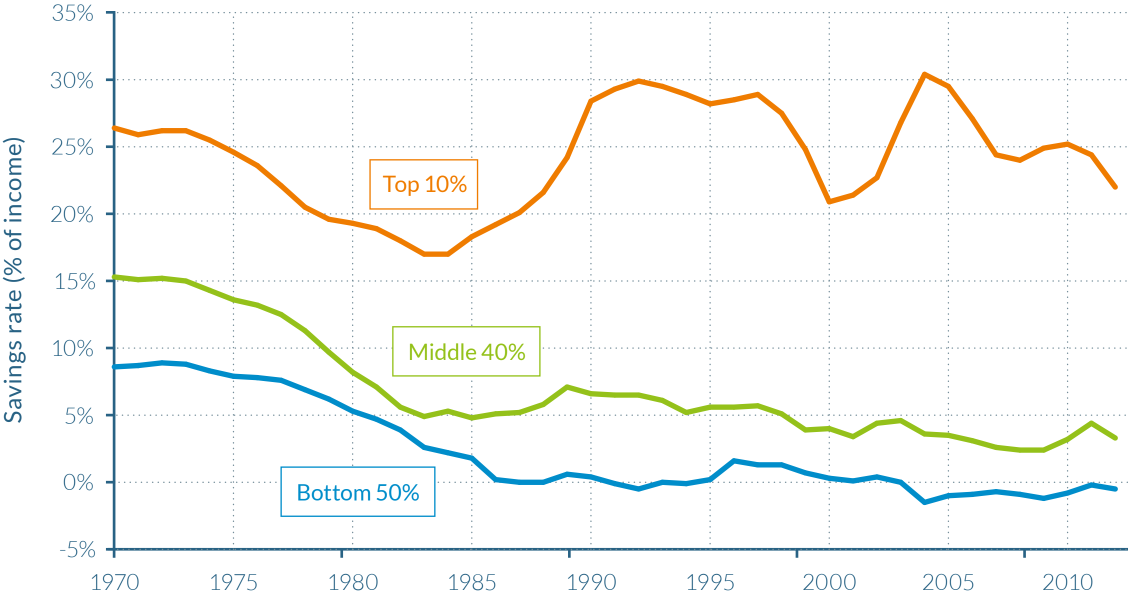
In the long-run, it is the savings rates of groups and the long-run rate of return on the type of wealth (assets) that they hold that determine wealth concentration.[12] In particular, if the savings rates and/or the rates of return of the top wealth groups are higher than the average, this can generate large multiplicative effects, and lead to very high wealth concentrations.

As illustrated by **Figure 4.4.6**, there were significant differences in savings rates between wealth groups in France between 1970 and 2012. While the top 10% of wealth holders generally saved between 20%–30% of their annual incomes over the observed period, this fraction was much smaller and fell notably over the period for the middle 40% and the bottom 50%, from 15% of annual income in 1970 to less than 5% by 2012, and from 8% to approximately 0%, respectively. Similar trends were found in the UK and the United States, reinforcing the assertion that savings rate differentials were the key structural force accounting for rising wealth concentration in many developed economies over this period.

Average rates of return on assets also vary significantly between different wealth groups over the 1970–2014 period. The notable inequalities in rates of return between higher and lower wealth groups is due to significant differences in their respective portfolio of assets, as indicated earlier in **Figure 4.4.5**. In particular, top wealth groups own more financial assets, particularly equities, which can have much higher rates of return than real estate assets or savings deposited in financial institutions. Indeed, the average annual return on financial assets such as equities, shares and bonds is over four-times greater than the returns on housing assets, though this difference falls to a more modest 50% when including real capital gains.[13]

Figure 4.4.6

Savings rates by wealth groups in France, 1970–2012



Source: Garbinti, Goupille-Lebret and Piketty (2017). See wir2018.wid.world for data series and notes.

In 2012, the Middle 40% saved 3% of income, while the Bottom 50% spent more than they saved.

The elderly hold the keys to French wealth

How did wealth inequality evolve across age groups over the recent period? Looking first at the age-wealth profile, it is evident that the average wealth owned by those aged 20 has consistently been very limited at less than 15% of average adult wealth throughout the series history. Wealth then rises sharply with age, peaking between 55–65 years old at 150–170% of average adult wealth depending on which era is examined. Thereafter, wealth slightly declines, but remains at very high levels, around 125%–150% of from age 60 to age 80, as illustrated by **Figure 4.4.7**.

These age-wealth profile slightly evolved over the past fourty years, as wealthiest individuals grew older. In 2010, wealth is accumulated notably later in life than in 1995 and 1970, with wealth peaking at age 65, seven to ten years later than in 1970 and 1995. Note also that old-age individuals make very substantial inter vivos gifts in France, so that average wealth at high ages would be even higher without these gifts, particularly at the end of the period. Gifts are made on average about 10 years before death, and the aggregate gift flow has increased from about 20%–30% of the aggregate bequest flow in the 1970s to as much as 80% of the aggregate bequest flow in the 2000s–2010s.[14]

Habit formation, income inequality dynamics and tax evolutions are likely to drive the inequality of saving rates

While it is not possible to fully explain why saving rates and rates of return change in the way that they do, it is possible to identify key factors that were at play since the early twentieth century. Between 1914 and 1945, one can imagine that the saving rates of the top wealth groups were severely affected by the capital and fiscal shocks of the 1914–1945 period. In particular, there was no progressive taxation prior to 1914, and in the interwar period, effec-

Figure 4.4.7
Age-wealth profiles in France, 1970–2010

In 2010, the average wealth of those aged 50 was 30% more than the average personal wealth of the adult population.

tive tax rates for top income and wealth groups quickly reached very substantial levels, for example 20%–40%, and sometimes even more.[15] In the likely scenario that top wealth holders reacted by reducing their consumption levels and living standards less than the increase in tax (which came in addition to a negative shock to their pre-tax capital incomes), then in effect, they had to reduce their saving rate.

After 1945, those at the bottom and in the middle of the wealth distribution saved at higher rates than before, during the high-growth postwar decades due to some form of "habit formation" effect whereby individuals were prudent with their consumption and saved earnings in case of shocks or crises.[16] It is also possible that rising top income shares in recent decades, together with growth slowdown for bottom and middle groups, has contributed to rising inequality in saving rates, and this has been exacerbated by some form of relative consumption effect (see Chapter 2.5) , whereby the bottom 90% is consuming a greater proportion of their income than the top 10% leaving little savings for investment in assets. This is particularly the case for the bottom 50%.

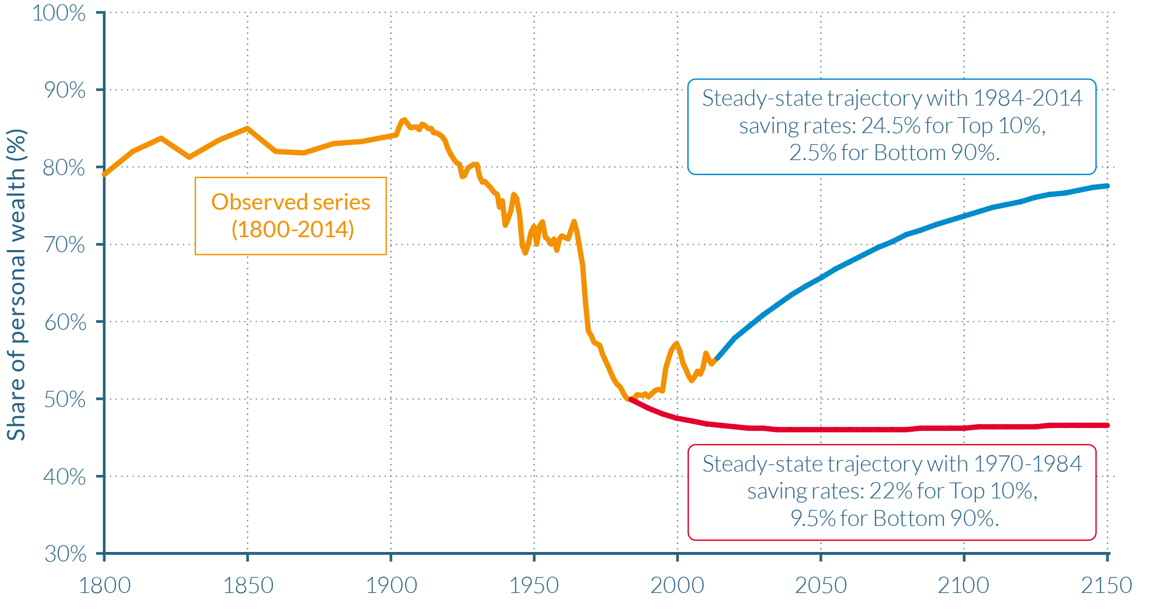
It is clear that changes in the tax system, and in particular in tax progressivity, as seen post World War II and during the 1960s, can have very large impacts on both the inequality of saving rates between groups and on the inequality of rates of return, and therefore on wealth inequality in the long-run. The inequality of rates of return can also be influenced by many other factors, including financial regulation and deregulation seen after the great depression and the reduction in capital controls in the mid- to late-1980s, as well as the introduction and end of rent controls.

Wealth concentration could return to Gilded Age level by 2100

The savings rates and rates of return per wealth group can be used to estimate each

Figure 4.4.8

Top 10% wealth share simulations in France, 1800–2150



Source: Garbinti, Goupille-Lebret and Piketty (2017). See wir2018.wid.world for data series and notes.

In 2150, the share of total wealth owned by the Top 10% will be 78% if the saving rates of the Top 10% and Bottom 90% remain the same as their average during the 1984-2014 period: 24.5% and 2.5%, respectively.

groups' share of total wealth in the coming decades. Assuming the same inequality of saving rates that were observed over the 1984–2014 period—namely 24.5% for the top 10% and 2.5% for the bottom 90%—will persist, together with the same inequality of rates of return and the same inequality of labor income, the share of total wealth owned by the top 10% will gradually increase to the levels that were observed in the nineteenth and early twentieth centuries, that is, approximately 85% of total wealth. If, however, the 1970–1984 trends had persisted after 1984 and continued during the upcoming decades, the top 10% would have experienced a decline in their share of total wealth. Using the same average savings rates, the same inequality of rates of return and the same inequality of labor income as during 1970–1984, the top 10% would have owned slightly more than 45% of total wealth today and this figure would further decrease throughout the 21st Century. (See **Figure 4.4.8**.)

There are two main messages from these relatively simple simulations. Firstly, moderately small evolutions in the inequality of saving rates or rates of return, for example, can have enormous impacts on steady-state wealth inequality. Secondly, these effects can take decades and even generations before they fully materialize. This delayed-impact can explain why declining wealth concentration continued long after the capital shocks of the 1914–1945 period. Once some structural parameters have changed, it takes many decades to reach a new steady-state.

4.5

WEALTH INEQUALITY IN SPAIN

Information in this chapter is based on "Housing Bubbles, Offshore Assets and Wealth Inequality in Spain (1984–2013)," by Clara Martínez-Toledano, 2017. WID.world Working Paper Series (No. 2017/19).

- ▷ The Spanish housing and stock market booms of the last 30 years have seen the country's personal wealth to national income ratio almost double from around 380% in 1984 to 730% in 2007, before falling to just under 650% by 2014.
- ▷ With an average wealth of almost €813 000 per adult, the top 10% owned almost 57% of Spain's personal wealth in 2013. The share of the bottom 50% was 7%, with an average wealth of just over €18 900. The relative shares of personal wealth remained virtually unchanged during the last thirty years.
- ▷ The ability of the wealthy to adapt and diversify their asset portfolio depending on which assets were experiencing the most growth has enabled them to benefit from the Spanish housing boom and shelter somewhat from the impact of its crash.
- ▷ Approximately €146 billion was held by Spanish citizens in offshore wealth in 2012, increasing the concentration of wealth considerably.

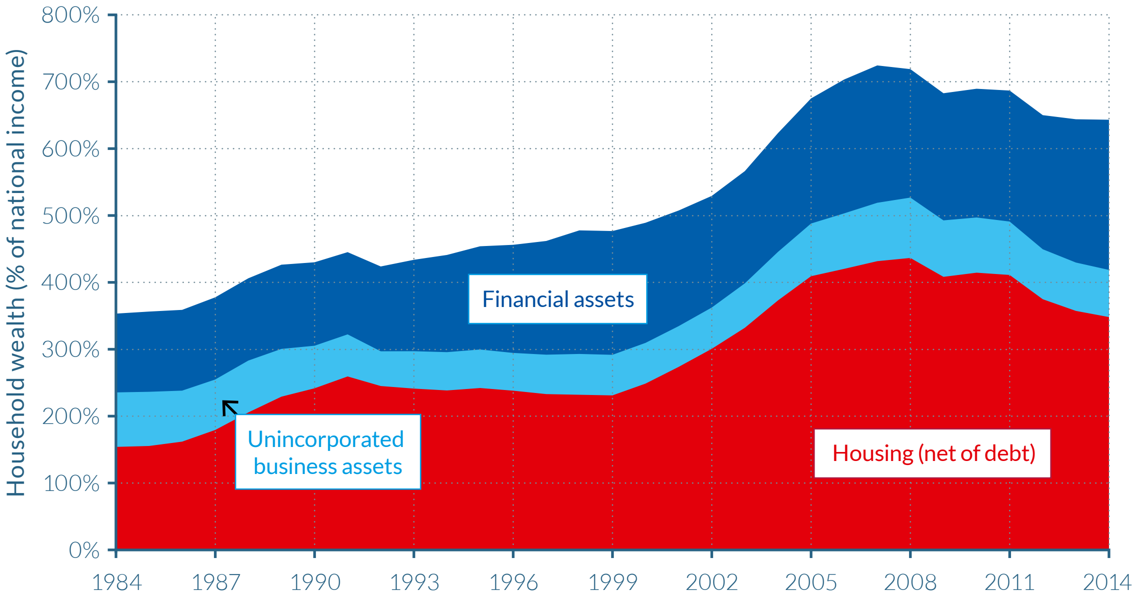
Spain has experienced an unprecedented increase in aggregate wealth over the past thirty years, predominantly due to the housing the country experienced over the last 30 years. Much has been written about this economic phenomenon, when house prices tripled between 1985 and 1991 and tripled again between 1996 and 2008,[17] and the value of the stock market increased sevenfold before halving, but much less so on its distributional effects. In particular, there has been little research into which groups have benefited from this increase in wealth, how much each of these groups have benefited, how differences in wealth between groups have changed over time, whether the importance of asset categories has altered, and which factors are the source of the aforementioned changes?

Using high-quality, publicly available data, Martínez-Toledano's recent paper[18] seeks to answer these questions. The author combines tax records, national accounts and wealth surveys, as well as the capitalization method[19] that is used by Saez and Zucman for the United States,[20] to deliver a consistent, unified wealth distribution series for Spain between 1984 and 2013, with detailed breakdowns by age over the period 1999–2013.

The rising value of housing has fueled the growth of Spanish wealth

The Spanish personal wealth to national income ratio almost doubled between 1984 and 2014. As illustrated by **Figure 4.5.1** personal wealth amounted to around 380% in the late eighties and grew to around 470% in the mid-nineties. From 1995 onwards, personal wealth started to increase more rapidly, reaching its peak at 728% of national income in 2007, before the global financial crisis. After the bubble burst in 2008, personal wealth dropped notably and continued to decrease thereafter. In 2014, the Personal Wealth to National Income ratio amounted to 646%, a level similar to the Personal Wealth to National Income ratio of years 2004 and 2005, but much higher than

Figure 4.5.1
Composition of household wealth in Spain, 1984–2014



Source: Martínez-Toledano (2017). See wir2018.wid.world for data series and notes.
In 2014, the value of financial assets in Spain was 226% of national income.

the ratios of the eighties and nineties, as illustrated by **Figure 4.5.1**.

Figure 4.5.1 also shows how the components of total net Spanish wealth have evolved over the 30-year period. The late eighties saw growth in net housing that was more than double the speed of the increase in financial assets, but this trend was reversed during the nineties as financial assets started to be accumulated at a faster pace than property, due mainly to the rise in stock prices that arose from the dot-com bubble. However, after the stock market crash of 2000, housing prices increased at a pace that surpassed even the significant growth of financial assets. The value of housing then reached its peak in 2008, after which the sizeable housing bubble that had been built up burst and the fall in housing wealth was larger than that of financial assets.

This period was also characterized by the increasing importance of net housing in the asset portfolios of households. While properties are the most important asset held by the average Spanish household between 1984 and 2014, always representing more than 40% of total household net wealth, the composition of personal wealth has not evolved homogeneously. Indeed, personal wealth has lost importance in periods when financial assets significantly increase, such as the one that preceded the dot-com bubble. The increase in the fraction of property in the total portfolio of households has also been exacerbated by the steady decrease in the fraction of unincorporated business assets, which fell from 23% in 1984 to 11% in 2014, due mainly to the relative reduction in the importance of agriculture within the Spanish economy.

The top 10% has owned more than half of Spain's personal wealth since the mid-1980s

Table 4.5.1, displays the wealth level, threshold and shares of personal wealth for Spanish adults in 2013. On average, the net wealth per adult in Spain was approximately €144 000. However, the average wealth within the bottom 50% of the distribution was just 13% of the countrywide average, at €18 900. Cumulatively, the share of personal wealth held by the top 50% was less than 7%. Average wealth within the next 40% of the distribution was slightly over €133 000, giving the group a 37% share of personal wealth, not largely dissimilar to their population share. This left the top 10% holding over 56% of Spanish personal wealth, with an

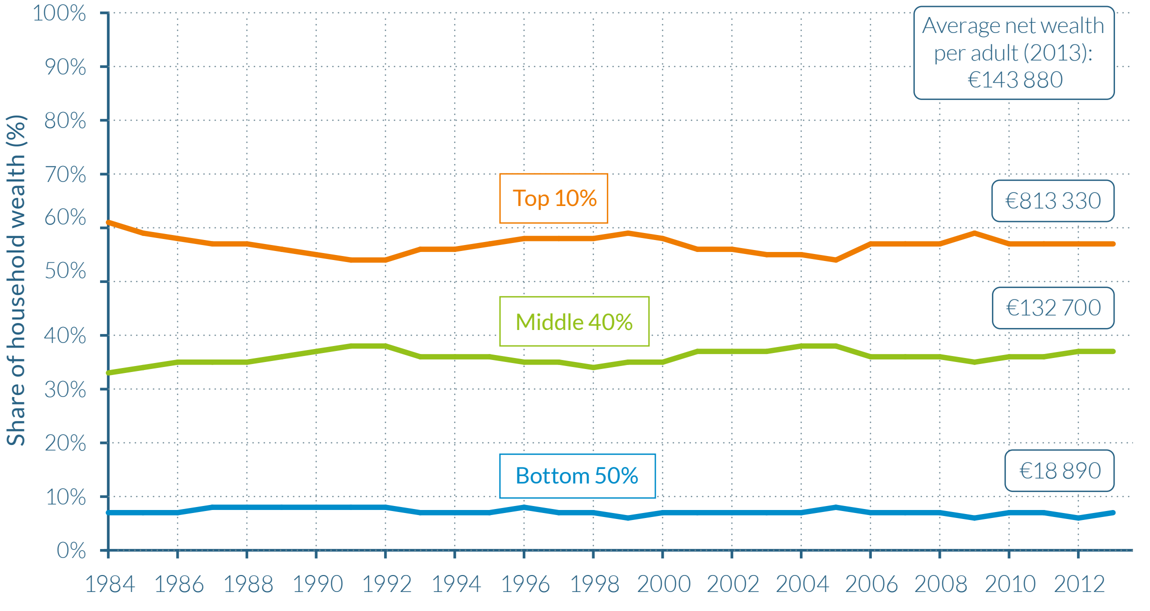
Table 4.5.1
The distribution of household wealth in Spain, 2013

Wealth group	Number of families	Wealth threshold (€)	Average wealth (€)	Wealth share
Full Population	35 083 000	–	144 000	100%
Bottom 50%	17 541 000	–	18 900	6.6%
Middle 40%	14 033 000	43 000	133 000	36.9%
Top 10%	3 508 000	317 000	813 000	56.5%
Top 1%	350 800	1 385 000	3 029 000	21.1%
Top 0.1%	35 080	4 775 000	10 378 000	7.2%

Source: Martínez-Toledano (2017). See wir2018.wid.world for data series and notes.

In 2013, the average wealth of the Top 1% in Spain was €3 029 000. All values have been converted to 2016 constant euros (accounting for inflation). For comparison, €1 = $1.1 = ¥7.3 at market exchange rates. Numbers may not add up due to rounding.

Figure 4.5.2
Wealth shares in Spain, 1984–2013



Source: Martínez-Toledano (2017). See wir2018.wid.world for data series and notes.

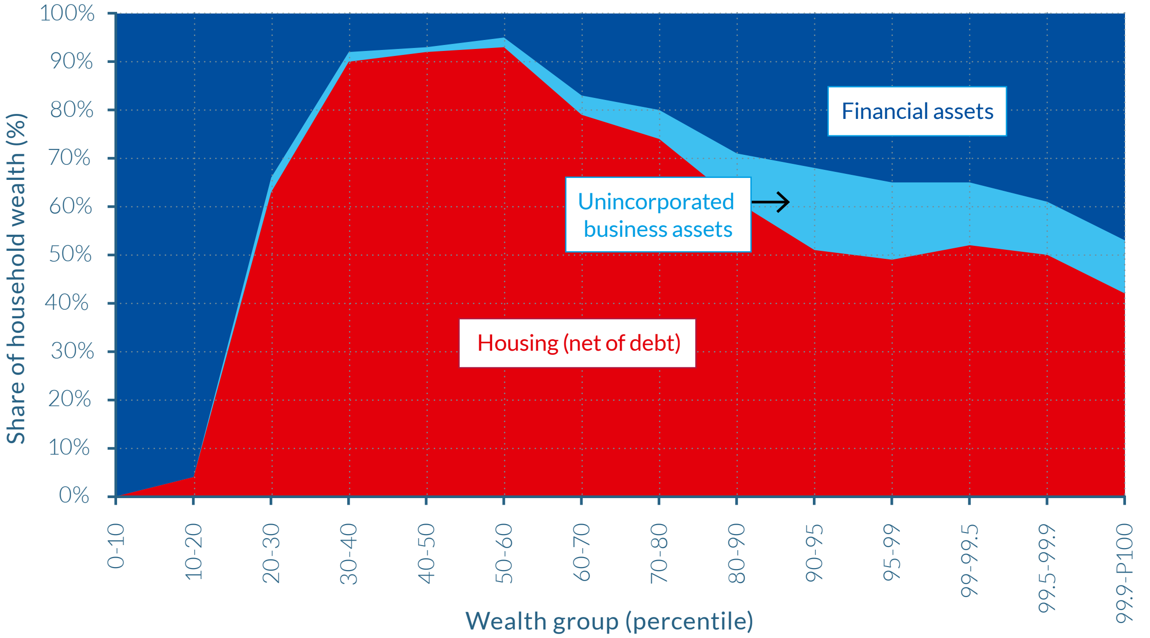
In 2013, the Bottom 50% share of household wealth in Spain was 7%. All values have been converted to 2016 constant euros (accounting for inflation). For comparison, €1 = $1.1 = ¥7.3 at market exchange rates.

average wealth of approximately €813 000, over five-and-a-half times greater than the national average wealth and 43 times greater than the average wealth of 50% of the Spanish adult population.

The drastic differences in the shares of personal wealth reported in 2013, have remained largely unchanged throughout the preceding 29-year period. As **Figure 4.5.2** shows below, the share of personal wealth held by each group has remained within a band of eight percentage points. The share of personal wealth attributable to the bottom 50% has always been very small, reaching a peak of 9% in 1992, but fell back to just over 6% in 2013, roughly equal to its level at the start of the period. The personal wealth share of the middle 40% has concentrated between 32% and 39% of total net wealth, remaining over 35% for the majority of the observed period, while the share of the top 10% has fluctuated between 53% and 61%. Notably, the top 10% wealth share dropped from the mid-eighties until the beginning of the 1990s, at the expense of the increased shares of both the middle 40% and the bottom 50% of the distribution, as house prices rose threefold across Spain. The top 10% wealth share then increased during the nineties, as the stock market grew strongly, before decreasing until the mid-2000s and increasing again until the start of the global financial crisis and burst of the housing bubble in 2008. Since then, the share of the top 10% decreased, before stabilizing at a similar level to that during the mid-nineties.

While the changes in relative assets prices have had a rather limited impact on overall wealth inequality in Spain, there are important differences in the portfolio of assets owned by different wealth groups. As shown by **Figure 4.5.3**, in 2013, the bottom 20% of the Spanish wealth distribution mostly owned financial assets, which largely came in the form of savings and current deposits in banks. As one move towards the center of the wealth distribution, property becomes the most

Figure 4.5.3
Asset composition by wealth group in Spain, 2013



Source: Martínez-Toledano (2017). See wir2018.wid.world for data series and notes.
In 2013, 93% of the household wealth of the 5th decile (p50-p60) was composed of housing assets (net of debt).

dominant form of wealth (approximately 90% between the 30th and 60th percentiles). Thereafter, the dominance of financial assets within wealth portfolios grows larger as the individuals analyzed become wealthier. However, unlike the bottom 50%, bank deposits form only a minor part of financial assets for the top 10% and the top 1% of the distribution. Instead, the wealthiest Spanish adults own a combination of equities, investment funds, fixed income assets such as bonds, currency, life insurance reserves and pension funds. The same general pattern of asset composition by wealth group also applies for the period between 1984 and 2012, as can be seen in Figures 4.5.4 and 4.5.5. The only notable difference has been the falling importance of unincorporated assets over the 28-year period, which can mainly be attributed to the reduction in agricultural activity among the self-employed.

By decomposing the evolution of wealth in Spain by asset categories and by wealth group, it is possible to see how asset price movements between 1984 and 2013 affected their respective asset portfolios and shares of personal wealth. The figures within **Figure 4.5.4** clearly show how the impact of the stock market boom of 2000 and the burst of the housing bubble in 2007 affected portfolios and shares of the top 1%. Reviewing the trend in the financial assets component of the wealth of the top 1%, there is an obvious spike in the value of financial assets and its dominance in their portfolio in 1999, the year preceding the dot-com crisis.

One particularity of the Spanish case relative to other rich nations is the importance of housing assets in the portfolio of households, even at the top of the distribution. This has been the case during the whole of the 29-year period analyzed, but this trend became even more striking in the years up to 2007, when the increase in the value of dwellings was largest. In Spain, the top 10% and top 1% of the wealth distribution own 26% and 8% of

Figure 4.5.4
Composition of the wealth share of the Top 1% in Spain, 1984–2013

In 2013, the Top 1% owned 11% of household wealth in financial assets. All values have been converted to 2016 constant euros (accounting for inflation). For comparison, €1 = $1.1 = ¥7.3 at market exchange rates.

total net wealth in housing, respectively, whereas in France these figures are 19% and 5%, respectively.[21]

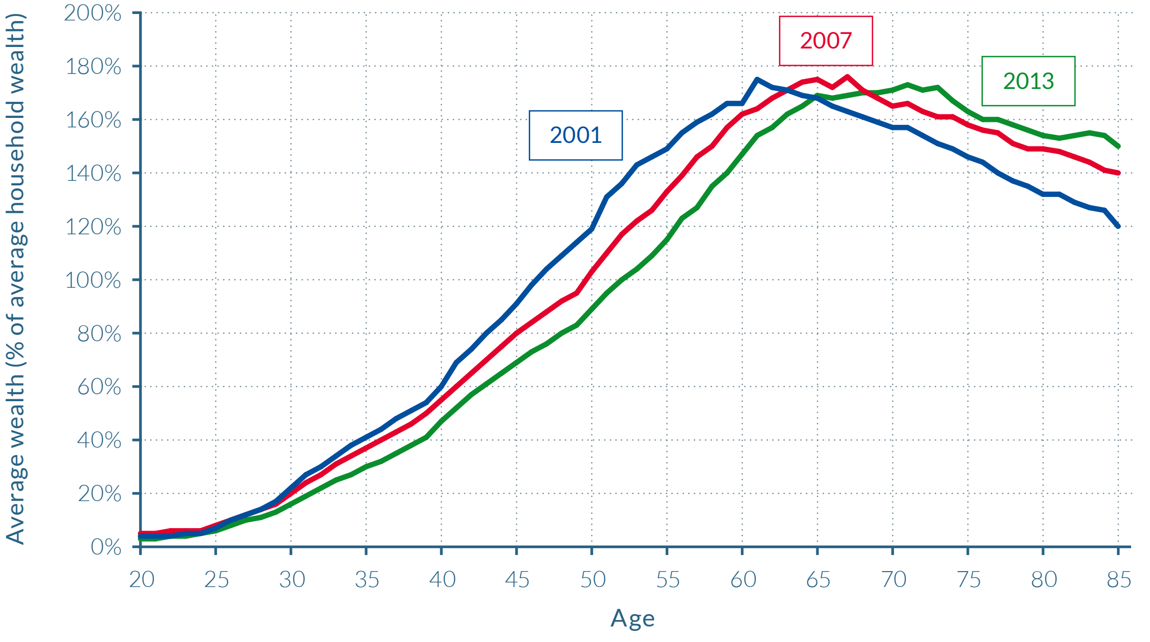
Increasingly greater sums of wealth are being passed on to the offspring of the wealthy

The detailed micro-files available in Spain from 1999 also allow Martínez-Toledano to analyze how wealth varies between different age groups, and how this has changed over time. As **Figure 4.5.5** shows, average wealth has been consistently very small for those aged 20 during the 14-year period studied, at less than 10% of total wealth. Wealth exhibits a rising trend with age. At age 40, individuals own approximately 50% of average wealth whereas at age 60, they own more than 150% of average wealth. After 60, the average adult wealth declines moderately but never falling below 120%. As average wealth does not decline sharply after age 60 and remains at a level that is notably above average wealth, old-age individuals thus pass away with substantial wealth and transmit this to their offspring.

There are, however, important differences in relative wealth levels across age groups over the 1999–2013 period. Old individuals (+60) are better off and the young (20–39) worse off after the economic crisis, since the average wealth for the old relative to total average wealth is larger in 2013 than in 2001. This is consistent with the large increase in youth unemployment[22] after the burst of the bubble and at the same time the stability in Social Security pension payments. When decomposing the wealth distribution series by age, it appears that wealth inequality is more pronounced for the young (20–39) than for the old (+60) and middle-old (40–59), for which wealth inequality is almost as large than for the population taken as a whole. A plausible explanation is the importance of bequests that transfer the wealth of the older generations to the younger generation.

Figure 4.5.5

Age-wealth profiles in Spain, 2001–2013

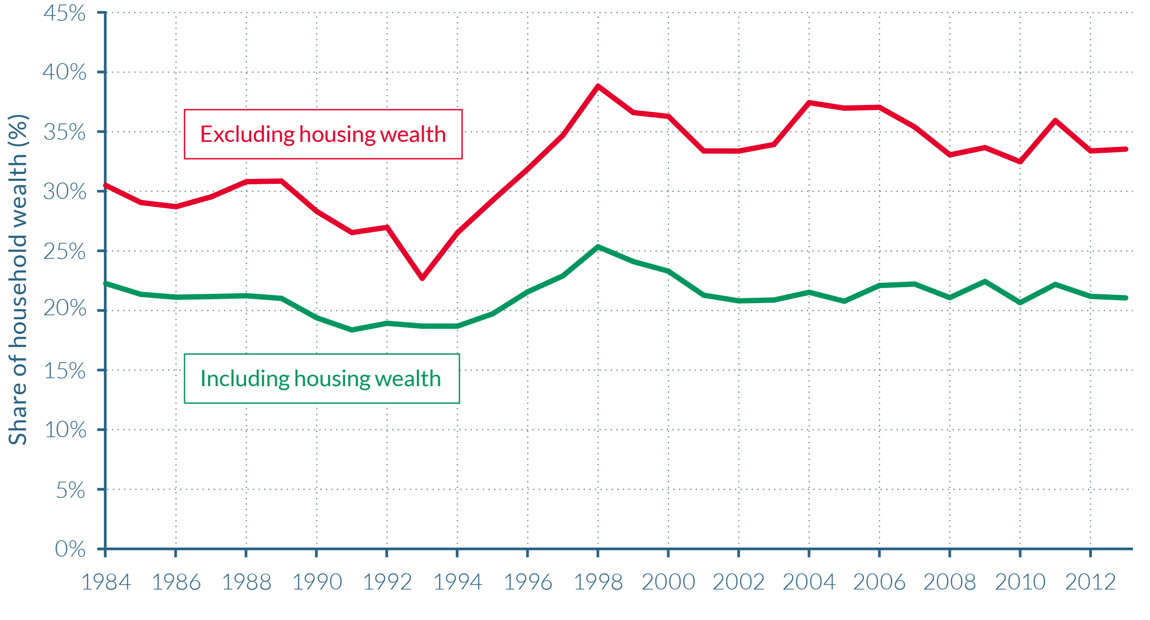


Source: Martínez-Toledano (2017). See wir2018.wid.world for data series and notes.

In 2013, the average wealth of those aged 50 was 89% of the average wealth of all Spanish households.

Figure 4.5.6

Top 1% wealth share in Spain, 1984–2013



Source: Martínez-Toledano (2017). See wir2018.wid.world for data series and notes.

In 2013, the wealth share of the Top 1% was 21% of total wealth. However, when excluding housing wealth, the Top 1% share was 34%.

Higher transfer rates among wealthy families, combined with high youth unemployment rates and consequently a low wealth accumulation through labor income savings by the young (which would moderate wealth inequality), can explain higher inequality levels among the young than among the elderly.

The Spanish property bubble had a neutral effect on wealth inequality

The high level of disaggregation in Martínez-Toledano's wealth distribution series also helps to explain why Spain's housing bubble had a curiously neutral effect on the level of wealth inequality in the country. In Spain, as in many European countries, the increased ownership of property among the bottom 90%, and the significant share that housing represents in their asset portfolios, has contributed to reducing wealth inequality. **Figure 4.5.6** illustrates that wealth concentration for the top 1% is approximately 10 percentage points lower between 1984 and 2013 when housing wealth is included. But moreover, the figure also shows that wealth inequality including and excluding housing followed a similar trend post 2000, confirming that the housing boom and bust had little impact on wealth inequality.

In order to understand this puzzling result, it is important to see how the composition of net housing wealth has changed over time. The fraction of total net housing owned by the top 1% increased considerably between 2005 and 2009, the years in which housing prices skyrocketed, at the expense of the proportion of homes owned by the middle 40%. This increased concentration of home ownership was principally the result of the increase in the number of secondary properties bought by the top 1%, relative to the middle 40%, and not due to relatively larger increases in the price of properties owned by the wealthiest. The ratio of the house prices of the top 10% (and top 1%) to the value of dwellings of the middle 40% remained constant between 2005 and 2009.

But if housing concentration increased at the top during the bubble and decreased thereafter, why has total wealth concentration remained virtually unchanged? One plausible explanation is that individuals within the top 1% substituted financial assets for property during the period of the housing boom, but then accumulated greater financial assets when house prices began to fall. The fraction of total financial assets held by the top 1% decreased during the boom years. This is consistent with the idea that wealthy individuals can better diversify their portfolios, and have the capabilities to invest more in risky assets, when prices are increasing—and can more easily disinvest when prices fall, to then acquire other assets.

Disparities in savings rates and returns on assets drive long-run wealth inequality

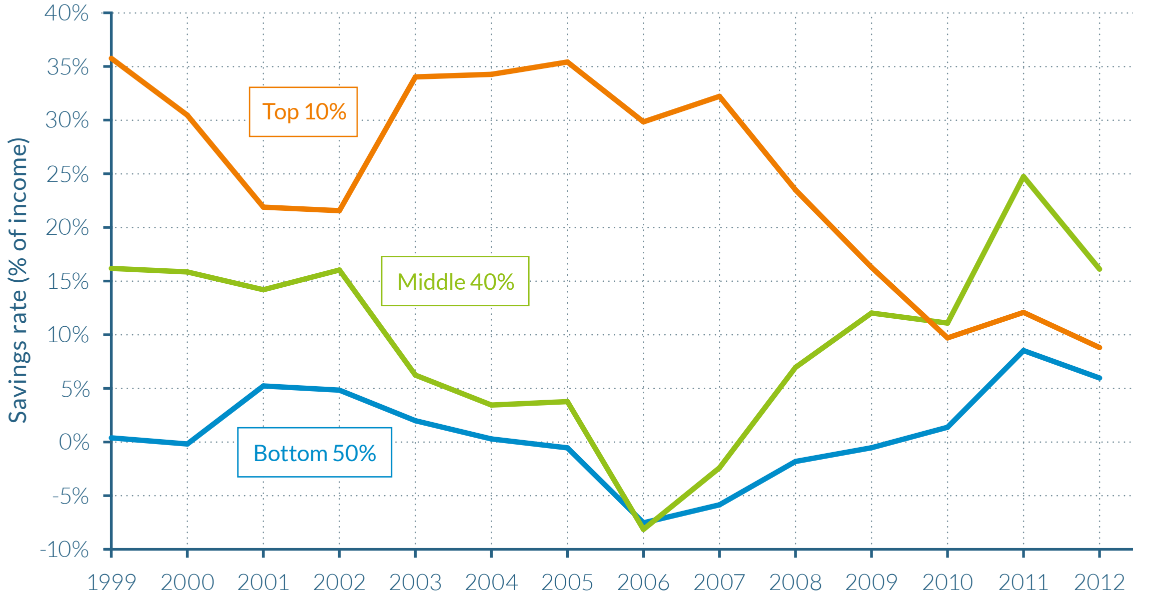
In order to understand the underlying forces driving wealth inequality dynamics in Spain, it is useful to analyse how income, savings rates and the rate of inequality have evolved between 1999 and 2012.

There are significant differences in the savings rates between wealth groups in Spain and these have changed over time, as illustrated by **Figure 4.5.7a-c**. These disparities reflect the high levels of wealth concentration observed in Spain, with an average savings rate of 27% of income for the top 10% over this period, compared to 10% among the middle 40% and just 1% for the bottom 50%.

Analyzing the evolution of savings rates more closely reveals one important point. The housing bubble increased the difference in saving rates between the wealthy and the less-wealthy during the boom years and reduced their stratification during the bust period. **Figure 4.5.7a** shows that during the years prior to the property bubble bursting, the savings rate of the top 10% remained high as they accumulated more housing, while the savings rate for the middle 40% and the bottom 50% decreased, as their accumulation

Figure 4.5.7a

Saving rates in Spain, 1999–2012

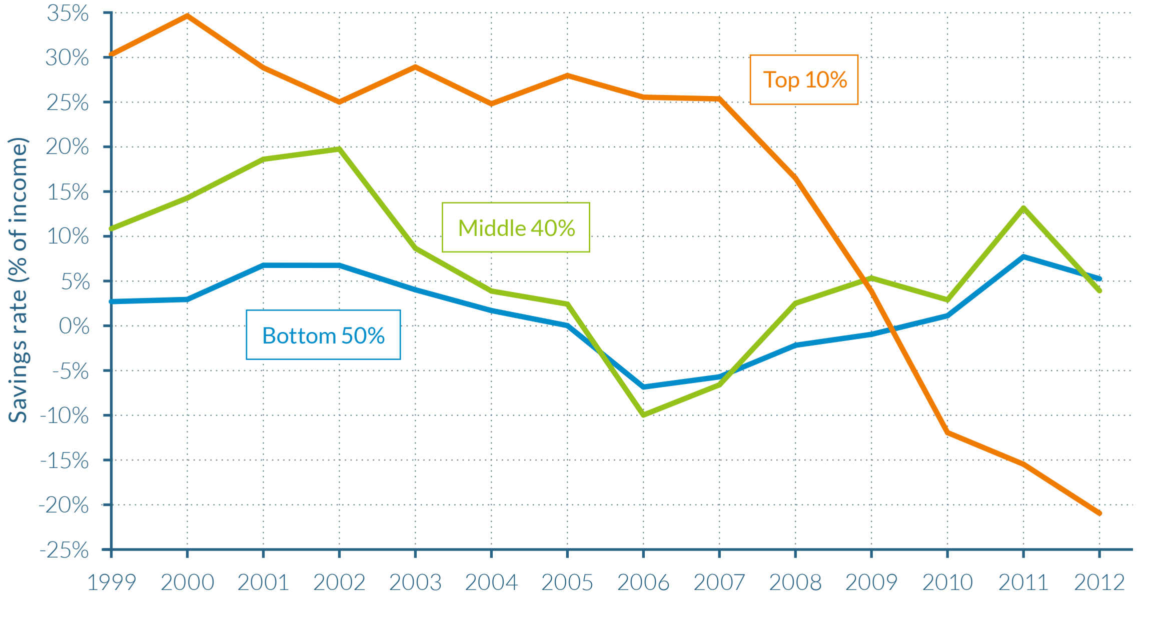


Source: Martínez-Toledano (2017). See wir2018.wid.world for data series and notes.

In 2012, the Middle 40% saved 16% of income, while the Bottom 50% saved 6% of income.

Figure 4.5.7b

Saving rates on net housing in Spain, 1999–2012



Source: Martínez-Toledano (2017). See wir2018.wid.world for data series and notes.

In 2012, the Bottom 50% saved 5% of their income on housing.

of housing assets was facilitated through borrowing. After the property bubble burst, the top 10% sold some of their housing assets and started to accumulate more financial assets to compensate for the decrease in housing prices. Nonetheless, the total savings rate for the top 10% decreased during these years, likely because they needed to consume a larger fraction of their income. The middle 40% instead started to save more in order to repay their housing mortgages, and therefore the difference in saving rates across the two wealth groups was reduced. These two trends thus contributed to neutralizing wealth concentration during Spain's tumultuous period of housing price swings.

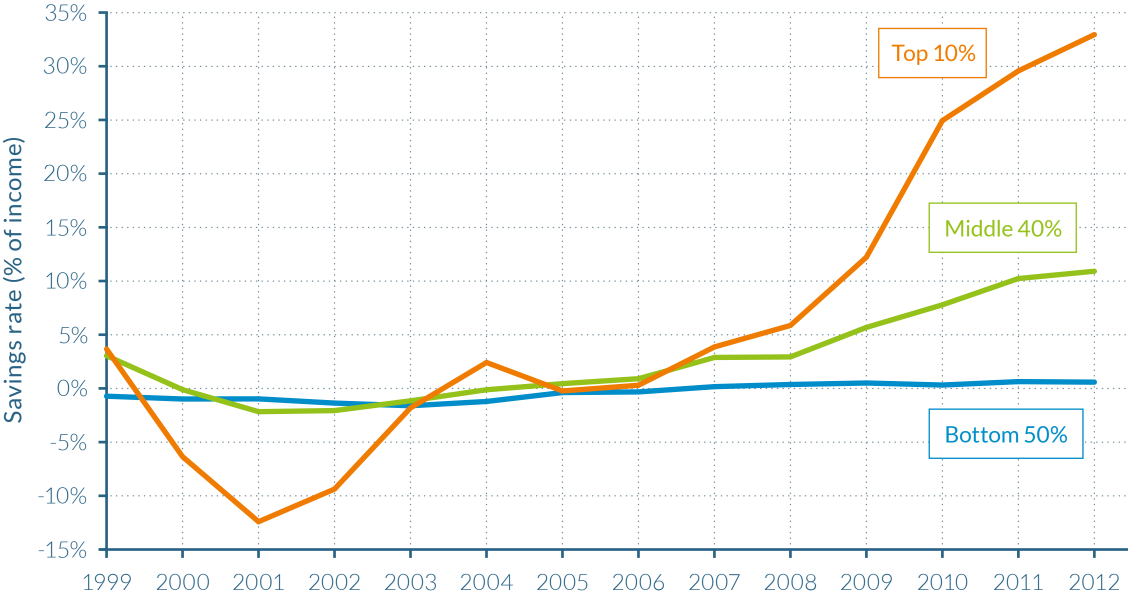
Wealth inequality has also been amplified by the variance in the rates of return on assets owned by different wealth groups in Spain over the 1986–2012 period.[23] This finding is consistent with the large differences in the asset portfolios of Spanish wealth groups documented earlier in the chapter (**Figure 4.5.1**), whereby top wealth groups are more likely to own financial assets such as equity that often have higher rates of return than other assets, including deposits and housing.

Factoring in offshore wealth into the Spanish wealth distribution reveals a higher level of inequality

As is common in many other countries, official financial data in Spain fails to capture a large part of the wealth held by households abroad. Research has shown that Spanish citizens use offshore financial institutions in tax havens for their portfolios of equities, bonds, and mutual fund shares. It is estimated by Zucman[24] that these assets amounted to approximately €80 billion in 2012—the equivalent of 9% of households' net financial wealth in Spain—of which three-quarters goes unrecorded. Thus, by omitting offshore wealth from the Spanish wealth distribution series, both total assets and wealth concentration are substantially underestimated.

Figure 4.5.7c

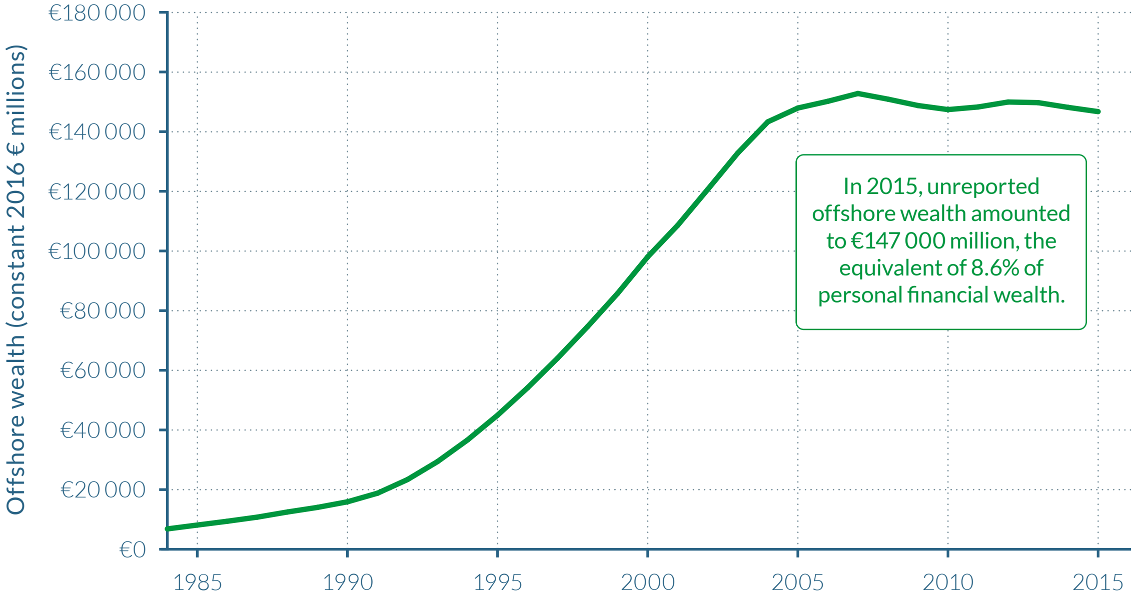
Saving rates on financial assets in Spain, 1999–2012



Source: Martínez-Toledano (2017). See wir2018.wid.world for data series and notes.

In 2012, the Bottom 50% saved 1% of their income on financial assets.

Figure 4.5.8
Total unreported offshore assets in Spain, 1984–2015



Source: Martínez-Toledano (2017). See wir2018.wid.world for data series and notes.

Notes: In 2015, unreported offshore wealth amounted to €147 billion. All values have been converted to 2016 constant euros (accounting for inflation). For comparison, €1 = $1.1 = ¥7.3 at market exchange rates.

Using data series from the Swiss National Bank, offshore wealth taxation forms and the 2012 tax amnesty, Martínez-Toledano is able to adjust her wealth distribution series for offshore assets. As illustrated by **Figure 4.5.8**, the value of offshore assets increased rapidly during the eighties, nineties and at the beginning of the 2000s, before stabilizing after 2007, when Spanish tax authorities became stricter with tax avoidance and evasion schemes. Unreported offshore wealth amounted to almost €150 billion in 2012, representing 8.6% of personal financial wealth. Investment funds represented 50% of total unreported offshore assets in 2012, followed by stocks, 30%, and deposits and life insurance, which made up 18% and 2%, respectively.

The Spanish wealth distribution series is then corrected by assigning the annual estimate of unreported offshore wealth proportionally to the wealthiest 1%. This is consistent with official documentation from the Spanish Tax Agency that states that the majority of foreign assets reported by Spanish residents are held by the top wealth holders and that these assets represented 12% and 31% of the total wealth tax base in 2007 and 2015, respectively. When offshore wealth is included in the wealth distribution, wealth concentration rises considerably, across the period between 1984 and 2013. Including offshore wealth shows that the concentration of wealth was in fact larger during the 2000s than in the eighties, contrary to what it is observed when these offshore assets are not taken into account. The wealth share of the top 1% averages approximately 24% from 2000–2013, notably larger than the 21% estimated when offshore wealth is disregarded.[25] This difference is quite remarkable, particularly given that during this period of time the country experienced a housing boom and both nonfinancial and financial assets held in Spain grew considerably as discussed earlier in this chapter.

4.6

WEALTH INEQUALITY IN THE UK

Information in this chapter is based on "Top Wealth Shares in the UK over more than a Century," by Facundo Alvaredo, Anthony Atkinson, and Salvatore Morelli, 2017. WID.world Working Paper Series (No. 2017/2).

- UK wealth inequality has shown a moderate increase since the 1980s, with the share of total wealth owned by the top 1% (almost half million individuals) rising from 15% in 1984 to 20–22% by 2013.
- The increase in wealth concentration in the last four decades is very much a phenomenon confined to the top 0.5 per cent, and, in particular, to the top 0.1 per cent (the richest 50 000 Britons), whose share of total wealth doubled from 4.5 to 9% between 1984 and 2013.
- Today's wealth inequality remains, however, notably lower than a century ago. In the wake of the first globalization era in 1914, the share of personal wealth going to the wealthiest 1% of UK individuals was around 70%, but their share began to fall thereafter. This encompassed two world wars, and much attention has been paid to the loss of capital during the periods 1914 to 1918 and 1939 to 1945. Top shares certainly fell in the UK during the war years, but these only accounted for a part of the large reduction that took place over the period as a whole. The large decline in top wealth shares in the UK in the twentieth century was very much a peacetime phenomenon.
- The substantial rise in owner-occupation during the twentieth century, additionally fostered by the sale of public housing, aided the reduction in wealth inequality to historically low levels in the 1980s, as the wealth share of the top 1% fell to 15%. But in the 1990s there was a change, with the return of private landlords as a result of the "buy to let."
- The concentration of non-housing wealth (financial and business assets) increased substantially between 1995 and 2013. At the same time, the increase in total wealth inequality has been smaller. It appears that housing wealth has moderated a definite tendency for there to be a rise in recent years in top wealth shares in financial wealth. When people talk about rising wealth concentration in the UK, then it is probably the latter that they have in mind.

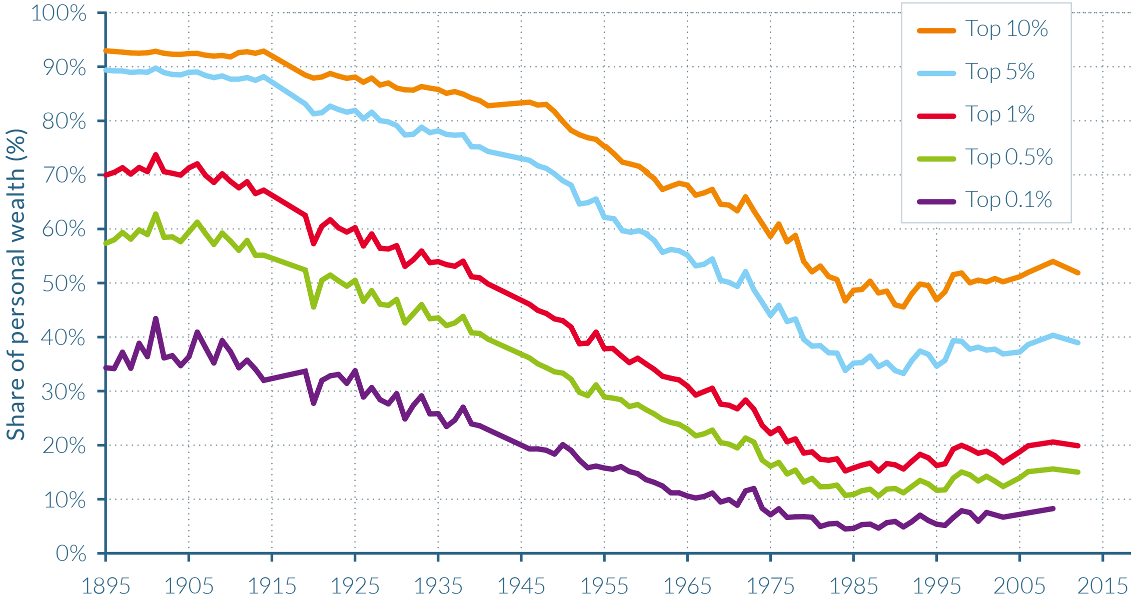
Wealth concentration in the UK underwent enormous transformation during the twentieth century

The evidence in the UK covers an extensive period, starting in the "Gilded Age" before the First World War. The long-run series since 1895 highlight the enormous transformation that has taken place in the distribution of wealth within the UK over more than a century.[26] Before the First World War, the top 5 per cent of wealth holders owned around 90 per cent of total personal wealth. There were very few owner-occupiers. A hundred years later, the share was around 40 per cent. The top 1 per cent used to own two-thirds of total wealth; their share is around one fifth today, when two thirds of households own a house.

Figure 4.6.1 shows the upper tail of the wealth distribution from 1895 to 2013. The changes in top shares can be summarized in terms of three periods. The first of these is the twenty-year period leading up to the First World War: in the wake of the first modern globalization, the share of personal wealth going to the wealthiest 1 per cent of UK individuals remained relatively stable at around 70 per cent. The second period covers more than half of the twentieth century: the share began to fall after 1914 and the decline continued until around 1980. This encompassed two world wars, and much attention has been paid to the loss of capital during the periods 1914 to 1918 and 1939 to 1945. Although UK top wealth shares certainly fell during the war years, most of the reduction was very much a peace phenomenon. By 1980, the share of the richest 1 per cent had decreased to some 17 per cent. This is still 17 times their proportionate share, but represents a dramatic reduction. The fall, however, came to an end in the mid 1980s, marking the beginning of the third period. Since the early 1980s the share of the top 1 per cent—representing approximately half a million individuals today—has moved in the opposite direction, rising from 15% in 1984 to 20–22% by 2013.

Figure 4.6.1

Top wealth shares in the UK, 1895–2013



Source: Alvaredo, Atkinson and Morelli (2017). See wir2018.wid.world for data series and notes.

In 2013, the Top 10% owned 47% of personal wealth.

Wealth inequality has increased in the UK since the 1980s, and is by no means insignificant

With the 1980s, the downward trend in top shares came to an abrupt stop and went into reverse. The inequality of wealth has moderately increased over the past four decades. In the early 1980s, when wealth inequality was at historical lows, the top 10% richest owned 46% of total wealth, and the top 1% share was 15%. Since then, the concentration of wealth rose mainly at the very top of the distribution. The top 10% richest individuals in the UK owned more than half of total wealth in 2013. A fifth of total wealth accrued to the top 1% individuals. The lower half of the top 1% (those between the 99th and the 99.5th percentiles) saw a relative stability in their share of total wealth, whereas the upper half saw an increase between 1985 and 2013. Indeed, most of the rise in the share of the top 1% is due to the top 0.5%, and mainly to the top 0.1%—whose share of total wealth doubled from 4.5 to 9% over the period. Consequently, the increase in the concentration of wealth in the last four decades is very much a phenomenon confined to the hands of the top 0.5 per cent (the richest 250 000 Britons), and in particular, of the top 0.1 per cent (the richest 50 000).

By 2013, the average wealth of British adults was approximately €173 000 (£141 000) in constant 2016 market values, but as can be seen in **Figure 4.6.2**, this wealth was far from equally distributed. The average wealth of the bottom 90% of the population was approximately a third of this nationwide average at just €83 200 (£68 000), suggesting that a significant proportion of the bottom 50% of the distribution have negligible wealth. The gap with the average wealth of the top 10–5%, 5–1%, top 1–0.5% and top 0.5% is then huge: their average wealth goes from €393 000 (£321 000) to €723 000 (£591 000), respectively, and further still from €1.48 million (£1.21 million) to €4.54 million (£3.71 million), indicating the exponential trend in wealth holdings the higher up the distribution one examines.

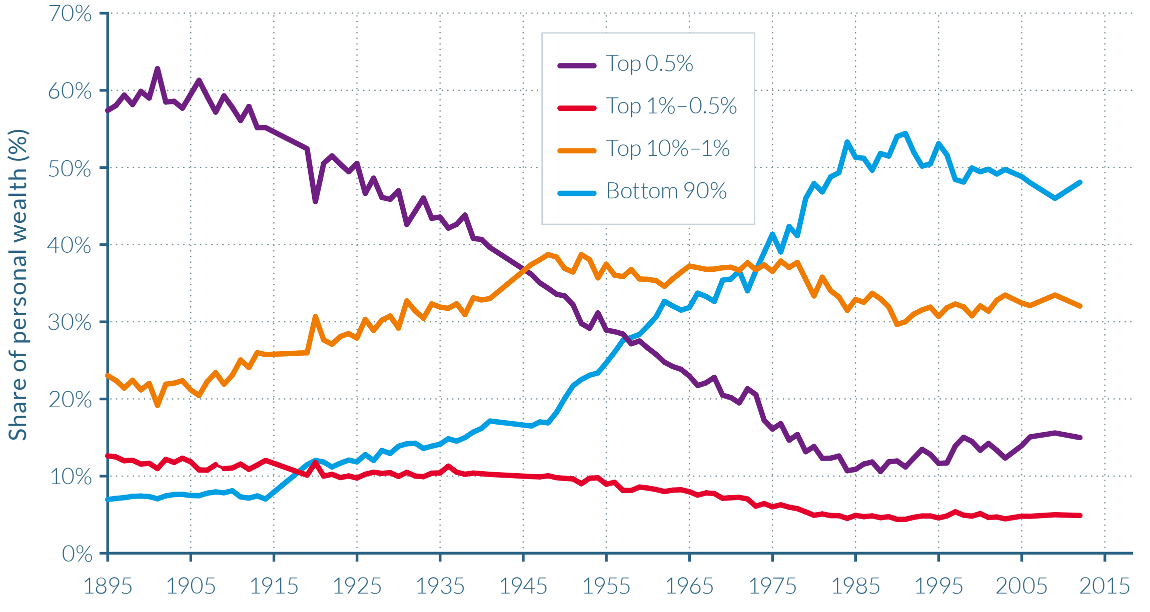
Despite recent rises, the level of wealth concentration is far from its extreme values at the beginning of the twentieth century. The first globalization era (1870–1914) brought with it extremely high shares of total wealth, with the top 10% of the wealth distribution owning almost 95% of total wealth on the eve of World War I. The 0.1% richest individuals then owned at least one third of total wealth, meaning that they had more than 333 times their proportionate share of total personal wealth. The share of the top 1% was around 70%, and that of the top 5% around 90%.

Inequality within top wealth groups substantially decreased from 1914 to 1980

The past century saw important transformations within top wealth groups, which did not all follow the same trajectory. **Figure 4.6.1** demonstrates the importance of looking within the top 10 per cent, and even within the top 1 per cent: it is not just the share of the wealthy that has changed but also the shape of the distribution at the top—that is, the inequality amongst the wealthiest. The share in total wealth of those in the top 10 per cent, but not in the top 1 per cent (that is, the "next 9 per cent") saw a rise in their share for the first half of the twentieth century at the expense of the top 1 per cent, followed by a period of stability until the end of the 1970s. The lower half of the top 1 per cent (those between the 99th and the 99.5th percentiles) saw a relative stability in their share until the 1950s, years when the share of the top 0.5 per cent was decreasing dramatically. Since 1980, the share of the lower half of the top 1 per cent has been again stable, but at a much lower level, while the upper half has been going up.

The extent of wealth concentration at the top depends on the inequality within the top wealth groups themselves (how unequal are top 1% wealth owners?) but also on the wealth required to become part of the wealthiest groups, the "entry price" (relative to mean wealth). Analyzing the "entry price", the minimum level of wealth required to be part of the

Figure 4.6.2
Wealth shares of the Top 10% and Bottom 90% in the UK, 1895–2012



Source: Alvaredo, Atkinson and Morelli (2017). See wir2018.wid.world for data series and notes.
In 2012, the Top 0.5% owned 15% of personal wealth.

top 10% and top 5% (relative to mean wealth) increased from the start of the series up to the end of the 1970s, and then levelled off. However, at the other end of the scale, the entry price to become part of the top 0.1% fell steadily from 1911 to the 1980s, and then began to rise, as depicted by **Figure 4.6.3**. The entry price required to become part of the top 1% has halved since 1914. To sum up, the wealth required to enter the top 1 per cent in the UK is now some half the level required before the First World War, but it is also the case that wealth became less concentrated within the top 1 per cent.

Changes in the composition of property ownership played a key role in reducing wealth inequality before 1980

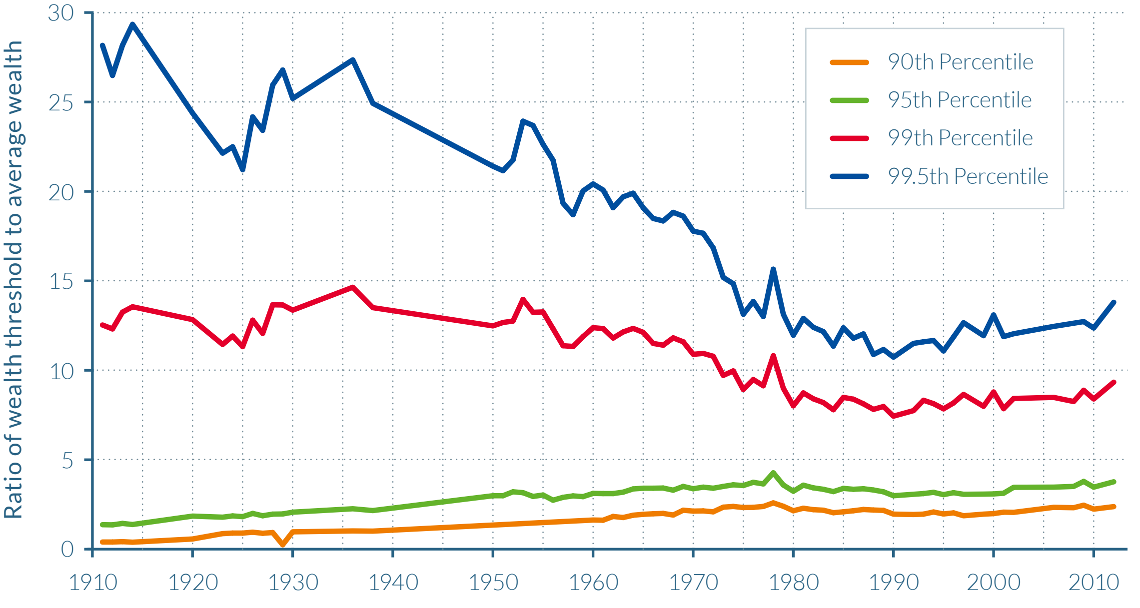
The role of housing wealth in increasing average total wealth in the UK has been widely discussed. In particular, Tony Atkinson and co-authors identified back in 1989,[27] that "popular wealth", that is, the sum of owner-occupied housing and consumer durables such as automobiles and household appliances, was one of the key determinants of the dynamics of UK top wealth shares up to the end of the 1970s, and moreover, that house price rises had reduced share of the top 1%. However, since then, there have been a number of major changes in the UK housing market.

It is perhaps most illuminating to analyze how tenure changes in the UK have impacted the role of housing wealth in total wealth dynamics, especially how housing policy affected both property prices and the extent of owner occupation. With this framing, the evolution of the housing market in the UK between the end of the First World War and 2011 can be split into three main develop-ments as described below.

Firstly, private landlords were progressively replaced with owner-occupation and social ownership of housing between 1918 and the end of the 1970s. The proportion of owner-occupied properties in England and Wales rose from 23% of households in 1918 to 50%

Figure 4.6.3

Wealth thresholds of the top wealth groups in the UK, 1910–2012



Source: Alvaredo, Atkinson and Morelli (2017). See wir2018.wid.world for data series and notes.

In 2012, the value of personal wealth required to enter the Top 5% in the UK was 3.8 times greater than average wealth per adult. Wealth estimates account for inflation.

in 1971, and then to 58% by 1981.[28] This coincided with a fall in the share of housing owned by private landlords, from 76% in 1918 to 11% in 1981. Both factors led to a decline in the total wealth share of the top 1%, which contained a disproportionate number of landlords. This shift from a private-rented to owner-occupied housing market did not in itself change the ratio of housing wealth to total personal wealth (different people owned the same house at different points of time), but it was affected by the growth of social housing from 1% of the housing market in 1918 to 31% in 1981.

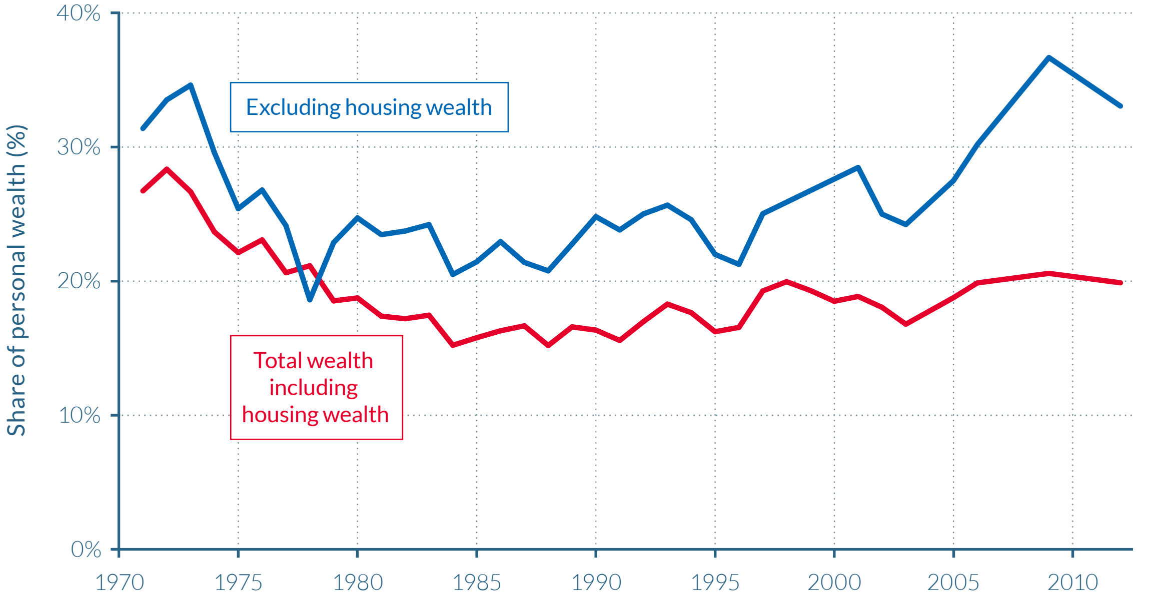
Secondly, council houses were widely sold off and housing rose as a percentage of total wealth in the 1980s. The decision to sell public housing by the conservative governments of the 1980s reduced the share of social housing in housing stock to 23%, with owner-occupation going up to 68% and private renting having fallen to 9%. More of the housing stock therefore entered personal wealth, and the ratio of residential housing wealth to total wealth rose by some ten percentage points in the 1980s.

Thirdly, the 1990s saw the return of private landlords. Their share in the housing market doubled from 9% in 1991 to 18% in 2011, as a result of "buy to let" schemes under successive conservative and labor governments. This increased share of private landlords came at the expense of a fall in owner-occupation (-4 percentage points) and a fall in social housing (-5 percentage points). Furthermore, whereas the selling of council properties may have meant that increases in housing wealth were equalizing in the past, the return of the private landlord is likely to imply that increases in housing wealth may now have a more moderate equalizing effect than in the past.

Housing wealth has moderated the recent tendency for rising wealth concentration

All of this suggests that it is interesting to decompose the assets within the top brackets

Figure 4.6.4
Top 1% wealth share in the UK, 1971–2012



Source: Alvaredo, Atkinson and Morelli (2017). See wir2018.wid.world for data series and notes.
In 2013, the wealth share of the Top 1% was 20% of total wealth. However, when excluding housing wealth, the Top 1% share was 33%.

of the wealth distribution between housing and non-housing assets. Indeed, housing only accounts for a limited fraction of total wealth at the top: since 1970, the share of housing wealth for the top 1 percent has been bounded between 10 and 25 percent of total net worth. It is instructive to look at the distribution of wealth minus residential housing, net of mortgage liabilities. **Figure 4.6.4** shows the top shares of total wealth and of wealth excluding housing for the period since 1971. It appears that, as we should expect, the top shares of the distribution of non-housing wealth are higher: the share of the top 1 per cent averages 25 per cent over the period 1971 to 1997, compared with 18 per cent for the corresponding share for all wealth. Although there is more variability in the shares excluding housing wealth (shares are smoothed to some degree by the housing element), overall there is little difference in their evolution over the last quarter of the twentieth century. Up to 2000, we do not get a very different story if one just takes non-housing wealth, with a decided fall in the top shares until the end of the 1970s, and with broad stability until the mid 1990s.

However, in the twenty-first century, there is a distinct difference: the gap between the share of the top 1 per cent in wealth excluding housing and the share for all wealth widened. The changes over time are also different, with the concentration of non-housing wealth (financial and business assets) increasing substantially between 1995 and 2013. It appears that housing wealth has moderated a definite tendency for there to be a rise in the concentration of other forms of wealth apart from housing. When people talk about rising wealth concentration in the UK, then it is probably the latter that they have in mind.

NOTES

1 In comparison, the top 10% of the global income distribution typically receives between 50% and 60% of total income (depending on whether one uses purchasing power parity or market exchange rates). See Part II.

26 The study focuses on the shares of total personal wealth, that is, the value of the assets owned by individuals, net of their debts. Assets include financial assets, such as cash, bank accounts or bonds or company shares; and real assets, such as houses and farmland;, consumer durables; and household business assets. The total wealth considered in the paper differs in important respects from total national wealth, as measured in the national accounts balance sheets. Contrary to personal wealth, total national wealth includes the wealth of nonprofit institutions serving households. Estimation methods also differ between the two concepts.

PART V

TACKLING ECONOMIC INEQUALITY

5.1

WHAT IS THE FUTURE OF GLOBAL INCOME INEQUALITY?

- ▷ The future of global income inequality is likely to be shaped by both convergence forces (rapid growth in emerging countries) and divergence forces (rising inequality within countries). No one knows which of these forces will dominate and whether these evolutions are sustainable.
- ▷ However, our benchmark projections show that if within-country inequality continues to rise as it has since 1980, then global income inequality will rise steeply, even under fairly optimistic assumptions regarding growth in emerging countries. The global top 1% income share could increase from nearly 20% today to more than 24% in 2050, while the global bottom 50% share would fall from 10% to less than 9%.
- ▷ If all countries were to follow the high inequality growth trajectory followed by the United States since 1980, the global top 1% income share would rise even more, to around 28% by 2050. This rise would largely be made at the expense of the global bottom 50%, whose income share would fall to 6%.
- ▷ Conversely, if all countries were to follow the relatively low inequality growth trajectory followed by Europe since 1980, the global top 1% income share would decrease to 19% by 2050, while the bottom 50% income share would increase to 13%.
- ▷ Differences between high and low inequality growth trajectories within countries have an enormous impact on incomes of the bottom half of the global population. Under the US-style, high inequality growth scenario, the bottom half of the world population earns €4 500 per adult per year in 2050, versus €9 100 in the EU-style, low inequality growth scenario (for a given global average income per adult of €35 500 in 2050 in both scenarios).

The past four decades have been marked by steeply rising income inequality within countries. At the global level, inequality has also risen sharply since 1980, but the situation more or less stabilized beginning in the early 2000s. What will happen in the future? Will growth in emerging countries lead to a sustained reduction in global income inequality? Or will unequal growth within countries drive global income inequality back to its 2000 levels? In this chapter, we discuss different possible global income inequality scenarios between now and 2050.

The projections of global wealth inequality presented in the previous chapter showed that the continuation of current unequal rates of growth among wealth groups would lead to a compression of the global middle-class wealth share and a further rise in wealth inequality. These projections must, however, be interpreted with great care; only China, Europe, and the United States are included in the analysis of the previous chapter given large limitations in wealth inequality data.

Fortunately, more data are available to measure income inequality, and in this chapter we present more elaborate projections of global income inequality. Before discussing the results, it is necessary to stress what can and cannot be reliably projected. As the saying goes, "all models are wrong; some are useful." Our projections are attempts to represent possible states of global inequality in the future, so as to better understand the role played by key determinants. The purpose of our projections is not to predict the future. The number of forces (or variables) that we consider in our analysis is limited. This makes our projections straightforward and simple to understand, but also limits their ability to predict the future. Our projections of global income inequality dynamics are based on the modeling of three forces: within-country income inequality, national level total income growth, and demographics.

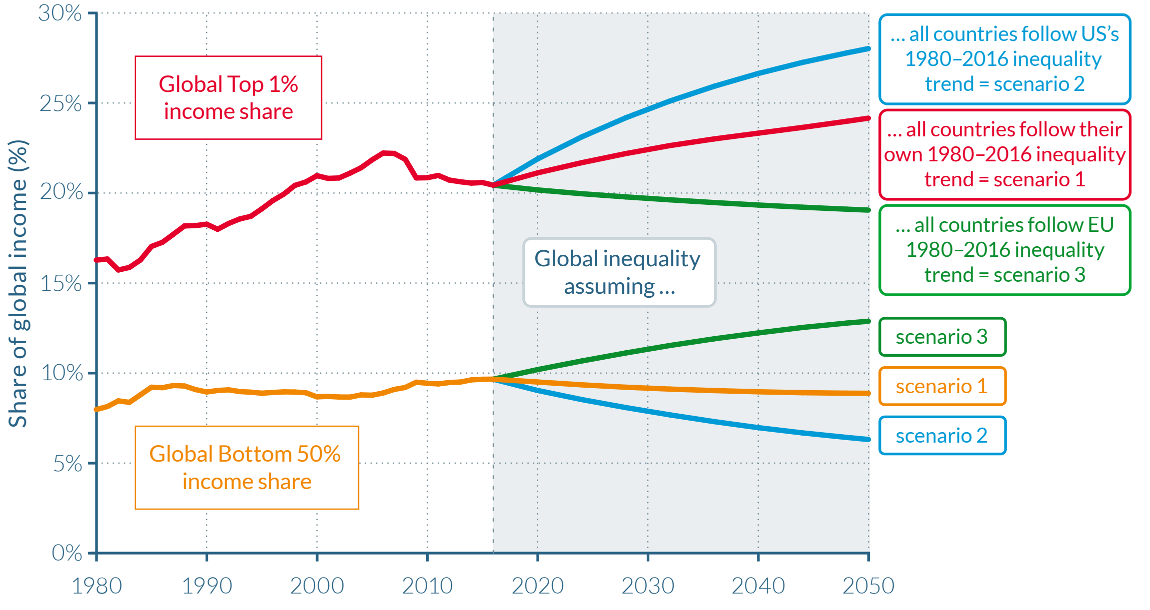
One of the key questions we seek to address is the following: will between-country convergence—that is, Asian, African, and Latin American countries catching up with rich countries—dominate in the future and lead to a reduction of global income inequality? Or will forces of divergence (the increase of inequality within countries) take over? Demographic dynamics are also important to take into account. Fast population growth in countries where inequality is rising, for instance, will tend to accentuate global divergence. It is difficult to say which of these forces will dominate *a priori*. Such an exercise can thus help us understand under what conditions different outcomes might result.

Defining three scenarios to project global income inequality up to 2050

Three scenarios are defined to project the evolution of inequality up to 2050. All our scenarios run up to the halfway mark of the twenty-first century; this has us looking out at a time span similar to the one that has passed since 1980—the starting date of our analyses in the previous chapters. Our first scenario represents an evolution based on "business as usual"—that is, the continuation of the within-country inequality trends observed since 1980. The second and third are variants of the business-as-usual scenario. The second scenario illustrates a high within-country inequality trend, whereas the third scenario represents a low within-country inequality trend. All three scenarios have the same between-country inequality evolutions. This means that a given country has the same average income growth rate in all three scenarios. It also has the same population growth rate in all three scenarios. For estimations of future total income and population growth we turned to the OECD 2060 long-term forecasts.[1] We also relied on the United Nations World Population Prospects.[2]

In the first scenario, all countries follow the inequality trajectory they have followed since the early 1980s. For instance, we know that the bottom 50% income earners in China captured 13% of total Chinese growth over the 1980–2016 period.[3] We thus assume that

Figure 5.1.1
Global income share projections of the Bottom 50% and Top 1% , 1980–2050



Source: WID.world (2017). See wir2018.wid.world for data series and notes.

If all countries follow the inequality trajectory of the US between 1980 and 2016 from 2017 to 2050, the income share of the global Top 1% will reach 28% by 2050. Income share estimates are calculated using Purchasing Power Parity (PPP) euros. PPP accounts for differences in the cost of living between countries. Values are net of inflation.

bottom 50% Chinese earners will capture 13% of Chinese income growth up to 2050. The second scenario assumes that all countries follow the same inequality trajectory as the United States over the 1980–2016 period. Following the above example, we know that bottom 50% US earners captured 3% of total growth since 1980 in the United States. The second scenario then assumes that within all countries, bottom 50% earners will capture 3% of growth over the 2017–2050 period. In the third scenario, all countries follow the same inequality trajectory as the European Union over the 1980–2016 period—where the bottom 50% captured 14% of total growth since 1980.

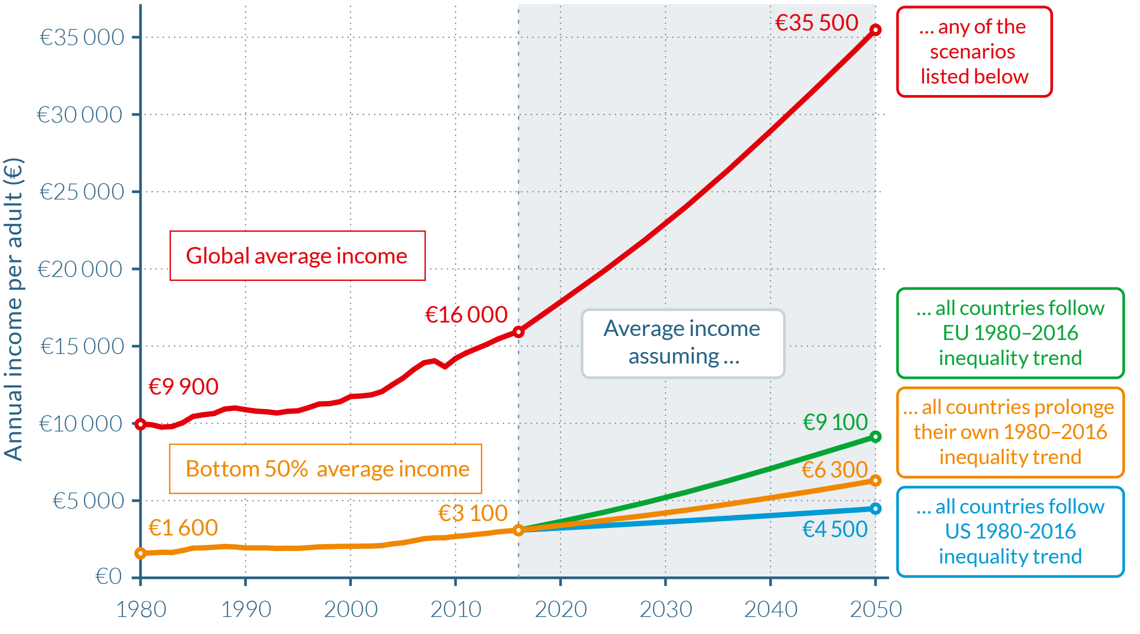
Under business as usual, global inequality will continue to rise, despite strong growth in low-income countries.

Figure 5.1.1 shows the evolution of the income shares of the global top 1% and the global bottom 50% for the three scenarios. Under the business-as-usual scenario (scenario 1), the income share held by the bottom 50% of the population slightly decreases from approximately 10% today to less than 9% in 2050. At the top of the global income distribution, the top 1% income share rises from less than 21% today to more than 24% of world income. Global inequality thus rises steeply in this scenario, despite strong growth in emerging countries. In Africa, for instance, we assume that average per-adult income grows at sustained 3% per year throughout the entire period (leading to a total growth of 173% between 2017 and 2050).

These projections show that the progressive catching-up of low-income countries is not sufficient to counter the continuation of worsening of within-country inequality. The results also suggest that the reduction (or stabilization) of global income inequality

Figure 5.1.2

Global average income projections, 1980–2050



Source: WID.world (2017). See wir2018.wid.world for data series and notes.

By 2050, the global average income will reach €35 500, compared to €16 000 in 2016. If all countries follow Europe's inequality trajectory between 1980 and 2016, the average income of the Bottom 50% of the world population will be €9 100 by 2050. Income estimates are calculated using Purchasing Power Parity (PPP) euros. For comparison, €1 = $1.3 = ¥4.4 at PPP. PPP accounts for differences in the cost of living between countries. Values account for inflation.

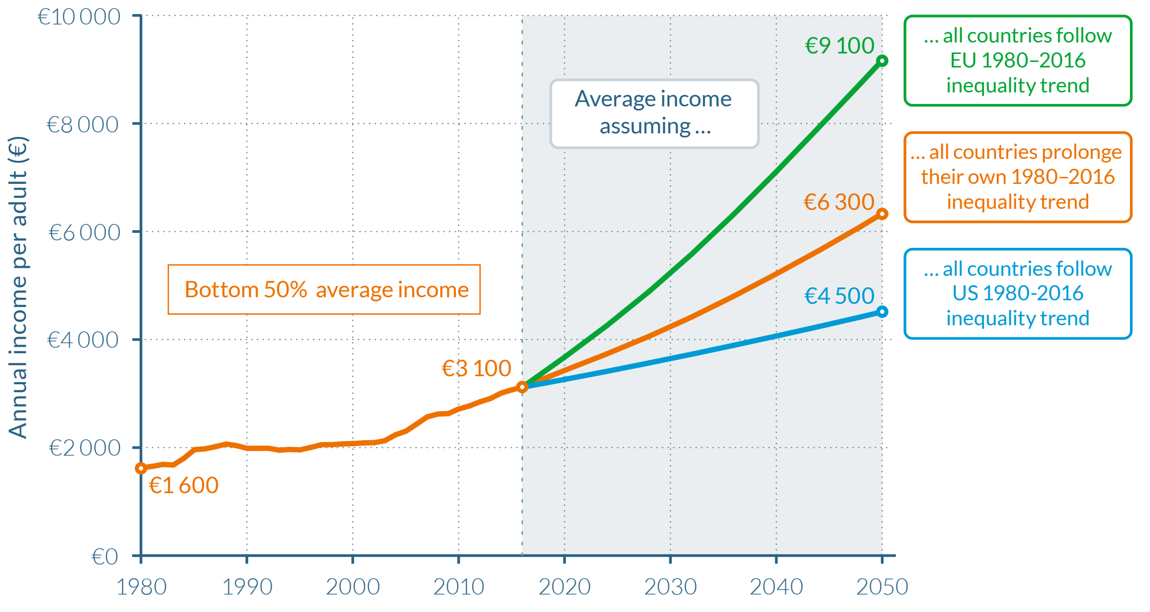
observed since the financial crisis of 2008, discussed in Chapter 2, could largely be a short-run phenomenon induced by the shocks on top incomes, and the growth slowdown in rich countries (particularly in Europe).

In scenario two, future global income inequalities are amplified as compared to scenario one, as the gap between the global top 1% share and the global bottom 50% share in 2050 widens. In this scenario, the global top 1% would earn close to 28% of global income by 2050, while the bottom 50% would earn close to 6%, less than in 1980, before emerging countries started to catch up with the industrialized world. In this scenario, the increase in the top 1% income share (a positive change of eight percentage points over the 2016–2050 period) is largely, but not entirely, made at the expense of the bottom 50% (a negative change of four percentage points).

Scenario three presents a more equitable global future. It shows that global inequality can be reduced if all countries align on the EU inequality trajectory—or more equitable ones. In this scenario, the bottom 50% income share rises from 10% to approximately 13% in 2050, whereas the top 1% decreases from 21% to 19% of total income. The gap between the shares held by the two groups would, however, remain large (at about six percentage points). This suggests that, although following the European pathway in the future is a much better option than the business-as-usual or the US pathway, even more equitable growth trajectories will be needed for the global bottom 50% share to catch up with the top 1%. Achieving a world in which the top 1% and bottom 50% groups capture the same share of global income would mean getting to a point where the top 1% individuals earn on average fifty times more than those in the bottom half. Whatever the scenarios followed, global inequalities will remain substantial.

Figure 5.1.3

Global average income projections of the Bottom 50%, 1980–2050



Source: WID.world (2017). See wir2018.wid.world for data series and notes.

If all countries follow the inequality trajectory of Europe between 1980 and 2016, the average income of the Bottom 50% of the world population will be €9 100 by 2050. Income estimates are calculated using Purchasing Power Parity (PPP) euros. For comparison, €1 = $1.3 = ¥4.4 at PPP. PPP accounts for differences in the cost of living between countries. Values are net of inflation.

Within country inequality trends are critical for global poverty eradication

What do these different scenarios mean in terms of actual income levels, and particularly for bottom groups? It is informative to focus on the dynamics of income shares held by different groups, and how they converge or diverge over time. But ultimately, it can be argued that what matters for individuals—and in particular those at the bottom of the social ladder—is their absolute income level. We stress again here that our projections do not pretend to predict how the future will be, but rather aim to inform on how it *could* be, under a set of simple assumptions.

Figure 5.1.2 depicts the evolution of average global income levels and the average income of the bottom half of the global population in the three scenarios described above. The evolution of global average income does not depend on the three scenarios. This is straightforward to understand: in each of the scenarios, countries (and hence the world as a whole) experience the same total income and demographic growth. It is only the matter of how this growth is distributed within countries that changes across scenarios. Let us reiterate that our assumptions are quite optimistic for low-income countries, so it is indeed possible that global average income would actually be slightly lower in the future than in the figures presented. In particular, the global bottom 50% average income would be even lower.

In 2016, the average per-adult annual income of the poorest half of the world population was €3 100, in contrast to the €16 000 global average—a ratio of 5.2 between the overall average and the bottom-half average. In 2050, global average income will be €35 500 according to our projections. In the business-as-usual scenario, the gap between average income and the bottom would widen (from a ratio of 5.2 to a ratio of 5.6) as the bottom half would have an income of €6 300. In the US scenario, the bottom half of the world population earn €4 500 per year and per adult—rising the global average income to bottom 50% income ratio of 7.9. Average income of the global bottom half will be €9 100 in the EU scenario, reducing the bottom 50% to average income ratio to 3.9.

The gap between global average income and the average income of the bottom half of the population is particularly high in all scenarios. However, the difference in average income of the bottom 50% between the EU scenario and the US scenario is important, as well. Average income of the global bottom 50% would be more than twice higher in the EU scenario than in the US scenario at €9 100 versus €4 500. This suggests that within-country inequality trajectories matter—and matter substantially—for poverty eradication. In other words, pursuing high-growth strategies in emerging countries is not merely sufficient to lift the global bottom half out of poverty. Reducing inequality within countries is also key.

The scenarios point toward another crucial insight: global inequality is not bound to rise in the future. Our analysis (in Part II) of the different income inequality trajectories followed by countries showed that, if anything, more equitable growth does not mean dampened growth. This result is apparent when time periods are compared (the United States experienced higher growth in the 1950s–1960s when inequality was at its lowest) or when countries are compared with one another (over the past decades, China grew much faster than India, with a lower level of inequality, and the EU had a more equitable path than the United States but a relatively similar growth rate). This suggests that it is possible to pursue equitable development pathways in a way that does not also limit total growth in the future.

What can governments do to prevent the rise of national and global inequality? The next and final chapters of this report discuss various policy options which need to be democratically debated, on the basis of sound and transparent economic data, if societies are to seriously address the issues raised by rising levels of income and wealth concentration. We do not attempt to resolve any of these policy debates, and nor do we claim to have the right answer as to which set of policies will be best suited to a given country given its own economic, political, social, and cultural situation. Recent research, however, points to fundamental economic issues that have not been discussed enough over the past decades. These include the role of progressive taxation and global financial transparency to tackle rising inequality at the top of the distribution, as well as more equal access to education and good paying jobs to put an end to the stagnation of incomes at the bottom. Reassessing the role of public capital to invest in the future should also, in our view, be a key component of these future discussions.

5.2

TACKLING RISING INEQUALITY AT THE TOP: THE ROLE OF PROGRESSIVE TAXATION

- There has been a rise global top shares, but different countries have experienced widely different inequality trajectories. Institutional and policy changes implemented since the 1980 stand as the most powerful explanations for the different inequality trajectories.
- Income tax progressivity is a proven tool to combat rising income and wealth inequality at the top. Tax progressivity does not only reduce post-tax inequality; it also impacts pre-tax inequality, by discouraging top earners to capture a higher share of growth via aggressive bargaining for higher pay.
- Tax progressivity was sharply reduced in rich countries from the 1970s to the mid-2000s. During this period, the top marginal income tax rate in rich countries was brought from 70% to 42% on average. Since the global financial crisis of 2008, the downward trend has been halted and reversed in certain countries. Future evolutions remain, however, uncertain.
- Progressive taxation of wealth and inheritances is also a key component of redistribution. In some of the most unequal nations of the world (Brazil, South Africa, India, Russia, and the Middle East), inheritance tax is almost inexistent while the poor often face high tax rates on the basic goods they purchase.
- More generally, tax systems are highly regressive in large emerging countries. Evidence from recent inequality trends (for example, Brazil between 2000 and 2015) suggests that progressive tax reform should be given a higher priority in the future.

The previous chapters of this report confirm that income and wealth inequality largely increased at the top of the distribution. The rise in inequality has been driven by the substantial growth rates enjoyed by the very top groups as compared to the rest of the distribution. A common explanation for this growth is skill-biased technological change. That is, the evolution of technology is said to have increased the relative productivity—and hence the relative pay—of skilled labor relative to unskilled labor, thereby increasing the demand for skilled workers. Globalization could have had a similar impact in developed countries as discussed in chapter 2.1. As we have already repeatedly stressed, there are many limitations to this purely technological explanation. First, rising income inequality is a broad-ranging phenomenon which also involves capital income and wealth dynamics, and not only the distribution of labor income. The supply of skilled labor is determined by education. That is, the expansion of education leads to a rise in the supply of skills, while globalization and technological may change increase the demand for skills. Depending on which process occurs faster, the inequality of labor income will either fall or rise. This idea has been described as the race between education and technology.[4] In other words, different policies can make a large difference.

Another complementary explanation for rising top labor incomes is the "superstar effect."[5] According to this theory, technological change and globalization have made it easier for those who make it to the top to reap a higher share of growth. For instance, recording a song has more or less the same cost today as thirty years ago, but a successful music production can now reach a much broader audience. Because international firms have become larger, managers making it to the top control a much larger business than before, and their pay has increased as a result.[6] Due to the superstar effect, tiny differences in talent—or sometimes in bargaining power and other attributes—can translate into very large income differentials. It should be noted that these global "superstars" are not necessarily more productive or talented than they were thirty years ago. They are perhaps simply luckier to have been born a few decades after their elders.

In any case, the problem behind these two theories—education and superstar—is that they cannot fully account for cross-country divergences in top income trajectories. In a comparison of top remunerations in global firms, it stands out that there are important variations across countries—in particular, between the United States, Europe, and Japan. Germany's largest companies, for instance, are present in all global markets and are not less productive than their US counterparts, though CEO remunerations there are on average half as high as in the United States.[7] As discussed in chapter 2.3, the rise of labor income inequality was relatively limited in Europe compared to the United States, despite similar technical change and penetration of new technologies over the past forty years in both regions.

For the bottom and middle parts of the distribution, the importance of training and education designed to help individuals adapt to new modes of production cannot be overlooked. Unequal access to education is likely to have played a role in the stagnation of incomes of the bottom half of the distribution in recent decades—in particular, in the United States. These dynamics are discussed in the next chapter. They should, however, be distinguished from rising inequalities at the very top of the income distribution. Changes in policy and institutional contexts better account for the diversity of top income trajectories over the world. In particular, recent research shows that changes in tax progressivity have played an important role in the surge of top incomes over the past decades.

Top marginal tax rates have strong effects on both pre- and post-tax income inequality at the top

Progressive tax rates contribute to the reduction of post-tax income inequality at the top of the distribution via their highest marginal tax rates (that is, tax rates applicable above a certain level of income earned). Indeed, if an individual earns $2 million and if the top marginal tax rate is 50% above one million dollars, this individual will net out only $500 000 on the second million. If the top marginal tax rate is 80% above one million dollars, then the earner will net out only $200 000 on the second million. The reduction of inequality can be further enhanced if the public spending funded by this tax revenue is aimed at fostering equitable growth.

One often-neglected role of top marginal tax rates is their ability to reduce pre-tax income inequality. This can occur via two channels. The most obvious one is that when top marginal income tax rates are high, top earners have less money to save and accumulate wealth, and therefore potentially less income from capital next year. Another way to understand the impact on top income tax rates on income inequality is to focus on rich individuals' bargaining incentives. When top marginal tax rates are low, top earners have high incentives to bargain for compensation increases—for instance, by putting a lot of energy into nominating the right people to the compensation committees who decide on pay packages. Alternatively, high top marginal tax rates tend to discourage such bargaining efforts.[8] Reductions in top tax rates can thus drive upwards not only post-tax income inequality but pre-tax inequality, as well.

Higher top tax rates may, however, also discourage work effort and business creation among the most talented. In this scenario, higher top tax rates would lead to less economic activity by the rich and hence less economic growth. In this case, top tax rates are not a desirable policy. In principle, there should be room to discuss these conflicting and legitimate claims on the basis of dispassionate analyses and sound data.

Piketty, Saez, and Stantcheva (2014) have developed a theoretical model and an empirical framework taking into account these different effects.[9] By using a database on CEO compensation and performance in developed countries, they conclude that bargaining elasticities are an important part of the story—in particular, to understand the high rise of US CEOs' pay relative to their counterparts in Japan and Europe (with comparability established by shared corporate sector, firm size, and performance levels). By calibrating the theoretical model, they show top tax rates could rise up to 80% and be welfare-enhancing for everyone apart from the very top of the distribution.

The data at our disposal is still imperfect, and we certainly do not pretend that a mixture of econometric evidence and mathematical formula should replace public deliberation and political decision making on these complex issues. But at the very least, we feel that there is enough evidence to reopen this discussion about sharply progressive taxation at the very top.

It is also important to remember that top tax rates reached more than 90% in the United States and in the UK in the era of the 1940s to the 1970s. Such high tax rates do not appear to have harmed growth. In fact, over the past fifty years, all rich countries have grown more or less at the same rates despite very large tax-policy variations.

Figure 5.2.1 shows the relationship between changes in top marginal tax rates and in the top 1% pre-tax income share in OECD countries, which occurred between the early 1970s and the late 2000s. The correlation is particularly strong: on average, a 2 percentage point drop in the top marginal tax rate is associated with a 1 percentage point increase in the top 1% pre-tax income share. Countries such as Germany, Spain, Denmark, and Switzerland, which did not experience any significant top rate tax cut, did not experience increases in top income shares. Conversely, the United States, UK, and Canada experienced important reductions in top marginal tax rates and saw their top 1% income shares substantially increase. This graph strongly

Figure 5.2.1
Changes in top marginal tax rates and top income shares in rich countries since the 1970s

In the US, the top marginal income tax rate was reduced by 33 percentage points between the early 1970s and the early 2010s. During the same period of time, the Top 1% income share increased by 9.5 percentage points.

suggests that top tax rates play a key role in moderating pre-tax top incomes. In addition, there was no significant impact on growth, suggesting again that bargaining elasticities are more important than incentive effects.

A window of opportunity for tax progressivity?

Figure 5.2.2 presents in detail the evolution of top marginal income tax rates in the United States, the UK, Germany, France, and Japan since 1900. In the five countries, there was either no personal income taxation or there was a very modest of it at the turn of the twentieth century. Income tax was then introduced, partly to finance the First World War, and top marginal tax rates were brought to very high levels in the 1950–1970s. (Top tax rates rose up to 94% in the United States, 98% in the UK.) Top rates were then drastically reduced from the 1970s onwards (from 70% on average in these countries to 42% on average in the mid-2000s).

How to account for these movements? Up until the 1970s, policymakers and public opinion probably considered—rightly or wrongly—that at the very top of the income ladder, compensation increases reflected mostly greed or other socially wasteful activities rather than productive work effort. This is why the United States and UK were able to set marginal tax rates as high as 80%. More recently, the Reagan/Thatcher revolution succeeded in making such top tax rate levels unthinkable, at least for a while. But after decades of increasing income concentration that has brought about mediocre growth since the 1970s, and a Great Recession triggered by financial sector excesses, a rethinking of the Reagan and Thatcher policies is perhaps underway—at least in some countries.

Top marginal income tax increased in the United States, UK, Germany, France, and Japan over the past ten years. The United Kingdom, for instance, increased its top

In 2017, the top marginal tax rate of inheritance tax (applying to the highest inheritances) was 55% in Japan, compared to 4% in Brazil. Europe is represented by France, Germany and the UK.

income tax rate from 40% to 50% in 2010 in part to curb top pay excesses. In the United States, the Occupy Wall Street movement and its famous "We are the 99%" slogan also reflected the view that the top 1% gained too much at the expense of the 99%. Whether this marked the beginning of a new tax policy cycle that will counterbalance the steep fall observed since the 1970s remains a question. In the UK, the 2010 increase in top income tax rate was followed by slight reduction down to 45% in 2013. As we are writing these lines, the new US Republican administration and congress are preparing a major tax overhaul plan. The French government also projects to reduce tax rates on top incomes and wealth owners.

Top inheritance tax rates were recently increased in France, Japan, and the United States, as shown on **Figure 5.2.3**. In Japan and in the United States, this increase halted a progressive reduction in top inheritance tax rates initiated in the 1980s. In France and Germany, top inheritance tax rates have been historically lower than in the United States, UK, and Japan. In earlier chapters of this report we described the two world wars and various economic and political shocks of the twentieth century.[10] These durably reduced wealth concentration through other means than tax policy. As with the question of income tax progressivity, it is impossible to know whether this increase marks a new era of progressivity. The US tax overhaul plan plans to abolish the inheritance tax.

Inheritance is exempted from tax while the poor face high consumption taxes in emerging countries

While the past ten years saw some increases in tax progressivity in rich countries, it is worth noting that major emerging economies still do not have any tax on inheritance, despite the extreme levels of inequality observed there. Inheritance is taxed at a particularly small rate in Brazil (at a national average of around 4%, with a maximum federal rate of 8%). In India, China, and Russia, there is no inheritance tax—in contrast to rich countries (see **Figure 5.2.4**). In India, an 85% tax rate was in place in the 1970s and early 1980s before it was brought to 0% in 1984. One can plausibly argue that India's tax administration—or even Indian society as a whole—was not ready for very high top inheritance tax rates to begin with. But international evidence—in particular, from developed countries—suggests that a fairly progressive income and inheritance tax system can be an important component of a successful development strategy.

In emerging countries, it is also noteworthy that consumption taxes can be particularly high while inheritance tax is inexistent. In Brazil, for instance, the tax rate on electricity is around 30%, and high rates also apply to many other basic goods purchased by the poor. Extreme income and wealth inequality levels are thus sustained and reinforced by a regressive tax system. On a more positive note, the absence of inheritance taxes in emerging countries suggests that there is ample room for progressive tax policies. In a country like Brazil, as shown in chapter 2.11, incomes at the bottom rose over the past decades, but that this was partly to the detriment of the middle class, whose share of national income was reduced. This situation is bound to happen when the richest do not contribute fairly to the financing of the welfare state. Indeed, additional fiscal revenues collected through newly introduced progressive inheritance taxes could be used to fund educational or health programs and provide relief for the middle class in Brazil and other emerging countries.

5.3

TAX POLICY IN A GLOBAL ENVIRONMENT: THE CASE FOR A GLOBAL FINANCIAL REGISTER

- Although the tax system is a crucial tool to tackle inequality, it also faces potential obstacles, among which is tax evasion. The wealth currently held in tax havens is equivalent to more than 10% of global GDP and has increased considerably since the 1970s.
- The rise of tax havens makes it difficult to properly measure and tax wealth and capital income in a globalized world. Reducing financial opacity is critical to improve data on wealth and its distribution; to foster a more informed public debate about redistribution; and to fight tax evasion, money laundering, and the financing of terrorism.
- One key challenge involves recording the ownership of financial assets. While land and real-estate registries have existed for centuries, they miss a large fraction of the wealth held by households today, as wealth increasingly takes the form of financial securities. A global financial register recording the ownership of equities, bonds, and other financial assets would deal a severe blow to financial opacity.
- Little-known financial institutions called central security depositories (CSDs) already gather information about who owns financial assets. These data could be mobilized to create a global financial register. CSDs, however, are private actors in most OECD countries and will not transfer information to authorities in the absence of regulations compelling them to do so.
- Another difficulty lies in the fact that most CSDs do not directly record the names of the ultimate owners of financial securities, but only the names of the intermediaries.
- However, technical solutions have been identified by the CSDs themselves to allow end-investor identification. Moreover, more transparent systems exist in countries like Norway and China, which suggest that end-user transparency is technically and economically feasible at the CSD and at the global level.

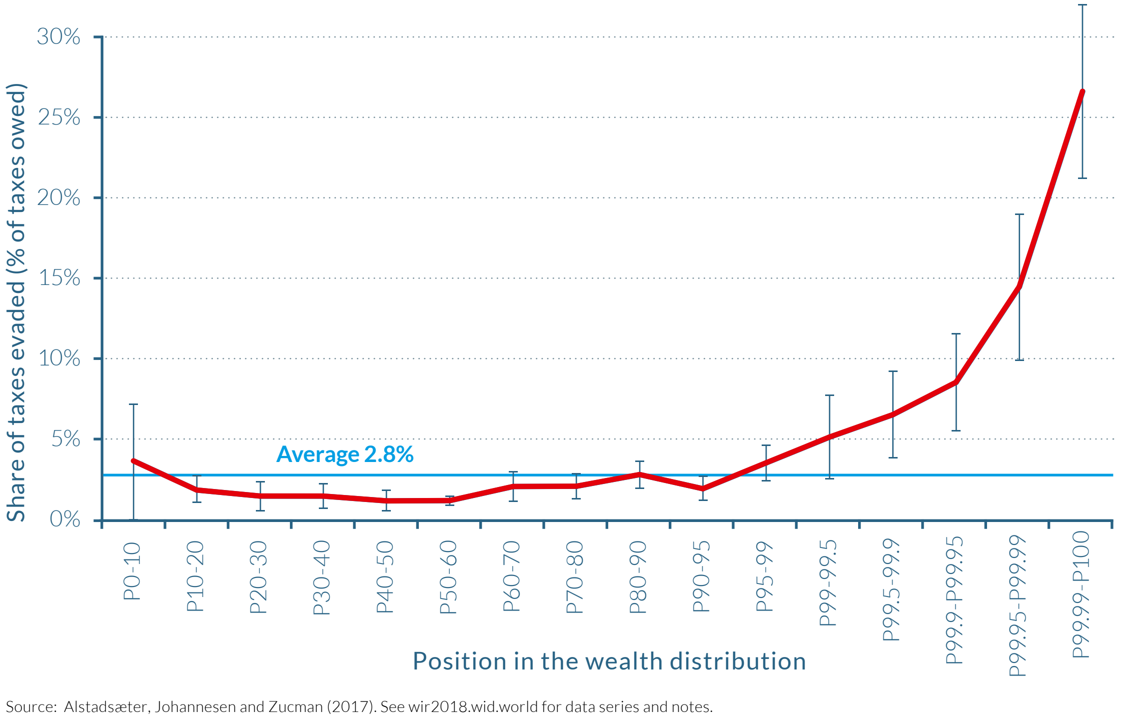
Multinational corporations and wealthy individuals are increasingly using tax havens to avoid or evade taxes. Fully 63% of all the foreign profits made by US multinationals are booked in a handful of offshore financial centers—Bermuda, Ireland, the Netherlands, Switzerland, Singapore, and Luxembourg—where they face very low tax rates, ranging from 0% to 5%. This represents a tenfold increase since the 1980s.

Assets worth the equivalent of 10% of world GDP are stored in tax havens by wealthy individuals. This figure rises to almost 40% in countries like Greece and Argentina, and to more than 50% in Russia, according to novel research by A. Alstadsæter, N. Johannesen, and G. Zucman.[11] At the global level, tax evasion deprives governments from about €350 billion in tax revenue each year.[12]

Tax evasion also seriously undermines tax progressivity. **Figure 5.3.1** shows the amount of taxes evaded as a share of taxes owed across the wealth distribution, in the case of Scandinavia. These statistics were produced by Alstadsæter, Johannesen, and Zucman (2017), who combine recent, massive data leaks (the "Panama papers" and the Swiss Leaks from HSBC Switzerland) with random audits and administrative records on income and wealth. While most of the population in advanced economies does not evade much tax—because most of its income derives from wages and pensions, which are automatically reported to the tax authorities—leaked data show pervasive tax evasion at the very top. The top 0.01% of the Scandinavian wealth distribution—a group that includes households with more than $45 million in net wealth—evades 25% to 30% of its personal taxes, an order of magnitude more than the average evasion rate of about 3%. Because Scandinavian countries rank among the countries with the highest social trust, lowest corruption, and strongest respect for the rule

Figure 5.3.1

Share of taxes evaded in Scandinavian countries, 2006



Source: Alstadsæter, Johannesen and Zucman (2017). See wir2018.wid.world for data series and notes.

In 2006, the Top 0.01% wealthiest individuals in Scandinavian countries evaded 27% of the total taxes they owed.

of law, that evasion among the wealthy may be even higher elsewhere.

Several recent policy initiatives have attempted to tackle offshore tax evasion. Before 2008, tax havens refused to share any information with foreign tax authorities. In 2010, the US Congress enacted the Foreign Account Tax Compliance Act, which compels foreign banks to disclose accounts held by US taxpayers to the IRS automatically each year, under the threat of economic sanctions. OECD countries have obtained similar commitments from most of the world's tax havens. Apparently, tax havens can be forced to cooperate if threatened with large enough penalties.

However, current enforcement efforts face important obstacles. Many tax havens and offshore financial institutions do not have incentives to provide accurate information, as they do not face large enough sanctions for non- or poor compliance. Second, a large and growing fraction of offshore wealth is held through intertwined shell companies, trusts, and foundations, which disconnect assets from their actual owners. This makes it easy for offshore banks to claim, falsely, that they do not have any European, American, or Asian clients at all—while in fact such persons are the beneficial owners of the assets held through shell companies.

As advocated by Gabriel Zucman in recent work, a global financial register would be a powerful tool for cutting through this opacity.[13] Such a register would allow tax and regulatory agencies to check that taxpayers properly report assets and capital income independently of whatever information offshore financial institutions are willing to provide. It would also allow governments to close corporate tax loopholes by enforcing a fair distribution of tax revenue globally for corporations with increasingly complex overseas operations. A global financial register could also serve as the informational basis for the establishment of a global wealth tax. The establishment of such a register would not, however, mean that ownership of assets would be disclosed to the general public. Such information could remain confidential in the same way that current income tax data is kept confidential.

The establishment of a global financial register could be based on the information already gathered by (mostly private) financial institutions known as central securities depositories (CSD). CSDs are the ultimate bookkeepers of the equities and bonds issued by corporations and governments. They can maintain accounts as end-investor segregated accounts—which is the most transparent model, as it links an individual to an asset. Or they can maintain omnibus accounts—a less transparent model, given that assets held by different investors are lumped into a single account under the name of a financial intermediary, making it difficult to identify end-investors. (See **Box 5.3.1**.)

One key issue with using CSDs as the building brick of a global financial register is that omnibus accounts prevail in most large western markets. (The Depository Trust Company in the United States and Clearstream in Europe, for instance, operate with omnibus accounts.) However, technical solutions facilitated by developments in information technologies already exist to allow the identification of ultimate asset holders in large Western CSDs. Moreover, in certain countries such as Norway, or large emerging markets such as China and South Africa, CSDs operate through systems which allow the identification of ultimate asset owners. In short, the creation of a global financial register does not face any insuperable technical problems. (See **Box 5.3.1**.)

Box 5.3.1

Towards a Global Financial Register?

This box draws upon Delphine Nougayrède, "Towards a Global Financial Register? Account Segregation in Central Securities Depositories and the Challenge of Transparent Securities Ownership in Advanced Economies," a working paper presented at a Columbia Law School Blue Sky workshop, April 2017.

Central Security Depositories as building blocks for a global financial register

In the modern financial system, shares and bonds issued by corporations are represented not by paper certificates but by electronic account entries. Holding chains are no longer direct—that is, do not connect issuers directly with investors, but involve many intermediaries often located in different countries. At the top of the chain, immediately after the issuers, are the central securities depositories (CSDs). Their role is to record the ownership of financial securities and sometimes to handle the settlement of transactions. The clients of CSDs are domestic financial institutions in the issuer country, foreign financial institutions, and other CSDs. After the CSD participants are several other layers of financial intermediaries, and at the end of the chain, a final intermediary, often a bank, holding the relationship with the investors.

Because so many intermediaries are involved, the issuers of financial securities are disconnected from end-investors; public companies that issue securities no longer know who their shareholders or bondholders are. CSDs, as a part of the chain of financial intermediation, both enable and obscure this relationship. The system was not intentionally designed for anonymity but it evolved this way over time because of the regulatory complexity of cross-border securities trading. The evolution toward non-transparency was also facilitated by the fact that the topic is too technical to be affected by public opinion.

Non-transparent accounts prevail in most Western CSDs

There are two broad types of accounts in the CSD world. "Segregated accounts" allow the holding of securities in distinct accounts opened in the name of the individual end-investors. This model thus allows transparency. The opposite model is that of "omnibus accounts" (or in the United States, "street name registration") where securities belonging to several investors are pooled together into one account under the name of a single account-holder, usually a financial intermediary, thereby obscuring the identity of the end-investors.

One of the key issues for a global financial register is that non-transparent accounting (that is, "omnibus accounts") prevails in most Western markets. For instance, the US CSD, the Depository Trust Company (DTC), uses omnibus accounts. In its books, the DTC identifies only brokerage firms and other intermediaries, not the ultimate owners of US stocks and bonds. "Omnibus accounts" also prevail in most European countries—in particular, within the Euroclear and Clearstream CSDs. This makes it difficult to construct a global financial register on the basis of the currently existing Western CSDs.

More transparency is possible, however

More transparency within Western CSDs can however be envisioned. The current system creates a number of risks for the financial industry, of which it is very aware. In 2014, Luxembourg's Clearstream Banking agreed to a $152 million settlement with the US Treasury following allegations that it had held $2.8 billion in US securities through an omnibus account for the benefit of the Central Bank of Iran, which was subject to US sanctions. As a result, the securities industry discussed a number of options that could be put in place to allow greater transparency of information on end-investors. This might include discontinuing the use of omnibus accounts, introducing new covering message standards (as is done in the payments industry) or ex-post audit trails, which would enable information on the identity of the ultimate beneficiary of financial transactions to circulate throughout the chain. New technologies such as distributed ledger technology (blockchain) could also foster greater transparency.

Transparent market infrastructures already exist today. In Norway, the CSD lists all individual shareholders in domestic companies, acts as formal corporate registrar, and reports back directly to the tax authorities. In China, the China Securities Depository Clearing Corporation Limited ("Chinaclear") operates a system that is fully transparent for shares issued by Chinese companies and held by domestic Chinese investors. At the end of 2015, it held $8 trillion worth of securities in custody, broadly the range of the CSDs of France, Germany, and the UK, and maintained securities accounts for ninety-nine million end-investors. Some segregation functionalities already exist within some of the larger Western CSDs (like DTC or Euroclear), which could be expanded. Many believe that segregated CSD accounting would support better corporate governance by giving greater voice to small investors. All of this suggests that more could be done within the large Western CSDs to implement greater investor transparency.

5.4

TACKLING INEQUALITY AT THE BOTTOM: THE NEED FOR MORE EQUAL ACCESS TO EDUCATION AND GOOD PAYING JOBS

- More equal access to education and good paying jobs is key to countering the stagnation and sluggish income growth rates of the bottom half of the population. Recent research shows that there can be enormous gaps between the beliefs evinced in public discourses about equal opportunity and the realities of unequal access to education.
- In the United States, for instance, out of one hundred children whose parents are among the bottom 10% income earners, only thirty go to college. The figure reaches ninety when parents are within the top 10% earners.
- On the positive side, research shows that elite colleges in the United States may improve openness to students from poor backgrounds without compromising their outcomes.
- In rich or emerging countries, it might be necessary to set transparent and verifiable objectives—together with changes in the financing and admission systems—in order to equalize access to education.

As is now well known that inequality has risen at the top of income and wealth distributions in recent decades. However, this report also sheds light on the stagnation or sluggish growth rates of the bottom 90%, and especially of the bottom 50% of the distribution. The situation has been particularly extreme in the United States, as shown in Chapter 2.4. To a lesser extent, bottom income groups have also lagged behind the rest of the population in terms of income growth in European countries as well as in fast-growth emerging countries. To counter such dynamics, progressive income and wealth taxes are not sufficient. More equal access to education and good paying jobs is key. This chapter explores recent findings on the interaction between educational inequalities and income inequalities.

Novel research allows us to better understand the determinants of educational inequalities and their interactions with income inequality

To what extent are income and wage inequality the result of a fair, meritocratic process? How do family resources determine the opportunities of their children? Publicly available data to assess these questions is still scarce in most countries around the globe. But recent research has contributed to answering the question. In particular, using US administrative data on more than fifty million children and their parents, Raj Chetty, Nathaniel Hendren, Patrick Kline, Emmanuel Saez, and Nicholas Turner were able to provide remarkable results on intergenerational mobility.[14]

Intergenerational mobility, broadly speaking, refers to the link between children's economic trajectories and their parents' economic situations. In the United States, estimations show that mobility levels are low as compared to other countries: fewer than eight American children out of a hundred born in the 20% poorest families manage to get to the top 20% of earners as adults, as compared to twelve in Denmark and more than thirteen in Canada. Another powerful way to illustrate the extent of educational inequality in the United States is to focus on the percentage of children attending college by income groups. Out of a hundred children whose parents are within the bottom 10% income earners, only thirty go to college. The figure reaches ninety when parents are within the top 10% earners.

The findings displayed by **Figure 5.4.1** show that there is sometimes an enormous gap between official discourses about equal opportunity, meritocracy, and so forth and the reality of unequal access to education. This also suggests that it might be necessary to set transparent and verifiable objectives—together with changes in the financing and admission systems—in order to equalize access to education.

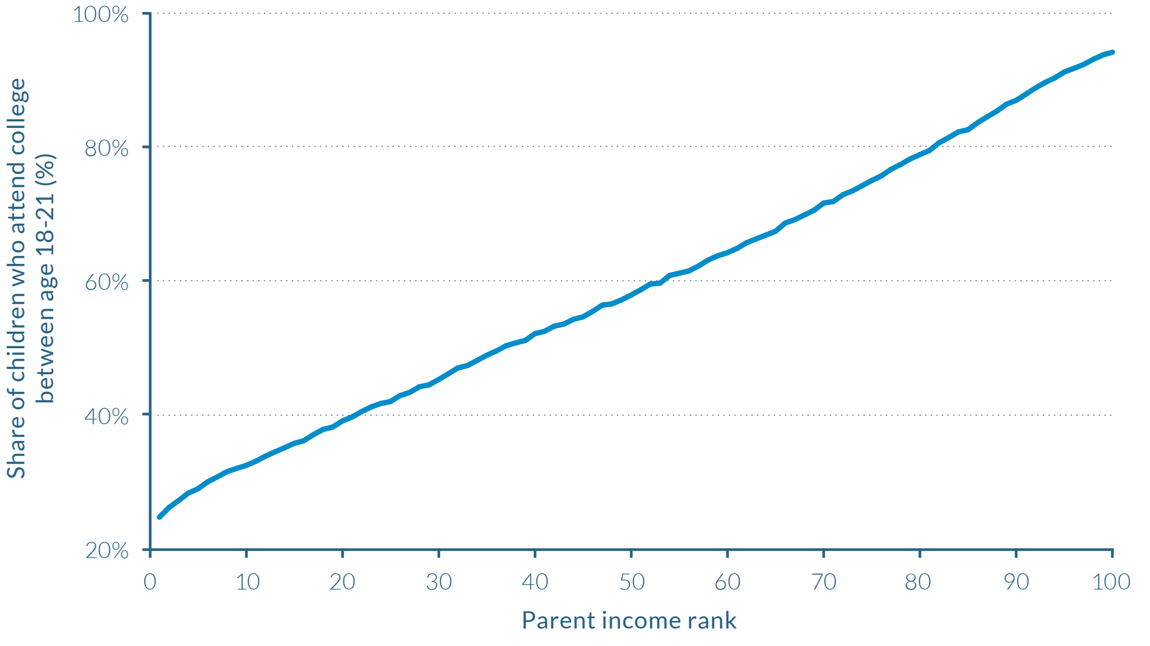
In the United States, intergenerational mobility is also a local issue

In the case of the United States, strong geographic inequalities also interact with educational inequalities. In geographical areas with the highest mobility, a child born in a family from the bottom 20% of the income distribution has a 10% to 12% chance of reaching the top 20% as an adult (that is about as much as in the highly mobile countries of Canada or Denmark). Examples of highly mobile places include the San Francisco Bay and Salt Lake City in Utah. In areas with low intergenerational mobility, a child born in a family from the bottom 20% of the income distribution has only a 4% to 5% chance of reaching the top 20% as an adult. No advanced economy for which we have data has such low rates of intergenerational mobility. Cities in the US south (such as Atlanta) or the US rust belt (such as Indianapolis and Cincinnati) typically have such low mobility rates.

What factors best explain these geographical differences in mobility? Detailed analysis shows that race and segregation play an important role in the United States. In general,

Figure 5.4.1

College attendance rates and parent income rank in the US for children born in 1980–1982



Source: Chetty, Hendren, Kline and Saez (2014). See wir2018.wid.world for data series and notes.

30% of children whose parents are in the Bottom 10% of the income distribution attend college between age 18 and 21. Almost 90% of children whose parents are in the Top 10% of the income distribution attend college between age 18 and 21.

intergenerational mobility is lower in areas with larger African-American populations. However, in areas with large African-American populations, both blacks and whites have lower rates of upward income mobility, indicating that social and environmental causes other than race, such as differences in history and institutions, may play a role. Spatial and social segregation is also negatively associated with upward mobility. In particular, longer commuting time decreases opportunities to climb the social ladder, and spatial segregation of the poorest individuals has a stronger negative impact on mobility. This suggests that the isolation of lower-income families and the difficulties they experience in reaching job sites are important drivers of social immobility.

Income inequality at the local level, school quality, social capital, and family structure are also important factors. Higher income inequality among the poorest 99% of individuals is associated with lower mobility.[15] Meanwhile, a larger middle class stimulates upwards mobility.[16] Higher public school expenditures per student along with lower class sizes significantly increase social mobility. Higher social capital also favors mobility (for example, areas with high involvement in community organizations).[17] Finally, family structure is also a key determinant; upward mobility is substantially lower in areas where the fraction of children living in single-parent households, or the share of divorced parents, or the share of non-married adults is higher.

What is remarkable is that combining these factors explains very effectively social mobility patterns. Taken together, five factors—commuting time, income inequality among the 99% poorest individuals, high-school dropout rates, social capital, and the fraction of children with single parents—explain 76% of inequalities in upward mobility across local areas in the United States. The vast geographic disparities in mobility in the United States, and the fact that they can be best explained by a combination of social factors at the commuting zone level, show that intergenerational mobility is largely a local issue.

Access to quality higher education is particularly unequal in the United States

The link between school quality and upward mobility that was highlighted above suggests that educational policies, school organization, and access rules can play a key role in promoting intergenerational mobility. Raj Chetty, John Friedman, Emmanuel Saez, Nicholas Turner, and Danny Yagan recently characterized intergenerational mobility in US colleges over a period of nearly fifteen years, from 1999 to 2013.[18] They show the extent of inequality in access to higher education, but also reveal tremendous scope for improvement: if all institutions could be made as efficient as the highest 10% colleges in terms of social mobility, then mobility in the United States would be perfect. Children's outcomes would be unrelated to their parents'.

Intergenerational mobility at the level of a given college may be defined as bringing together two components: the access rate and the success rate. Access rate refers to the openness of that college to students from lower-income groups, and can be measured as the proportion of students in it who come from the poorest 20% families. Success rate refers to that college's ability to help children from poor backgrounds reach higher income groups throughout their life. It might, for instance, be evaluated as the share of students ending up in the top 20% income group, given that they come from families in the bottom 20% of the national income distribution. Putting these together, one might define the mobility rate as the fraction of all students in a given college who come from the poorest 20% families *and* end up in the top 20% group. Theoretically, the mobility rate of a perfectly mobile society would be 4%.[19] The fact that it is currently just 1.7% in the United States as a whole shows that there is room for substantial improvement in providing low-income children with fair opportunities.

It is important to note, nevertheless, that family income differences only weakly predict the income positions of children from the same college. We saw that, at the national level, parental income strongly determined future position in the income distribution. However, within a given college, the relationship between parental income and student income is five times lower. At the national US level, children from the top 20% income groups end up 30 percentiles higher in the distribution than those from the bottom 20%; but among students attending a given elite college, this gap shrinks to close to 7 percentiles on average.

Contribution to mobility varies greatly across US colleges

Access to elite colleges remains highly unequal in the United States. Approximately 3% of children at Harvard University born between 1980 and 1982 come from the bottom 20% poorest families, whereas 70% come from the top 10%. In Ivy-Plus colleges (the most selective colleges in the United States) in general, there are more students coming from the top 1% richest families (14.5%) than from the bottom half (13.5%) of the population.

Such figures contrast sharply with public colleges. At Glendale Community College in Los Angeles, for instance, 32% of students come from the bottom quintile and only 14% from the top quintile. What is interesting is that high access rate colleges can also have high success rates (outcomes similar to highly selective colleges), translating into high mobility rates. Colleges helping many low-income students to reach the top of the income distribution tend to be public colleges welcoming a large number of low-income students. The existence of such institutions is particularly meaningful as it indicates that elite colleges may improve openness to students from poor backgrounds without compromising their outcomes.

Trends in mobility are heterogeneous, but show that little progress has been made overall

How did access and success rates evolve in the past decade in the United States? The data allow us to track their evolution between 2000 and 2011. During this period, the fraction of low-income college students increased from 10.6% to 12.8%, and this growth has been concentrated at for-profit institutions and two-year colleges. Access rates increased by only 0.65 percentage points among the most selective colleges, even though most Ivy-Plus colleges implemented tuition reductions and other policies to welcome more students from disadvantaged backgrounds. This does not mean that these policies were inefficient. Given the context of rising inequality in the United States, mobility may have worsened without them. All that is visible is that the net combination of these factors left access to elite colleges mostly unchanged.

Differences in mobility rates show that improving poor children's access to high-performing schools could substantially improve the contribution of education to upward mobility. Given that children from low-income families have similar success rates than their peers of a given college, opening them access to good colleges can hardly be considered as misplacement. Until now, efforts to expand access has mostly focused on elite colleges. Considering changes in admissions criteria may be an important way forward. Improving access and increasing funding to high-mobility-rate colleges may also be critical. These colleges have very good outcomes, admit a large number of low-income students, and operate at relatively low cost compared to elite colleges.

Educational inequalities can also be important in countries with lower levels of income and wealth inequality

European countries experienced a smaller rise of income and wealth inequality than that observed in the United States in recent decades (see Parts II–IV). This certainly does not mean, however, that the issue of education inequality is not relevant in Europe. In particular, France is one of the most unequal OECD countries in terms of educational inequality, as highlighted by the 2015 Programme for International Student Assessment (PISA). While the PISA survey provides information on France's general performance in terms of educational inequalities, still very little is known about the local characteristics explaining the large differences in outcomes between students from low- and high-income backgrounds. Gabrielle Fack, Julien Grenet, and Asma Benhenda have made significant contributions in this respect; their findings based on new data on middle schools and high schools in the Parisian region illustrate a particularly extreme case of educational inequality, but also are encouraging as they reveal how public policies can address these issues.[20]

As their work shows, in 2015, 115 public middle schools and 60 private schools welcomed more than 85 000 students, many of whom came from higher socio-professional groups (49%) and few from disadvantaged backgrounds (16%). Overall, Parisian middle schools appear to be extremely segregated, with the share of students from lower socio-professional groups ranging from 0.3% to 63% in middle schools of the capital. Private schools play a key role in social segregation by concentrating wealthier families: most private schools in Paris included less than 10% of students from low-income groups, and the private school with the highest level of social diversity welcomed only 25%. Therefore, it appears that private schools succeed in crowding out less-advantaged students and contribute directly to the polarization of the French educational system.

Social segregation is closely related to spatial segregation

This polarization is reinforced by territorial segregation. Paris is strongly divided into distinct areas—the north, northeast, east, and south, where median yearly income levels are below €30 000, and the center and west, where they are usually above €40 000. At the same time, access to Parisian middle schools is determined by location in the city. The French system allocates students in restricted geographical areas according to a "school map" *(carte scolaire)*, which implies that a student living at a given address can in principle access only one public middle school. Unsurprisingly, the repartition of students coming from poor and rich backgrounds therefore closely resembles that of parental income: certain middle schools in the relatively modest areas of Paris have more than 50% of students from low-income families, while most of schools in the richest areas of the city have less than 10%.

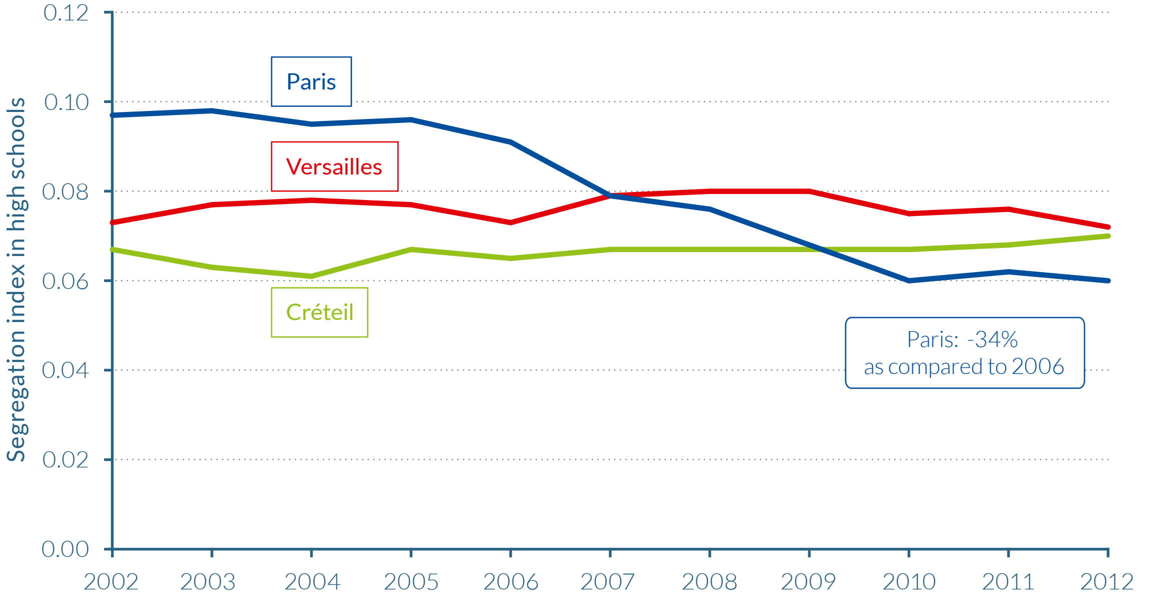
Spatial segregation, however, goes far beyond these geographical areas, and also exists at a very narrow level within Parisian districts *(arrondissements)*. In the eighteenth district, for instance, the share of students coming from poor backgrounds ranges from 9% to 58%, among high schools that are just a few hundred meters apart from one another. This effect is also reinforced by private schools, as wealthy families have the option to escape the public middle-school system.

Transparent data is a necessary condition to improve public debates on education

Tracking the evolution of educational segregation is fundamental to understanding why France displays such extreme disparities in students from low- versus high-income groups—and it is of crucial importance to evaluate existing policies. Concerning middle schools, segregation has been much higher in Paris than in Versailles or Créteil (both neighboring towns, all managed under different

Figure 5.4.2

The impact of an allocation policy on segregation in France, 2002–2012



Source: Fack, Grenet & Benhenda (2014). See wir2018.wid.world for data series and notes.

Between 2006 and 2012, the segregation index for high schools in Paris decreased by 34%.

administrative units) since 2002, and has remained relatively stable in the three cities.

However, new evidence from the evolution of segregation in high schools shows a very different picture. In 2007–2008, Paris implemented a new system of student allocation to high schools. Contrary to neighboring towns of Versailles and Créteil, where geographic proximity remained decisive, Paris decided to allocate students to their schools on the basis of their grades, across areas larger than before, to encourage social mixing. Students coming from disadvantaged backgrounds also obtained bonus points and therefore had more flexibility in the choice of their high schools.

Social segregation in public high schools in Paris decreased by one-third between 2002 and 2012 (see **Figure 5.4.2**), so that Paris has achieved a rate lower than in both Versailles and Créteil since 2010. The analysis of the new high-school allocation system based on students' grades shows that it played an important part in this evolution. Between 2005 and 2012, the share of students with grants based on social criteria, studying in the top 25% Parisian high schools, nearly doubled—from 12% to 21%, while this share remained stable in the neighboring cities, as well as in Parisian middle schools which did not implement the allocation procedure.

This evaluation shows that reducing social segregation is possible. Evaluating and designing new allocation systems is therefore of crucial importance to giving equal opportunities to all children regardless of their socioeconomic origin. In this respect, citizens can engage in a transparent, democratic debate informed by reliable information. Indeed, this issue is not limited to rich countries. Emerging countries such as India are also confronted with large educational inequalities. Some have for a long time established reservation systems based on quotas. These are complex and far from perfect, but the study of their strengths and limits can help others countries make progresses (see **Box 5.4.1**).

Indeed, reservation systems cannot be sufficient to ensure equal access to education. If public schools and universities do not have enough resources to pay for good teachers, buildings, and furniture, even the most equalizing allocation system will have little impact on the democratization of quality education. Large public investments in this are essential today, in emerging and rich countries countries alike. In addition, educational policies alone are not sufficient to tackle inequality at the bottom—policies supporting fair wages are also key (see **Box 5.4.2**).

Box 5.4.1

Reservation policies in India

In order to tackle extreme social inequalities, India developed a vast system of preferential admission to the universities (as well as in public sector employment) for children from the lowest castes (the SC/ST or "Scheduled Castes/Scheduled Tribes," the former highly discriminated untouchables, or almost 30% of the population). This nationwide program started in the 1950s. The implementation of reservation policies based on social and cultural segregation, however, faces complex measurement and political challenges. What is the correct way to identify legitimate beneficiaries? How can a dynamic reservation system be designed, which takes into account demographic, cultural, and economic changes?

In India, the so-called "reservation policies" aroused growing frustration amongst the children in the intermediate castes (the OBC, or "Other Backward Classes," roughly 40% of the population) caught between the most disadvantaged groups and the highest castes. Since the 1980s, several Indian states extended the policy of preferential admission to these new groups (including the Muslims who were excluded from the original system). Conflicts concerning these arrangements are all the greater because the old boundaries between castes are porous and do not always match the hierarchies in income and wealth. Far from it, in fact. In 2011, the federal government finally resolved to clarify these complex relationships by organizing a socio-economic census of the castes (the first to be carried out since 1931). The results of this census have been criticized as being unreliable and the central government also agreed on a series of measurement errors.

This reveals the importance of sound and legitimate data production systems to track demographic, economic, and cultural evolutions. In order to bypass current criticisms associated with reservation policies, one option for India could be to gradually transform these preferential admission policies into rules founded on universal social criteria, such as parental income or place of residence, along the lines of the admission mechanisms used for entry to schools or higher education institutions.

To a large extent, it could be argued that a country like India is simply endeavoring to confront the challenge of effective equality with the means available to a state based on the rule of law, in a situation where inequality of status originating in the former society and past discrimination is particularly extreme and threatens to degenerate into violent tensions at any time. However, as we have seen above, rich countries are not exempt from these issues, either—as may sometimes be thought. Indeed, rich and poor countries alike have a great deal to learn from the trials and errors of the Indian reservation system, one of the oldest nationwide affirmative action programs in the world.

Box 5.4.2

Minimum wage, fair wage, and corporate governance

Educational policies promoting social mobility and equality of opportunity are certainly key to reducing income inequality and widening access to good jobs. They remain, however, limited in their ability to provide decent incomes to all. Policy tools potentially useful for increasing workers' pay include the minimum wage, and more democratic corporate governance.

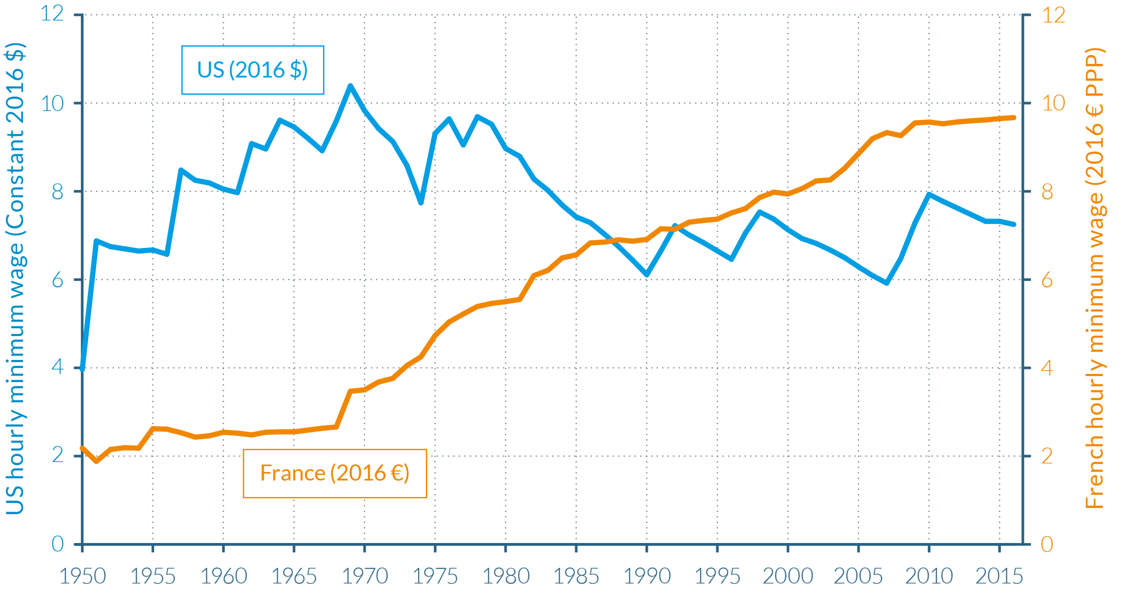
It is, in this respect, noteworthy to mention that wage inequality and employment precariousness remain of crucial importance, and have been increasing in a range of countries. According to the International Labour Organization, the share of labor in aggregate income has continued its long-run decline in the past five years, and still, 80% of workers are paid less than the average wage of the firm in which they work—a fact that skills-related characteristics fail dramatically to explain. Whether countries record high rates of average income growth or not, if individuals can only expect a declining share of it, equality-of-opportunity policies in education alone will fall short of meeting their demands.

Minimum wages and labor market regulation can be critical to tackling income inequality. **Figure 5.4.3** illustrates how regulatory policies can be tightly linked to disparities in earnings. While the real minimum wage has been steadily increasing in France since the beginning of the 1970s, in the United States it was actually higher in 1980 than it is today. Differences in income inequality dynamics between the two countries mirror this pattern, especially at the bottom of the distribution, as chapters 2.4 and 2.5 showed. Today, minimum wage workers in France earn nearly €10 per hour, almost 50% more than their counterparts in the United States, and this despite an average national income per adult in the United States that is 50% higher than in France. Minimum wages can therefore usefully help in compressing wage disparities, and notably differences in earnings between men and women, given that women are overrepresented among the low-paid in both developed and developing countries.

To reduce wage inequality and improve the overall quality of jobs would surely require deep changes in the way the power of different stakeholders is determined and organized. Some Nordic and German-speaking countries have already undergone changes in this direction by promoting "codetermination." For instance, employees' representatives hold half the seats in executive boards of major German firms, which ensures better consideration of workers' interests in companies' strategic choices or decisions over executive or workers' pay. These examples suggest that while being crucial, educational policies cannot suffice on their own to tackle the extreme inequality levels observed in certain countries.

Figure 5.4.3

Minimum wage in France and the US, 1950–2016



Source: Piketty (2014) and updates. See wir2018.wid.world for data series and notes.

Between 2000 and 2016, the hourly minimum wage rose from €7.9 to €9.7 in France, while it rose from $7.13 to $7.25 in the US. Income estimates are calculated using Purchasing Power Parity (PPP) euros for France and dollars for the US. For comparison, €1 = $1.3 = ¥4.4 at PPP. PPP accounts for differences in the cost of living between countries. Values are net of inflation.

5.5

A MESSAGE FROM THE PAST: LET GOVERNMENTS INVEST IN THE FUTURE

- The share of public wealth in national wealth has declined in most countries analyzed in this report. In many rich countries, it is now close to zero (France, Germany, Japan) or even negative (US, UK).
- Such low levels of public wealth makes tackling existing and future inequality extremely challenging given that governments do not currently possess the resources necessary for investments in education, healthcare and environmental protection.
- Selling public assets and/or undergoing prolonged periods of austerity would be barely sufficient, or even insufficient, to repay public debts. Moreover, these policies would leave governments without the means to improve equality of opportunity for their citizens.
- History indicates that there are three different ways – and generally a combination of the three – by which a reduction of large public debts can be achieved: progressive taxes on private capital, debt relief, and inflation. Given the potential difficulties in controlling the incidence and extent of inflation, a combination of the former two policies appears more appropriate.
- Reducing public debt is, however, by no means an easy task. Whilst several options exist and have been used across history, it is challenging to identify the best option(s) for each country. This is a matter for serious public debate, which must be grounded in sound economic, social and historical data and analyses

The share of public wealth in total national wealth has declined in all the countries analyzed in this report (see Part III). In Russia and China, this decline is the logical consequence of the move away from a communist system. Both countries were, however, successful to maintain relatively high levels of public capital as compared to rich countries. The current situation in rich countries stands out as an anomaly from a historical perspective.

During the postwar economic boom, public assets in European countries were considerable (approximately 100–130% of national income, thanks to their very large public sectors, the result of postwar nationalizations), and significantly higher than public debt (which was typically less than 30% of national income). In total, public capital—net of debt—was largely positive, in the range of 70–100% of national income. As a result, net public wealth made up a significant share of total national wealth between 1950 and 1980, typically around 15–25% or more.

Over the past thirty years, public debt approached 100% of national income in most industrialized economies, with the result that net public capital became almost zero. On the eve of the global financial crisis in 2008, it was already negative in Italy. The latest available data, presented in Part IV, shows that net public capital has become negative in the United States, Japan, and the United Kingdom. In France and in Germany, net public capital is just slightly higher than zero.

This situation does not mean that rich countries have become poor: it is their governments which have become poor. As discussed in Part IV, private wealth—net of debt—has risen spectacularly since the 1970s. Private wealth represented 300% of national income back then. Today it has risen to, or exceeded, 600% in most rich countries. This prosperity in private wealth is due to multiple causes: the rise in property prices (agglomeration effects in larger metropolitan areas); the aging of the population and decline in its growth (which automatically increases savings accumulated in the past in relation to current income and contributes to inflating the prices of assets); and the privatization of public assets and rise in debt (which is held in one form or another by private owners, via the banks). Also contributing to this increase were the very high returns obtained by the highest financial assets (which structurally grow faster than the size of the world economy) and the evolution in a legal system globally very favorable to private property owners (both in real estate and in intellectual property).

It is interesting to remark that countries such as China and Russia, despite large shifts in the balance of private and public capital since their transition away from Communism, have succeeded in maintaining relatively high public wealth levels. In China, public wealth is above 200% of national income, and it is close to 100% in Russia. While the ratio has sharply decreased in Russia over the past two decades, it has remained fairly constant in China. In both cases, it is still much higher than in rich countries. Governments in these countries have preserved significant means of action and control over their economies.

Large public property has obviously important consequences for the state's ability to conduct industrial, educational, or regional development policy (sometimes efficiently and sometimes less so). In contrast, negative public wealth also has potentially enormous fiscal consequences: governments with negative net public wealth typically have to pay large interest payments before they can finance public spending and welfare transfers, while those with large positive net public wealth can potentially benefit from substantial capital income, and finance more public spending than what they levy in taxes. This situation is particularly problematic in a situation of high income and wealth inequality.

What, then, are the different options for highly indebted governments? One possibility would be to sell all public assets (including all public buildings, schools, universities, hospitals, police stations, and infrastructure). In the United States, Japan, and the UK—and even more true of Italy—this would not be sufficient to repay the totality of public debt. In France and Germany, it would barely be sufficient. In all these cases, moreover, states would then have lost all (or nearly all) means of control over their education and health systems. To put it differently, social states would largely disappear, leaving governments without means to ensure equality of opportunity.

Another option would be to undergo prolonged periods of austerity, via drastic reductions in governments' expenditures. In effect, this also contributes to increasing inequality as governments would slash their redistribution programs to repay debts. In terms of both justice and efficiency, austerity and privatizations stand out as very bad measures.

Fortunately there are also other options. In history, one generally observes three different ways—and generally a combination of the three—to accelerate the reduction of a large public debt: progressive taxes on private capital; debt relief; and inflation.

First, an exceptional tax on private capital can raise substantial revenue to reduce debt. For instance, a flat tax of 15% on private capital in rich countries (about 600% of national income) would yield nearly a year's worth of national income (exactly 90% of national income) and thus allow for immediate reimbursement of all nearly outstanding public debt.

This solution is equivalent to repudiation of the public debt, except for two crucial differences. First, it is always difficult to predict the ultimate incidence of a debt repudiation (even a partial one). Bondholders are forced to accept what is called a "haircut"—meaning that the value of government bonds held by banks and creditors is reduced by 10–20% or even more. The problem is that it is very difficult to predict which actors ultimately bear the loss and, when applied at a large scale, haircuts can trigger panic among investors and a wave of bankruptcies—and potentially, the meltdown of the financial sector, which few governments are willing to experience. Second, an exceptional tax on private capital, contrary to a debt repudiation, can be adjusted to individuals' wealth levels—by using an explicitly progressive rate structure. Given the very large concentration of wealth, this is highly preferable. For instance, the top 1% of the wealth distribution typically owns around 30% of total wealth (that is, the equivalent of 180% of national income if aggregate wealth represents 600% of national income). Instead of using a flat tax of 15% on private capital, one could raise the same revenue by exempting the bottom 99% of the wealth distribution and applying an average effective tax rate of 50% on the top 1% wealth group. Alternatively, one could use an intermediate system. For instance, a progressive tax on capital that levied zero tax on capital up to 1 million euros, a 10% tax between 1 and 5 million euros, and a 25% tax above 5 million euros would raise 20% of national income in Europe—and that would be an important step toward a gradual reduction of public debt.

Interestingly, a special tax on capital was applied in France in 1945 to reduce substantial public debt. This special tax had progressive rates which ranged from 0 to 25%. Most importantly, special progressive taxes on private wealth were put in place after the Second World War in Germany, and were gradually paid by German private wealth holders between the 1950s and the 1980s.

At that time, exceptional progressive taxes on private wealth were used together with various gradual forms of debt repudiation and debt relief—an obvious second way to accelerate the reduction of a large public debt. In particular, Germany benefited from a near complete reduction of its foreign debt at the

London conference in 1953. These were debts that were accumulated by Germany during the reconstruction period of 1945 to 1953. International creditors—largely governments—decided in 1953 to postpone repayment until German unification (with no indexation mechanism), and the debt was eventually entirely cancelled.[21]

In the current context, new forms of debt relief might develop in Europe, and to some extent have already started to develop (albeit too slowly, and with multiple hesitations and setbacks). Specifically, public institutions like the European Central Bank (ECB) and the European Stability Mechanism (ESM) could gradually take onto their balance sheets rising fractions of individual countries' public debts and postpone repayments until certain social, economic, and environmental objectives have been met. This would make it possible to have the advantages of debt repudiation without the financial instability coming from investor panic and bankruptcies.

Finally, the third solution used historically to accelerate the reduction of a large public debt is inflation. Historically, this mechanism played a crucial role in the reduction of most public debts. High levels of inflation were the major mechanisms used in France and Germany to bring their public debts to very low levels after the First World War, and they also played a central role in the aftermath of the Second World War, together with more sophisticated mechanisms like progressive wealth taxes and debt relief. One major problem with inflation as a policy instrument is that it is hard to control. Once it starts, policymakers may have difficulties stopping it. Inflation, moreover, is a much less precise tool than taxation in terms of incidence. In theory, it could act as a tax on those who have idle capital, and provide relief to those who are indebted by reducing the value of their debt. In practice, however, it can have less desirable effects from a fairness point of view. During high-inflation phases, large and well diversified portfolios invested on the stock market

In 1945, public debt in Germany was 183% of national income, and decreased to 22% in 1953.

Box 5.5.1

The importance of standardized inequality metrics for international comparisons and collective learning

The need for sound economic data to allow civil society, researchers, businesses, and policymakers to debate and develop informed and balanced policy responses to rising economic inequality has been a dominant theme in this report.

In that regard, it is interesting to note that the United Nations agreed in 2015 to seventeen sustainable development goals (SDGs), as part of a global agenda to transform society in rich and poor countries alike. Recognizing that rising income and wealth inequality has become a universal issue, SDG Target 10 commits countries to "reduce inequalities within and among countries." To that end, the SDG framework calls on states to articulate nationally specific implementation strategies and to put in place monitoring and review processes to meet the UN goals.

This development is particularly remarkable since international organizations have until recently paid limited attention to within-country inequality issues, considering the reduction of inequalities to be a sovereign issue for each country, or positing inequalities as a necessary evil towards global improvement of wellbeing. Concerns about domestic income inequalities were politically confined in the shadow of absolute poverty considerations, until the UN's Sustainable Development Goals replaced its former Millenium Development Goals. In addition, global development goals have so far only focused on poor and emerging countries—leaving rich countries aside. We have seen, however, that both rich and poor countries face rising inequality.

In this context, the unanimous endorsement of SDG Target 10.1 by the UN member states marks an important shift. Target 10.1 aspires to "by 2030, progressively achieve and sustain income growth of the bottom 40 per cent of the population at a rate higher than the national average." This target was subject to harshly contested debates among country representatives. While China argued that within-country inequality reduction was a national prerogative, the United States contended that a standalone goal on inequality would better be achieved through economic growth. At some point, the inequality target was even removed from the SDG list. A group of countries led by Denmark, Norway, and Brazil supported its reinsertion, arguing that a specific metric should be used to precisely ensure that growth reduces inequality.[a] If anything, such debates suggest that countries are taking this new indicator seriously.

Table 5.5.1

Real income growth in emerging and rich countries, 1980–2016

		Brazil	China	France	India	Russia	USA
2015–2016	**Bottom 40%**	-7.1%	6.4%	1.7%	4.4%	-1.4%	0.6%
	Full Population	-5%	6.6%	1.4%	4.5%	-2.7%	2.2%
2000–2016	**Bottom 40%**	12%	200%	10%	50%	119%	-7%
	Full Population	1%	281%	4.7%	108%	69%	12%
1980–2016	**Bottom 40%**	–	359%	31%	107%	-21%	-3.9%
	Full Population		833%	40%	223%	52%	66%

Source: WID.world (2017). See wir2018.wid.world for data series and notes.

Between 1980 and 2016, the average pre-tax income of the Bottom 40% in China grew by 359%. In comparison, the average pre-tax income of the full adult population grew by 833%.

How do countries fare on SDG Target 10.1? WID.world data is particularly suited to address this question. **Table 5.5.1** compares target achievement of six countries over the following periods of time: 2015–2016, 2000–2016, and 1980–2016. The focus here is on pre-tax income.

In 2016–2015, only one country was able to meet the target: France. In all five other countries, the income growth of the bottom 40% was lower than the national average. These results help underscore the power of this objective: it is transformative in the sense that it cannot be automatically met. Countries will have to act if they want to fulfill their commitments. The 2000–2016 period provides another crucial insight. During this time span, Brazil, France, and Russia were able to meet the target—with very different average growth trajectories, however. This implies that success has been possible over relatively longer time spans for several countries, and suggests that meeting the target in the future is not only desirable but also feasible—even if results over the 1980–2016 period are less encouraging.

Two points are worth noting.

First, as described earlier in this report, inequality also increased at the top. Focusing on the bottom 40% alone can miss important dynamics—in part for the middle class, which may be squeezed between increases in both the bottom 40% share and the top 1% share. In particular, the top 1% can also grow significantly faster, as was the case in most countries for the periods considered. In Brazil from 2000 to 2016, the bottom 40% grew much faster (12%) than the average (1%), but the top 1% grew at 24% in the meantime. To a lesser extent, this also occurred in France over 2015–2016, with bottom 40% groups and the top 1% growing faster than average. This means that the income share held by individuals richer than the bottom 40% but poorer than the top 1% decreased. This "squeezed middle class" phenomenon obviously poses one of the most important policy challenges for the years to come and deserves very careful scrutiny.

Second, these estimates focus on pre-tax income. Pre-tax income inequality estimates take into account most cash redistribution in rich countries (see Box 2.4.1) but do not include personal income and wealth taxes. International comparisons of post-tax income inequality measures are thus also necessary to assess the full impact of fiscal policy. As discussed earlier in this report, more work lies ahead to collect, harmonize, and analyze such information. The United Nations and other international organizations have a responsibility in this regard. WID.world will remain committed to working toward such results, with all its statistical contributors willing to dedicate resources to this task, to enlighten the public democratic debate.

Bearing in mind these remarks, the SDG Target 10.1 on inequality stands out as a very useful tool for stakeholders dedicated to tackling economic inequality. To be sure, an inequality metric based on sound data cannot in itself change policy—but it is a necessary basis for doing so. The SDG framework can also lead to the establishment of a framework for collective learning on inequality reduction policies.[b] As emphasized in this report, there is large scope for learning between rich and poor countries regarding the fiscal, educational, wage, and public investments policies they employ to promote fairer development pathways.

b Chancel et al., "Reducing Inequalities within Countries."

can earn a good return while smaller wealth holdings of the middle class and the poor held in savings accounts can be wiped out. A combination of exceptional wealth taxes and debt relief seems like a better option.

Reducing public debt is thus by no means an easy task. Several options exist and have been used across history. We certainly do not pretend that we have identified the best option for each country. This is a matter of serious public debate, which must be grounded in sound economic, social, and historical analysis and comparisons over time and countries. (See **Box 5.5.1**.) In this discussion, there is one crucial element: today, large investments are required to promote more equal access to education or to protect the environment and combat the consequences of climate change.[22] If these challenges go unaddressed they are likely to reinforce tomorrow's levels of economic inequality. Recent history has shown that in exceptional circumstances, exceptional measures were taken by societies through their governments to reinvest in the future.

NOTES

1 OECD (2017), GDP long-term forecast. doi: 10.1787/d927bc18-en. Note that the rates we use are voluntarily more optimistic than the rates assumed by the OECD to compute their total global income in 2050 for Africa, Latin America, and Asia. Assuming higher growth rates tends to reduce global inequality. Ours should be seen as a conservative approach to the rise of global inequality in the coming decades.

CONCLUSION

The *World Inequality Report 2018* draws from data available on the World Wealth and Income Database (WID.world), which combines historical statistical sources in a consistent and fully transparent way to fill a gap in the democratic debate regarding inequality. Our objective in this report has been to present inequality data that are consistent with macroeconomic statistics such as GDP and national income and that can be easily understood and used by the public, to help ground deliberations and decisions in facts. Our data series are fully transparent and reproducible; our computer codes, assumptions, and detailed research papers are available online so that any interested person can access and use them.

Drawing on novel inequality data published on WID.world, Part II showed that since 1980, income inequality has increased rapidly in North America and Asia, has grown moderately in Europe, and has stabilized at extremely high levels in the Middle East, sub-Saharan Africa, and Brazil. The poorest half of the global population has seen its income grow significantly thanks to high growth in Asia (particularly in China and India). Perhaps the most striking finding of this report, however, is that, at the global level, the top 0.1% income group has captured as much of the world's growth since 1980 as the bottom half of the adult population. Conversely, income growth has been sluggish or even nil for the population between the global bottom 50% and top 1%. This includes North American and European lower- and middle-income groups. The diversity of trends observed in the report suggest that global dynamics are shaped by a variety of national institutional and political contexts. There is no inevitability behind the rise of income inequality.

In Part III, we presented recent shifts in public versus private capital ownership. Understanding the dynamics of private and public capital ownership is critical to understanding the dynamics of global inequality, and particularly of wealth inequality. We documented a general rise in the ratio between net private wealth and national income in nearly all countries in recent decades. It is striking to see that this long-run finding has been largely unaffected by the 2008 financial crisis, or by the asset price bubbles experienced by countries including Japan and Spain. There have also been unusually large increases in the ratios for China and Russia, following their transitions from communist- to capitalist-oriented economies. These shifts were mirrored by the dynamics of public wealth, which has declined in most countries since the 1980s. Net public wealth (public assets minus public debts) has even become negative in recent years in the United States, Japan, and the United Kingdom, and is only slightly positive in Germany and France. This arguably limits government ability to regulate the economy, redistribute income, and mitigate rising inequality.

In Part IV, we discussed how increasing income inequality, and the large transfers of public wealth to private hands which have occurred over the past forty years, have led to a rise in wealth inequality among individuals. At the global level—represented by China, Europe, and the United States—the top 1% share of wealth increased from 28% in 1980 to 33% today, while the bottom 75% share oscillated around 10%. Large rises in top wealth shares have been experienced in

China and Russia following their transitions from communism toward capitalist economies, though the different inequality dynamics experienced between these two countries highlight different economic and political transition strategies. In the United States, wealth inequality has increased dramatically over the last thirty years and has mostly been driven by the rise of the top 0.1% wealth owners. Growing inequality of income and saving rates created a snowballing effect of rising wealth concentration. The increase in top wealth shares in France and the UK has been more moderate over the past forty years, in part due to the dampening effect of the rising housing wealth of the middle class and lower income inequality relative to the United States.

In Part V, we presented projections on the future of global income inequality, which is likely to be shaped both by convergence forces (rapid growth in emerging countries) and divergence forces (rising inequality within countries). Our benchmark projections showed that if within-country inequality continues to rise as it has since 1980, then global income inequality will rise steeply, even under fairly optimistic assumptions about growth in emerging countries. The global top 1% income share could increase from nearly 20% today to more than 24% by 2050, in which case the global bottom 50% share could fall from 10% to less than 9%. If all countries were to follow the high inequality growth trajectory followed by the United States since 1980, the global top 1% income share would rise even more. Conversely, if all countries were to follow the relatively low-inequality growth trajectory followed by Europe since 1980, the global top 1% income share would actually decrease by 2050. This finding reinforces one of our main messages: rising income inequality is not inevitable in the future. We also stressed that differences between high and low inequality growth trajectories within countries have enormous impacts on incomes of the bottom half of the global population.

The remainder of Part V was dedicated to a discussion of key policy issues that should be brought back to the center of the political agenda to tackle inequality. We certainly do not claim to have ready-made solutions to rising inequality within all countries. We believe, however, that much more can be done in the four key policy areas we highlight.

We first emphasized that progressive income taxation is a proven tool to combat rising income and wealth inequality at the top. It not only reduces posttax inequality, it also shrinks pretax inequality by discouraging top earners from capturing higher shares of growth via aggressive bargaining for higher pay. It should be noted that tax progressivity was sharply reduced in rich countries from the 1970s to the mid-2000s. Since the global financial crisis of 2008, however, the downward trend has been halted and reversed in some countries. The future use of progressive taxation remains uncertain and will depend on democratic deliberation.

Second, we argued that although tax systems are crucial mechanisms for tackling inequality, they also face obstacles—among them, tax evasion. The wealth held in tax havens is currently equivalent to more than 10% of global GDP and has increased considerably since the 1970s. The rise of tax havens makes it difficult to properly measure and tax wealth and capital income in a globalized world. Reducing financial opacity is critical to improving data on wealth and its distribution, to fostering a more informed public debate about redistribution, and to fighting tax evasion, money laundering, and the financing of terrorism. One key challenge, however, involves recording the ownership of financial assets. While land and real estate registries have existed for centuries, they miss a large fraction of the wealth held by households today, as wealth increasingly takes the form of financial securities. A global financial register recording the ownership of equities, bonds, and other financial assets would deal a severe blow to financial opacity.

Third, we discussed the importance of achieving more equal access to education and good paying jobs, if the bottom half of the population is to escape the trap of stagnating or sluggish income growth rates. Recent research shows the enormous gaps that often exist between public discourses about equal opportunity and the practical realities of unequal access to education. In the United States, for instance, out of a hundred children whose parents fall within the bottom 10% of income earners, between twenty and thirty go to college. That figure reaches ninety, however, among children whose parents fall within the top 10% of earners. On the positive side, research shows that elite colleges in the United States are able to improve openness to students from poor backgrounds without compromising their outcomes. Whether a country is rich or emerging, it might have to set transparent and verifiable objectives—while also making changes in financing and admissions systems—to equalize access to education. Democratic access to education can achieve much, but unless there are also mechanisms to provide people at the bottom of the distribution with access to good paying jobs, investments in education cannot do enough to tackle inequality. Better representation of workers in corporate governance bodies and boosts in minimum wages are important tools to achieve this.

Finally, we stressed the need for governments to invest more in the future, both to address current income and wealth inequality levels and to prevent further increases. This is particularly difficult given that governments have become poor and heavily indebted in rich countries over the past decades. Reducing public debt is by no means an easy task, but several options exist for accomplishing it (including taxation, debt relief, and inflation), all of which have been used across history. Finding the proper combination of solutions will require serious public debate, which must be grounded in sound economic, social, and historical analysis.

To conclude, we must repeat that current knowledge of global income and wealth inequality remains limited and unsatisfactory. Much more data collection work lies ahead of us to expand the geographical coverage of our inequality data, as well as to provide more systematic representations of pre- and post-tax income and wealth inequality. WID.world, the World Inequality Lab, and their partner institutions are committed to pursuing these efforts in the coming years.

The WID.world database is currently being expanded to increase its coverage of emerging countries in Asia (in particular, Malaysia and Indonesia), Africa (for instance, in South Africa), and Latin America (Chile and Mexico, among others).

We are also currently working towards better integration of natural capital in national wealth estimates, as the importance of environmental degradation as a dimension of inequality continues to grow.

More gender inequality data are also being integrated to WID.world and we are developing estimates of inequality at the regional (subnational) level, with the aim of further reducing the gap between individuals' perceptions of inequality and what economic statistics are able to measure. Indeed, WID.world is just one step in a long, cumulative research process.

We welcome efforts made by other institutions and researchers to take part in this collective endeavor. And we very much hope that, together with all interested actors and citizens, we will continue making progress toward financial transparency and economic democracy in the years to come.

APPENDIX

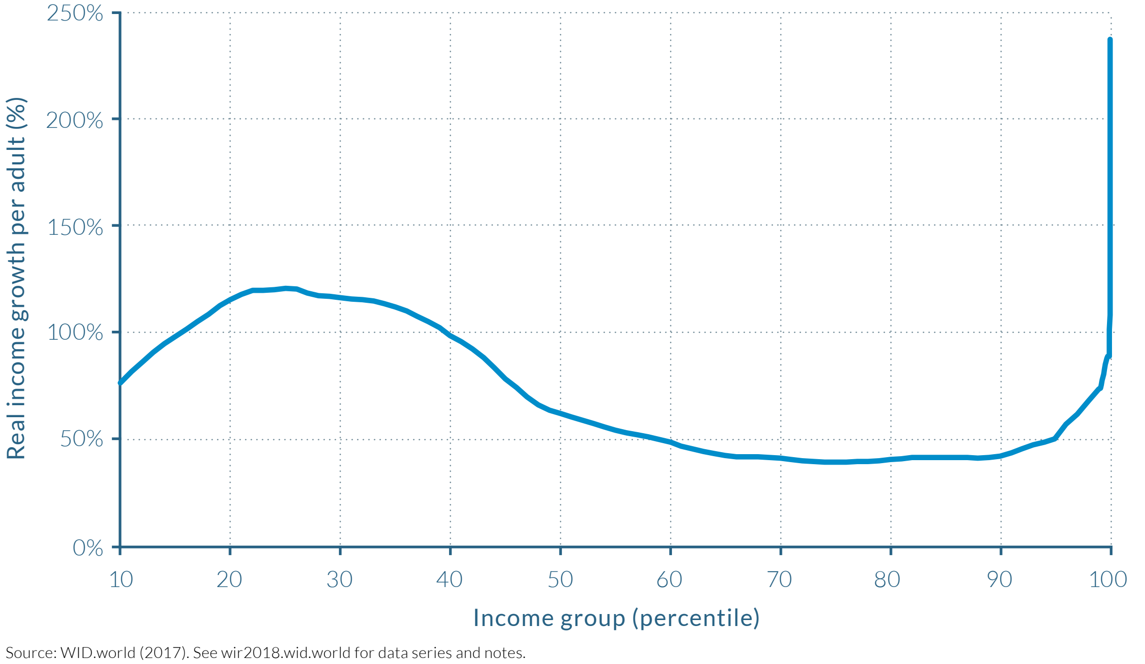
APPENDIX

- In order to improve the ease of reading of the World Inequality Report, we have not included all technical details in the main body of the text.
- However, interested readers are warmly invited to visit the Report's dedicated website (wir2018.wid.world) for methodological details on how estimations were constructed. In our efforts to be as transparent as possible, the website hosts all the methodological documents, country technical papers, raw data sources and computer codes used for the production of the series presented in the World Inequality Report.
- In particular, for detailed technical notes on each of the graphs presented in the report, users should refer to the document: "World Inequality Report 2018 Technical Notes" (WID.world Technical Notes 2017/7). This document at times redirects readers towards other working papers or scientific articles where more exhaustive information can be ascertained.
- The online publication of these documents is essential in our view to increase the level of transparency and reproducibility of global inequality data. We would encourage as many people as possible to view the site, make their own estimations, and discover ways in which our data can be improved and what alternative assumptions would be made in order to do so.
- Below is a limited selection of Appendix graphs, that we refer to earlier in the World Inequality Report. Figures A1 to A3 show alternative methods to represent our main results on global income inequality dynamics. Figure A4 focuses on income inequality dynamics in India and China and provides an example of the types of additional graphs which can be obtained on wir2018.wid.world.

In this representation of global income inequality dynamics discussed in Chapter 2.1, we scale the horizontal axis by population size, meaning that the distance between different points on the x-axis is proportional to the size of the population of the corresponding income group. (See **Box 2.1.1**)

Figure A1

Total income growth by percentile across all world regions, 1980–2016: Scaled by population



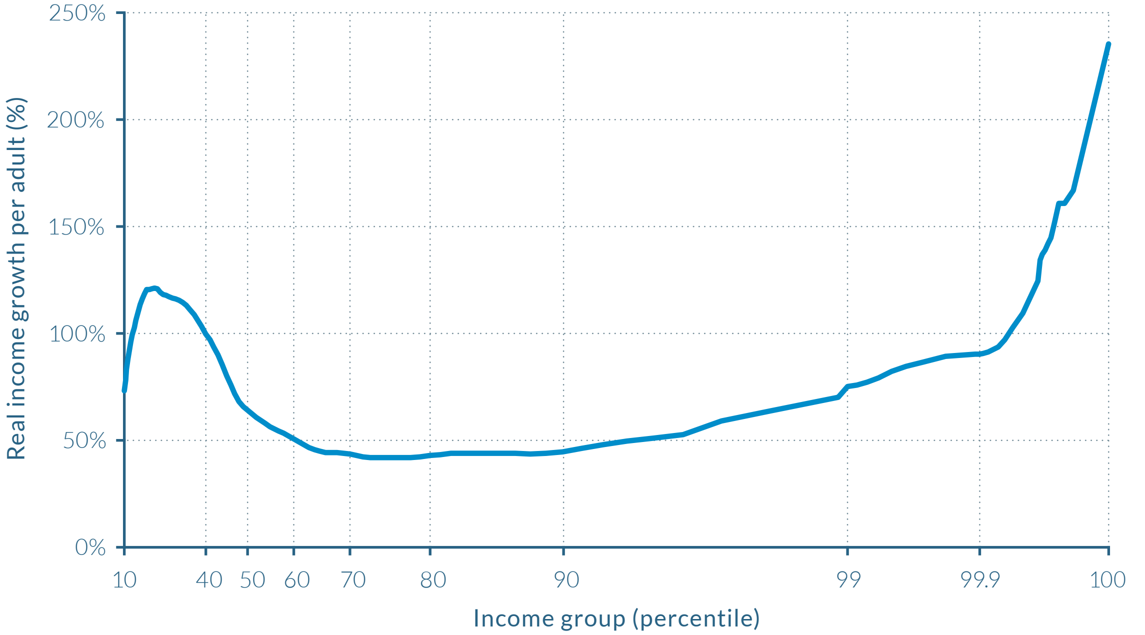
Source: WID.world (2017). See wir2018.wid.world for data series and notes.

This graph is scaled by population size, meaning that the distance between different points on the x-axis is proportional to the size of the population of the corresponding income group. The income group p0p1 (lowest percentile), for instance, occupies 1% of the size of the x-axis. On the horizontal axis, the world population is divided into a hundred groups of equal population size and sorted in ascending order from left to right, according to each group's income level. The Top 1% group is divided into ten groups, the richest of these groups is also divided into ten groups, and the very top group is again divided into ten groups of equal population size. The vertical axis shows the total income growth of an average individual in each group between 1980 and 2016. For percentile group p99p99.1 (the poorest 10% among the richest 1% of global earners), growth was 74% between 1980 and 2016. The Top 1% of income earners captured 27% of total growth over this period. Income estimates account for differences in the cost of living between countries. Values are net of inflation.

In this representation of global income inequality dynamics discussed in Chapter 2.1, we scale the horizontal axis by the share of growth captured by income group, meaning that the distance between different points on the x-axis is proportional to the share of growth captured by the corresponding income group. (See **Box 2.1.1**)

Figure A2

Total income growth by percentile across all world regions, 1980–2016: Scaled by share of growth captured



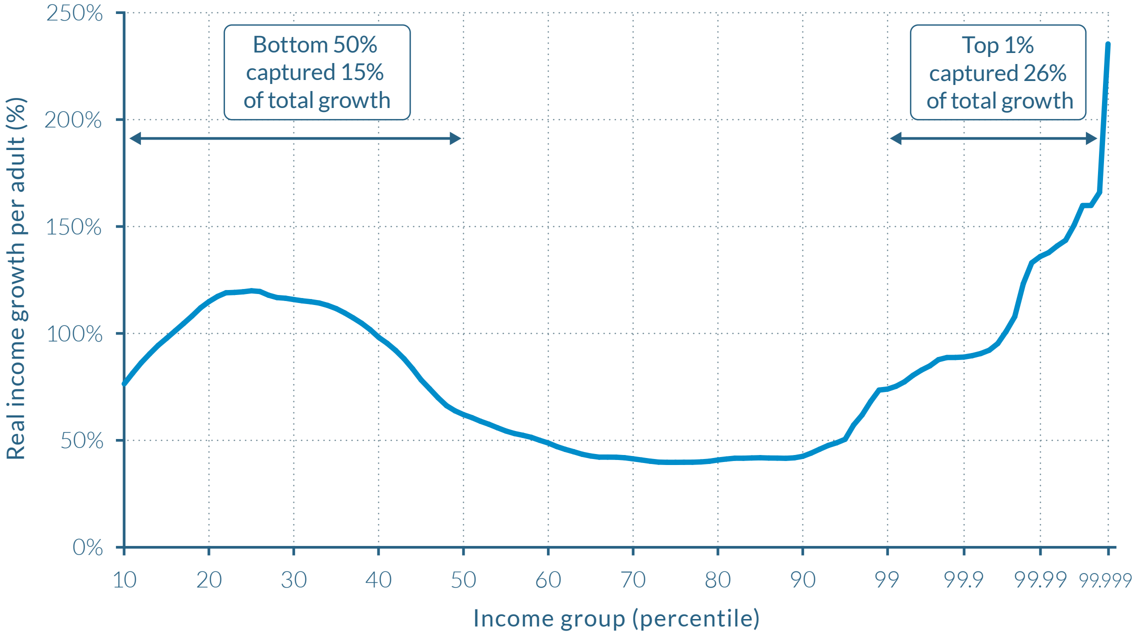
Source: WID.world (2017). See wir2018.wid.world for data series and notes.

This graph is scaled by the share of growth captured by income group, meaning that the distance between different points on the x-axis is proportional to the share of growth captured by the corresponding income group. The top 0.001% (p99.999p100), for instance, captured 3.6% of total growth. Therefore, the distance between p99.999 and p100 (the last two points of this graph) corresponds to 3.6% of the total size of the x-axis. On the horizontal axis, the world population is divided into a hundred groups of equal population size and sorted in ascending order from left to right, according to each group's income level. The Top 1% group is divided into ten groups, the richest of these groups is also divided into ten groups, and the very top group is again divided into ten groups of equal population size. The vertical axis shows the total income growth of an average individual in each group between 1980 and 2016. For percentile group p99p99.1 (the poorest 10% among the richest 1% of global earners), growth was 74% between 1980 and 2016. The Top 1% of income earners captured 27% of total growth over this period. Income estimates account for differences in the cost of living between countries. Values are net of inflation.

In this representation of global income inequality dynamics discussed in Chapter 2.1, we adopt a combination of the scaling methods used in Figure A1 and Figure A2 so as to better visualize global inequality dynamics throughout the entire distribution. (See **Box 2.1.1**)

Figure A3

Total income growth by percentile, 1980–2016: Brazil, China, India, Europe, Middle-East, Russia, US-Canada



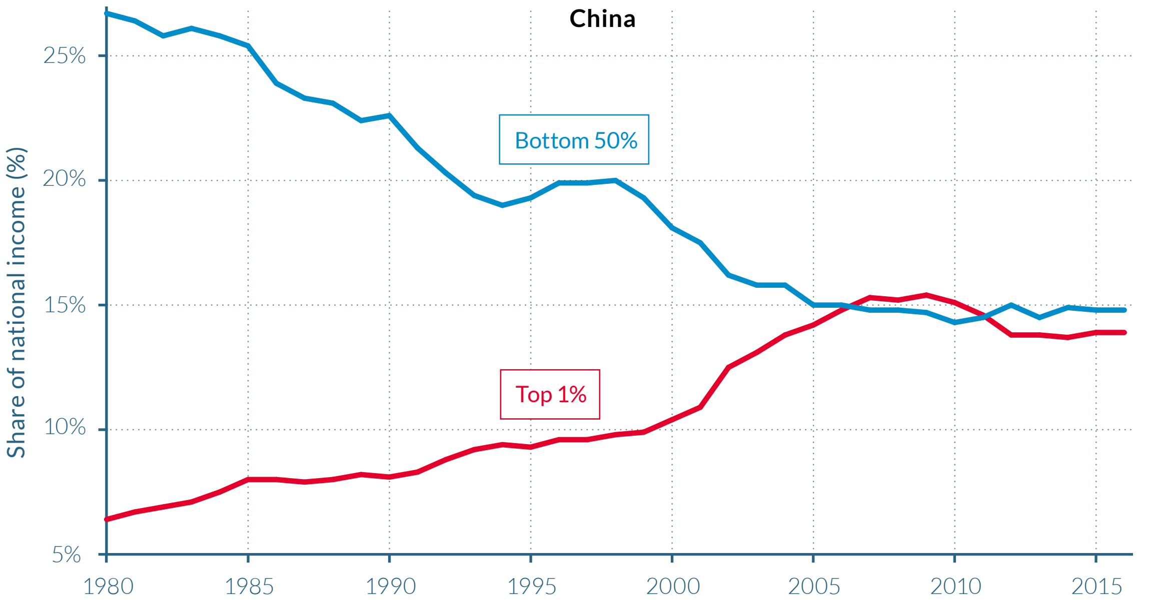
Source: WID.world (2017). See wir2018.wid.world for data series and notes.

On the horizontal axis, the world population is divided into a hundred groups of equal population size and sorted in ascending order from left to right, according to each group's income level. The Top 1% group is divided into ten groups, the richest of these groups is also divided into ten groups, and the very top group is again divided into ten groups of equal population size. The vertical axis shows the total income growth of an average individual in each group between 1980 and 2016. For percentile group p99p99.1 (the poorest 10% among the richest 1% of global earners), growth was 83% between 1980 and 2016. Income estimates account for differences in the cost of living between countries. Values are net of inflation.

This graph shows the evolution of top 1% and bottom 50% income shares in India and China. It is an example of the additional graphs which can be produced online on wid.world and which are discussed in the various methodological documents referred to in the report.

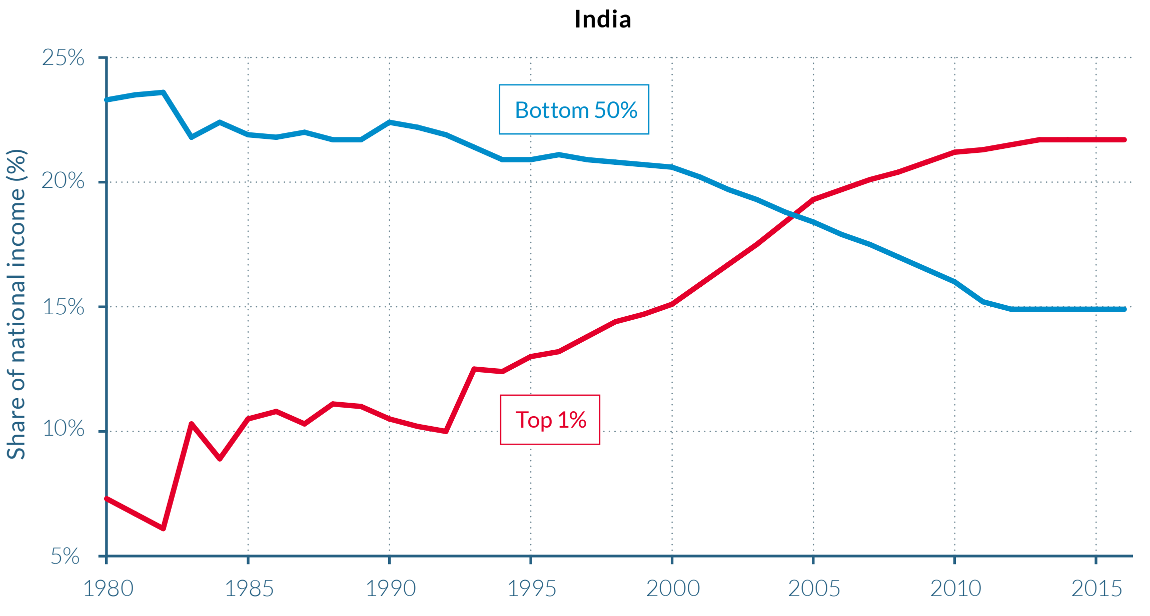
Figure A4

Top 1% vs. Bottom 50% income shares in China and India, 1980–2015



Source: WID.world (2017). See wir2018.wid.world for data series and notes.

In 2015, the Top 1% national income share was 13.9% in China.



Source: WID.world (2017). See wir2018.wid.world for data series and notes.

(/en/news/press-release/2010/04/25/world-bank-reforms-voting-power-gets-86-billion-boost.print)

WASHINGTON, April 25, 2010 – The 186 countries that own the World Bank Group today endorsed boosting its capital by more than $86 billion and giving developing countries more influence, implementing historic changes to position the poverty fighting institution for the transformed world emerging from the global crisis. Along with this first general capital increase for the World Bank for more than 20 years and shift in voting power to developing countries, the Development Committee of the Board of Governors also backed the Bank's new post-crisis strategy, and a comprehensive reform package to make the Bank faster, more flexible, and more accountable.

"We are grateful to our shareholding countries for this strong vote of confidence," said World Bank Group President **Robert B. Zoellick.** *"This extra capital can be deployed to create jobs and protect the most vulnerable through investments in infrastructure, small and medium sized enterprises, and safety nets. The change in voting-power helps us better reflect the realities of a new multi-polar global economy where developing countries are now key global players. In a period when multilateral agreements between developed and developing countries have proved elusive, this accord is all the more significant."*

The four main components of the package are:

Financial resources:

- An increase of $86.2 billion in capital for the International Bank for Reconstruction and Development (IBRD), the arm that lends to developing countries, from a general capital increase and a selective capital increase linked to the change in voting-powers; this includes $5.1 billion in paid-in capital.
- A $200 million increase in the capital of the IFC, the World Bank Group's private sector arm, as part of an increase in shares for developing and transition countries. IFC will also, subject to board approval, consider raising additional capital through issuing a hybrid bond to shareholding countries and through retaining earnings.

Voting Power:

- A 3.13 percentage point increase in the voting power of Developing and Transition countries (DTCs) at IBRD, bringing them to 47.19 percent -- a total shift to DTCs of 4.59 percentage points since 2008. This increase fulfills the Development Committee commitment in Istanbul in October 2009 to generate a significant increase of at least 3 percentage points in DTC voting power.

View More +

- The IBRD 2010 realignment will result from a selective capital increase of $27.8 billion, including paid-in capital of $1.6 billion.
  · An increase in the voting power of Developing and Transition Countries at IFC to 39.48 percent -- a total shift to DTCs of 6.07 percentage points.
- The IFC 2010 realignment will result from a selective capital increase of $200 million and increase in the basic votes for all members.
- An agreement to review IBRD and IFC shareholdings every five years with a commitment to equitable voting power between developed countries and DTCs over time.

Post-Crisis Strategy:
The Bank is sharpening its strategic focus where it can add most value, emphasizing: 1) Targeting the poor and vulnerable, especially in Sub-Saharan Africa; 2) Creating opportunities for growth with a special focus on agriculture and infrastructure; 3) Promoting global collective action on issues from climate change and trade to agriculture, food security, energy, water and health; 4) Strengthening governance and anti-corruption efforts; and, 5) Preparing for crises.

Operational Reforms:
The Bank's series of reforms represent the most comprehensive reform agenda undertaken by the institution. These include:

- A new Access to Information Policy, inspired by the Indian and U.S. freedom of information acts, which makes the Bank a world leader among multilateral institutions on information disclosure.
- The Bank's Open Data Initiative, launched last week, puts the World Bank at the forefront of giving free and easy access to information on developing countries.
- Investment lending reform that will improve the focus on results, increase speed and delivery, and strengthened risk management.
- Strengthened governance and anti-corruption efforts that will provide more resources for prevention and coordinated sanctions to fight corruption -- including the new cross-debarment agreement announced this month with multilateral development banks.

Transparency at the IMF

Transparency in economic policy and the availability of reliable data on economic and financial developments are critical for sound decision-making and for the smooth functioning of an economy. The IMF has policies in place to ensure that meaningful and accurate information—both about its own role in the global economy and the economies of its member countries—is provided in real time to its global audiences.

Transparency helps economies function better and makes them less vulnerable to crises. **Greater openness on the part of member countries** encourages more widespread public discussion and examination of policies, enhances the accountability of policymakers and the credibility of policies, and facilitates efficient and orderly functioning of financial markets. **Greater openness and clarity by the IMF** about its own policies and the advice it provides to its member countries contributes to a better understanding of the IMF's own role and operations, building traction for the Fund's policy advice and making it easier to hold the institution accountable. Outside scrutiny should also support the quality of surveillance and IMF-supported programs.

The IMF's approach to transparency is based on the overarching principle that it will strive to disclose documents and information on a timely basis unless strong and specific reasons argue against such disclosure. The principle respects the voluntary nature of publication of documents that pertain to member countries.

Publication of country documents prepared for consideration by the IMF Executive Board ("Board documents") is typically "**voluntary but presumed**," meaning that, while voluntary, the publication of these documents is encouraged. An even **stronger presumption** applies to publication of documents relating to the use of Fund resources, though their publication is voluntary**.** A member's consent to publication of a Board document is typically obtained on a non-objection basis. The publication of policy papers is presumed but it is subject to Board approval, while the publication of multi-country documents requires consent either from the Board or the involved members depending on the type of document involved.

The IMF's efforts to improve the understanding of its operations and engage more broadly with the public has been pursued along four broad lines: (i) transparency of surveillance and IMF-supported programs, (ii) transparency of its financial operations; (iii) external and internal review and evaluation; and (iv) external communications.

Transparency of surveillance and IMF-supported programs

- In recent years, the IMF's surveillance has become increasingly transparent. In 2016, 96 percent of member countries published a press release, providing the IMF Executive Board's assessment of the member's macroeconomic and financial situation, and 96 percent of members published the IMF country report.

- In 2016, 100 percent of member countries that used an IMF program published the reports, and 100 percent published their letters of intent, memoranda on economic and financial policies, and technical memoranda of understanding.

Financial and operational information about the IMF

- Members' Financial Data—timely information for every member country on its financial position with the IMF—is posted on the IMF's website.

- IMF Financial Activities (updated weekly), quarterly data on Financial Transactions, and monthly data on Financial Resources and Liquidity are posted on the IMF website.

- Other information posted about the IMF includes the Codes of Conduct for IMF staff and Executive Directors, recruitment policies, and procurement guidelines.

Internal and external evaluations of IMF practices

- IMF staff regularly conducts reviews of policies and procedures to improve the IMF's effectiveness. Recent reviews include the role of trade in the IMF's work, how to improve IMF surveillance, the effectiveness of the Financial Sector Assessment Program, and evenhandedness of IMF surveillance.

- An Independent Evaluation Office (IEO), established in July 2001, provides objective and independent evaluations of IMF policies and operations. The Office operates independently of IMF management and at arm's length from the IMF's Executive Board. The IEO's reports and work program are publicly available. Recent IEO reviews have examined the IMF's response to the financial crisis and the quality of IMF economic forecasts. Reviews are typically open and inclusive and often draw on contributions from IMF member countries, donor agencies, international organizations, and civil society organizations.

External communications

- Each year the IMF receives roughly 28,000 general queries via email and phone and about 1,060 inquiries addressed specifically to the Managing Director of the IMF. The IMF's Communications Department responds to these inquiries.

- Each month, the Fund's external website receives about 6 million page views,1.2 million visitors, and around 319,000 report downloads.

- A Civil Society Policy Forum, organized jointly with the World Bank, runs in parallel with the Annual and Spring Meetings of the IMF and World Bank, covering a wide range of topics, including many organized by civil society organizations themselves.

- IMF staff and management hold regular meetings, seminars, and consultations with civil society and other stakeholders at Fund headquarters and worldwide on specific policy or country issues. Invitations are extended by the IMF to contribute to reviews of its policies, by attending seminars or by providing comments to papers posted on its external website.

FINANCIAL STABILITY BOARD

June 2012

Charter of the Financial Stability Board[1]

Having regard to:

(1) the initial mandate given to the Financial Stability Forum by the Finance Ministers and Central Bank Governors of the Group of Seven (20 February 1999);

(2) the broadened mandate given by the Heads of State and Government of the Group of Twenty (London Summit, 2 April 2009, "*Declaration on Strengthening the Financial System*");

(3) the call of the Heads of State and Government of the Group of Twenty to re-establish the Financial Stability Board "with a stronger institutional basis and enhanced capacity" (London Summit, 2 April 2009, "*Declaration on Strengthening the Financial System*");

(4) the Financial Stability Board Charter of 25 September 2009 and the endorsement by the Heads of State and Government of the Group of Twenty of the institutional strengthening of the FSB through its Charter (Pittsburgh Summit, 25 September 2009);

(5) the affirmation by the Heads of State and Government of the Group of Twenty of the FSB's role in coordinating at the international level the work of national financial authorities and international standard setting bodies in developing and promoting the implementation of effective regulatory, supervisory and other financial sector policies in the interest of global financial stability (Seoul Summit Leaders' Declaration, 12 November 2010); and

(6) the call of the Heads of State and Government of the Group of Twenty to strengthen FSB's capacity, resources and governance through establishment of the FSB on an enduring organisational basis (Cannes Summit, 4 November 2011, Cannes Summit Final Declaration);

Recognising the need to promote financial stability by developing strong regulatory, supervisory and other financial-sector policies, and fostering a level playing field through coherent policy implementation across sectors and jurisdictions;

We, the Members of the Financial Stability Board hereby amend and restate the original Charter of 25 September 2009 in the following manner:

---

[1] This Charter, as amended and restated, was endorsed by the Heads of State and Government of the Group of Twenty at their Los Cabos Summit on 19 June 2012.

I. General provisions

Article 1. Objectives of the Financial Stability Board

The Financial Stability Board (FSB) is established to coordinate at the international level the work of national financial authorities and international standard setting bodies (SSBs) in order to develop and promote the implementation of effective regulatory, supervisory and other financial sector policies. In collaboration with the international financial institutions, the FSB will address vulnerabilities affecting financial systems in the interest of global financial stability.

Article 2. Mandate and tasks of the FSB

(1) As part of its mandate, the FSB will:

(a) assess vulnerabilities affecting the global financial system and identify and review on a timely and ongoing basis within a macroprudential perspective, the regulatory, supervisory and related actions needed to address them, and their outcomes;

(b) promote coordination and information exchange among authorities responsible for financial stability;

(c) monitor and advise on market developments and their implications for regulatory policy;

(d) advise on and monitor best practice in meeting regulatory standards;

(e) undertake joint strategic reviews of and coordinate the policy development work of the international standard setting bodies to ensure their work is timely, coordinated, focused on priorities and addressing gaps;

(f) set guidelines for and support the establishment of supervisory colleges;

(g) support contingency planning for cross-border crisis management, particularly with respect to systemically important firms;

(h) collaborate with the International Monetary Fund (IMF) to conduct Early Warning Exercises;

(i) promote member jurisdictions' implementation of agreed commitments, standards and policy recommendations through monitoring of implementation, peer review and disclosure; and

(j) undertake any other tasks agreed by its Members in the course of its activities and within the framework of this Charter.

(2) The FSB will promote and help coordinate the alignment of the activities of the SSBs to address any overlaps or gaps and clarify demarcations in light of changes in national and regional regulatory structures relating to prudential and systemic risk, market integrity and investor and consumer protection, infrastructure, as well as accounting and auditing.

(3) The FSB should, as needed to address regulatory gaps that pose risk to financial stability, develop or coordinate development of standards and principles, in collaboration with the SSBs and others, as warranted, in areas which do not fall within the functional domain of another international standard setting body, or on issues that have cross-sectoral implications.

Article 3. Consultation

(1) In the development of the FSB's medium- and long-term strategic plans, principles, standards and guidance, the FSB should consult widely amongst its Members and with other stakeholders including private sector and non-member authorities. This process shall include engaging with the FSB Regional Consultative Groups and include an outreach to countries not included in the Regional Consultative Groups.

(2) The FSB should have a structured process for public consultation on policy proposals.

Article 4. Accountability and transparency

The FSB will discharge its accountability, beyond its members, through publication of reports and, in particular, through periodical reporting of progress in its work to the Finance Ministers and Central Bank Governors of the Group of Twenty, and to Heads of State and Governments of the Group of Twenty.

II. Members

Article 5. Members

(1) The following are eligible to be a Member:

- (a) Authorities from jurisdictions responsible for maintaining financial stability, such as ministries of finance, central banks, and supervisory and regulatory authorities;
- (b) International financial institutions; and
- (c) International standard setting, regulatory, supervisory and central bank bodies.

(2) The eligibility of Members will be reviewed periodically by the Plenary in the light of the FSB objectives.

(3) Current Members of the FSB are listed in Annex A.

Article 6. Commitments of Members

(1) Member jurisdictions commit to:

- (a) pursue the maintenance of financial stability;
- (b) maintain the openness and transparency of the financial sector;

(c) implement international financial standards; and

(d) undergo periodic peer reviews, using among other evidence IMF/World Bank public Financial Sector Assessment Program reports

(e) take part in implementation monitoring of agreed commitments, standards and policy recommendations.

(2) The FSB will periodically report on the degree of adherence by the Members to these commitments and the evaluation process.

(3) In support of the mandate and tasks laid down in Article 2 (1) (e), the standard setting bodies will report to the FSB on their work without prejudice to their existing reporting arrangements or their independence. This process should not undermine the independence of the standard setting process but strengthen support for strong standard setting by providing a broader accountability framework.

(4) The international financial institutions participate as Members in the FSB in accordance with their respective legal frameworks and policies.

III. Organisation

Article 7. Structure

The organisational structure of the FSB consists of the following:

(1) the Plenary;

(2) the Steering Committee;

(3) Standing Committees;

(4) Working Groups

(5) the Regional Consultative Groups;

(6) the Chair; and

(7) the Secretariat.

Article 8. Appointment processes

Appointment processes should be open and transparent for all positions within the FSB.

The Plenary

Article 9. Responsibilities of the Plenary

(1) The Plenary is the sole decision-making body of the FSB for all matters governed by this Charter.

(2) Decisions by the Plenary shall be taken by consensus.

(3) The Plenary:

(a) decides on the manner in which the Plenary conducts its affairs;

(b) approves the work programme and the budget of the FSB;

(c) adopts reports, principles, standards, recommendations and guidance developed by the FSB;

(d) decides on Membership of the FSB;

(e) appoints the Chair;

(f) appoints the chairs of the Standing Committees and the Secretary General at the proposal of the FSB Chair;

(g) establishes Standing Committees and working groups, as necessary, and gives them their mandates;

(h) endorses the mandates of the working groups set up by the FSB Steering and Standing Committees;

(i) decides on any amendments to this Charter; and

(j) decides on any other matter governing the business and affairs of the FSB.

Article 10. Representation and attendance

(1) Representation at the Plenary shall be at the level of central bank governor or immediate deputy; head or immediate deputy of the main supervisory/regulatory agency; and deputy finance minister or deputy head of finance ministry.

Plenary representatives also include the chairs of the main SSBs and committees of central bank experts, and high-level representatives of the IMF, the World Bank, the Bank for International Settlements (BIS) and the Organisation for Economic Co-operation and Development.

(2) All Members shall be entitled to attend the Plenary Meetings. The Chair shall preside over the Plenary Meetings.

(3) The Chair can extend, after consultation with Members, ad-hoc invitations to representatives of non-FSB Members to attend the whole or part of the Plenary Meetings. In the context of specific sessions of the Plenary, the Chair can also invite, after consultation with Members, representatives of the private sector.

Article 11. Seat assignments

The number of seats in the Plenary assigned to Member jurisdictions reflects the size of the national economy, financial market activity and national financial stability arrangements of the corresponding Member jurisdiction.

The seat assignments shall be periodically reviewed in accordance with the above criteria.

Steering Committee

Article 12. Responsibilities of the Steering Committee

(1) The Steering Committee shall provide operational guidance between the Plenary meetings to carry forward the directions of the FSB and prepare the Plenary Meetings in order to allow the Plenary to efficiently fulfil its mandate.

(2) The Steering Committee may establish working groups as needed which may include representatives of non-FSB members.

(3) The duties of the Steering Committee include the following:

- (a) monitor and guide the progress of FSB's ongoing work;
- (b) promote coordination across and commission work from the Standing Committees and other working groups;
- (c) ensure effective information flow to all Members;
- (d) coordinate and conduct, jointly with the relevant SSBs, reviews of the policy development work of the international SSBs, including with regard to regulatory gaps that pose risk to financial stability.
- (e) prepare options for decision of the Plenary; and
- (f) take forward, after consultation and consistent with the directions of the Plenary, any other work necessary for the FSB to fulfil its mandate.

Article 13. Composition and appointment

(1) The composition of the Steering Committee is decided by the Plenary at the proposal of the Chair in a manner that ensures maximum effectiveness in taking forward the FSB's work while having regard to balanced representation in terms of geographic regions and institutional functions.

(2) The composition of the Steering Committee shall be reviewed periodically in accordance with the criteria set out in the previous section.

Standing Committees

Article 14. Standing Committee on Assessment of Vulnerabilities (SCAV)

The SCAV's functions are to:

(1) monitor and assess vulnerabilities affecting the global financial system and propose to the Plenary actions needed to address them

(2) monitor and advise on market and systemic developments, and their implications for regulatory policy; and

(3) provide input for the Early Warning Exercise conducted in collaboration with the IMF.

Article 15. Standing Committee on Supervisory and Regulatory Cooperation (SCSRC)

The SCSRC's functions are to:

(1) address key financial stability issues relating to the development of supervisory and regulatory policy, identify relative priorities, and seek to ensure that the different policy initiatives fit together into a coherent whole;

(2) assist in managing the coordination issues that arise among supervisors and regulators on issues that have cross-sector implications and raise any need for policy development required to close regulatory gaps that pose risk to financial stability ;

(3) set guidelines for and oversee the establishment and effective functioning of supervisory colleges; and

(4) advise on and monitor best practice in meeting regulatory standards with a view to ensure consistency, cooperation and a level playing field across jurisdictions.

Article 16. Standing Committee on Standards Implementation (SCSI)

The SCSI's functions are to:

(1) ensure comprehensive and rigorous implementation monitoring of international financial standards, agreed G20 and FSB commitments, recommendations and other initiatives in consultation and coordination with other relevant bodies, through mechanisms such as the Coordination Framework for Implementation Monitoring (CFIM);

(2) undertake peer reviews amongst its members;

(3) report to the Plenary on members' commitments and progress in implementing international financial standards, agreed G20 and FSB commitments, recommendations and other initiatives; and

(4) encourage global adherence to prudential regulatory and supervisory standards, such as through the FSB's Framework for Strengthening Adherence to International Standards.

Article 17. Standing Committee on Budget and Resources (SCBR)

The SCBR's functions are to:

(1) provide the Plenary with assessments of the resource needs of the Secretariat taking into account the current mandate, the work programme and emerging demands;

(2) review a medium-term budget and resource framework as well as annual resource budget for the FSB Secretariat, with due regard to cost control, for approval by the Plenary;

(3) identify, evaluate and recommend to the Plenary options for independent raising of resources by the FSB, over the medium term, to supplement the funding received from the BIS;

(4) ensure, through appropriate arrangements, necessary transparency in the matters of financial governance of the FSB so as to be able to withstand public scrutiny.

Article 18. Chairs and composition

(1) The chairs of the Standing Committees are selected from and appointed by the Plenary at the Chair's recommendation for terms of two years renewable once. They report to the Plenary on their work programs.

(2) Membership in Standing Committees is decided by the Plenary on the proposal of FSB Chair, drawn up in consultation with the chair of the Standing Committee with due regard to the effectiveness, balanced representation and the mandate of the respective Standing Committee. Membership is normally drawn from the designated representatives on the Plenary.

(3) A Member authority can, in consultation with the Chair, decide whether its representation in a Standing Committee is through another authority or agency of the Member jurisdiction that is not a designated FSB Member.

(4) The chairs of Standing Committees can extend ad-hoc invitations to non-members to attend the whole or part of their meetings.

Article 19. Setting up of working groups

Standing Committees may establish working groups as needed which may include representatives of non-FSB members.

Regional Consultative Groups (RCGs)

Article 20. Regional Consultative Groups

(1) The FSB Regional Consultative Groups provide a structured mechanism for:

- (a) interaction of FSB members with non-members regarding the various FSB initiatives underway and planned;
- (b) promoting implementation within the region of international financial policy initiatives; and
- (c) the regional group members to share amongst themselves and with the FSB their views on vulnerabilities affecting the financial system, on FSB initiatives and on other measures that could be taken to promote financial stability.

(2) The current Regional Consultative Groups are listed in Annex B.

Chair

Article 21. Appointment and Responsibilities

(1) The Chair is selected from representatives on the Plenary and appointed by the Plenary for a term of three years renewable once.

(2) The Chair should have recognised expertise and standing in the international financial policy arena

(3) The Chair convenes and chairs the meetings of the Plenary and of the Steering Committee. The Chair oversees the Secretariat.

(4) The Chair is the principal spokesperson for the FSB and represents the FSB externally. The Chair should be informed of all significant matters that concern the FSB.

(5) More generally, the Chair will take all decisions and act as necessary to achieve the objectives of the FSB in accordance with the directions given by the Plenary.

(6) The Chair, in the discharge of the functions as the Chair, shall owe duty entirely to the FSB and the FSB membership and to no other authorities or institutions.

Secretariat

Article 22. Secretariat

(1) The Secretariat shall be directed by the Secretary General.

(2) The Secretary General shall be appointed by the Plenary at the proposal of the Chair for a term of five years renewable.

(3) The Secretary General shall be under the responsibility, and shall act in accordance with the instructions, of the Chair. The Chair shall be responsible for providing general direction to the Secretary General, in accordance with any directions given by the Plenary.

(4) Secretariat staff shall be selected by the Secretary General following an appropriate recruitment and evaluation process.

(5) In appointing the Secretariat staff, the Secretary General shall, subject to the importance of securing the highest standards of efficiency and of technical competence and expertise in financial stability and regulatory policy areas, pay due regard to the importance of a balanced composition in terms of geographic regions and institutional functions, and of retaining institutional memory by having an adequate proportion of staff on open-ended contracts.

(6) The Secretary General and the Secretariat staff in the discharge of their functions should owe their duty entirely to the FSB and to no other authorities or institutions.

(7) The main responsibilities of the Secretariat include the following:

(a) to support the activities of the FSB, including its Committees, Regional Consultative Groups and working groups;

(b) to facilitate cooperation amongst the Members and between the FSB and other institutions;

(c) to ensure efficient communication to Members and others;

(d) to manage efficiently the financial, material and human resources allocated to the FSB (including the selection of staff who may be seconded by Members);

(e) to maintain the records, administer the website and deal with the correspondence of the FSB; and

(f) to carry out all other functions that are assigned by the Chair or the Plenary.

(8) The Secretariat shall be located in Basel at the BIS.

IV. Final provisions

Article 23. Legal Effect

This Charter is not intended to create any legal rights or obligations.

Article 24. Effective date

This Charter shall come into effect on 19 June 2012.

Annex A

List of FSB Members

(as amended on 26 March 2015)

A. Member Jurisdictions

Argentina

- Ministry of Finance
- Central Bank of Argentina

Australia

- Department of the Treasury
- Reserve Bank of Australia

Brazil

- Ministry of Finance
- Central Bank of Brazil
- Securities and Exchange Commission of Brazil

Canada

- Department of Finance
- Bank of Canada
- Office of the Superintendent of Financial Institutions (OSFI)

China

- Ministry of Finance
- People's Bank of China
- China Banking Regulatory Commission

France

- Ministry of Economy and Finance
- Bank of France
- Autorité des Marchés Financiers (AMF)

Germany

- Ministry of Finance
- Deutsche Bundesbank
- Bundesanstalt für Finanzdienstleistungsaufsicht (Bafin)

Hong Kong SAR

- Hong Kong Monetary Authority

India

- Ministry of Finance
- Reserve Bank of India
- Securities and Exchange Board of India

Indonesia

- Ministry of Finance
- Bank Indonesia

Italy

- Ministry of the Economy and Finance
- Bank of Italy
- Commissione Nazionale per le Società e la Borsa (CONSOB)

Japan

- Ministry of Finance
- Bank of Japan
- Financial Services Agency

Korea

- Bank of Korea
- Financial Services Commission

Mexico

- Ministry of Finance and Public Credit
- Bank of Mexico

Netherlands

- Ministry of Finance
- Netherlands Bank

Russia

- Ministry of Finance
- Central Bank of the Russian Federation

Saudi Arabia

- Ministry of Finance

- Saudi Arabian Monetary Agency

Singapore

- Monetary Authority of Singapore

South Africa

- Ministry of Finance
- South African Reserve Bank

Spain

- Ministry of Economy and Competitiveness
- Bank of Spain

Switzerland

- Swiss Federal Department of Finance
- Swiss National Bank

Turkey

- Undersecretariat of the Treasury
- Central Bank of the Republic of Turkey

United Kingdom

- HM Treasury
- Bank of England
- Financial Conduct Authority

United States

- Department of the Treasury
- Board of Governors of the Federal Reserve System
- Securities and Exchange Commission

European Union

- European Central Bank
- European Commission

B. International Financial Institutions

- Bank for International Settlements (BIS)
- International Monetary Fund (IMF)
- Organisation for Economic Co-operation and Development (OECD)
- World Bank

C. International Standard-Setting, Regulatory, Supervisory and Central Bank Bodies

- Basel Committee on Banking Supervision (BCBS)
- Committee on Payments and Market Infrastructures (CPMI)
- Committee on the Global Financial System (CGFS)
- International Accounting Standards Board (IASB)
- International Association of Insurance Supervisors (IAIS)
- International Organization of Securities Commissions (IOSCO)

Annex B

List of the FSB Regional Consultative Groups

(1) FSB Regional Consultative Group for the Americas

(2) FSB Regional Consultative Group for Asia

(3) FSB Regional Consultative Group for the Commonwealth of Independent States

(4) FSB Regional Consultative Group for Europe

(5) FSB Regional Consultative Group for the Middle East and North Africa

(6) FSB Regional Consultative Group for the Sub-Saharan Africa

FSB Procedural Guidelines

1 February 2013

(as amended on 21 July 2016)

Table of Contents

FSB Procedural Guidelines

Preamble

The following Procedural Guidelines (PGL) provide guidance to the Secretariat and Members to improve transparency and consistency of practice in the operational activities of the FSB under its Charter.[1] The PGL represent good practices for internal administrative purposes. They were adopted by the Plenary at its meeting on 28 January 2013 and amended on 21 July 2016.

A. Plenary Meetings

A.1 Scheduling of meetings

1. The Plenary should meet in person at least twice in a calendar year. One meeting of the Plenary per year should be held at the domicile of the FSB in Basel, Switzerland.
2. Well before the end of the year, the Plenary should develop and agree a work programme and a calendar for its meetings and tele-/video-conferences for the following year. The Secretary General should **confirm the dates** of the meetings and tele-/video-conferences as early as possible and at least **40 calendar days** ahead of the meeting date and at least **seven calendar days** ahead of the date of the tele-/video-conference.
3. The FSB Chair may decide to hold additional meetings or tele-/video-conferences if urgently needed.
4. In scheduling meetings and deciding on venues, best efforts should be made to take into account other relevant international meetings and to distribute the travel burden, including by an appropriate rotation of meeting locations.
5. The Plenary meetings and tele-/video-conferences that discuss documents to be delivered to the G20 should be held at least seven calendar days ahead of the relevant meetings of the G20 Finance Ministers and Central Bank Governors or G20 Leaders' Summit.

A.2 Agenda and meeting documents

6. The FSB Chair should draw up the provisional agenda for each meeting of the Plenary.
7. The Secretary General should **communicate the provisional agenda** for Plenary meetings and tele-/video-conferences to Member representatives as early as possible and at least **14 calendar days** in advance for meetings and at least **seven calendar days** in advance for conference calls.
8. Member representatives should have the right to propose an item for inclusion in the agenda. The FSB Chair will decide on such proposals.

[1] The PGL do not apply to Regional Consultative Groups (RCGs), which are governed by their Plenary-approved *Operational Framework* and the RCG-specific *Operational Procedures* as adopted by each RCG.

9. The **final meeting agenda and related documents** should be communicated to Member representatives by the Secretary General or the Secretariat at least **10 calendar days** in advance, and for conference calls, at least **4 calendar days** in advance, except for urgent issues for which the circulation period could be shorter. If the agenda for a conference call is long and/or complex and thus, it, in effect, replaces a meeting, the deadlines for sending the final agenda and documents to Member representatives should be the same as for a meeting.

10. The agenda should set out clearly the purpose of the discussion, name the invited lead speakers and identify documents that are to be discussed and decided upon by the Plenary, and/or to be published after the meeting.

11. Unless the FSB Chair decides otherwise, where the documents for adoption or decision are not sent according to this timeframe, the related agenda item will stand automatically postponed for the next meeting or conference call, or, if the circumstances so demand in the view of the Secretariat, be decided by written procedure.

12. The non-FSB member co-chairs of the RCGs, if invited to and attending the Plenary meetings, should receive all the Plenary documents at the same time as the Member representatives.

13. The list of documents for dispatch should specify the documents that will be shared with the RCGs **within 14 days** following the Plenary meeting, as required under the *Operational Framework of the FSB Regional Consultative Groups*. The documents for dispatch will also invite comments, if any, from Member representatives regarding the sharing of such documents with the RCGs. Objections to sharing a document with the RCGs should be conveyed to the Secretariat before the Plenary meeting to enable discussion on the objections at the meeting, and action accordingly.

A.3 Meeting summary and action points

14. The FSB Secretariat should prepare a draft summary of each meeting and conference call, containing decisions and conclusions reached as well as action points agreed and, if so requested by Member representative(s), summarising any specific minority points of view expressed by Member representative(s).

15. The **draft summaries** should be distributed to Member representatives as soon as possible but no later than **10 calendar days** after the meeting or conference call. Summaries should be reviewed or **commented upon** by Member representatives in writing **within 10 calendar days** of circulation.

16. The **final summary** should be circulated to Member representatives no later than **30 calendar days** after the meeting or conference calls and posted on e-FSB.

A.4 Written procedure

17. Members' comments on a document may be obtained through written procedure, as opposed to in-person meetings or tele-/video-conferences. Written procedure (i.e., circulation of documents to Members by the Secretariat for obtaining their written comments) should be adopted whenever judged appropriate by the Secretary General

based upon the efficient working of the FSB, if necessary, in consultation with the Member representatives.

18. Any Member representative should be able to request the discussion of a paper submitted for written procedure, if he / she deems it necessary, by notifying the Secretariat of this view prior to the deadline established by the Secretariat for sending comments. On receiving such a request from a Member representative, the Secretary General should consult the Member representative making the request, and thereafter, if necessary, consult the FSB Chair for a decision on the request.

19. The **comment period** should be no less than **10 calendar days** after circulation of documents by the Secretariat, except in case of final revisions or fatal flaw reviews, or in exceptional circumstances by decision of the FSB Chair. Fatal-flaw reviews, following a written procedure, may have a shorter comment period.

20. Requests for additional time to comment should be made to the Secretary General or the Secretariat staff concerned before the comment period has elapsed, specifying the additional time needed. If the extension is granted, the Secretary General or the Secretariat staff concerned should provide written confirmation of the additional time given.

21. In case Member representatives have not sent comments under written procedure within the time provided, or have not requested an extension of time, it will be assumed that they had no comments to offer.

22. Comments received after the deadline or after the additional time given will not be considered unless the Secretary General decides the comments can be accommodated without significant disruption to the workflow.

23. A Member representative that was unable to send comments in time would not be precluded from providing comments in subsequent meetings or conference calls if the same issue were to be on the agenda.

24. Comments received under written procedure should be made available to all Member representatives by the Secretariat either in aggregated or disaggregated form, clearly identifying where they came from.

25. If it does not appear possible to resolve Member representatives' fatal-flaw comments through written procedure, the Secretary General may propose to the Chair to convene a conference call or a meeting.

A.5 Seating arrangements

26. Where two or three authorities from the same jurisdiction are Members of the FSB and all participate in the Plenary meeting, the representative of one of these authorities should be seated at the back. The same should apply to IFIs and SSBs with two seats. Member representatives sitting at the back should have the rights of the table. Representation at the table can be changed during a meeting according to the topic discussed.

26a. It was agreed at the Tokyo Plenary meeting in March 2016 that the European Central Bank would be granted a second seat at the Plenary table to be occupied by ECB

Banking Supervision. To accommodate this special case, the member authorities from France, Germany and Italy will give up in rotation one of their two seats at the table so that at all times the three countries in total have five seats at the table and four seats at the back.

A.6 Substitute representatives of Members

27. A designated Member representative unable to attend a Plenary meeting could be substituted, for that meeting, by his or her immediate deputy. Such a substitute should have the same rights in the meeting as the designated Member representative.

A.7 Substitution of the Chair

28. The Plenary may ask a Member representative or the Secretary General to chair a part of the meeting where the Chair recuses himself/herself from that part of the meeting due to a potential or actual conflict of interest.

B. Meetings of the Steering Committee and Standing Committees

29. The Steering Committee and Standing Committees should apply the procedures of the Plenary in their respective contexts, except the timelines for circulation of documents which could be shorter than for the Plenary. In respect of the Steering Committee, the circulation timelines should be no less than half the time specified for the Plenary documents.

30. The Steering Committee should meet at least four times a calendar year and as convened by the Chair, normally well in advance of Plenary meetings.

31. Committee chairs should, to the extent possible, seek to use teleconferencing and video conferencing wherever appropriate as a substitute for meetings.

32. There should be no substitution of designated Member representatives at meetings of the Steering Committee without prior approval of the FSB Chair.

C. Establishment of Committees and Working Groups

C.1 Standing Committees

33. Standing Committees are intended as permanent bodies. The functions of the existing Standing Committees are set out in the FSB Charter.

34. Should any new Standing Committee be established, its mandate should be proposed by the FSB Chair and endorsed by the Plenary.

35. The Standing Committees should report regularly on their work to the Plenary. The reporting should include, as appropriate, oral or written reports by the chair of the Standing Committee. Written reports as well as any other reports submitted to the Plenary should be reviewed and approved by the Standing Committee through written procedure.

36. The work programme of the Standing Committees should be approved by the Plenary.

The Standing Committees should adapt their work plans to the meeting schedule of the Plenary.

37. The Plenary may decide to wind up a Standing Committee if it is satisfied that the Committee has served its purpose and its continued existence is no longer necessary.

C.2 Working Groups

38. Working Groups should apply the procedures for the Plenary in their own contexts, wherever appropriate and reasonable, except the timelines for circulation of documents, which could be shorter than for the Plenary.

39. As a general principle, these should be temporary groups, with a pre-defined term, which could be extended by the Plenary as necessary.

40. Mandates of Working Groups should be specified by the body that established them and if that is not the Plenary, also endorsed by the Plenary.

41. Mandates should be laid down in writing, specifying the objectives and tasks of the Working Group, the projected duration of its work, and its reporting chain.

42. For carrying out the Working Group's mandate, temporary work streams, with a specific mandate, reporting chain and term, may be established, upon a proposal of its chair or any of its members.

43. Working Groups should adapt their work plan to the meeting schedule of the body they report to. Where the work is conducted in conjunction with one or more standard setting bodies, the work plan should also take due account of the meeting schedule and work plan of the standard setting bodies.

44. Working Groups should report regularly on their work to the Plenary. Reporting should include, as appropriate, oral or written reports by the chair of the Working Group. Written reports should be reviewed and approved by the Working Group. The final report of the Working Group should go through written procedure before being adopted by the Working Group.

D. Selection and Appointment Processes

D.1 General

45. Selection processes for the positions of chairs and the Secretary General should be open and transparent, and should be completed before the expiry of the term of the existing incumbent(s). The FSB Chair or, in case of selection of the FSB Chair, the Nomination Committee (NC) should explain the process and outcome of the process to the Plenary.

46. The FSB Secretariat should inform Member representatives about all positions falling vacant within a reasonable period in advance, but no later than one month ahead of anticipated vacancies. Members should be invited to nominate candidates who meet the specified criteria of professional expertise and background.

47. From the nominations received, priority should be given to selecting individuals who are well qualified and competent for the position vis-à-vis the FSB's cross-sectoral and

cross-institutional functional domain. Geographical and institutional diversification may also be taken into account when deciding on appointment of chairs or the composition of FSB Committees and Working Groups.

D.2 FSB Chair

48. For the selection of the FSB Chair, the Plenary should constitute a temporary NC, composed of up to seven Member representatives (including its chair) having regard to balanced geographical and institutional representation, no later than two months before the expiry of the Chair's term. The composition of the NC should be proposed to the Plenary by the FSB Secretary General after consultation with Member representatives.

49. Members may nominate candidates for the FSB Chair, in response to the Secretariat's notification, to the NC, up to the pre-announced deadline. The NC should consult Member representatives about the nominated candidates. The FSB Chair should be appointed by the Plenary following a proposal of the NC.

D.3 Standing Committee chairs

50. After consultation with Member representatives, the FSB Chair should propose Standing Committee chairs to the Plenary from the nominations received from Members in response to the Secretariat's notification.

51. An individual should not chair simultaneously more than one Standing Committee or Working Group. The chair of a Standing Committee should not chair a Working Group established by that committee.

D.4 Working Group chairs

52. Chairs of Working Groups should be appointed by the Plenary at the recommendation of the chair of the body constituting the Working Group, in consultation with that body. Working Group chairs should normally be drawn from Member representatives on the Plenary. However, other officials of Members, officials of other authorities in Members' jurisdictions, or staff of the FSB Secretariat could also be appointed as chairs of Working Groups. In all cases, it should be ensured that the chairs of Working Groups have recognised deep expertise in the required area.

53. If the term of a Working Group extends beyond two years, its chair could be re-appointed once.

E. Composition of Committees and Working Groups

E.1 General Principles governing the composition of Committees[2]

54. The following general principles should guide the composition of the committees:

---

[2] Extracted from the FSB Chair's letter to Members of 19 July 2009.

a) All Members should be involved in some Committee – the Steering Committee and/or a Standing Committee – but not all Members can be involved in all Committees.

b) Balanced geographic and institutional representation should be ensured.

c) To ensure effectiveness of the Committees' work, the size of each Standing Committee should not be greater than 20-25 members.

E.2 Steering Committee

55. The composition of the Steering Committee should be reviewed at an interval of two years and its members should be eligible for reappointment.[3]

56. Members should be invited to participate in the Steering Committee according to their field of expertise.

E.3 Standing Committee

57. Members nominated for the Standing Committees should normally[4] be drawn from designated representatives on the Plenary. The composition of Standing Committees should be reviewed at an interval of two years and its members should be eligible for reappointment.

58. Member representatives should be invited to participate in the Standing Committees according to their field of expertise.

58a. Standing Committee representation and participation should be governed by the following principles:

a) In order to ensure consistency of participation, each member of a Standing Committee should designate an immediate deputy as his/her standing alternate who would attend meetings/conference calls in his/her absence. This alternate should be able to speak for his/her member organisation on policy matters. In exceptional circumstances, with the agreement of the Standing Committee chair, the standing alternate could be a suitable direct report who is not an immediate deputy to the Standing Committee member.

b) When neither the member nor the standing alternate can attend a meeting or call, another representative may attend the meeting/call in order that the member can be informed of the discussion. This person would be expected not to speak

c) If, for whatever reasons, neither the member nor standing alternate is able to attend three consecutive Committee meetings/calls, then that Member authority would lose its Standing Committee seat. The Member could request the seat again for consideration during the next review of the composition of the Standing Committees.

---

[3] The latest review was undertaken in January 2012 (cf. PLEN/2012/06).

[4] As noted in Article 18(3) of the FSB Charter, a Member authority can, in consultation with the Chair, decide whether its representation in a Standing Committee is through another authority or agency of the Member jurisdiction that is not a designated FSB Member. In such cases, the representative should be at a level similar to a Plenary member.

E.4 Working Groups

59. The composition of Working Groups should be decided by the chairs of the Working Groups in consultation with the chair of the body constituting the Working Group.

60. In deciding on the membership of Working Groups, the respective chairs should consider nominations received by the Secretariat, with due regard to the effectiveness, balanced representation and mandate of the Working Group.

61. The membership should normally be drawn from Members. The membership could also be drawn from other authorities of Members' jurisdictions or from non-FSB Members, having regard to their expertise and the mandate of the Working Group.

F. Staffing of Secretariat

62. The composition of the FSB Secretariat should reflect the diversity of FSB's membership in terms of institutional functions and geographic regions.

63. Appointments should be given to well qualified, competent and highly motivated individuals, having due regard to the highest standards of efficiency and FSB's cross-sectoral and cross-institutional nature.

64. Secretariat positions should be a suitable mix of open-ended and fixed-term positions as well as short-term secondments from Members.

65. Member representatives should be informed about vacancies in the Secretariat, including that of the Secretary General, and be invited to nominate suitable candidates for the positions. Vacancies may also be advertised publicly.

66. The vacancy notice should contain a description of the primary responsibilities and eligibility criteria for the position, including expected professional expertise, educational background and practical experience required of the candidates, also indicating an appropriate response time.

G. Distribution of Documents

67. The agenda and meeting documents should be distributed by e-mail and simultaneously posted on the secure e-FSB website. Sensitive documents should be posted on e-FSB, with notification sent by e-mail.

68. The documents should contain a document number, based on a document numbering system adopted by the Secretariat, to uniquely identify all documents sent to the Plenary, Committees and Working Groups.

69. The timelines for circulation of documents are tabulated in the Annex.

H. Confidentiality

H.1 Data and information sharing

70. All non-public data and information shared by Members within the FSB should be treated with due confidentiality and not be disclosed to third parties, except in cases where its disclosure is compelled by law or necessitated under respective legal frameworks applicable to Members, or referred to in any publication or external research without prior written consent of the parties providing the data or information.

71. Members and their staff, and Secretariat staff,[5] should exercise all due care and caution and take all reasonable measures to prevent access to information and data by unauthorised persons and prevent any accidental loss or disclosure of such information and data.

72. Discussions in the FSB Plenary, Steering Committee, Standing Committees and Working Groups are on a confidential basis. It is the duty of the Member representatives to protect the confidentiality of discussions and the views of individual members.

H.2 Access to documents

73. The documents of the Plenary and Committees should be made accessible to Member representatives through a secure e-FSB website, unless decided otherwise in case of specific documents.

74. The members of each Committee and Working Group have individual access to a dedicated and secure e-FSB sub-page for that Committee or Working Group where all documents pertaining to that Committee or Working Group should be posted.

75. The members of the RCGs have individual access to a dedicated and secure e-FSB sub-page for the RCGs and also to the dedicated sub-page of their respective RCGs.

76. The staff of the Secretariat should have individual access to all e-FSB sub-pages, except those which are made accessible only to the staff governed by a subject-specific confidentiality agreement(s) signed by them.

77. The e-FSB website should include information on upcoming meetings and conference calls, current work streams, and memberships of committees and working groups, and Secretariat contact information.

78. Plenary documents will be shared with RCGs, as described in paragraphs 12 and 13.

H.3 Public disclosure

79. Members should identify in documents to be published, any confidential or market sensitive information that they request should not be published and inform the Secretariat accordingly. The Secretariat should take due care that such information as agreed by the Plenary is removed from the documents before their publication.

---

[5] The duty of confidentiality of Secretariat staff with respect to all non-public information, be it oral or written, or stored using electronic media, are governed by the BIS Code of Conduct which forms part of the general employment conditions.

80. The Secretariat should prepare press releases on Plenary meetings and separate press statements on important policy decisions for Plenary approval. Whenever possible, the draft press releases on policy decisions placed for Plenary approval should be circulated to the Plenary ahead of the meeting.

81. Meeting summaries and the associated list of action points should not be published.

I. Public Consultations

82. The Plenary may decide to conduct a public consultation in order to seek input from interested parties and the public on specific issues or policy proposals. The following process should be adopted for public consultation:

a) An invitation to provide written comments and/or a dedicated press release inviting written comments should be published on the FSB website.

b) Invitation should specify the consultation period, which should, other than in exceptional circumstances, be **no less than 30 days** and state that responses received will be published on the FSB website unless requested otherwise by the respondents.

c) The responses received should be published on the FSB's website within **not later than 15 calendar days** from the close of the consultation period.

83. The FSB may also convene roundtables, hearings and other events to gather input from various stakeholders.

J. Audited financial statements

84. The annual audited financial statements of the FSB should be circulated to the Plenary for approval no less than 30 days ahead of the Plenary meeting at which the statements are to be approved.

Annex: Plenary timeframes

No.	Action	Time period
1.	Issuance of notification[6]	
(a)	for meetings	At least **40 calendar days** ahead of the meeting date
(b)	for conference calls	At least **7 calendar days** ahead of the conference call date
2.	Circulation of provisional agenda	
(a)	for meetings	At least **14 calendar days** ahead of the meeting date
(b)	for conference calls	At least **7 calendar days** ahead of the conference call date
3.	Circulation of final agenda and documents	
(a)	for meetings	At least **10 calendar days** ahead of the meeting date, except for urgent issues for which the circulation period could be shorter
(b)	for conference calls	At least **4 calendar days** ahead of the conference call date, except for urgent issues for which the circulation period could be shorter
4.	Circulation of draft summaries of meetings/conference calls	No later than **10 calendar days** after the meeting/conference call
5.	Commenting on summaries	Within **10 calendar days** of circulation
6.	Circulation of final summaries of meetings/conference calls	No later than **30 calendar days** after the meeting/conference call
7.	Commenting on other documents	No less than **10 calendar days** after circulation of documents, except for fatal-flaw reviews

Note: The timeframes for circulation of Steering Committee documents should be no less than half the time specified above for the Plenary documents (cf. PGL 29, page 4).

[6] Cf. PGL 3.

INTERNATIONAL MONETARY FUND

January 2018

KEY TRENDS IN IMPLEMENTING THE FUND'S TRANSPARENCY POLICY

IMF staff regularly produces papers proposing new IMF policies, exploring options for reform, or reviewing existing IMF policies and operations. The Report prepared by IMF staff and completed on December 6, 2017 has been released.

The staff report was issued to the Executive Board for information. The report was prepared by IMF staff. The views expressed in this paper are those of the IMF staff and do not necessarily represent the views of the IMF's Executive Board.

The IMF's transparency policy allows for the deletion of market-sensitive information and premature disclosure of the authorities' policy intentions in published staff reports and other documents.

Electronic copies of IMF Policy Papers
are available to the public from

KEY TRENDS IN IMPLEMENTING THE FUND'S TRANSPARENCY POLICY

Approved By
Martin Mühleisen

Prepared by Strategy, Policy, and Review Department

CONTENTS

List of Abbreviations

AML-CFT	Anti-Money Laundering and Combating the Financing of Terrorism
DSA	Debt Sustainability Analysis
EFF	Extended Fund Facility
EPA	Ex-Post Assessment
EPE	Ex-Post Evaluation
FATF	Financial Action Task Force
FCL	Flexible Credit Line
FSRB	FATF-Style Regional Bodies
FSSA	Financial System Stability Assessment
HIPC	Heavily Indebted Poor Countries
LOI	Letter of Intent
MEFP	Memorandum on Economic and Financial Policy
PIN	Public Information Notice
PLL	Precautionary and Liquidity Line
PPM	Post-Program Monitoring
PRS	Poverty Reduction Strategy
PSI	Policy Support Instrument
ROSC	Report on Observance of Standards and Codes
SBA	Stand-By Arrangement
SCF	Standby Credit Facility
SMP	Staff-Monitored Program
TMU	Technical Memorandum of Understanding
UFR	Use of Fund Resources

At the time of the 2005 *Review of the Fund's Transparency Policy*, the Executive Board requested regular updates on trends in implementing the transparency policy. The tables in this report provide an overview of recent developments, reflecting information on documents considered by the Board in 2014 and updating the previous annual report on *Key Trends*. Deeper analysis of these trends is undertaken in the context of periodic reviews of the Fund's Transparency Policy.

Table 1. Trends in Publication Rates (2014–16) 1/2/

Type of Report	2014 Reports discussed	2014 Published (percent)	2015 Reports discussed	2015 Published (percent)	2016 Reports discussed	2016 Published (percent)
All Documents	984	93	922	92	913	92
Staff Reports	220	93	217	94	201	96
Article IV, UFR, or Combined	193	93	188	94	186	96
Stand-alone Article IV 3/	112	92	113	92	115	95
Article IV combined with UFR, PPM, SMP, EPA, PSI	20	90	14	100	17	94
Stand-alone UFR	61	97	61	95	54	100
Stand-alone PPM, SMP, EPA, EPE, PSI	22	95	27	93	15	93
Joint Staff Advisory Note	5	60	1	100	0	n/a
HIPC Country Papers	0	n/a	1	100	0	n/a
Selected Issues/Statistical Annexes	78	90	84	90	93	89
FSSAs	10	70	9	78	12	92
ROSCs 4/	32	72	20	90	25	80
Article IV Press Releases	108	92	102	98	120	96
UFR and PSI Chairman's statements	92	99	80	95	53	100
Authorities' statements 5/	151	99	149	95	165	100
Country Policy Intention Documents	218	96	182	91	170	100
LOIs/MEFPs 6/	134	97	118	93	114	100
TMUs 6/	74	99	56	93	56	100
PRS documents	10	70	8	50	0	n/a
All Policy Papers	75	84	79	80	74	78
Policy Papers that are presumed to be published 7/	66	95	68	93	62	94

1/ Refers to documents considered by the IMF Executive Board during the calendar year, and published within six months of the end of the calendar year; e.g. the publication rate for 2016 refers to documents discussed by the Board in 2016 and published by June 30, 2017.

2/ Data include documents issued for the Board's consideration in a meeting or on a lapse-of-time basis. SMPs, which are for information only, are also included.

3/ Includes discussions held with members' territories and currency unions in the context of Article IV consultations with their constituent members.

4/ Includes initial ROSC assessments and reassessments produced by the IMF, as well as the World Bank and, in the case of AML/CFT ROSCs, by FATF and FATF-style regional bodies (FSRB), issued on a stand-alone basis or in FSSAs. Does not include assessments under detailed standards assessments.

5/ Does not include authorities' statements that are included in ROSCs. Includes Executive Directors' Statements and "right of reply" documents.

6/ Includes LOIs/MEFPs and TMUs issued in the context of SMPs and PSIs.

7/ The presumption of publication does not apply to certain papers dealing with administrative matters, for instance internal audits and papers on personnel and human resource issues.

Table 2. Trends in Publication Rates of Article IV and UFR Staff Reports (2014–16)[1/]

(By economic and regional characteristics)

	2014		2015		2016	
Reports by group [2/]	Reports discussed	Published (percent)	Reports discussed	Published (percent)	Reports discussed	Published (percent)
Article IV, UFR and combined staff reports [3/]	193	93	188	94	186	96
Advanced markets	39	100	30	100	34	100
Emerging markets	88	91	81	94	91	92
Developing countries	66	92	77	91	61	100
Emerging market and developing countries [3/]	154	92	158	92	152	95

UFR and PSI Chairman's statements	91	19	13	8	76	5	4	1	53	0	0	0
Country Policy Intention Documents [5/]	210	21	6	3	166	2	11	0	170	14	7	6
Policy papers [6/]	63	24	1	1	63	23	2	1	58	20	2	1

1/ Refers to documents considered by the IMF Executive Board during the calendar year, and published within six months of the end of the calendar year; e.g. the publication rate for 2016 refers to the documents discussed by the Board in 2016 and published by June 30, 2017.

2/ Data include documents issued for the Board's consideration in a meeting or on a lapse-of-time basis. It also includes SMPs, which are for information only.

3/ Based on World Economic Outlook definitions, including the new definition of Low-Income Developing Countries established in 2014 (http://www.imf.org/external/np/pp/eng/2014/060314.pdf). Also includes discussions held with members' territories and currency unions in the context of Article IV consultations with their constituent members.

4/ Number of calendar days.

5/ Includes LOIs/MEFPs/TMUs issued in the context of SMPs and PSIs.

6/ Only includes policy papers for which publication is presumed.

Table 4a. Deletions in Article IV and UFR Staff Reports (2014–16) [1/ 2/]

(Percent of all published reports, unless otherwise indicated)

	2014				2015				2016			
Reports by group [3/]	Number published	With deletions	With deletions on exch. rate issues	With deletions on fin. sector issues	Number published	With deletions	With deletions on exch. rate issues	With deletions on fin. sector issues	Number published	With deletions	With deletions on exch. rate issues	With deletions on fin. sector issues
All Article IV and UFR reports	180	19	6	7	176	11	4	7	179	12	4	7
Advanced markets	39	23	0	8	30	13	3	10	34	12	3	12
EU	26	12	0	4	18	11	0	11	22	18	5	18
Other Europe	3	0	0	0	4	50	25	25	4	0	0	0
ROW	10	60	0	20	7	0	0	0	7	0	0	0
Emerging markets	80	26	11	11	76	16	7	11	84	19	6	10
Developing countries	61	8	2	0	70	4	1	3	61	2	2	0
Emerging market and developing countries	141	18	7	6	147	10	4	7	145	12	4	6
Africa	45	9	0	2	49	2	0	2	44	2	0	2
Asia	24	21	4	0	26	8	4	8	27	7	7	0
Central and Eastern Europe	13	15	0	0	16	6	0	6	17	12	0	12
CIS and Mongolia	12	58	42	33	10	30	10	20	9	22	22	11
Middle East	19	16	5	0	18	11	11	6	12	33	17	8
Western Hemisphere	28	32	11	14	28	21	7	11	36	17	3	8

1/ Refers to documents considered by the Board during the calendar year, and published within six months of the end of the calendar year; e.g. the publication rate for 2016 refers to the documents discussed by the Board in 2016 and published by June 30, 2017.

2/ Because a single report can have deletions falling into multiple categories, e.g., exchange rate, financial sector and/or other areas, there is no fixed relationship between the second column and the third and fourth column under each year.

3/ Based on World Economic Outlook definitions. Also includes discussions held with members' territories and currency unions in the context of Article IV consultations with their constituent members.

Table 4b. Deletions in 2016[1/]

(Percent of all deletions requested by income group and region, unless otherwise indicated)

Reports by group [2/]	Number of deletion requests [3/]	Approved	*Of which*: Partially rejected[4/]	Rejected	Rejected, but subsequently approved by management	Reason deletion requests were rejected[5/6/]: Information is already in the public domain	Information is sufficiently general not to trigger market disruption in near term	Inclusion of information in Staff report does not impede ability to implement new policy	Other
All Article IV, UFR and combined reports	66	70	27	30	0	8	12	3	8
Advanced markets	14	64	14	36	0	14	14	0	7
EU	12	75	17	25	0	0	17	0	8
Other Europe	1	0	0	100	0	100	0	0	0
ROW	1	0	0	100	0	0	0	0	0
Emerging markets	50	72	30	28	0	6	10	4	8
Developing countries	2	50	50	50	0	0	50	0	0
Emerging market and developing countries									
Africa	1	100	100	0	0	0	0	0	0
Asia	3	67	67	33	0	0	0	0	33
Central and Eastern Europe	4	50	25	50	0	50	0	0	0
CIS and Mongolia	6	67	50	33	0	0	0	0	33
Middle East	22	82	23	18	0	0	9	9	0
Western Hemisphere	16	63	25	38	0	6	25	0	6
Countries with fixed or crawling pegs or bands	36	69	31	31	0	6	17	6	3
Countries with other exchange rate regimes	24	63	29	38	0	13	8	0	17

1/ Figures refer to deletions made to staff reports for Article IV consultations and use of Fund resources that went before the Board from January 1, 2016 to December 31, 2016.

2/ Based on *World Economic Outlook* definitions. Also includes discussions held with members' territories and currency unions in the context of Article IV consultations with their constituent members.

3/ This aggregate includes deletion requests received by country desks and reviewed by SPR; it does not include requests received and rejected by country teams that were not forwarded to SPR for review. Each deletion is counted separately, implying that there may be multiple deletion requests for each document.

4/ Partially rejected deletions include items where only part of the requested deletion was accepted or where the deletion was reformulated and then accepted.

5/ Deletions may be made on the basis of market sensitivity when the material is not already in the public domain, is market-relevant within the near term, and is sufficiently specific to create a clear risk of triggering a disruptive market reaction if disclosed.

6/ Deletions may be made on the basis of premature disclosure of policy intentions where material is not already in the public domain, the information consists of operational details of a policy the authorities intend to implement, and premature disclosure of the operational details would, in itself, seriously undermine the ability of the authorities to implement it.

Table 5a. Corrections in Article IV and UFR Staff Reports (2014-16)[1/ 2/]

(Percent of all published reports, unless otherwise indicated)

	2014				2015				2016

Western Hemisphere	329	89	13	11	0	1	5	4	0	0
Countries with fixed or crawling pegs or bands	537	88	17	12	0	1	5	4	0	1
Countries with other exchange rate regimes	753	92	11	8	0	0	3	4	0	0

1/ Figures refer to corrections made to staff reports for Article IV consultations and use of Fund resources that went before the Board from January 1, 2016 to December 31, 2016.
2/ Certain corrections are subject to Staff review as per the Transparency Policy (http://www.imf.org/external/np/pp/eng/2009/102609.pdf) and the 2013 Transparency Policy Review (http://www.imf.org/external/np/pp/eng/2013/051413.pdf). As per the policy, corrections to staff reports cannot be used to improve the presentation, extend staff's or the authorities arguments, alter staff's assessment, or introduce any new information.
3/ Based on World Economic Outlook definitions. Also includes discussions held with members' territories and currency unions in the context of Article IV consultations with their constituent members.
4/ This aggregate includes correction requests received by country desks and reviewed by SPR; it does not include requests received and rejected by country teams that were not forwarded to SPR for review. Each correction is counted separately, implying that there may be multiple correction requests for each document.
5/ Partially rejected corrections include items where the requested correction was reclassified or reformulated and then accepted.
6/ Corrections may only be made after the Board date if the correction is brought to the attention of the Board before the conclusion of the Board’s consideration of the document, or the failure to make the correction would undermine the overall value of the publication.

Finland	Nicaragua	
France	Niger	
Gabon	Nigeria	
Germany	Norway	
Ghana	Pakistan	
Grenada	Palau	
Guatemala	Panama	

1/ Includes discussions held with members' territories and currency unions in the context of Article IV consultations with their constituent members.

2/ The members listed in this table had published all their Article IV and/or all their UFR staff reports considered by the Board in 2016, by June 30, 2017.

3/ Member countries who published some of their Article IV/UFR staff reports in 2016 are Ecuador and Suriname.

4/ This list does not reflect the 43 members and members' territories that did not have an Article IV or UFR document considered by the Board in 2016: Angola , Aruba, Australia, Benin, Burundi, Cameroon, Congo (Democratic Republic of) Congo (Republic of), Djibouti, Eritrea, Estonia, Gambia, Greece, Iran, Israel, Kazakhstan, Kuwait, Laos, Libya, Macao SAR, Micronesia, Mongolia, Mozambique, Myanmar, Nauru, Nepal, Qatar, Rwanda, Samoa, Seychelles, Somalia, South Sudan, Spain, Swaziland, Syria, Tajikistan, Togo, Turkmenistan, Uganda, Uzbekistan, Venezuela, Yemen, and Zambia.

Table 7(a) Members Not Publishing Article IV Reports in 2016 [1/2]

Antigua and Barbuda
Bahrain
Brunei Darussalam
Ecuador
Georgia
Oman
Suriname

1/ These member countries had Article IV documents considered by the Board in 2016 (including for discussions with currency unions in the context of Article IV consultations with their constituent members), but had not published these documents by June 30, 2017.
2/ All these countries published Press Releases except Antigua and Barbuda, Ecuador, Georgia, and Oman.

Table 7(b) Members Not Publishing All UFR Staff Reports in 2016[1/]

None

1/ These member countries had UFR staff reports considered by the Board in 2016, but had not published all of these documents by June 30, 2017.

Table 8. Longest and Shortest Publication Lags for 2016 1/ 2/ 3/

Shortest Publication Lag			Longest Publication Lag

1/ Under the Fund's Transparency Policy, a member country's consent to publish is typically obtained on a "non-objection" basis. However, a member may "opt out" of the "non-objection" system, in which case the member's explicit consent is required prior to publication of its country and related policy intention documents. See: http://www.imf.org/external/np/pp/eng/2014/040714.pdf.

G20 Leaders' Communiqué
Brisbane Summit, 15-16 November 2014

1. Raising global growth to deliver better living standards and quality jobs for people across the world is our highest priority. We welcome stronger growth in some key economies. But the global recovery is slow, uneven and not delivering the jobs needed. The global economy is being held back by a shortfall in demand, while addressing supply constraints is key to lifting potential growth. Risks persist, including in financial markets and from geopolitical tensions. We commit to work in partnership to lift growth, boost economic resilience and strengthen global institutions.

2. We are determined to overcome these challenges and step up our efforts to achieve strong, sustainable and balanced growth, and to create jobs. We are implementing structural reforms to lift growth and private sector activity, recognising that well-functioning markets underpin prosperity. We will ensure our macroeconomic policies are appropriate to support growth, strengthen demand and promote global rebalancing. We will continue to implement fiscal strategies flexibly, taking into account near-term economic conditions, while putting debt as a share of GDP on a sustainable path. Our monetary authorities have committed to support the recovery and address deflationary pressures when needed, consistent with their mandates. We will be mindful of the global impacts of our policies and cooperate to manage spillovers. We stand ready to use all policy levers to underpin confidence and the recovery.

3. This year we set an ambitious goal to lift the G20's GDP by at least an additional two per cent by 2018. Analysis by the IMF-OECD indicates that our commitments, if fully implemented, will deliver 2.1 per cent. This will add more than US$2 trillion to the global economy and create millions of jobs. Our measures to lift investment, increase trade and competition, and boost employment, along with our macroeconomic policies, will support development and inclusive growth, and help to reduce inequality and poverty.

4. Our actions to boost growth and create quality jobs are set out in the Brisbane Action Plan and in our comprehensive growth strategies. We will monitor and hold each other to account for implementing our commitments, and actual progress towards our growth ambition, informed by analysis from international organisations. We will ensure our growth strategies continue to deliver and will review progress at our next meeting.

Acting together to lift growth and create jobs

5. Tackling global investment and infrastructure shortfalls is crucial to lifting growth, job creation and productivity. We endorse the Global Infrastructure Initiative, a multi-year work programme to lift quality public and private infrastructure investment. Our growth strategies contain major investment initiatives, including actions to strengthen public investment and improve our domestic investment and financing climate, which is essential to attract new private sector finance for investment. We have agreed on a set of voluntary leading practices to promote and prioritise quality investment, particularly in infrastructure. To help match investors with projects, we will address data gaps and improve information on project pipelines. We are working to facilitate long-term financing from institutional investors and to encourage market sources of finance, including transparent securitisation, particularly for small and medium-sized enterprises. We will continue to work with multilateral development banks, and encourage national development banks, to optimise use of their balance sheets to provide additional lending and ensure our work on infrastructure benefits low-income countries.

6. To support implementation of the Initiative, we agree to establish a Global Infrastructure Hub with a four-year mandate. The Hub will contribute to developing a knowledge-sharing platform and network between governments, the private sector, development banks and other international organisations. The Hub will foster collaboration among these groups to improve the functioning and financing of infrastructure markets.

7. To strengthen infrastructure and attract more private sector investment in developing countries, we welcome the launch of the World Bank Group's Global Infrastructure Facility, which will complement our work. We support similar initiatives by other development banks and continued cooperation amongst them.

8. Trade and competition are powerful drivers of growth, increased living standards and job creation. In today's world we don't just trade final products. We work together to make things by importing and exporting components and services. We need policies that take full advantage of global value chains and

encourage greater participation and value addition by developing countries. Our growth strategies include reforms to facilitate trade by lowering costs, streamlining customs procedures, reducing regulatory burdens and strengthening trade-enabling services. We are promoting competition, entrepreneurship and innovation, including by lowering barriers to new business entrants and investment. We reaffirm our longstanding standstill and rollback commitments to resist protectionism.

9. Our actions to increase investment, trade and competition will deliver quality jobs. But we must do more to address unemployment, raise participation and create quality jobs. We agree to the goal of reducing the gap in participation rates between men and women in our countries by 25 per cent by 2025, taking into account national circumstances, to bring more than 100 million women into the labour force, significantly increase global growth and reduce poverty and inequality.

10. We are strongly committed to reducing youth unemployment, which is unacceptably high, by acting to ensure young people are in education, training or employment. Our Employment Plans include investments in apprenticeships, education and training, and incentives for hiring young people and encouraging entrepreneurship. We remain focussed on addressing informality, as well as structural and long-term unemployment, by strengthening labour markets and having appropriate social protection systems. Improving workplace safety and health is a priority. We ask our labour and employment ministers, supported by an Employment Working Group, to report to us in 2015.

11. We are committed to poverty eradication and development, and to ensure our actions contribute to inclusive and sustainable growth in low-income and developing countries. We commit to take strong practical measures to reduce the global average cost of transferring remittances to five per cent and to enhance financial inclusion as a priority. The G20 Food Security and Nutrition Framework will strengthen growth by lifting investment in food systems, raising productivity to expand food supply, and increasing incomes and quality jobs. We support efforts in the United Nations to agree an ambitious post-2015 development agenda. The G20 will contribute by strengthening economic growth and resilience.

Building a stronger, more resilient global economy

12. Strengthening the resilience of the global economy and stability of the financial system are crucial to sustaining growth and development. We have delivered key aspects of the core commitments we made in response to the financial crisis. Our reforms to improve banks' capital and liquidity positions and to make derivatives markets safer will reduce risks in the financial system. We welcome the Financial Stability Board (FSB) proposal as set out in the Annex requiring global systemically important banks to hold additional loss absorbing capacity that would further protect taxpayers if these banks fail. Progress has been made in delivering the shadow banking framework and we endorse an updated roadmap for further work. We have agreed to measures to dampen risk channels between banks and non-banks. But critical work remains to build a stronger, more resilient financial system. The task now is to finalise remaining elements of our policy framework and fully implement agreed financial regulatory reforms, while remaining alert to new risks. We call on regulatory authorities to make further concrete progress in swiftly implementing the agreed G20 derivatives reforms. We encourage jurisdictions to defer to each other when it is justified, in line with the St Petersburg Declaration. We welcome the FSB's plans to report on the implementation and effects of these reforms, and the FSB's future priorities. We welcome the progress made to strengthen the orderliness and predictability of the sovereign debt restructuring process.

13. We are taking actions to ensure the fairness of the international tax system and to secure countries' revenue bases. Profits should be taxed where economic activities deriving the profits are performed and where value is created. We welcome the significant progress on the G20/OECD Base Erosion and Profit Shifting (BEPS) Action Plan to modernise international tax rules. We are committed to finalising this work in 2015, including transparency of taxpayer-specific rulings found to constitute harmful tax practices. We welcome progress being made on taxation of patent boxes. To prevent cross-border tax evasion, we endorse the global Common Reporting Standard for the automatic exchange of tax information (AEOI) on a reciprocal basis. We will begin to exchange information automatically with each other and with other countries by 2017 or end-2018, subject to completing necessary legislative procedures. We welcome financial centres' commitments to do the same and call on all to join us. We welcome deeper engagement of developing countries in the BEPS project to address their concerns. We will work with them to build their tax administration capacity and implement AEOI. We welcome further collaboration by our tax authorities on cross-border compliance activities.

14. We endorse the 2015-16 G20 Anti-Corruption Action Plan that will support growth and resilience. Our actions are building cooperation and networks, including to enhance mutual legal assistance, recovery of

the proceeds of corruption and denial of safe haven to corrupt officials. We commit to improve the transparency of the public and private sectors, and of beneficial ownership by implementing the G20 High-Level Principles on Beneficial Ownership Transparency.

Strengthening global institutions

15. The G20 must be at the forefront in helping to address key global economic challenges. Global economic institutions need to be effective and representative, and to reflect the changing world economy. We welcome the increased representation of emerging economies on the FSB and other actions to maintain its effectiveness. We are committed to maintaining a strong, quota-based and adequately resourced International Monetary Fund (IMF). We reaffirm our commitment in St Petersburg and in this light we are deeply disappointed with the continued delay in progressing the IMF quota and governance reforms agreed in 2010 and the 15th General Review of Quotas, including a new quota formula. The implementation of the 2010 reforms remains our highest priority for the IMF and we urge the United States to ratify them. If this does not happen by year-end, we ask the IMF to build on its existing work and stand ready with options for next steps.

16. We need a strong trading system in an open global economy to drive growth and generate jobs. To help business make best use of trade agreements, we will work to ensure our bilateral, regional and plurilateral agreements complement one another, are transparent and contribute to a stronger multilateral trading system under World Trade Organization (WTO) rules. These rules remain the backbone of the global trading system that has delivered economic prosperity. A robust and effective WTO that responds to current and future challenges is essential. We welcome the breakthrough between the United States and India that will help the full and prompt implementation of the Trade Facilitation Agreement and includes provisions on food security. We commit to implement all elements of the Bali package and to swiftly define a WTO work programme on the remaining issues of the Doha Development Agenda to get negotiations back on track. This will be important to restore trust and confidence in the multilateral trading system. We agreed to discuss ways to make the system work better when we meet next year. We will continue to provide aid-for-trade to developing countries in need of assistance.

17. Increased collaboration on energy is a priority. Global energy markets are undergoing significant transformation. Strong and resilient energy markets are critical to economic growth. Today we endorse the G20 Principles on Energy Collaboration. We ask our energy ministers to meet and report to us in 2015 on options to take this work forward. Gas is an increasingly important energy source and we will work to improve the functioning of gas markets.

18. Improving energy efficiency is a cost-effective way to help address the rising demands of sustainable growth and development, as well as energy access and security. It reduces costs for businesses and households. We have agreed an Action Plan for Voluntary Collaboration on Energy Efficiency, including new work on the efficiency and emissions performance of vehicles, particularly heavy duty vehicles; networked devices; buildings; industrial processes; and electricity generation; as well as work on financing for energy efficiency. We reaffirm our commitment to rationalise and phase out inefficient fossil fuel subsidies that encourage wasteful consumption, recognising the need to support the poor.

19. We support strong and effective action to address climate change. Consistent with the United Nations Framework Convention on Climate Change (UNFCCC) and its agreed outcomes, our actions will support sustainable development, economic growth, and certainty for business and investment. We will work together to adopt successfully a protocol, another legal instrument or an agreed outcome with legal force under the UNFCCC that is applicable to all parties at the 21st Conference of the Parties (COP21) in Paris in 2015. We encourage parties that are ready to communicate their intended nationally determined contributions well in advance of COP21 (by the first quarter of 2015 for those parties ready to do so). We reaffirm our support for mobilising finance for adaptation and mitigation, such as the Green Climate Fund.

20. We are deeply concerned with the humanitarian and economic impact of the Ebola outbreak in Guinea, Liberia and Sierra Leone. We support the urgent coordinated international response and have committed to do all we can to contain and respond to this crisis. We call on international financial institutions to assist affected countries in dealing with the economic impacts of this and other humanitarian crises, including in the Middle East.

21. We remain resolute in our commitment to lift economic growth, support job creation, promote development and build global confidence. We thank Australia for its leadership this year. We look forward to working together in 2015 under Turkey's presidency and to discussing progress at our next meeting in Antalya on 15-16 November 2015. We also look forward to meeting in China in 2016.

Annex

Agreed documents

The following documents agreed by the G20 support our communiqué:

- Brisbane Action Plan, November 2014
- G20 Note on the Global Infrastructure Initiative and Hub, November 2014
- 2014 Financial Inclusion Action Plan, November 2014
- G20 Plan to Facilitate Remittance Flows, November 2014
- G20 Food Security and Nutrition Framework, November 2014
- Development Working Group Accountability Framework, November 2014
- 2015-16 G20 Anti-Corruption Action Plan, November 2014
- G20 High-Level Principles on Beneficial Ownership Transparency, November 2014
- G20 Principles on Energy Collaboration, November 2014
- G20 Energy Efficiency Action Plan, November 2014
- The 2015 G20 Accountability Assessment Process, November 2014
- 2014 Accountability Assessment Report, November 2014

Ministerial statements

- Communiqué, Meeting of G20 Finance Ministers and Central Bank Governors, Cairns, 20-21 September 2014
- G20 Labour and Employment Ministerial Declaration, Melbourne, 10-11 September 2014, including G20 Statement on Safer and Healthier Workplaces
- Chairman's Summary, Meeting of G20 Trade Ministers, Sydney, 29 July 2014
- Communiqué, Meeting of G20 Finance Ministers and Central Bank Governors, Washington DC, 10-11 April 2014
- Communiqué, Meeting of G20 Finance Ministers and Central Bank Governors, Sydney, 22-23 February 2014

Supporting documents

We welcome the delivery of the following documents:

- G20 Members' Comprehensive Growth Strategies, November 2014
- G20 Members' Country Employment Plans, November 2014
- IMF Surveillance Note, November 2014
- Quantifying the Impact of G-20 Members' Growth Strategies, OECD/IMF report, November 2014
- Growth Strategies: G20 Emerging Market Economies – World Bank Group Assessment, November 2014
- Global Infrastructure Facility: Update for G20 Leaders, World Bank Group, November 2014
- G20/OECD Report on Effective Approaches to Support Implementation of the G20/OECD High-Level Principles on Long-Term Investment Financing by Institutional Investors, and Annex, November 2014
- Report on G20 Trade and Investment Measures, WTO, OECD, and UNCTAD, November 2014
- G20 Labour Markets: Outlook, Key Challenges and Policy Responses, OECD, ILO and World Bank Group, November 2014
- Opportunities for Economic Growth and Job Creation in Relation to Food Security and Nutrition, FAO and OECD (with inputs from ADB, IFAD, ILO, IFPRI and WTO), September 2014
- Financial Reforms: Completing the Job and Looking Ahead, Financial Stability Board Chairman's Letter to G20 Leaders, November 2014
- Adequacy of loss-absorbing capacity of global systemically important banks in resolution, Financial Stability Board, November, 2014
- Cross-Border Recognition of Resolution Action, Financial Stability Board, September 2014
- Updated G20 Roadmap towards Strengthened Oversight and Regulation of Shadow Banking in 2015, Financial Stability Board, November 2014

- Report to the G20 Brisbane Summit on the FSB's review of the structure of its representation, Financial Stability Board, November 2014
- OECD Secretary-General's Report to G20 Leaders on Tax Matters, November 2014
- International Organisations' proposal for structured dialogue process with developing countries on tax matters, November 2014

These documents are in addition to those delivered to G20 Finance Ministers and Central Bank Governors, Labour and Employment Ministers, and Trade Ministers at their meetings this year.

G20 Working Group reports

- G20 2014 Brisbane Anti-Corruption Update
- 2014 Brisbane Development Update
- G20 Energy Sustainability Working Group 2014 Co-chairs' Report
- G20 Climate Finance Study Group – Report to Ministers, 2014

Issues for further action

- The FSB proposal for an internationally agreed standard requiring global systemically important banks (G-SIBs) to hold additional loss absorbing capacity in resolution will be subject to public consultation, a rigorous quantitative impact assessment and further refinement before any final measure is agreed by the 2015 Summit. The impact analyses will include consideration of the consequences of this requirement on banks in emerging markets, G-SIBs headquartered in EMEs, and state-owned banks.

- Given the challenges litigation poses and in order to strengthen the orderliness and predictability of the sovereign debt restructuring process, we welcome the international work on strengthened collective action and pari passu clauses. We call for their inclusion in international sovereign bonds and encourage the international community and private sector to actively promote their use. We ask our Finance Ministers and Central Bank Governors to discuss the progress achieved on this and related issues.

- If the US does not ratify the 2010 IMF reforms by end-2014, we ask the IMF to discuss options for next steps shortly thereafter and we ask our Finance Ministers and Central Bank Governors to work with the IMFC to schedule a discussion on these options in their next meeting.

Acknowledgements

We thank international organisations, including the IMF, OECD, World Bank Group, WTO, ILO, FSB and UN, for their reports and recommendations, which have provided valuable inputs to G20 discussions. These can be found at http://www.g20.org/official_resources.

We thank the Business 20, Civil Society 20, Labour 20, Think 20 and Youth 20 for their important contribution to the G20's work.
